    2. Test for infinite resistance between the signal circuit terminal 1 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module.
    - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the ground circuit terminal 3.
6. Verify the scan tool Left Turn Signal Switch parameter is Active.
    - **If not Active**
    1. Vehicle OFF, disconnect the X3 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit terminal 1 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If Active**
7. Verify the scan tool Right Turn Signal Switch parameter is Inactive.
    - **If not Inactive**
    1. Vehicle OFF, disconnect the X3 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the signal circuit terminal 2 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module.
    - **If Inactive**
8. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the ground circuit terminal 3.
9. Verify the scan tool Right Turn Signal Switch parameter is Active.
    - **If not Active**
    1. Vehicle OFF, disconnect the X3 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit terminal 2 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.

   - **If Active**

10. Test or replace the S78 Turn Signal/Multifunction Switch.

Turn Signal Lamps Malfunction

1. Vehicle OFF, exterior lamps OFF, disconnect the harness connector at the appropriate turn signal lamp.
2. Test for less than 10 Ω between the appropriate ground circuit terminal listed below and ground.
   - E4LF Turn Signal Lamp - Left Front terminal 2
   - E4RF Turn Signal Lamp - Right Front terminal 2
   - A9A Outside Rearview Mirror - Driver terminal 5
   - A9B Outside Rearview Mirror - Passenger terminal 5
   - E4LR Turn Signal Lamp - Left Rear socket terminal
   - E4RR Turn Signal Lamp - Right Rear socket terminal
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Connect a test lamp between the appropriate control circuit terminal listed below and ground, vehicle in Service Mode.
   - E4LF Turn Signal Lamp - Left Front terminal 1
   - E4RF Turn Signal Lamp - Right Front terminal 1
   - A9A Outside Rearview Mirror - Driver terminal 6
   - A9B Outside Rearview Mirror - Passenger terminal 6
   - E4LR Turn Signal Lamp - Left Rear socket terminal
   - E4RR Turn Signal Lamp - Right Rear socket terminal
4. Verify the test lamp turns ON and OFF when commanding the appropriate Turn Signal Lamp ON and OFF with a scan tool.
   - **If the test lamp is always OFF**
   1. Vehicle OFF, disconnect the appropriate harness connector listed below at the K9 Body Control Module.
      - X5 left turn signals
      - X4 right turn signals
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If the test lamp is always ON**
   1. Vehicle OFF, disconnect the appropriate harness connector listed below at the K9 Body Control Module, vehicle in Service Mode.
      - X5 left turn signals
      - X4 right turn signals
   2. Test for less than 1 V between the control circuit terminal and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K9 Body Control Module.
   - **If the test lamp turns ON and OFF**
5. Test or replace the appropriate turn signal lamp.

Turn Signal Indicators Malfunction

1. Vehicle in Service Mode.
2. Verify the left and right turn signal indicators turn ON and OFF while commanding the Instrument Cluster Gauge Sweep Test ON and OFF with a scan tool.
   - **If the left or right turn signal indictors are always OFF or remain ON**

     Replace the P16 Instrument Cluster.

   - **If the left and right turn signal indictors turn ON and OFF**
3. Replace the K9 Body Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Front Turn Signal Lamp Bulb Replacement**
- Refer to **Outside Rearview Mirror Turn Signal Lamp Replacement**
- Refer to **Rear Fascia Lower Signal Lamp Replacement**
- Refer to **Stop and Turn Signal Lamp Bulb Replacement (Europe, Korea with Rear Fog)** **Stop and Turn Signal Lamp Bulb Replacement (Europe, Korea, North America with Back-up Bulb)**
- Refer to **Turn Signal Switch Replacement**
- Refer to **Control Module References** for BCM or Instrument Cluster replacement, programming and setup

REPAIR INSTRUCTIONS

TURN SIGNAL SWITCH REPLACEMENT

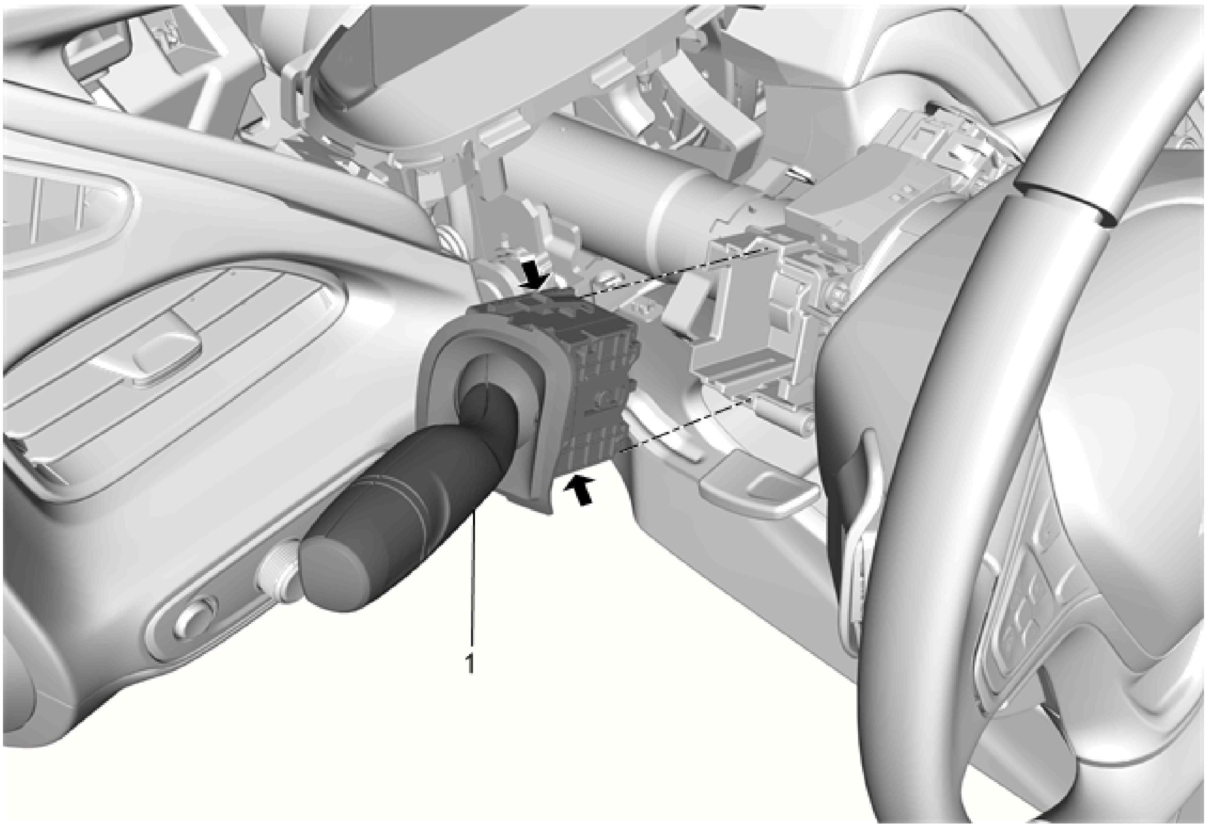

Fig. 1: Turn Signal Switch
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Steering Column Lower Trim Cover Replacement	
1	Turn Signal Switch **Procedure** 1. Release the retaining tabs and remove the turn signal switch from the switch bracket. 2. Disconnect the electrical connector.

BRAKE PEDAL POSITION SENSOR CALIBRATION

Calibration Criteria

NOTE: **Do not apply the brake pedal during the brake pedal position sensor calibration procedure. Any movement of the brake pedal during this procedure will cause the calibration procedure to fail. If this occurs, the brake pedal position sensor calibration must be repeated.**

Brake pedal position sensor calibration must be performed after the brake pedal position sensor, body control module (BCM), engine control module (ECM), or hybrid powertrain control module have been serviced. The calibration procedure will set the brake pedal position sensor home value. This value is used by the BCM and ECM/HPCM to determine the action of the driver applying the brake system and to provide this information to the vehicle subsystems via serial data.

Calibration Procedure

1. Apply the parking brake.
2. Vehicle in Service Mode, place the transmission in the PARK position for automatic transmission or NEUTRAL position for manual transmission.
3. Install a scan tool.
4. Clear all DTCs before proceeding.
5. Navigate to the Configuration/Reset Functions menu of the BCM.
6. Select the Brake Pedal Position Sensor Learn procedure and follow the directions displayed on the screen.

BRAKE PEDAL POSITION SENSOR REPLACEMENT

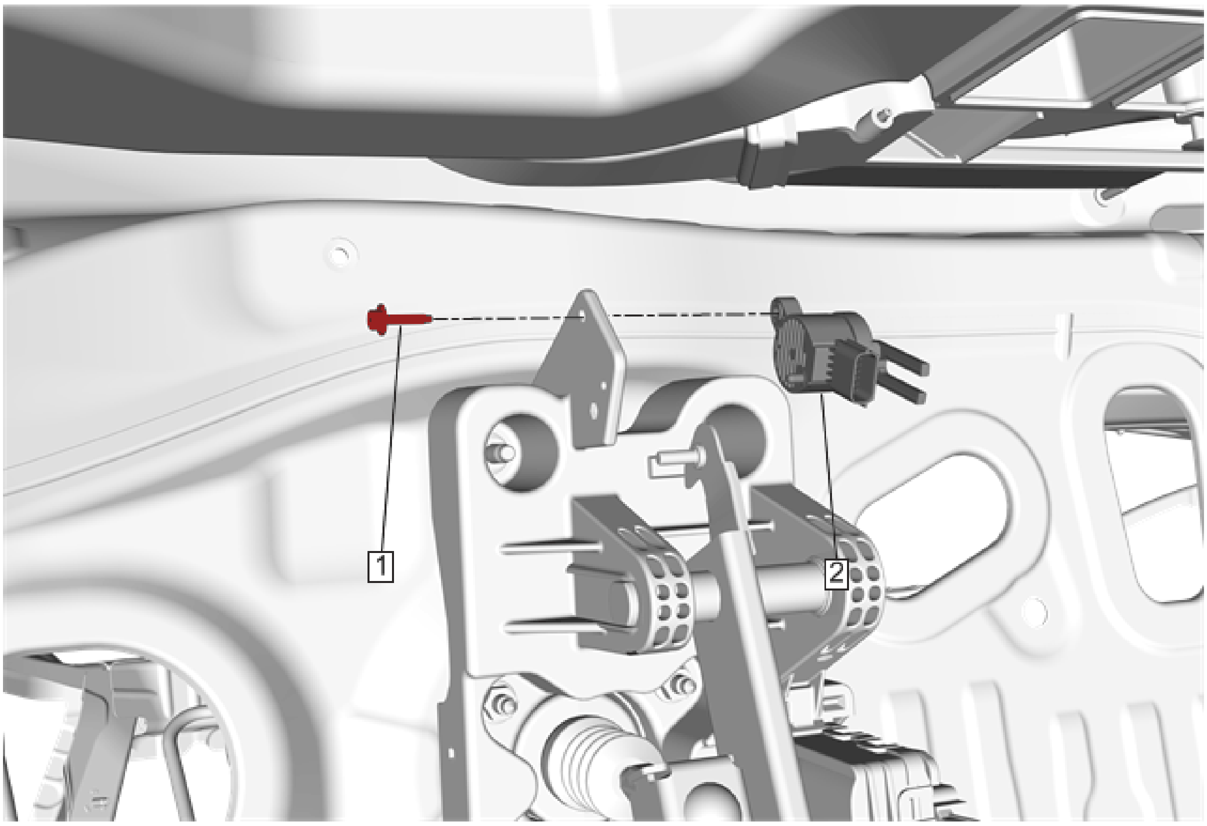

Fig. 2: Brake Pedal Position Sensor

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Instrument Panel Trim Pad Replacement - Left Side	
1	Headlamp Switch **Procedure** Release the tabs and remove the switch.

HAZARD WARNING SWITCH REPLACEMENT

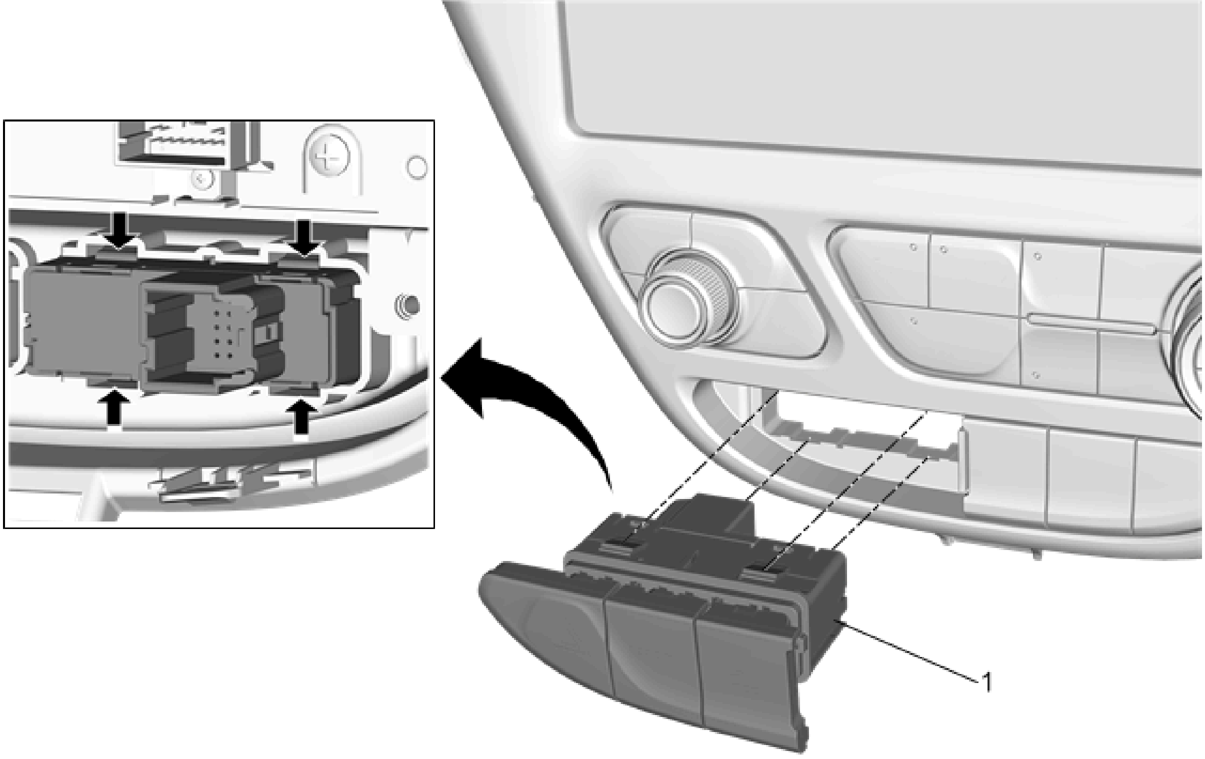

Fig. 4: Hazard Warning Switch
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Instrument Panel Trim Plate Replacement	
1	Hazard Warning Switch **Procedure** Release the tabs and remove the switch.

CENTER COURTESY LAMP REPLACEMENT

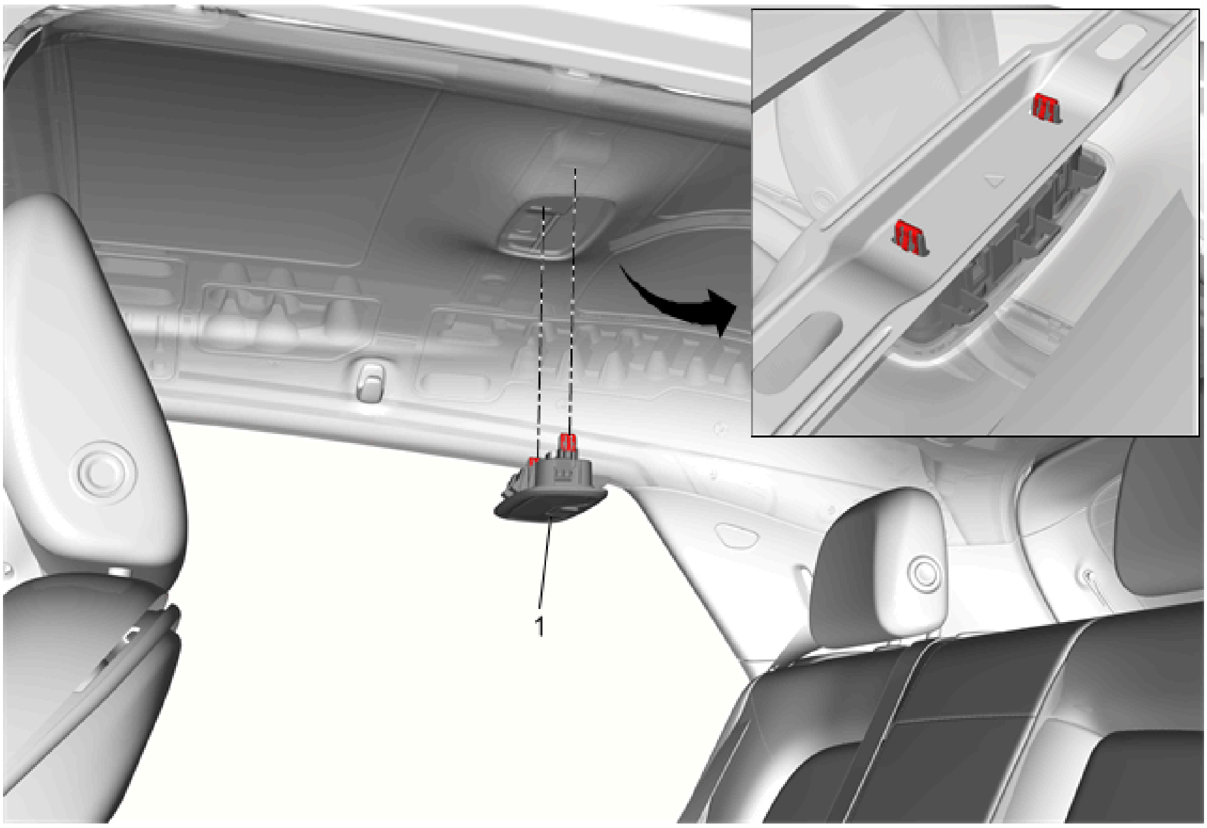

Fig. 5: Center Courtesy Lamp
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Center Courtesy Lamp **Procedure** 1. Use a flat bladed plastic trim tool. 2. Release enough of the courtesy lamp wiring harness from headliner to allow slack for installation. 3. Wrap the exposed harness with foam tape to preventing rattling. 4. Disconnect the electrical connector.

REAR SEAT POSITION CENTER COURTESY LAMP BULB REPLACEMENT

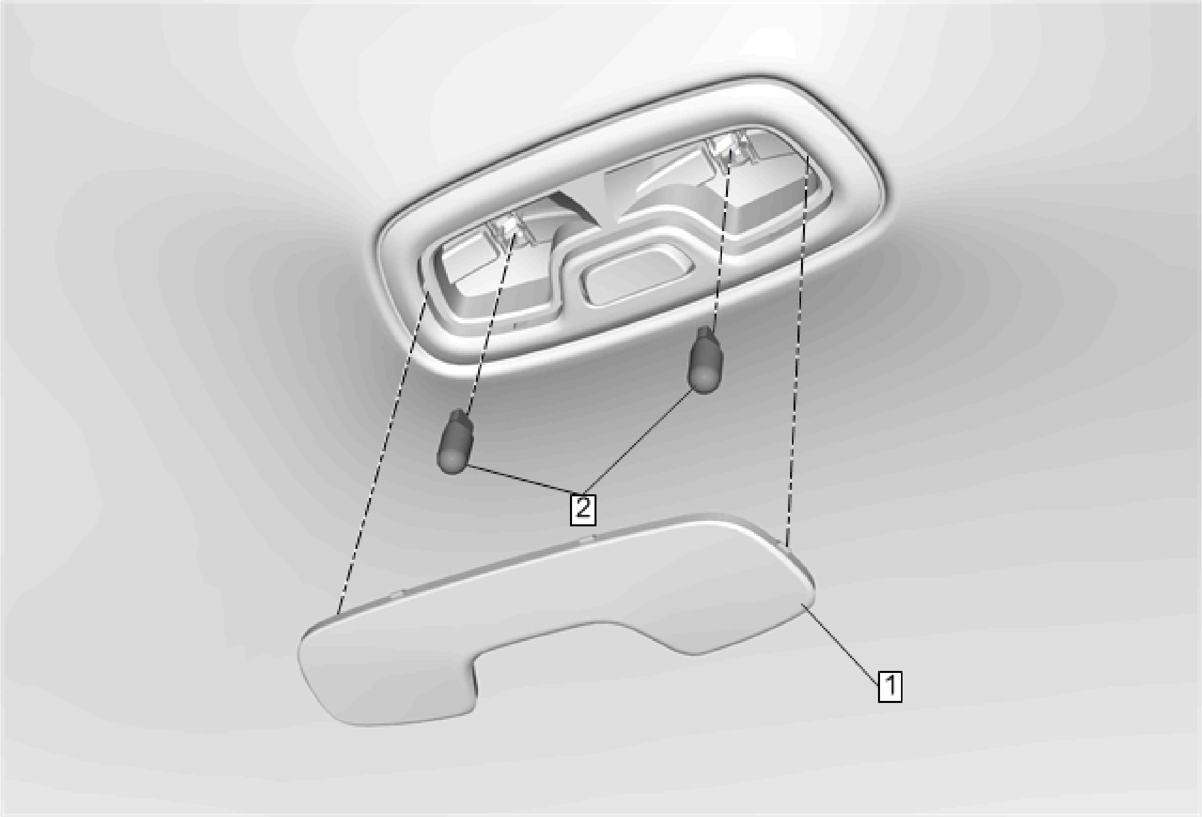

Fig. 6: Rear Seat Position Center Courtesy Lamp Bulb
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Center Courtesy Lamp Lens **Procedure** 1. Use a flat bladed plastic trim tool. 2. Release the plastic retaining tabs.
2	Rear Seat Position Center Courtesy Lamp Bulb

OUTSIDE REARVIEW MIRROR TURN SIGNAL LAMP REPLACEMENT

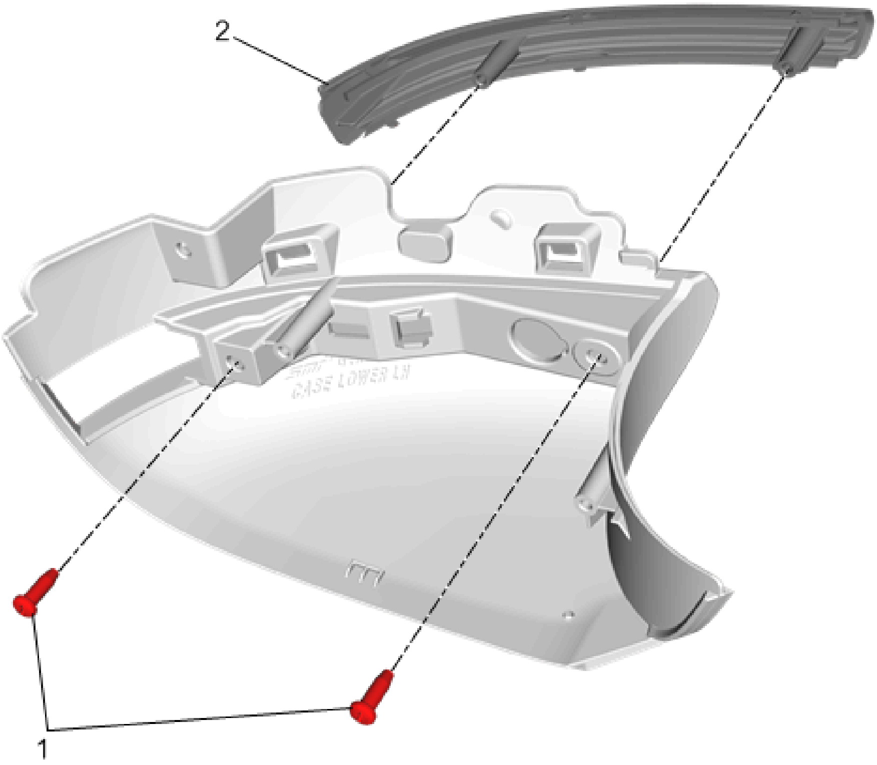

Fig. 7: Outside Rearview Mirror Turn Signal Lamp
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Outside Rearview Mirror Housing Lower Cover Replacement	
1	Outside Rearview Mirror Turn Signal Lamp Screw **CAUTION:** Fastener Caution **Tighten** 0.8 N.m (7 lb in)
2	Outside Rearview Mirror Turn Signal Lamp

HEADLAMP REPLACEMENT

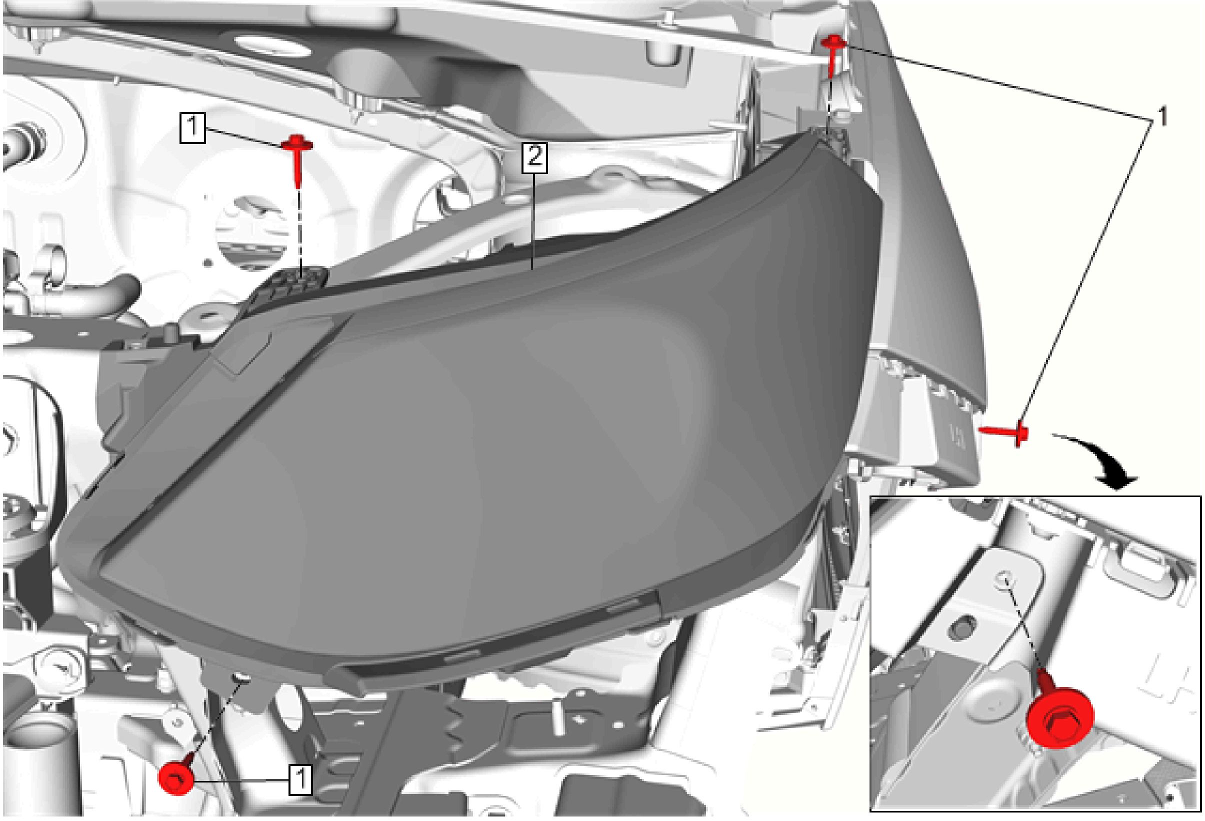

Fig. 8: Headlamp
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Front Bumper Fascia Replacement (North America) Front Bumper Fascia Replacement (Europe, Korea) 2. Front Fender Upper Rear Molding Bolt - Remove - Front Fender Upper Rear Molding Replacement	
1	Headlamp Bolt **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2.5 N.m (22 lb in)
2	Headlamp **Procedure** 1. Remove the fastener shared by the front fender upper rear molding. 2. Disconnect the electrical connector. 3. Perform the headlamp aiming procedure. Headlamp Aiming (Europe, Korea)Headlamp Aiming (North America)

HEADLAMP BALLAST REPLACEMENT

Removal Procedure

WARNING: **The high intensity discharge system produces high voltage and current. In order to reduce the risk of severe shocks and burns, the battery negative cable must be disconnected any time service work is being performed on or around the high intensity discharge system.**

WARNING: **The high intensity discharge system produces high voltage and current. To reduce the risk of severe shocks and burns:**

- **Never open the high intensity discharge system ballast or the arc tube assembly starter.**
- **Never probe between the high intensity discharge system ballast output connector and the arc tube assembly.**

1. Remove the headlamp. Headlamp Replacement

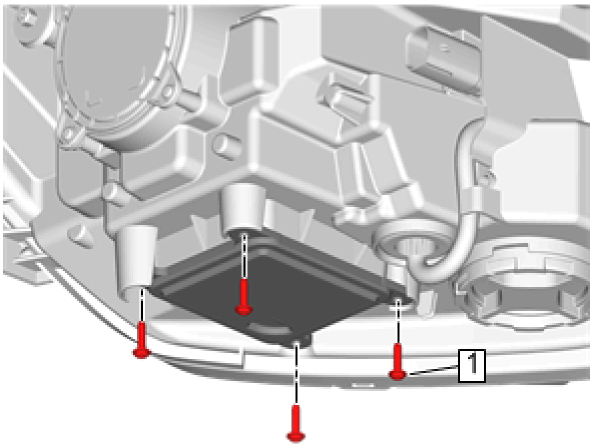

Fig. 9: Headlamp Ballast Fasteners
Courtesy of GENERAL MOTORS COMPANY

2. Remove the headlamp ballast fasteners (1).

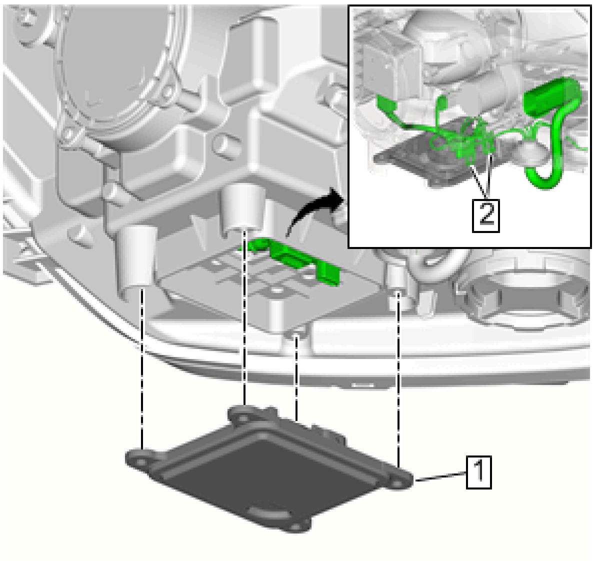

Fig. 10: Headlamp Ballast
Courtesy of GENERAL MOTORS COMPANY

3. Remove the headlamp ballast (1).
4. Disconnect the electrical connectors (2).

Installation Procedure

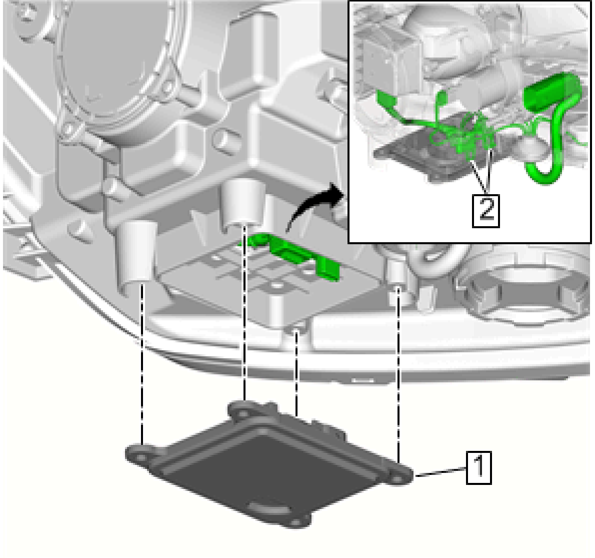

Fig. 11: Headlamp Ballast
Courtesy of GENERAL MOTORS COMPANY

1. Connect the electrical connectors (2).
2. Install the headlamp ballast (1).

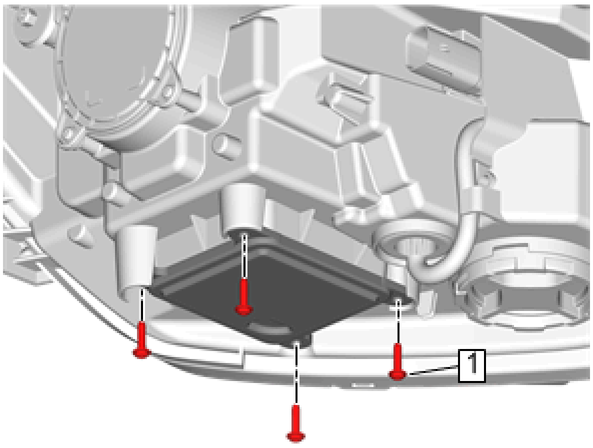

Fig. 12: Headlamp Ballast Fasteners
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **Refer to Fastener Caution .**

3. Install the headlamp ballast fasteners (1) and tighten to 2.5 N.m (22 lb in).
4. Install the headlamp. **Headlamp Replacement**

HEADLAMP BULB REPLACEMENT

Removal Procedure

WARNING: **The high intensity discharge system produces high voltage and current. In order to reduce the risk of severe shocks and burns, the battery negative cable must be disconnected any time service work is being performed on or around the high intensity discharge system.**

WARNING: **The high intensity discharge system produces high voltage and current. To reduce the risk of severe shocks and burns:**

- **Never open the high intensity discharge system ballast or the arc tube assembly starter.**

- **Never probe between the high intensity discharge system ballast output connector and the arc tube assembly.**

1. Remove the headlamp. **Headlamp Replacement**

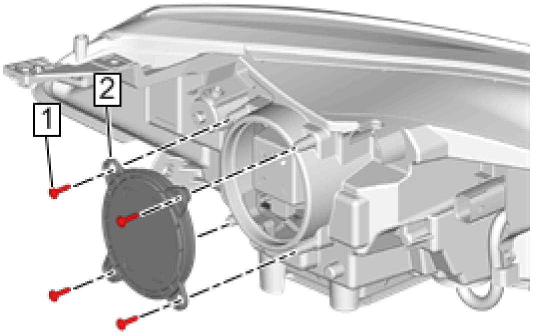

Fig. 13: Headlamp Bulb Access Cover Fasteners
Courtesy of GENERAL MOTORS COMPANY

2. Remove the headlamp bulb access cover fasteners (1).
3. Remove the headlamp bulb access cover (2).

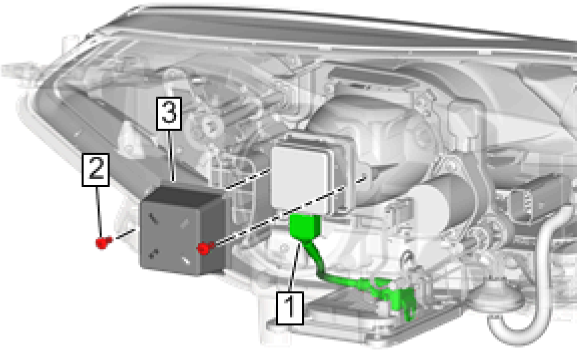

Fig. 14: Headlamp Bulb Retaining Cover Fasteners
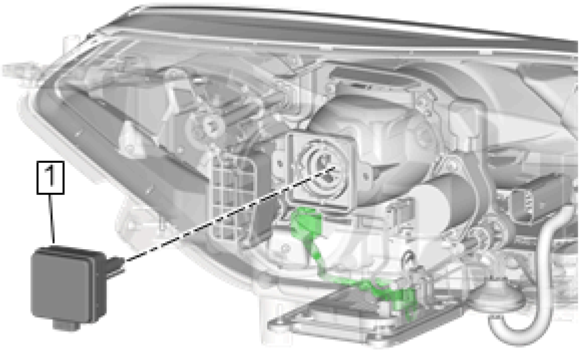
Courtesy of GENERAL MOTORS COMPANY

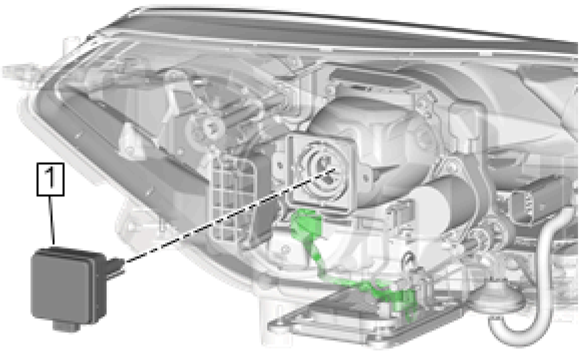
4. Disconnect the electrical connector (1).
5. Remove the headlamp bulb retaining cover fasteners (2).
6. Remove the headlamp bulb retaining cover (3).



[Fig. 15: Headlamp Bulb]
Courtesy of GENERAL MOTORS COMPANY

7. Remove the headlamp bulb (1).

Installation Procedure



[Fig. 16: Headlamp Bulb]
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The outer ring of the assembly contains alignment keys to ensure the correct orientation.**

1. Install the headlamp bulb (1).

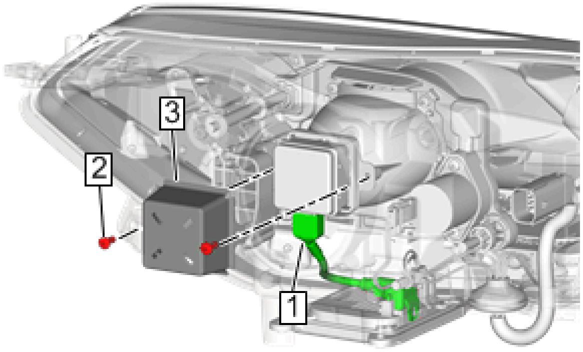


Fig. 17: Headlamp Bulb Retaining Cover Fasteners
Courtesy of GENERAL MOTORS COMPANY

2. Install the headlamp bulb retaining cover (3).

CAUTION: **Refer to Fastener Caution .**

3. Install the headlamp bulb retaining cover fasteners (2) and tighten to 2.5 N.m (22 lb in).
4. Connect the electrical connector (1).

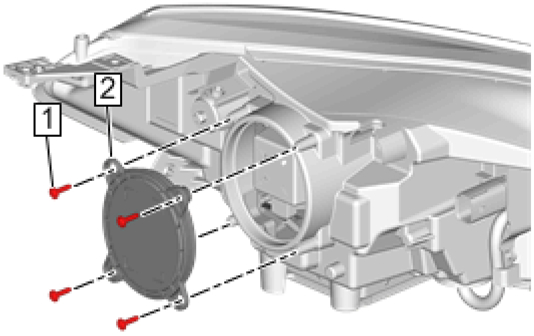

Fig. 18: Headlamp Bulb Access Cover Fasteners
Courtesy of GENERAL MOTORS COMPANY

5. Install the headlamp bulb access cover (2).
6. Install the headlamp bulb access cover fasteners (1) and tighten to 2.5 N.m (22 lb in).
7. Install the headlamp. **Headlamp Replacement**

HEADLAMP AIMING (EUROPE, KOREA)

General

Directive 76/756 EEC and ECE-Regulation 48 cover checking and aiming of headlamps on vehicle. Correct aiming of headlamps of vehicles should enable optimal road illumination by the low beam-, with minimal glare to oncoming traffic. For this purpose the inclination of the light beam in relation to the road surface and the angle of the beam to the vertical longitudinal plane running through the vehicle centre must comply with the requirements laid down in the ECE regulation and EEC directive.

Glaring of the low beam is considered eliminated if the intensity of the illumination at a distance of 25 m (82 ft) from each individual headlamp on the plane perpendicular to the road and at the height of the headlamp as well as above, is not greater than 1 lux. This requirement is generally satisfied if the headlamp aiming is carried out according to these aiming guidelines.

For the nondazzling high beam (Intelilux) special attention must be turned to the correct lateral alignment of the headlamps (low beam).

If a non-railed adjustment device will be used, the lateral orientation of the adjustment device has to be checked separately in front of each single headlamp.

The measurement of adjustment for the basic headlamp aiming is displayed in % on the headlamp housing.

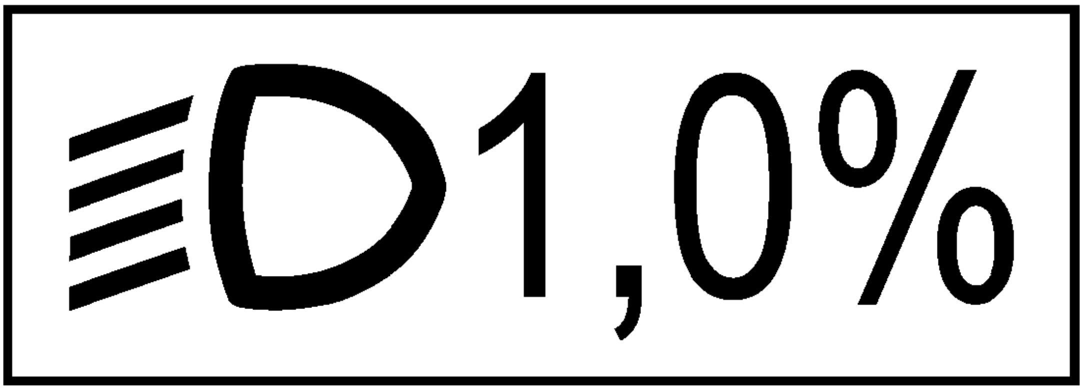

Fig. 19: Headlamp Aiming
Courtesy of GENERAL MOTORS COMPANY

Example: Label for a headlamp inclination of 1.0% for the low beam on the headlamp.

Reference 1.0 percent corresponds to the adjustment dimension of the headlamp with reference to the inclination of the light beam. The inclination at a distance of 10 m (33 ft) from vehicle headlamp is therefore 10 cm (4 in). The inclination of the low beam headlamp is indicated by its light/dark boundary (cut-off line).

Depending on the specific inner design of the headlamps, the movement of the lightbeam on the measurement screen is not exactly vertical or horizontal during the aiming on the aiming screws. This is caused by the technical solution of the suspension of the reflectors in the headlamp housing. After aiming of one axis the aiming of the other axis should be rechecked. For instance the vertical aiming could be changed a bit after the aiming of the horizontal axis. Therefore the vertical axis must be checked and if necessary aimed again after the aiming of the horizontal axis.

If a headlamp shows a significant deviation from the correct aiming for both horizontal and vertical direction the aiming operation must be performed step by step for the two directions. This means that in such a case the aiming of horizontal and vertical direction must be done alternately in small steps. Not more than one turn of an aiming screw shall be performed at once. After one turn change to the other aiming screw. Repeat this procedure until the headlamp is correctly aimed.

Headlamp Beam Setter / Inspection Station

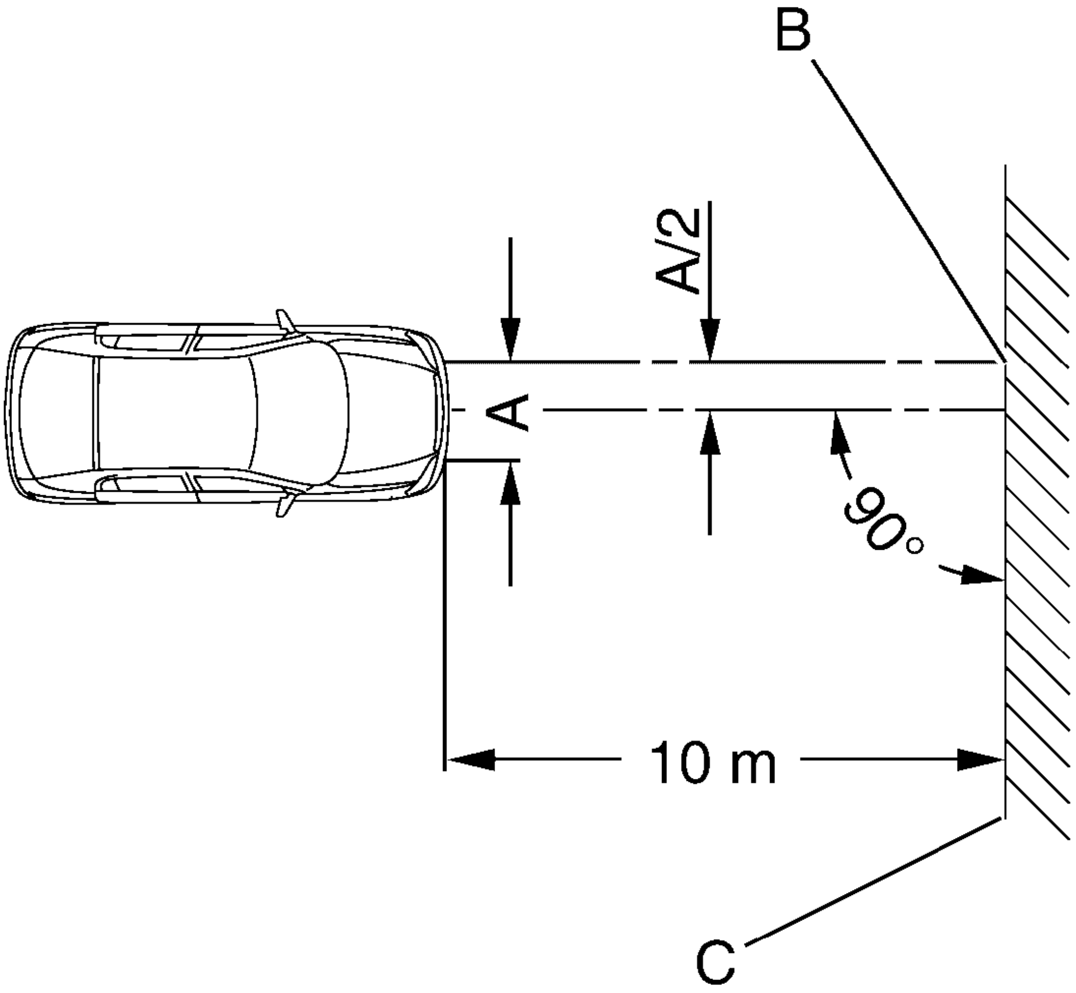

Fig. 20: Aiming Guideline
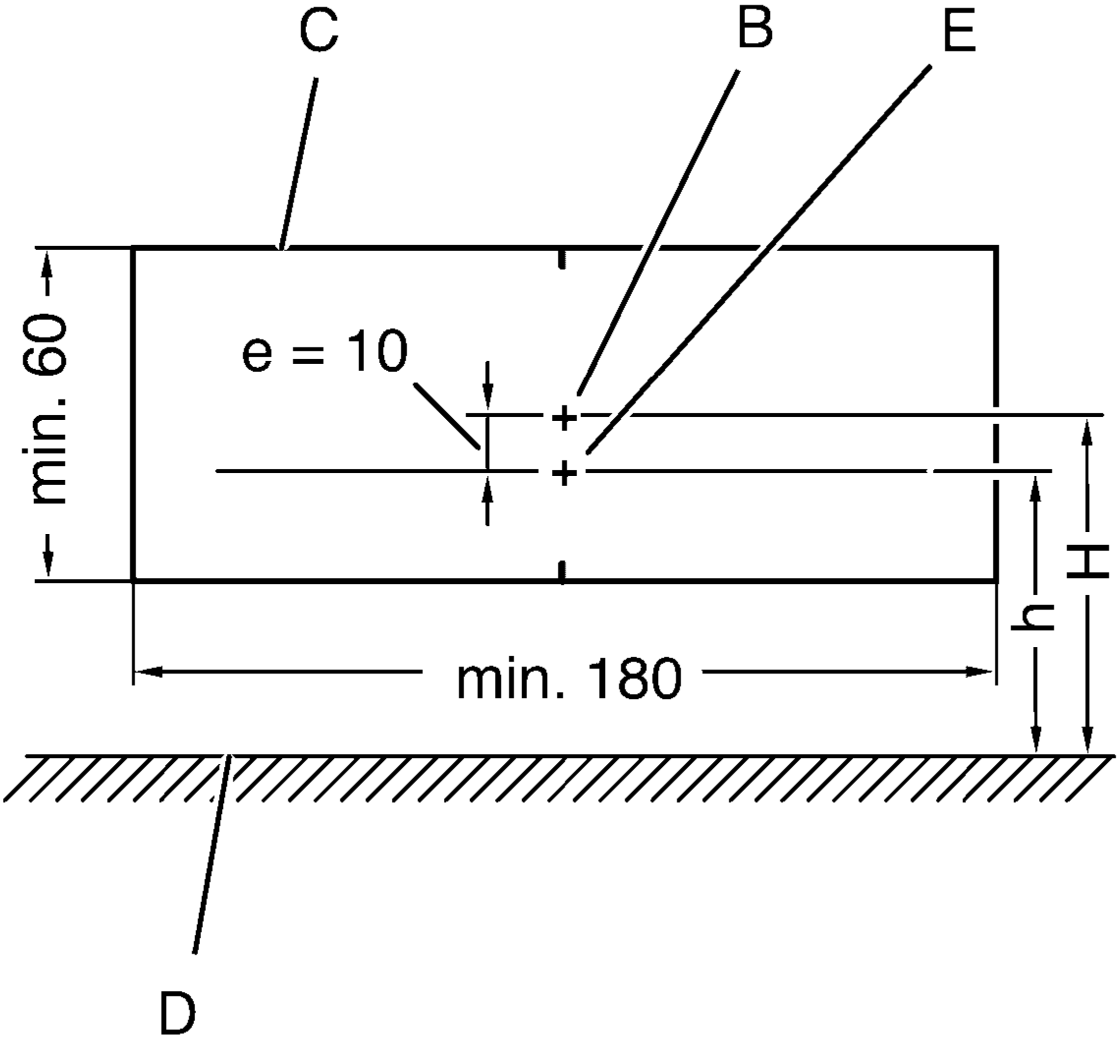
Courtesy of GENERAL MOTORS COMPANY

Abbreviations used:

A = Horizontal distance between headlamp centres

B = Central marking

C = Test surface



[Fig. 21: Aiming Guideline](#)
Courtesy of GENERAL MOTORS COMPANY

C = Test surface

D = Road surface

E = Break point (kink of cut-off line)

e = Aiming dimension in cm, e = H - h (aiming dimension, low beam headlamps usually at 1.0 percent, e = 10 cm (4 in), front fog lamps 2.0 percent, e = 20 cm (8 in), high beam headlamps (if separately amiable) at 0 percent, e = 0 cm (0 in).

H = Height of centre of headlamp over road surface

h = Height of light/dark boundary line (cut-off line) of low beam above road surface

The headlamp aiming is performed according to the specifications, as shown in the illustrations, using an adjuster. When using a headlamp adjuster, set up the height and position of the adjuster according to the instructions in the operation manual. Ensure that the vehicle tire surface that is in contact with the road and the surface for setting up the adjuster are at the same level and parallel with each another.

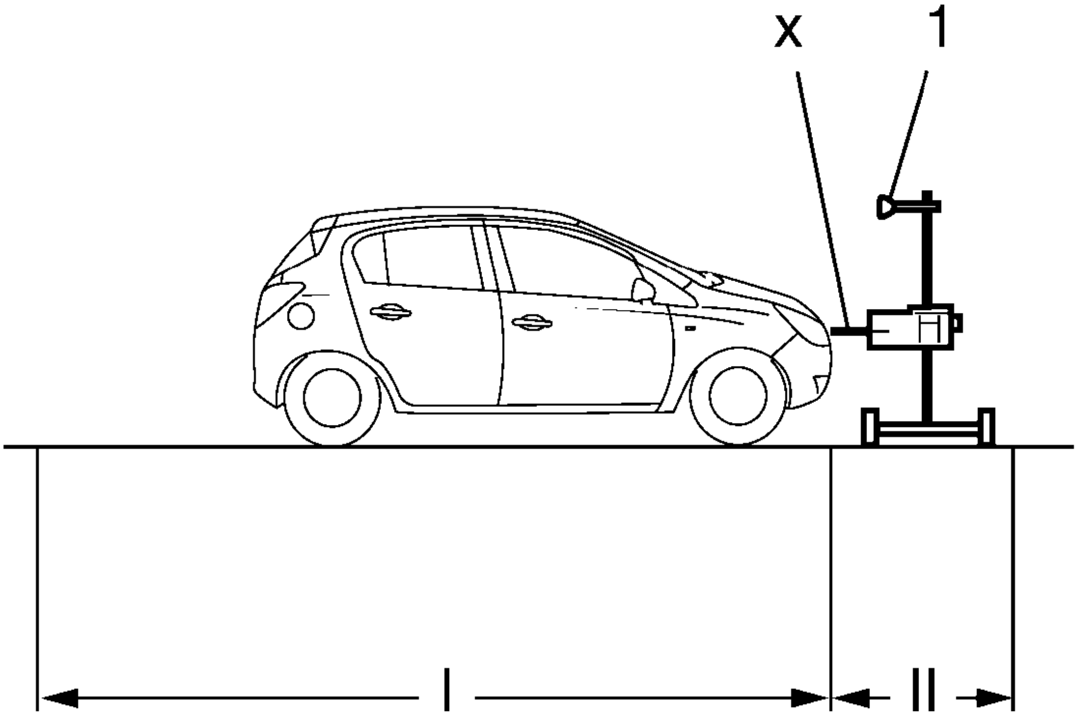


Fig. 22: Marking Of Control Mirror
Courtesy of GENERAL MOTORS COMPANY

X = Center of adjuster lens (see arrow mark on adjuster housing) must be aligned on the same level as the low beam headlamp and must be parallel to the ground.

1 = Use marking of the control mirror (1) to align the adjuster system in the correct angle to the vehicle, based on the information shown in the owner operating instructions.

The distance between the adjuster lens and the headlamp must be max. 0, 9 meters (refer to operation instructions of the adjuster system)

The surface on which the measuring instrument (adjuster system) and the vehicle stand must be flat. See follow table.

I difference utility space from vehicle	
longitudinal direction	**lateral direction**
Â± 3 mm / m	Â± 0 mm / 1 m
Â± 5 mm / 2m	Â± 0 mm / 2 m
Â± 7 mm /3 m	Â± 0 mm / 3 m
Â± 9 mm / 4 m	Â± 0 mm / 4 m
Â± 10 mm / 6 m	Â± 0 mm / 6 m
Â± 11 mm / 8 m	Â± 0 mm / 8 m

II difference utility space from vehicle	
longitudinal direction	**lateral direction**
Â± 1 mm / 1 m	Â± 1 mm / 1 m

Vehicle tires must have specified air pressure. Blackened bulbs must be replaced before adjusting.

The adjustment is performed at vehicle curb weight plus one person or 75 kg (165 lb) on the driver's seat. (Curb weight = weight of vehicle ready for use with 90% filled fuel tank plus the weight of all equipment carried during use, e.g. spare wheel, tools, jack, first aid kit, emergency warning triangle, etc.).

Light Pattern / Scheme of Headlamps

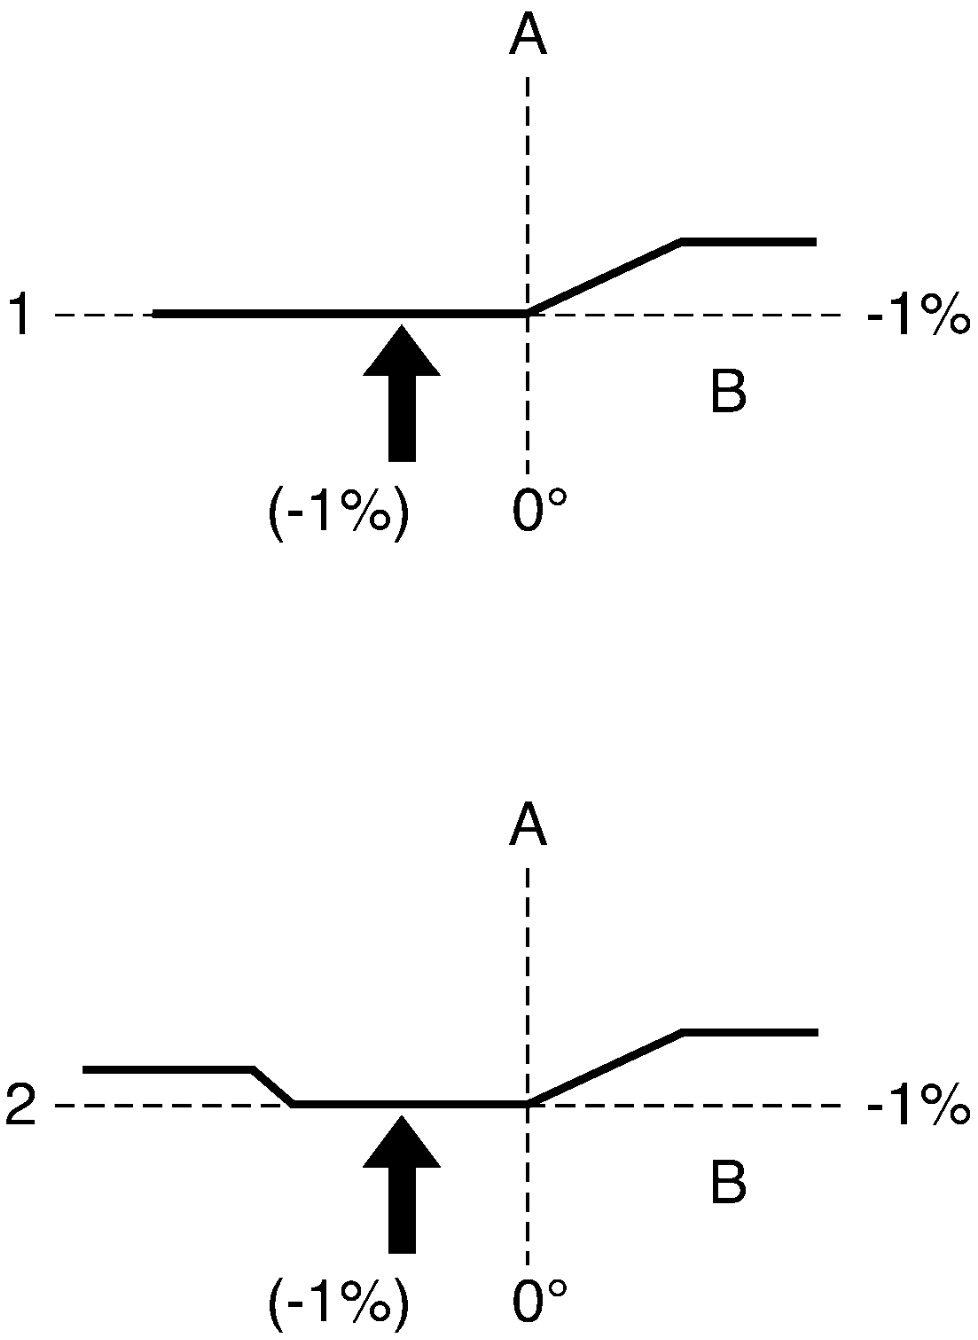

Fig. 23: Light Pattern / Scheme of Headlamp
Courtesy of GENERAL MOTORS COMPANY

A = Kink of cut-off line for the left/right setting

B = Horizontal area of the cut-off line for up/down setting

1 and 2 = Depending on the headlamp setup the outer sections will be straight or increasing.

Headlamp Aiming

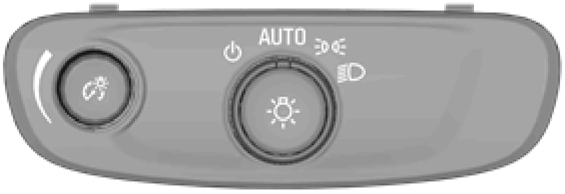

Fig. 24: Headlamp Switch
Courtesy of GENERAL MOTORS COMPANY

The headlamp switch must be turned on manual low beam if equipped, the manual headlamp range adjustment has to be in the zero position.

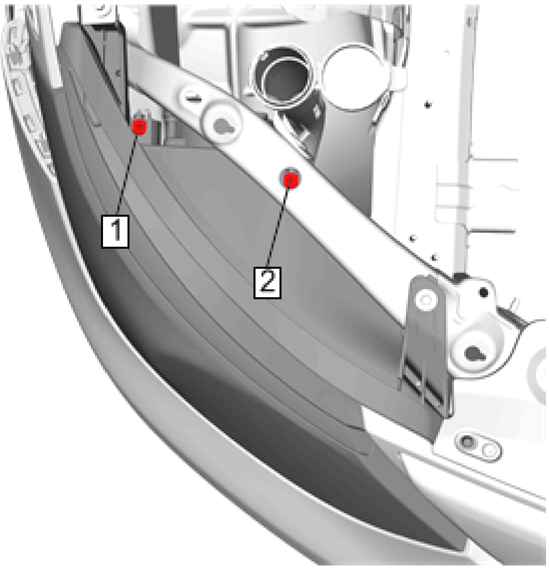

Fig. 25: Headlamp Screw
Courtesy of GENERAL MOTORS COMPANY

Halogen Headlamp

- (1) Aiming screw for vertical adjustment
- (2) Aiming screw for horizontal adjustment

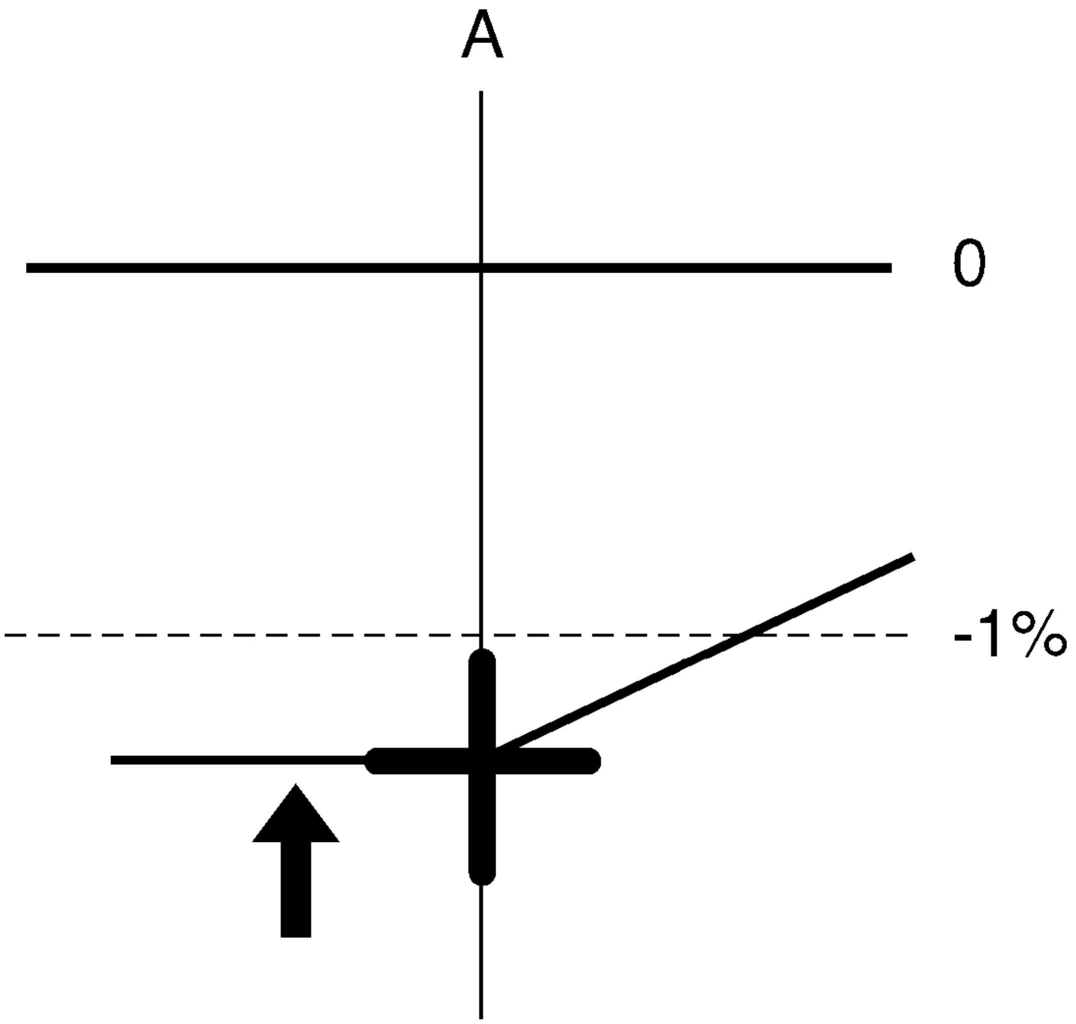

Fig. 26: Headlamp Adjustment Grid
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Guide and adjust the headlamps always from below to the horizontal area of the separation line**

For the vertical adjustment (adjustment of the height), the separation line has to be on the left side of the adjustment cross parallel to the horizontal adjustment line (1).

NOTE: **At first perform the vertical (1) and then the lateral adjustment. Check the vertical adjustment again after the lateral adjustment.**

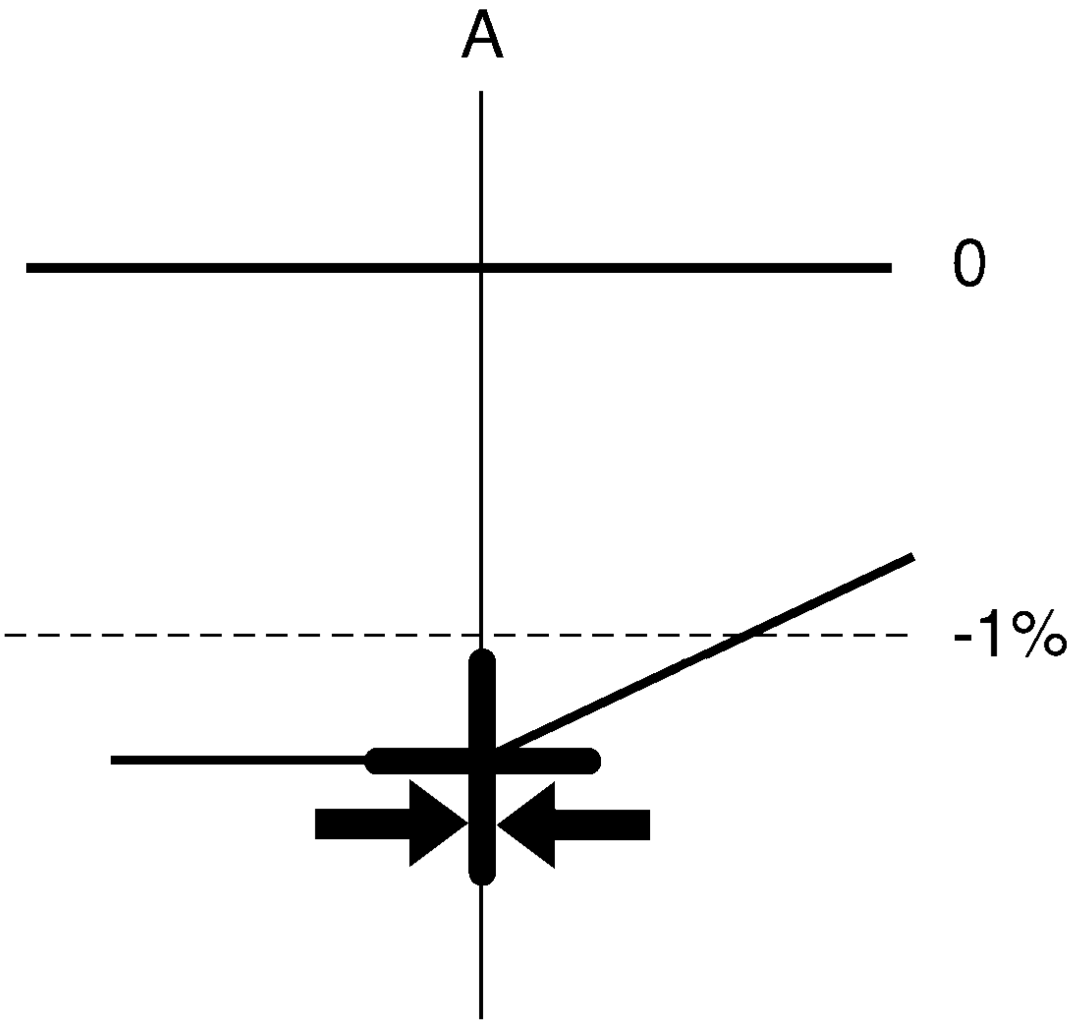

Fig. 27: Vertical Separation Line
Courtesy of GENERAL MOTORS COMPANY

To assure the correct lateral adjustment the horizontal increase (inflection point) must lay on the vertical separation line A (0 degree).

NOTE: **This description is valid for right hand traffic. For left hand traffic the light pattern of left and right side is mirrored.**

HEADLAMP AIMING (NORTH AMERICA)

Visual Aiming Preparation Procedure

NOTE: **Some state and local laws specify requirements for headlamp aim. Comply with all of these laws when performing any headlamp aiming operations.**

Headlamp aim should be checked:

- When a new headlamp capsule is installed.
- If service or repairs to the front end area have, or may have, disturbed the headlamps or their mounting.

The aiming screen should meet the following criteria:

- The area will consist of a level surface large enough to allow for a vehicle and an additional 7.62 m (25 ft) measured from face of lamps to the front of the aiming screen.
- The screen will be 1.52 m (5 ft) high x 3.66 m (12 ft) wide with a matte white surface well shaded from extraneous light, and properly adjusted to the floor on which the vehicle stands. Provisions

should be made to align the aiming screen parallel with the vehicle.

- The screen shall be provided with a fixed vertical centerline, two laterally adjustable vertical tapes, and one vertically adjustable horizontal tape.
- If a regular commercial aiming screen is not available, the screen may consist of a vertical wall having a clear uninterrupted area approximately 1.83 m (6 ft) high and 3.66 m (12 ft) wide. The surface should be finished with a washable non-gloss white paint.

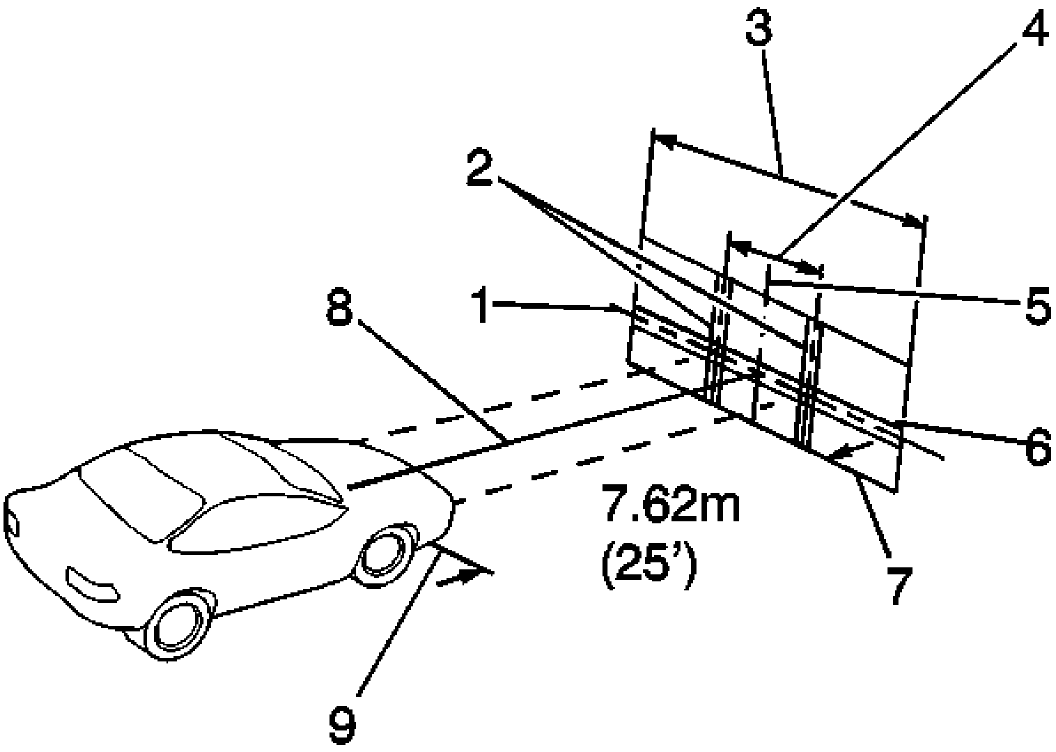

Fig. 28: Headlamp Aiming/Adjustment Procedure
Courtesy of GENERAL MOTORS COMPANY

- After the aiming screen has been set up in a permanent location, paint a reference line on the floor directly under the lens of the lamps to indicate the proper location of the headlamps when they are being aimed:
  - Distance between headlamps (1)
  - Center line of screen (2)
  - Adjustable vertical pointer (3)
  - Adjustable horizontal tape (4)
  - Diagram of light screen (5)
  - Vertical center line ahead of right headlamp pointer position (6)
  - 7.62 m (25 ft) (7)
  - Car axis (8)
  - Adjustable vertical pointer
  - Horizontal center line of lamps
  - Vertical center line ahead of left headlamp

Prior to aiming the headlamps, the following steps must be taken:

1. Remove any snow, ice or mud from the vehicle.
2. Stop all other work on the vehicle.
3. If any service has been performed on the vehicle, make sure that all of the components are back in their original place.
4. The vehicle must be on a level surface.

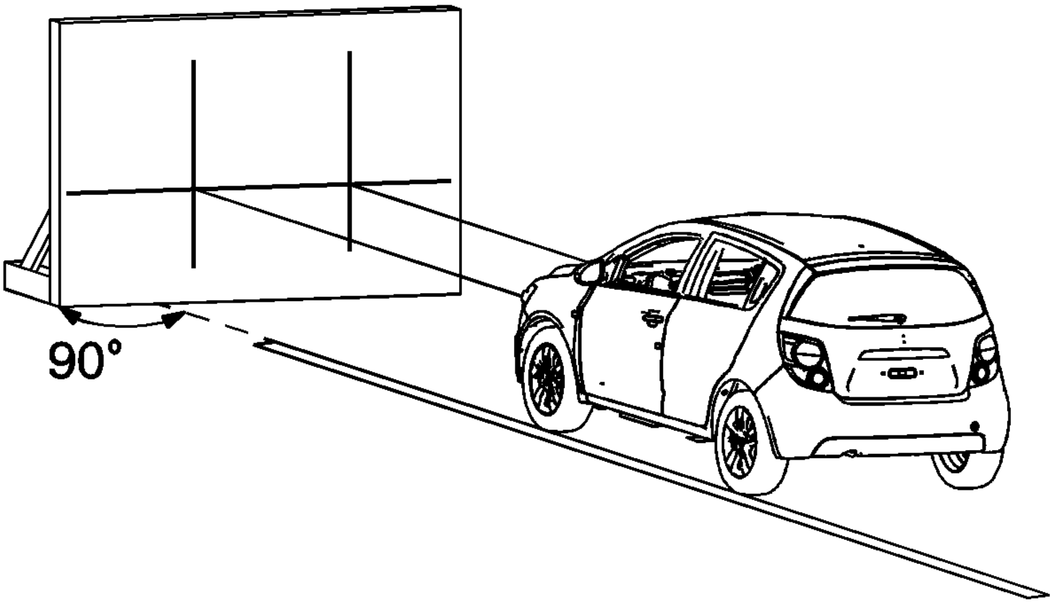

Fig. 29: Headlamp Aiming
Courtesy of GENERAL MOTORS COMPANY

5. The vehicle left tires must be aligned with the reference line extending from the screen with the headlamps aligned with the reference line.
6. Do not load any cargo in the vehicle.
7. The vehicle must contain approximately 75 kg (165 lb) on the driver seat.
8. Inflate the tires to the proper pressure.
9. Simulate the vehicle loads if the intended use of the vehicle is for hauling heavy loads or towing a trailer.
10. Rock the vehicle in order to stabilize the suspension.
11. Turn on the headlamps to low beam and observe the left and the top edges of the high intensity zone on the screen. The edges of the high intensity zone should fall within the specifications.

Headlamp Aiming Procedure

1. Open the hood.

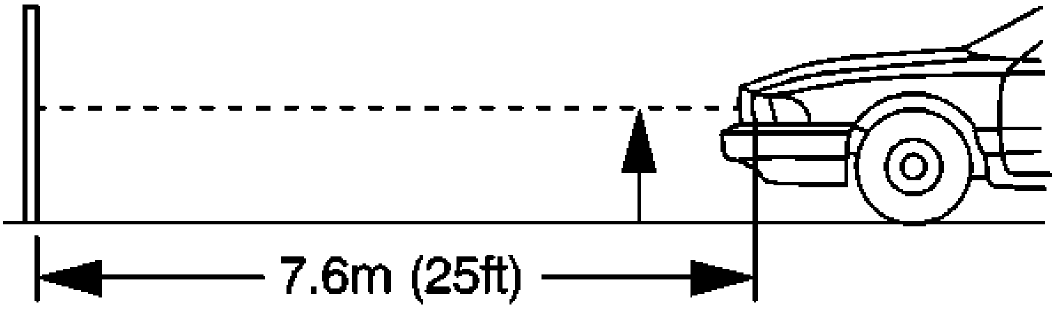

Fig. 30: Measuring Distance Between Headlamps Face & Aiming Screen
Courtesy of GENERAL MOTORS COMPANY

2. Measure from the floor to the center of the headlamp bulb. Some headlamps have an aim dot marked on the headlamp lens.
3. At the screen, measure from the floor and place the horizontal tape at the measured distance.
4. Measure from the reference line on the floor to the left headlamp bulb centerline.
5. At the screen, measure from the reference line and place the vertical tape at the measured distance.
6. Measure from the reference line on the floor to the right headlamp bulb centerline.
7. At the screen, measure from the reference line and place the vertical tape at the measured distance.

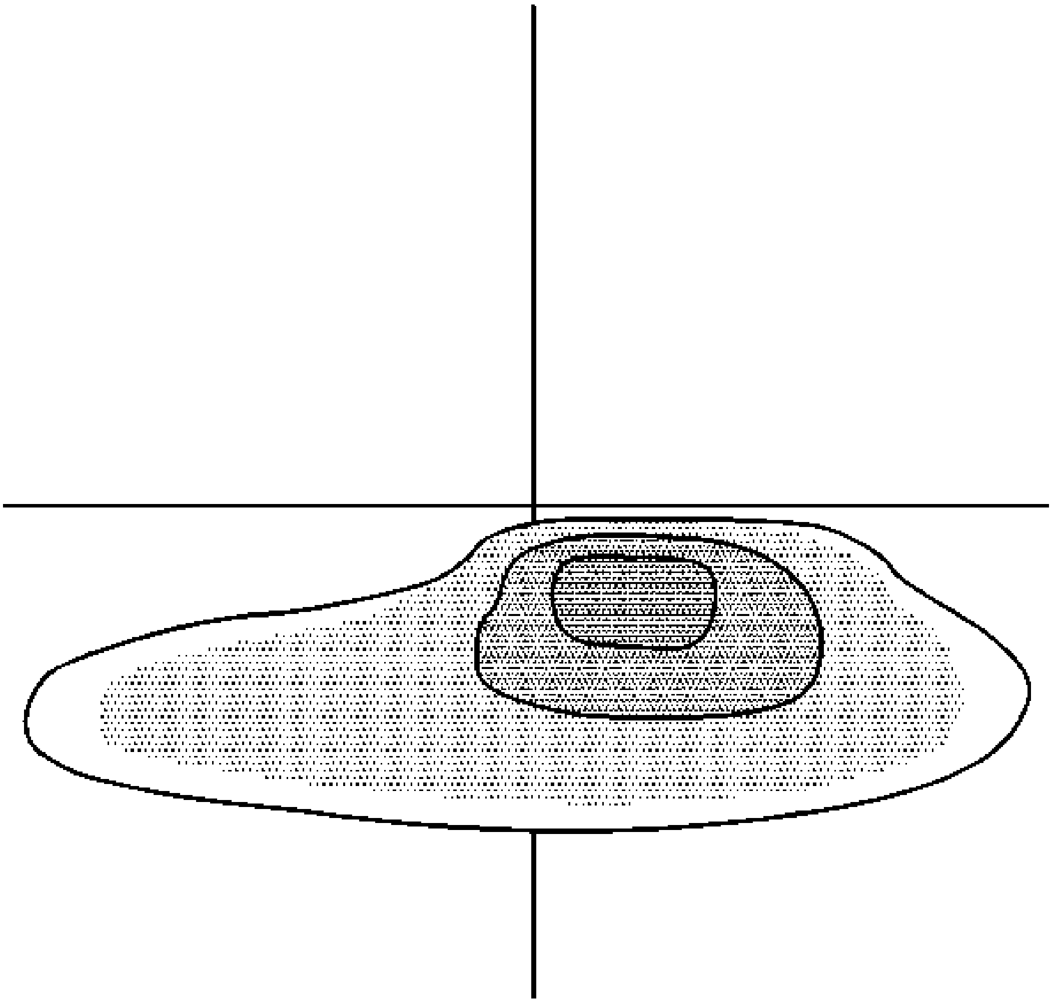

Fig. 31: Right Side Low Beam Proper Screen Positioning
Courtesy of GENERAL MOTORS COMPANY

NOTE: **DO NOT cover the headlamp. This may cause excessive heat build up.**

8. Turn ON the low beam headlamps. Block the light from projecting onto the screen from the passenger side headlamp.

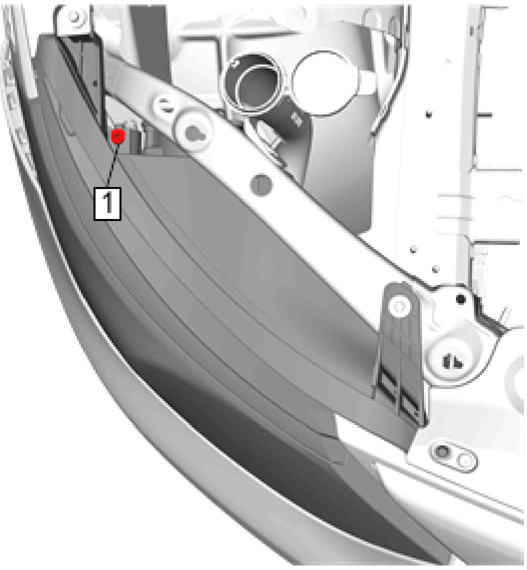

Fig. 32: Vertical Aim Screw
Courtesy of GENERAL MOTORS COMPANY

9. Adjust the vertical aim screw (1) of the headlamps to the specifications required by the state and the local authorities, or as shown in step number 8.
10. Repeat the aiming procedure for the passenger side headlamp while blocking the light from projecting onto the screen from the driver side headlamp.
11. Turn the headlamps OFF.
12. Close the hood.

FRONT TURN SIGNAL LAMP REPLACEMENT

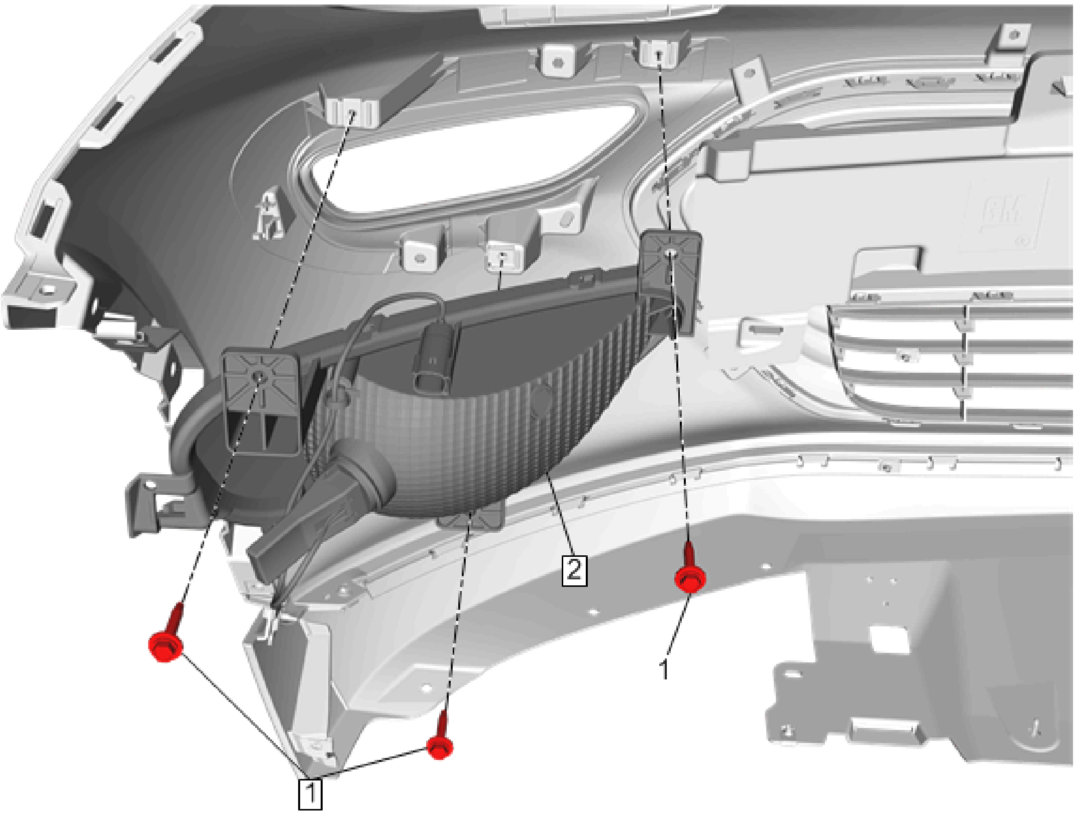

Fig. 33: Front Turn Signal Lamp
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Front Bumper Fascia Replacement (North America) Front Bumper Fascia Replacement (Europe, Korea)	
1	Front Turn Signal Lamp Bolt **CAUTION:** Fastener Caution **Tighten** 2.5 N.m (22 lb in)
2	Front Turn Signal Lamp **Procedure** Disconnect the electrical connector.

REAR SIDE MARKER LAMP REPLACEMENT

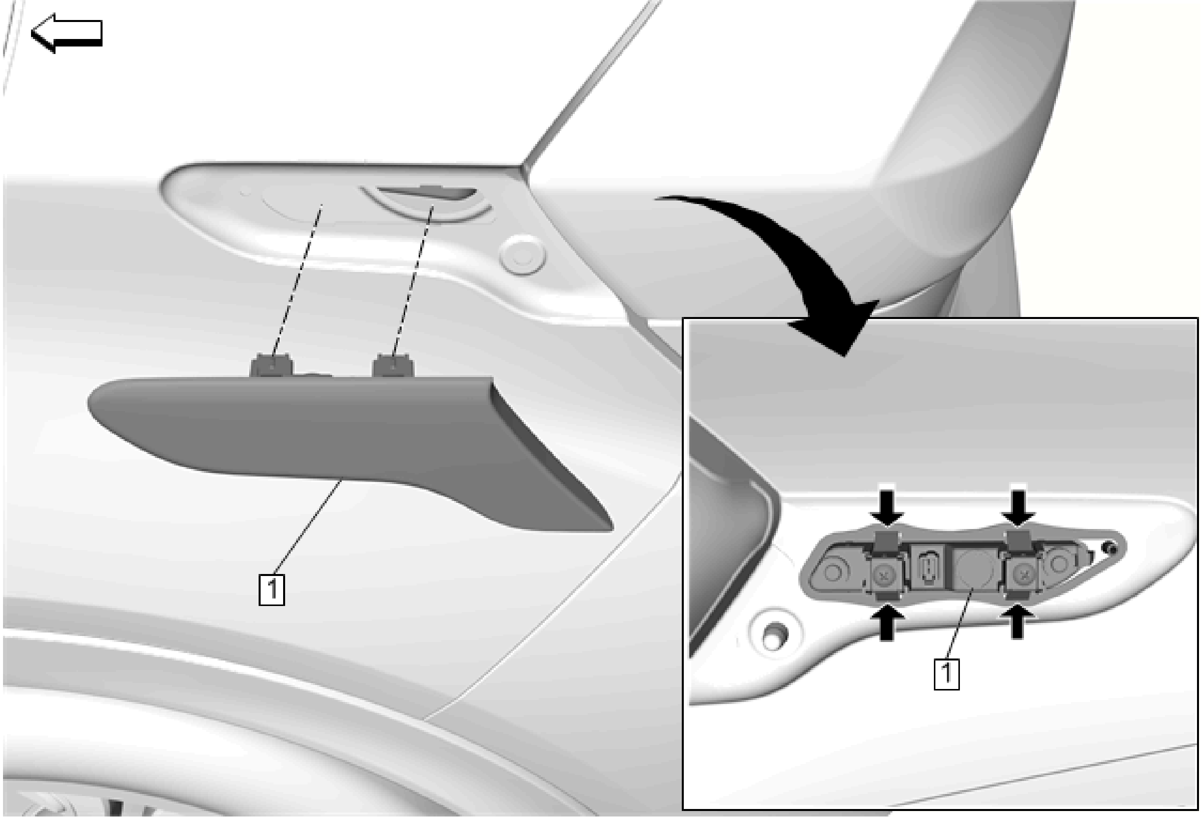

Fig. 34: Rear Side Marker Lamp
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	**CAUTION:** **To avoid paint damage, protect the area surrounding the part which you are removing or installing.** **CAUTION:** **Be very careful and gentle when using the plastic trim tool to remove the rear side marker lamp. The rear side marker lamp is very brittle and will be damaged if one is not careful with the plastic trim tool. If the rear side marker lamp is damaged it must be replaced.** Rear Side Marker Lamp**Procedure** Using a plastic trim tool, remove the side marker lamp from the body.

FRONT TURN SIGNAL LAMP BULB REPLACEMENT

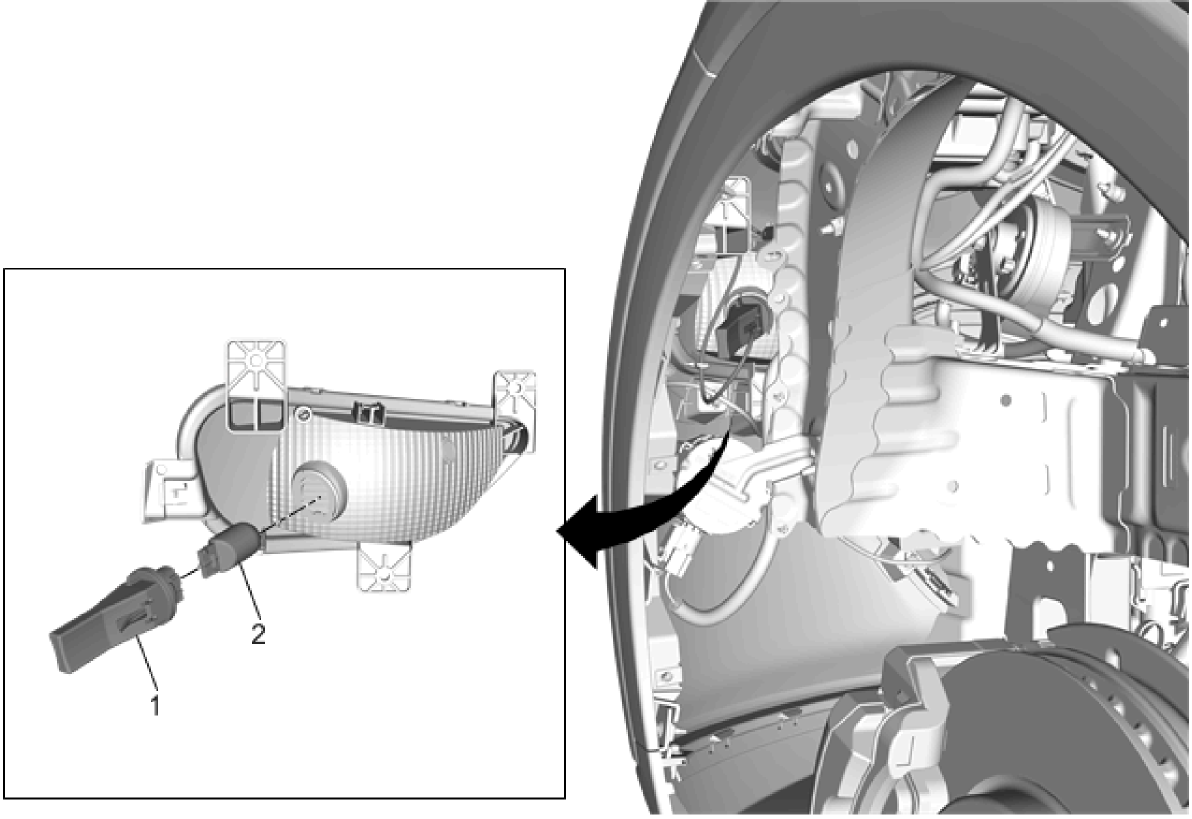

Fig. 35: Front Turn Signal Lamp Bulb

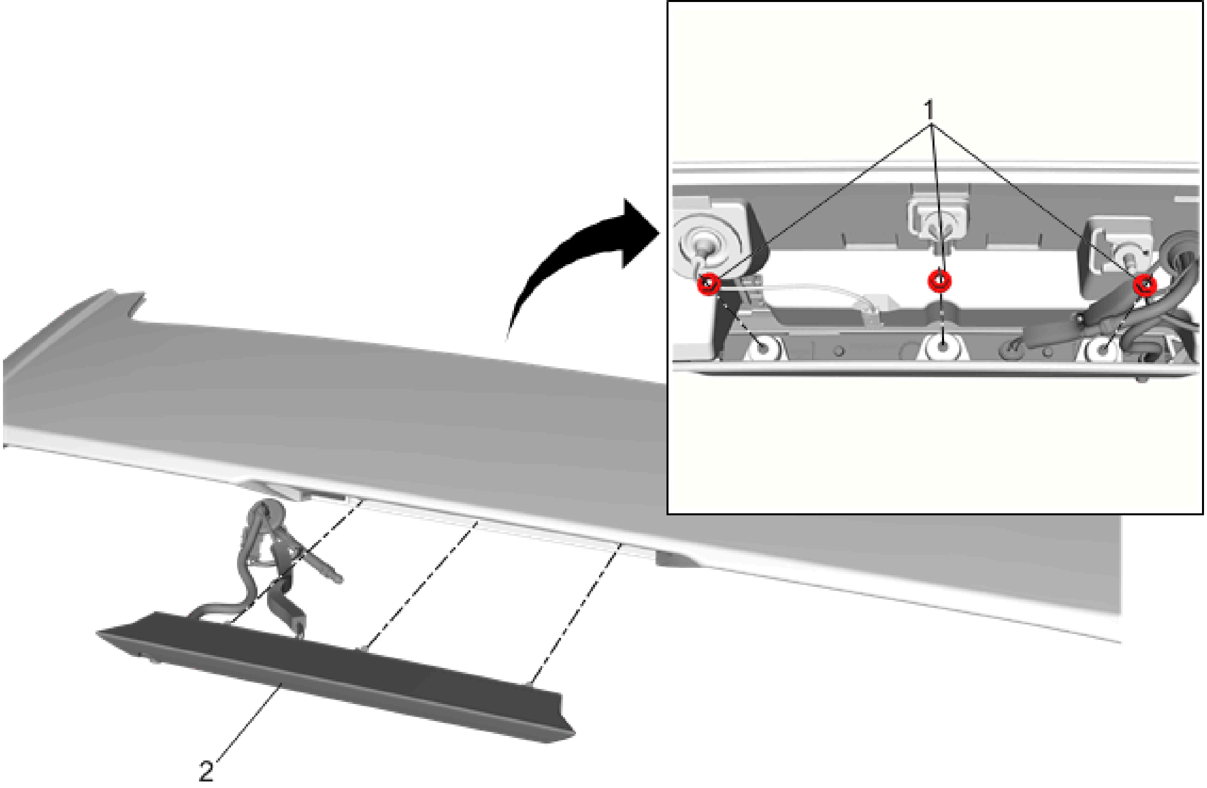
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: **Halogen Bulb Warning** **Preliminary Procedure Front Wheelhouse Liner Replacement**	
1	Front Turn Signal Lamp Bulb Socket **Procedure** Rotate the bulb socket counterclockwise to remove it from the lamp housing.
2	Front Turn Signal Lamp Bulb **Procedure** Pull the bulb straight from the lamp socket.

HIGH MOUNT STOP LAMP REPLACEMENT



[Fig. 36: High Mount Stop Lamp](#)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure [Rear End Spoiler Replacement](#)	
1	High Mount Stop Lamp Nut **CAUTION:** [Fastener Caution](#) **Tighten** 6 N.m (53 lb in)
2	High Mount Stop Lamp **Procedure** Disconnect the washer hose from rear washer nozzle. Route the hose and harness through the spoiler.

CARGO CENTER COURTESY LAMP REPLACEMENT

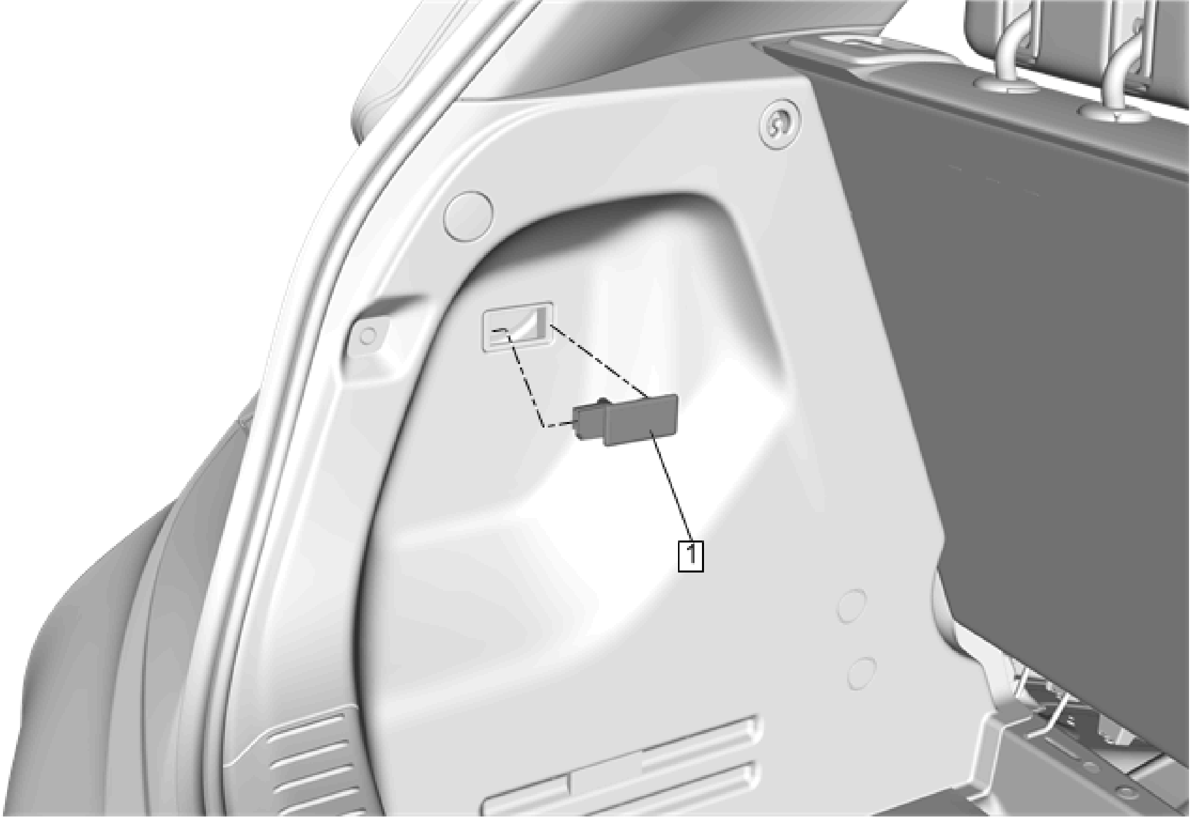


Fig. 37: Cargo Center Courtesy Lamp
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Cargo Center Courtesy Lamp **Procedure** 1. Use a plastic flat bladed trim tool in order to release the lamp assembly. 2. Disconnect the electrical connector.

CARGO CENTER COURTESY LAMP BULB REPLACEMENT

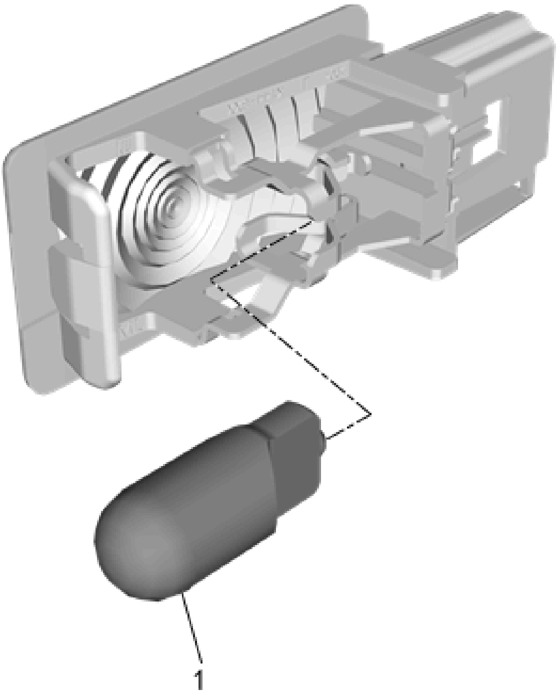

Fig. 38: Cargo Center Courtesy Lamp Bulb
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Cargo Center Courtesy Lamp Replacement	
1	Cargo Center Courtesy Lamp Bulb

REAR LICENSE PLATE LAMP REPLACEMENT

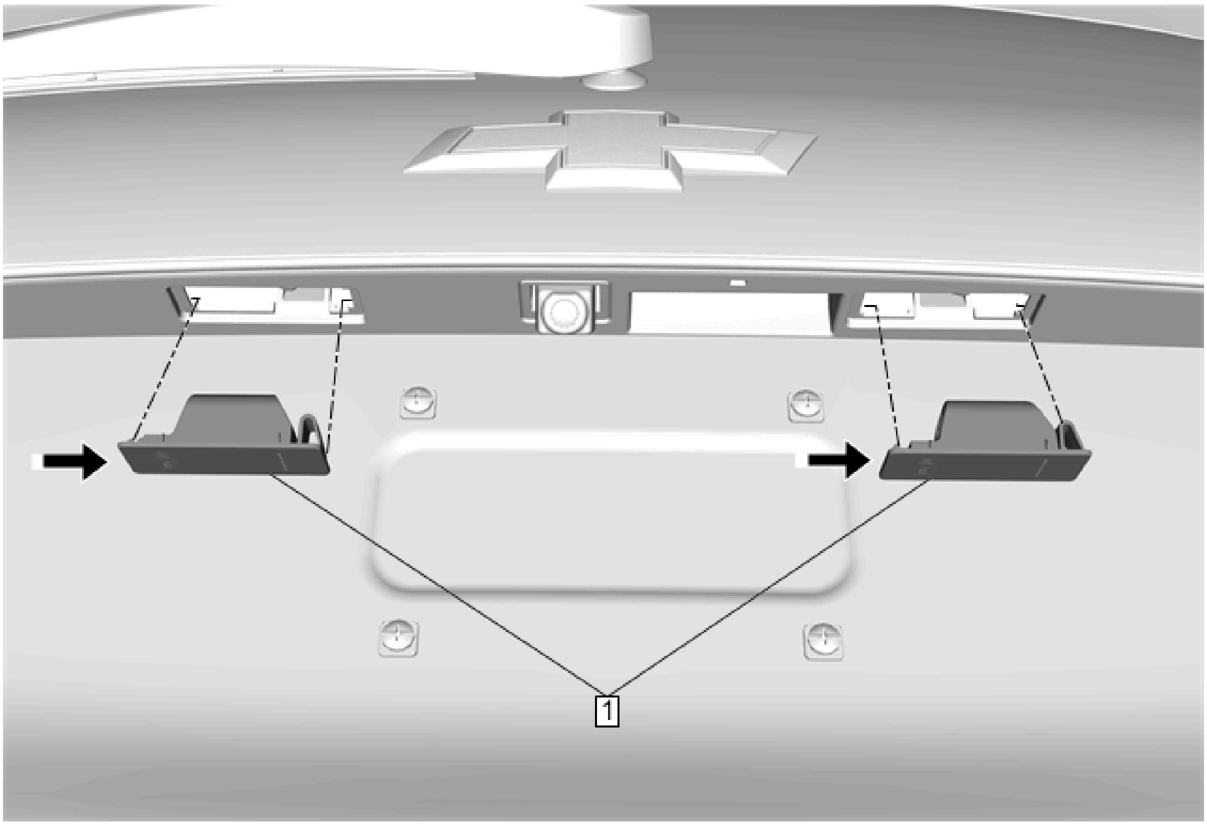

Fig. 39: Rear License Plate Lamp
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear License Plate Lamp **Procedure** 1. Using a plastic trim tool, from the left side, gently pry the lamp to the right, then downward to release and remove. 2. Remove the sockets from the lamps by twisting counterclockwise.

REAR LICENSE PLATE LAMP BULB REPLACEMENT

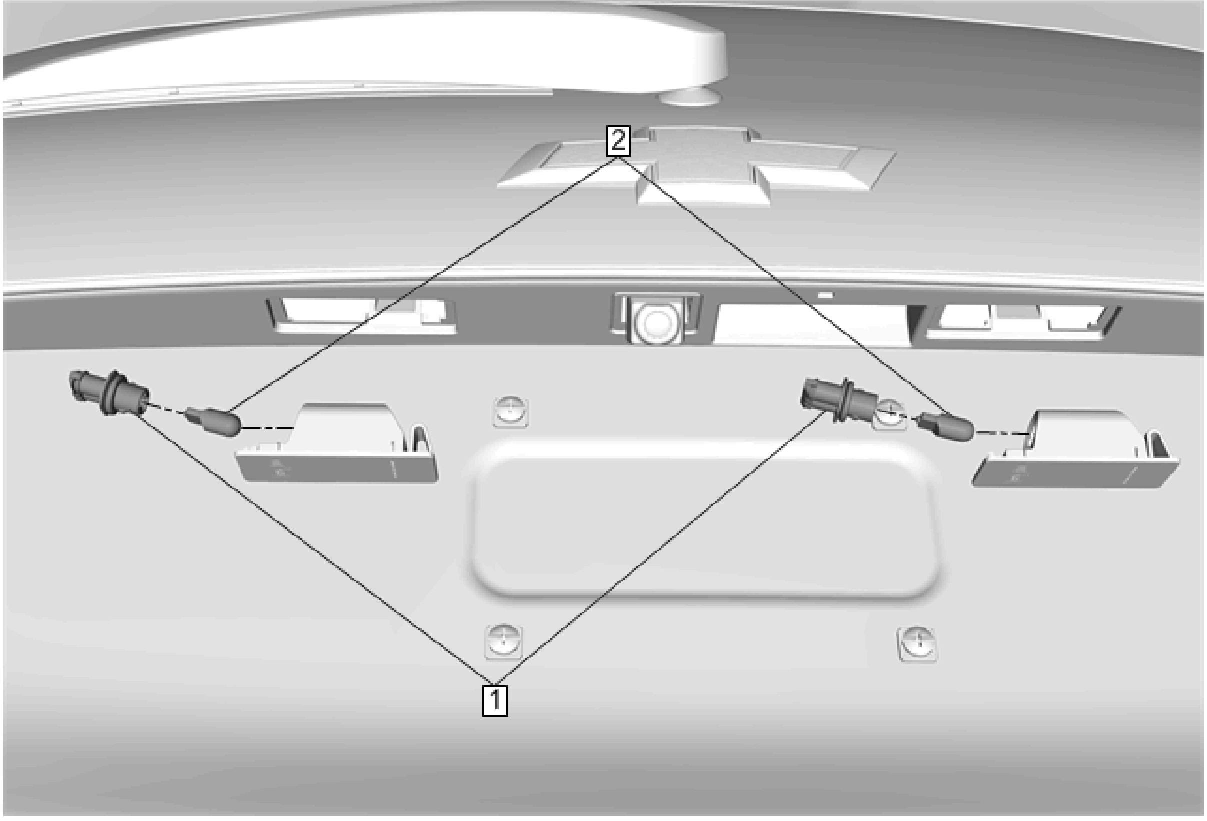

Fig. 40: Rear License Plate Lamp Bulb
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Rear License Plate Lamp Replacement	
1	License Plate Lamp Socket **Procedure** Rotate the bulb socket counterclockwise to remove it from the lamp housing.
2	Rear License Plate Lamp Bulb **Procedure** Pull the bulb straight from the lamp socket.

REAR LICENSE PLATE LAMP WIRING HARNESS REPLACEMENT

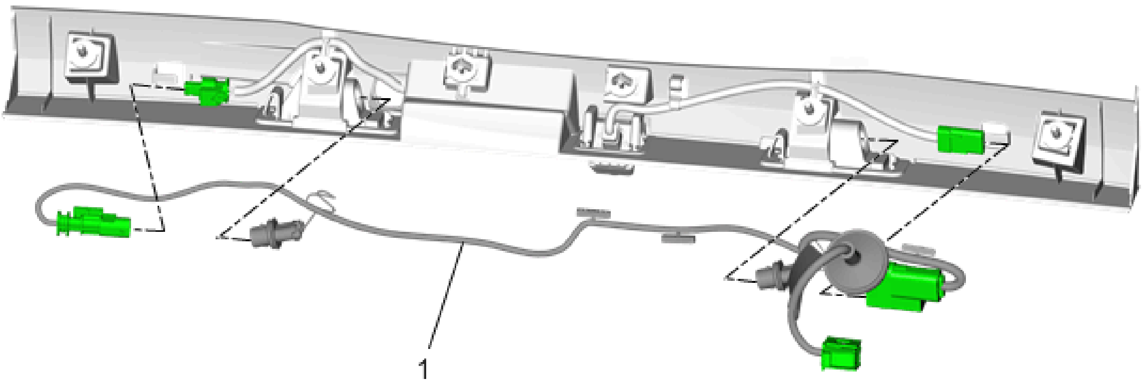

Fig. 41: Rear License Plate Lamp Wiring Harness
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Rear Closure Center Applique Replacement	
1	Rear License Plate Lamp Wiring Harness **Procedure** 1. Disconnect the electrical connector. 2. Transfer components as necessary.

REAR COMBINATION LAMP REPLACEMENT

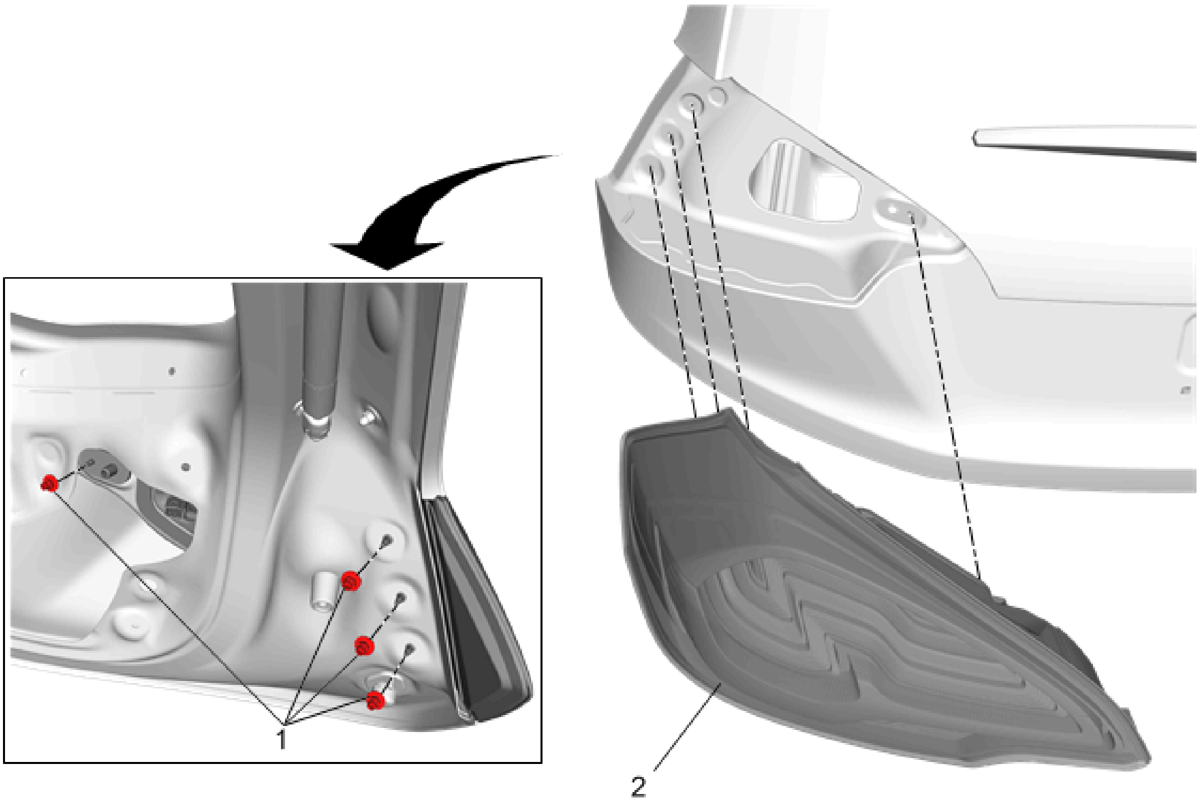

Fig. 42: Rear Combination Lamp
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Liftgate Lower Trim Finish Panel Replacement	
1	Rear Combination Lamp Nut **CAUTION:** **Refer to Fastener Caution .** **Procedure** Remove the lamp stud cover / cap **Tighten** 4.7 N.m (42 lb in)

Callout	Component Name
2	Rear Combination Lamp **Procedure** 1. Disconnect the electrical connector. 2. Release the integral retainers by pulling the lamp outward.

STOP AND TURN SIGNAL LAMP BULB REPLACEMENT (EUROPE, KOREA WITH REAR FOG)

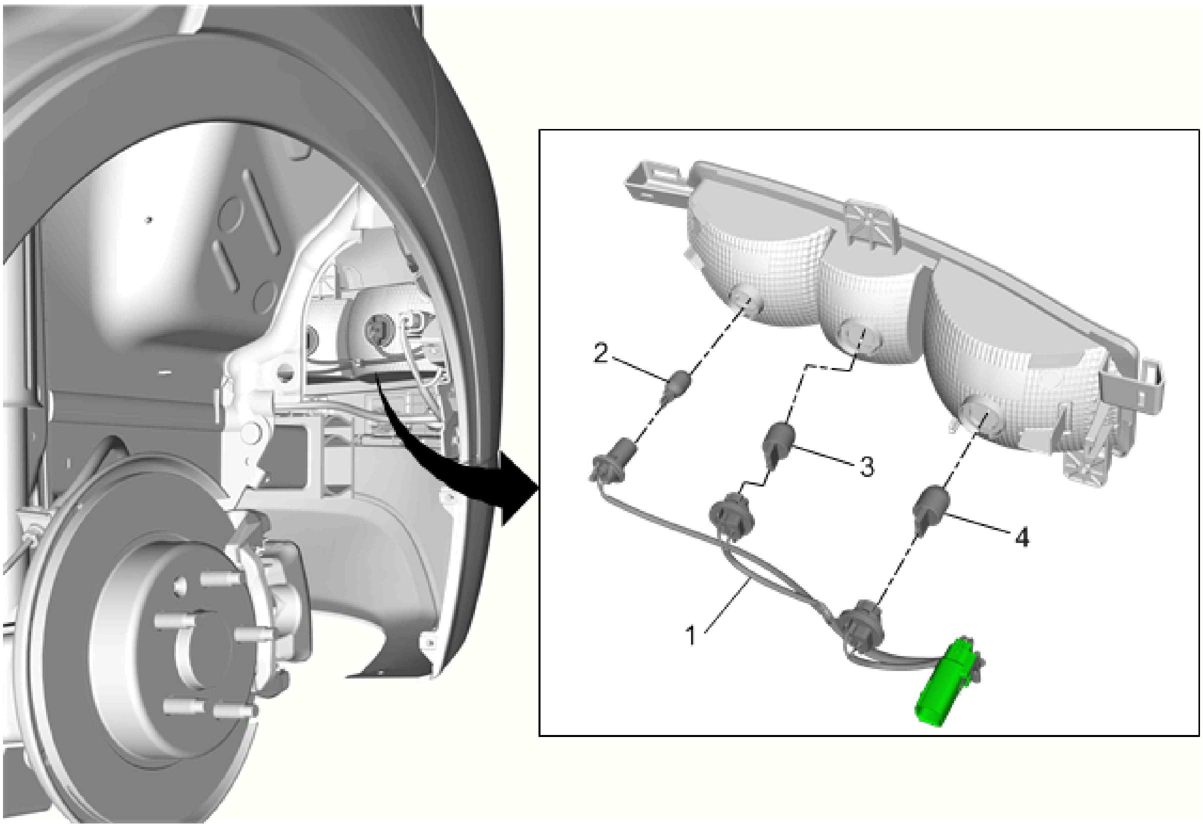

Fig. 43: Stop and Turn Signal Lamp Bulb (Europe, Korea with Rear Fog)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: **Halogen Bulb Warning** **Preliminary Procedure** Raise and support the vehicle. **Lifting and Jacking the Vehicle**	
1	Stop and Turn Signal Lamp Bulb Socket **Procedure** Rotate the bulb socket counterclockwise to remove it from the lamp housing.
2	Rear Fog Bulb **Procedure** Pull the bulb straight from the lamp socket.
3	Turn Signal Bulb **Procedure** Pull the bulb straight from the lamp socket.
4	Tail and Stop Bulb **Procedure** 1. Pull the bulb straight from the lamp socket. 2. Lower the vehicle. **Lifting and Jacking the Vehicle**

STOP AND TURN SIGNAL LAMP BULB REPLACEMENT (EUROPE, KOREA, NORTH AMERICA WITH BACK-UP BULB)

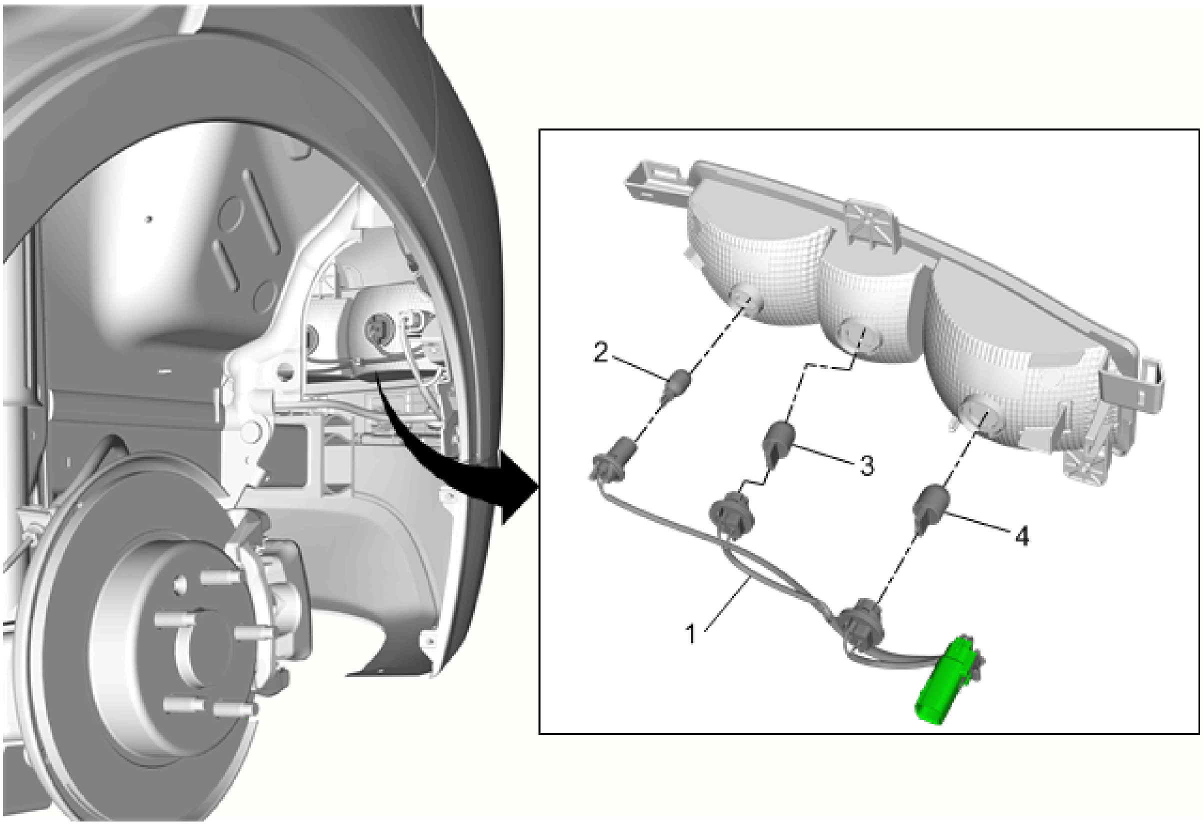

Fig. 44: Stop and Turn Signal Lamp Bulb (Europe, Korea, North America with Back-up Bulb)

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B154A OR B154B: MIRROR INTERNAL MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B154A 39

Driver Mirror Internal Malfunction

DTC B154B 39

Passenger Mirror Internal Malfunction

Circuit/System Description

The outside mirror switch and passenger window switch are on a serial data circuit with the memory seat module as the master. The mirror select and directional control switches are inputs to the memory seat module through the serial data circuit. When the memory seat module receives switch inputs from the outside mirror switch, mirror output commands are sent to the appropriate switch through the serial data circuit. The outside mirror switch and passenger window switch control the left and right outside rear view mirrors through bi-directional motor control circuits. The motor control circuits are floating while in an inactive state and the switches will apply power and ground to the control circuits as necessary to move the mirror in the commanded direction.

Mirror position is determined by both horizontal and vertical position sensors in each of the power mirrors. The outside mirror switch and passenger window switch supply a 5 V reference, low reference, and horizontal and vertical position signal circuits to these sensors. The signal circuits are referenced from 5 V by the switches and the signal circuit voltage levels represent the mirror positions. The mirror positions are sent to the memory seat module through the serial data circuit where they are stored for memory mirror operation. When the memory seat module receives a memory recall command, the memory seat module will send the go to position commands to the outside mirror switch and passenger window switch. The switches will then drive the appropriate mirror motors to the commanded position sensor settings.

Conditions for Running the DTC

Battery voltage must be between 9 - 16 V.

Conditions for Setting the DTC

B154A 39

An internal malfunction has been detected by the outside rearview mirror switch while commanding the driver outside rearview mirror UP, DOWN, LEFT or RIGHT.

B154B 39

An internal malfunction has been detected by the passenger window switch while commanding the passenger outside rearview mirror UP, DOWN, LEFT or RIGHT.

Action Taken When the DTC Sets

The affected outside rearview mirror will be inoperative.

Conditions for Clearing the DTC

B154A 39

The driver outside rearview mirror must be replaced before the DTC can be cleared.

B154B 39

The passenger outside rearview mirror must be replaced before the DTC can be cleared.

Circuit/System Verification

1. Ignition ON.

2. Verify the A9A Outside Rearview Mirror - Driver moves when commanding the Driver Mirror Horizontal Movement Right/Left and Driver Mirror Vertical Movement Up/Down with a scan tool.
    - **If the A9A Outside Rearview Mirror - Driver does not move RIGHT or LEFT or UP or DOWN**

      Replace the M77D Outside Rearview Mirror Motor - Driver.

    - **If the A9A Outside Rearview Mirror-Driver moves RIGHT, LEFT, UP and DOWN**
3. Verify the A9B Outside Rearview Mirror-Passenger moves when commanding the Passenger Mirror Horizontal Movement Right/Left and Passenger Mirror Vertical Movement Up/Down with a scan tool.
    - **If the A9B Outside Rearview Mirror-Passenger does not move RIGHT or LEFT or UP or DOWN**

      Replace the M77P Outside Rearview Mirror Motor - Passenger.

    - **If the A9B Outside Rearview Mirror-Passenger moves RIGHT, LEFT, UP and DOWN**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Outside Rearview Mirror Inner Actuator Replacement.

SYMPTOMS - MIRRORS

NOTE: The following steps must be completed before using the symptom tables.

1. Perform the **Diagnostic System Check - Vehicle** before using the Symptom Tables in order to verify that all of the following are true:
    - There are no DTCs set.
    - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Outside Mirror Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the system. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Heated Mirrors Malfunction**
- **Power Mirror Malfunction**
- **Power Mirror Folding Malfunction (With A45)Power Mirror Folding Malfunction (Without A45)**
- **Automatic Day-Night Mirrors Malfunction**
- **Power Mirror Tilt Inoperative in Reverse**
- **Rearview Camera Full Display Mirror Malfunction**

HEATED MIRRORS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Left Heated Mirror Element Control	2	1	3	-
Driver Outside Rearview Mirror Ground	-	1	-	-
Right Heated Mirror Element Control	2	1	3	-
Passenger Outside Rearview Mirror Ground	-	1	-	-
1. Single Heated Mirror Inoperative 2. Both Heated Mirrors Inoperative 3. Heated Mirrors Always On				

Circuit/System Description

The rear defogger relay supplies voltage to the outside rearview mirror heater elements based on the current state of the rear window defogger. The relay supplies B+ through the driver/passenger mirror heating element control circuit when a request is seen.

Description and Operation

Outside Mirror Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information.

Circuit/System Verification

1. Ignition ON/Vehicle in Service Mode..
2. Verify the E18 Rear Defogger Grid turns ON and OFF when commanding the Rear Defogger On and Off with a scan tool.
    - **If the E18 Rear Defogger Grid does not turn ON or OFF**

    Refer to Rear Window Defogger Malfunction .

  - **If the E18 Rear Defogger Grid turns ON and OFF**

3. Verify the E17D Outside Rearview Mirror Glass-Driver and the E17P Outside Rearview Mirror Glass-Passenger become warm when commanding the Rear Defogger On with a scan tool.
   - **If the E17D Outside Rearview Mirror Glass-Driver and the E17P Outside Rearview Mirror Glass-Passenger do not become warm**

     Refer to Circuit/System Testing.

   - **If the E17D Outside Rearview Mirror Glass-Driver and the E17P Outside Rearview Mirror Glass-Passenger become warm**
4. All OK.

Circuit/System Testing

Single Outside Mirror Defogger Inoperative

1. Ignition OFF and all vehicle systems OFF, disconnect the appropriate X510 or X610 inline harness connector at the A9 Outside Rearview Mirror. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 5 and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Ignition ON/Vehicle in Service Mode, connect a test lamp between the control circuit terminal 4 and the ground circuit terminal 5.
4. Verify the test lamp turns ON when commanding the Rear Defogger On with a scan tool.
   - **If the test lamp is always OFF**
   1. Ignition OFF, remove the test lamp, disconnect the X1 harness connector at the X50A Fuse Block - Underhood.
   2. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the E17 Outside Rearview Mirror Glass.
   - **If the test lamp turns ON**
5. Test or replace the E17 Outside Rearview Mirror Glass.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Outside Rearview Mirror Glass Replacement
- Engine Wiring Harness Junction Block Replacement

AUTOMATIC DAY-NIGHT MIRRORS MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	1	1	-	-
Backup Lamp Control	B2545 02	1	1	-
Ground	-	1	-	-
1. Inside Electrochromic Mirror Malfunction				

Circuit/System Description

The inside rearview mirror uses 2 photocell sensors. One sensor is the rear light sensor, located on the face side of the mirror, facing the rear of the vehicle. The rear light sensor is used to determine light conditions present at the mirror face. The other sensor is the front light sensor, located on the backside of the mirror, facing the front of the vehicle. The front light sensor is used to determine the exterior light conditions at the front of the vehicle. With a low exterior light condition detected by the front light sensor and a high light condition from the rear light sensor, the inside rearview mirror will automatically darken the face of the inside rearview mirror.

With the gear selector lever in the REVERSE position and the engine running, backup lamp control voltage is supplied as an input to the inside rearview mirror. The mirror monitors this input to disable the automatic day-night feature. This allows the driver to see objects in the mirror clearly when backing up, regardless of the rear light sensor status.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Cover the windshield with a blanket or other suitable item.
3. Verify the A10 Inside Rearview Mirror face dims when shining a bright light into the rear light sensor
    - **If the A10 Inside Rearview Mirror does not dim**

      Refer to Circuit/System Testing - Inside Review Mirror Dimming Inoperative

    - **If the A10 Inside Rearview Mirror dims**
4. Verify the A10 Inside Rearview Mirror face transitions from dim to bright while commanding the Backup Lamps Active and Inactive with a scan tool.

   - **If the A10 Inside Rearview Mirror does not transition between dim and bright.**

     Refer to Circuit/System Testing - Day-Night Disable Malfunction

   - **If the A10 Inside Rearview Mirror transitions between bright and dim states**
5. All OK.

Circuit/System Testing

Inside Review Mirror Dimming Inoperative

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the A10 Inside Rearview Mirror. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 5 and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
   - If 2 Ω or greater, repair the open/high resistance in the circuit.
   - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Ignition ON.
4. Verify a test lamp illuminates between the ignition circuit terminal 2 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition OFF.
   2. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, refer to **Power Mode Mismatch** .
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition OFF.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the A10 Inside Rearview Mirror.
   - **If the test lamp illuminates**
5. Replace the A10 Inside Rearview Mirror.

Day-Night Disable Malfunction

1. Ignition OFF, disconnect the harness connector at the A10 Inside Rearview Mirror.
2. Connect a test lamp between the control circuit terminal 1 and ground
3. Ignition ON, verify the test lamp turns ON and OFF while commanding the Backup Lamps Active and Inactive with a scan tool.
   - **If the test lamp is always ON**
   1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the control circuit terminal 1 and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, refer to **Backup Lamps Malfunction** .
   - **If the test lamp is always OFFN**
   1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module, ignition ON.

2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, refer to Backup Lamps Malfunction
    - **If the test lamp turns ON and OFF**
4. Replace the A10 Inside Rearview Mirror.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair

Inside Rearview Mirror Replacement

POWER MIRROR FOLDING MALFUNCTION (WITH A45)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Folding Mirror Motor Fold Control	1	1	-	-
Folding Mirror Motor Unfold Control	1	1	-	-
1. Power Folding Mirror Inoperative				

Circuit/System Description

The outside rearview mirror switch contains resistors which will reduce the signal voltage from the mirror control module, the mirror memory control module is programmed to move the driver outside mirror in a direction depending upon the voltage received from the outside rearview mirror switch. The outside rearview mirror switch has a 3 position rocker switch which corresponds to the driver outside rearview mirror select, no mirror select and passenger outside mirror selected. When the switch is in the no mirror select position and the mirror position switch is held in the DOWN position, mirror control module will command the driver outside mirror to fold or unfold and send a serial data message to the memory seat control module to send a fold or unfold command to the passenger window switch which will command the passenger outside rearview mirror to fold or unfold. The mirror control module and passenger window switch control the fold/unfold motors through bi-directional control circuits.

Diagnostic Aids

Power folding mirrors only operate when the mirror selector switch is in the no mirror select position.

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Mirror Select Switch parameter changes from None to Left and Right when cycling the S146 Window/Outside Rearview Mirror Switch - Driver..
    - **If the parameter does not change**

      Refer to Power Mirror Malfunction.

    - **If the parameter changes**
3. Verify the scan tool Mirror Direction Switch parameter changes from Inactive to Up, Down, Right and Left when cycling the S146 Window/Outside Rearview Mirror Switch - Driver.
    - **If the parameter does not change**

      Refer to Power Mirror Malfunction.

    - **If the parameter changes**
4. Verify the A9A Outside Rearview Mirror-Driver FOLD and UNFOLD when commanding the Driver Mirror Fold Motor to Fold and Unfold with a scan tool.
    - **If the A9A Outside Rearview Mirror-Driver does not FOLD and UNFOLD**

      Refer to Circuit/System Testing - Driver Outside Mirror Folding Command Malfunction.

    - **If the A9A Outside Rearview Mirror-Driver does FOLD and UNFOLD**
5. Verify the A9B Outside Rearview Mirror-Passenger FOLD and UNFOLD when commanding the Passenger Mirror Fold Motor to Fold and Unfold with a scan tool.
    - **If the A9B Outside Rearview Mirror-Passenger does not FOLD and UNFOLD**

      Refer to Circuit/System Testing - Passenger Outside Mirror Folding Command Malfunction.

    - **If the A9B Outside Rearview Mirror-Passenger does FOLD and UNFOLD**
6. All OK.

Circuit/System Testing

Driver Outside Mirror Folding Command Malfunction

1. Ignition OFF and all vehicle systems OFF, disconnect the X510 inline harness connector at the A9A Outside Rearview Mirror-Driver. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the control circuit terminal 10 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF, disconnect the harness connector at the S146 Window/Outside Rearview Mirror Switch - Driver.
    2. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the S146 Window/Outside Rearview Mirror Switch - Driver.
    - **If less than 10 Ω**

3. Test for less than 10 Ω between the control circuit terminal 9 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF, disconnect the harness connector at the S146 Window/Outside Rearview Mirror Switch - Driver.
    2. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the S146 Window/Outside Rearview Mirror Switch - Driver.
    - **If less than 10 Ω**
4. Connect a test lamp between control circuit terminal 10 and control circuit terminal 9, ignition ON.
5. Verify the test lamp turns ON when commanding the FOLD and UNFOLD states with a scan tool.
    - **If the test lamp remains OFF during either of the commands**
    1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S146 Window/Outside Rearview Mirror Switch - Driver.
    2. Test for infinite resistance between each control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the S146 Window/Outside Rearview Mirror Switch - Driver.
    - **If the test lamp turns ON during each of the commands**
6. Test or replace the A9A Outside Rearview Mirror-Driver.

Passenger Outside Mirror Folding Command Malfunction

1. Ignition OFF and all vehicle systems OFF, disconnect the X610 inline harness connector at the A9B Outside Rearview Mirror-Passenger. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the control circuit terminal 10 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF, disconnect the X2 harness connector at the S146 Window/Outside Rearview Mirror Switch - Driver.
    2. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the S146 Window/Outside Rearview Mirror Switch - Driver.
    - **If less than 10 Ω**
3. Test for less than 10 Ω between the control circuit terminal 9 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF, disconnect the X2 harness connector at the S146 Window/Outside Rearview Mirror Switch - Driver.
    2. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the S146 Window/Outside Rearview Mirror Switch - Driver.
    - **If less than 10 Ω**
4. Connect a test lamp between control circuit terminal 10 and control circuit terminal 9, ignition ON.
5. Verify the test lamp turns ON when commanding the FOLD and UNFOLD states with a scan tool.
    - **If the test lamp remains OFF during either of the commands**
    1. Ignition OFF, remove the test lamp, disconnect the X2 harness connector at the S146 Window/Outside Rearview Mirror Switch - Driver.
    2. Test for infinite resistance between each control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the S146 Window/Outside Rearview Mirror Switch - Driver.

- **If the test lamp turns ON during each of the commands**

6. Test or replace the A9B Outside Rearview Mirror-Passenger.

Component Testing

Outside Rearview Mirror

1. Ignition OFF, disconnect the harness connector at the appropriate A9 Outside Rearview Mirror.
2. Install a 10 A fused jumper wire between one of the control terminals and 12 V. Momentarily install a jumper wire between the other control terminal and ground. Reverse the jumper wires at least two times, the A9 Outside Rearview Mirror should perform the FOLD and UNFOLD functions.
    - **If the function does not perform the FOLD and UNFOLD functions**

      Replace the A9 Outside Rearview Mirror.

    - **If the function performs the FOLD and UNFOLD functions**
3. All OK

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Outside Rearview Mirror Replacement
- Front Side Door Window Control Switch Replacement
- Control Module References for the left mirror control module replacement, programming and setup

POWER MIRROR FOLDING MALFUNCTION (WITHOUT A45)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Folding Mirror Motor Fold Control	1	1	-	-
Folding Mirror Motor Unfold Control	1	1	-	-
1. Power Folding Mirror Inoperative				

Circuit/System Description

The outside mirror switch controls the power fold/unfold functions of the outside rearview mirrors. The folding mirror motors are controlled by using bi-directional motor controls through the folding mirror motor fold control circuit and the folding mirror motor unfold control circuit.

Diagnostic Aids

Power folding mirrors only operate when the mirror selector switch is in the no mirror select position.

Circuit/System Verification

1. Verify the outside folding mirrors is fully extended or fully retracted, refer to **Power Folding Mirrors Resetting Procedure**.
2. Ignition ON.
3. Verify the A9A Outside Rearview Mirror-Driver and the A9B Outside Rearview Mirror-Passenger FOLD and UNFOLD with the S146 Window/Outside Rearview Mirror Switch - Driver.
    - **If the A9A Outside Rearview Mirror-Driver or the A9B Outside Rearview Mirror-Passenger do not FOLD or UNFOLD**

      Refer to Circuit/System Testing

    - **If the A9A Outside Rearview Mirror-Driver and the A9B Outside Rearview Mirror-Passenger FOLD and UNFOLD**
4. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the inline harness connector at the appropriate A9 Outside Rearview Mirror. Ignition ON
2. Connect a test lamp between the control circuit terminal 9 and control circuit terminal 10.
3. Verify the test lamp turns ON when commanding the FOLD and UNFOLD states with the S146 Window/Outside Rearview Mirror Switch - Driver.
    - **If the test lamp remains OFF during either of the commands**
    1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S146 Window/Outside Rearview Mirror Switch - Driver.
    2. Test for infinite resistance between each control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in each control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, test or replace the S146 Window/Outside Rearview Mirror Switch - Driver.
    - **If the test lamp is always ON**
    1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S146 Window/Outside Rearview Mirror Switch - Driver, ignition ON.
    2. Test for less than 1 V between each control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, test or replace the S146 Window/Outside Rearview Mirror Switch - Driver
    - **If the test lamp turns ON during each of the commands**
4. Test or replace the A9 Outside Rearview Mirror.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Front Side Door Window Control Switch Replacement**
- **Outside Rearview Mirror Replacement**

POWER MIRROR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Outside Rearview Mirror Switch B+	1	1	-	-
Driver Mirror Motor Horizontal Control	1	2	2	-
Driver Mirror Motor Vertical Control	1	2	2	-
Passenger Mirror Motor Horizontal Control	1	3	3	-
Passenger Mirror Motor Vertical Control	1	3	3	-
Outside Rearview Mirror Switch Ground	-	1	-	-
1. Both Outside Power Mirrors Inoperative 2. Driver Outside Power Mirror Malfunction 3. Passenger Outside Power Mirror Malfunction				

Circuit/System Description

The outside rearview mirror switch controls the outside rearview mirrors based on the position of the mirror selector switch and which movement position is selected. The outside rearview mirror switch has four positions: up, down, left, and right. B+ is applied to the switch from the power mirror fuse and when a movement position switch is selected, voltage is sent to the commanded mirror via a mirror control circuit. The opposite mirror control circuit acts as a ground circuit for the bi-directional mirror motor. Ground is the applied through the switch.

Circuit/System Verification

1. Verify the mirror glass of the A9A Outside Rearview Mirror-Driver and the A9B Outside Rearview Mirror-Passenger move UP, DOWN, LEFT and RIGHT with the S146 Window/Outside Rearview Mirror Switch - Driver.
   - **If both outside mirror glasses do not move**

     Refer to Circuit/System Testing - Both Outside Rearview Mirrors Inoperative.

   - **If the driver outside mirror glass does not move UP, DOWN, LEFT or RIGHT**

     Refer to Circuit/System Testing - Driver Outside Mirror Movement Malfunction.

   - **If the passenger outside mirror glass does not move UP, DOWN, LEFT or RIGHT**

     Refer to Circuit/System Testing - Passenger Outside Mirror Movement Malfunction.

   - **If the mirror glass of the A9A Outside Rearview Mirror-Driver and the A9B Outside Rearview Mirror-Passenger move UP, DOWN, LEFT and RIGHT**
2. All OK.

Circuit/System Testing

Both Outside Rearview Mirrors Inoperative

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S146 Window/Outside Rearview Mirror Switch - Driver. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 24 and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Verify a test lamp illuminates between the B+ circuit terminal 23 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition OFF.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition OFF.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for infinite resistance between each of the control circuit terminals listed below and ground:
      - Control circuit terminal 2
      - Control circuit terminal 3
      - Control circuit terminal 4
      - Control circuit terminal 6
      - Control circuit terminal 7

        - Control circuit terminal 8
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the appropriate M77 Outside Rearview Mirror Motor.
    - **If the test lamp illuminates**
4. Test or replace the S146 Window/Outside Rearview Mirror Switch - Driver.

Driver Outside Mirror Movement Malfunction

1. Ignition OFF, disconnect the X501 inline harness connector at the A9A Outside Rearview Mirror-Driver. Ignition ON
2. Connect a test lamp between the control circuit terminal 1 and control circuit terminal 2.
3. Verify the test lamp turns ON when commanding the UP and DOWN states with the S146 Window/Outside Rearview Mirror Switch - Driver.
    - **If the test lamp remains OFF during either of the commands**
    1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S146 Window/Outside Rearview Mirror Switch - Driver.
    2. Test for infinite resistance between each control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in each control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, test or replace the S146 Window/Outside Rearview Mirror Switch - Driver.
    - **If the test lamp is always ON**
    1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S146 Window/Outside Rearview Mirror Switch - Driver, ignition ON.
    2. Test for less than 1 V between each control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, test or replace the S146 Window/Outside Rearview Mirror Switch - Driver.
    - **If the test lamp turns ON during each of the commands**
4. Connect a test lamp between the control circuit terminal 1 and control circuit terminal 3.
5. Verify the test lamp turns ON when commanding the LEFT and RIGHT states with the S146 Window/Outside Rearview Mirror Switch - Driver.
    - **If the test lamp remains OFF during either of the commands**
    1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S146 Window/Outside Rearview Mirror Switch - Driver.
    2. Test for infinite resistance between each control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in each control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, test or replace the S146 Window/Outside Rearview Mirror Switch - Driver.
    - **If the test lamp is always ON**
    1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S146 Window/Outside Rearview Mirror Switch - Driver, ignition ON.
    2. Test for less than 1 V between each control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, test or replace the S146 Window/Outside Rearview Mirror Switch - Driver.
    - **If the test lamp turns ON during each of the commands**

6. Test or replace the M77D Outside Rearview Mirror Motor-Driver.

Passenger Outside Mirror Movement Malfunction

1. Ignition OFF, disconnect the X601 inline harness connector at the A9B Outside Rearview Mirror-Passenger. Ignition ON
2. Connect a test lamp between the control circuit terminal 1 and control circuit terminal 2.
3. Verify the test lamp turns ON when commanding the UP and DOWN states with the S146 Window/Outside Rearview Mirror Switch - Driver.
    - **If the test lamp remains OFF during either of the commands**
    1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S146 Window/Outside Rearview Mirror Switch - Driver.
    2. Test for infinite resistance between each control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in each control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, test or replace the S146 Window/Outside Rearview Mirror Switch - Driver.
    - **If the test lamp is always ON**
    1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S146 Window/Outside Rearview Mirror Switch - Driver, ignition ON.
    2. Test for less than 1 V between each control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, test or replace the S146 Window/Outside Rearview Mirror Switch - Driver.
    - **If the test lamp turns ON during each of the commands**
4. Connect a test lamp between the control circuit terminal 1 and control circuit terminal 3.
5. Verify the test lamp turns ON when commanding the LEFT and RIGHT states with the S146 Window/Outside Rearview Mirror Switch - Driver.
    - **If the test lamp remains OFF during either of the commands**
    1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S146 Window/Outside Rearview Mirror Switch - Driver.
    2. Test for infinite resistance between each control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in each control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, test or replace the S146 Window/Outside Rearview Mirror Switch - Driver.
    - **If the test lamp is always ON**
    1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S146 Window/Outside Rearview Mirror Switch - Driver, ignition ON.
    2. Test for less than 1 V between each control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, test or replace the S146 Window/Outside Rearview Mirror Switch - Driver.
    - **If the test lamp turns ON during each of the commands**
6. Test or replace the M77P Outside Rearview Mirror Motor-Passenger.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Front Side Door Window Control Switch Replacement**
- **Outside Rearview Mirror Inner Actuator Replacement**

POWER MIRROR TILT INOPERATIVE IN REVERSE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

Mirror position is determined by both horizontal and vertical position sensors in each of the power mirrors. The mirror control module and passenger window switch supply a 5 V reference, low reference, and horizontal and vertical position signal circuits to these sensors. The signal circuits are referenced from 5 V by the switches and the signal circuit voltage levels represent the mirror positions. The mirror positions are sent to the memory seat module through the serial data circuit where they are stored for memory mirror operation. When the memory seat module receives a park tilt mirror in reverse command, the memory seat module will send the tilt down command to the mirror control module and the passenger window switch. The mirror control module and the passenger window switch will then drive the appropriate mirror motors to the commanded position.

Diagnostic Aids

The Park Tilt Mirror in Reverse is a feature in the Personalization Menu of the audio system controls that allows the operator to program the driver and/or passenger outside rearview mirrors to tilt downward when the vehicle is shifted into R (reverse). Verify that this feature has been correctly programmed into the system before performing extensive diagnostics

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON/Vehicle in Service Mode.
2. Verify the A9A Outside Rearview Mirror - Driver moves when commanding the Driver Mirror Horizontal Movement Right/Left and Driver Mirror Vertical Movement Up/Down with a scan tool.
    - **If the A9A Outside Rearview Mirror - Driver does not move RIGHT or LEFT or UP or DOWN**

Refer to Power Mirror Malfunction.

- **If the A9A Outside Rearview Mirror - Driver moves RIGHT, LEFT, UP and DOWN**

3. Verify the A9B Outside Rearview Mirror-Passenger moves when commanding the Passenger Mirror Horizontal Movement Right/Left and Passenger Mirror Vertical Movement Up/Down with a scan tool.
    - **If the A9B Outside Rearview Mirror-Passenger does not move RIGHT or LEFT or UP or DOWN**

      Refer to Power Mirror Malfunction.

    - **If the A9B Outside Rearview Mirror-Passenger moves RIGHT, LEFT, UP and DOWN**
4. All OK.

Circuit/System Testing

1. Ignition ON/Vehicle in Service Mode, shift the vehicle in REVERSE.
2. Verify that the appropriate A9 Outside Rearview Mirror moves DOWN.
    - **If the A9 Outside Rearview Mirror does not move DOWN**

      Replace the K40 Seat Memory Control Module

    - **If the A9 Outside Rearview Mirror does move DOWN**
3. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

REARVIEW CAMERA FULL DISPLAY MIRROR MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

Circuit/System Description

If equipped, full display mirror (FDM) provides a wider field of view than normally seen from the inside rearview mirror to assist when driving and changing lanes. When the tab under the inside rearview mirror is pulled rearward, a view of the area behind the vehicle displays on the mirror.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Verify there is no debris on the B87 Rearview Camera lens, and the lens is not damaged or the rearview camera is not out of alignment.
    - **If debris is found on the lens, or the lens is damaged, or the rearview camera is out of alignment**

      Clean the lens. If the lens, replace as necessary, or adjust the mirror.

    - **If there is no debris on the lens, or the lens is not damaged, or the rearview camera is not out of alignment**
2. All OK.

Circuit/System Testing

1. Ignition OFF/vehicle OFF, disconnect the coax cable connector at the B87 Rearview Camera.
2. Ignition On, test for 7 - 10 V between the center conductor of the coax cable and the coax cable ground shield wires.
    - **If the value within the range of 7 - 10 V**

      Replace the B87 Rearview Camera.

    - **If the value outside range of 7 - 10 V**
3. Disconnect the A10 Inside Rearview Mirror, and check the coaxal cable resistance
    - **If the value is more than 5 Ω**

      Replace the coax cable.

    - **If the value is less than 5 Ω**
4. Test or replace the A10 Inside Rearview Mirror.

Component Testing

CAUTION: **Refer to Test Probe Caution**

NOTE:

- **Before testing the coax cable, check the cable exterior for being pinched, cut, damaged, or having loose connections at the components, which can cause reception issues.**
- **To prevent false readings when testing the center coax terminals, use care not to ground the test probe on the outer housing/shield.**

Coax Cable Test

1. Test for less than 5 Ω between the coax cable center terminal end to end.
    - **If 5 Ω or greater**

      Replace the coax cable.

    - **If less than 5 Ω**
2. Test for greater than 5 Ω between the coax cable outer shield end to end.
    - **If 5 Ω or greater**

Replace the coax cable.

- **If less than 5 Ω**

3. Test for infinite resistance between the coax cable center terminal and the coax cable outer shield.
   - **If less than infinite resistance**

     Replace the coax cable.

   - **If infinite resistance**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair procedure.

- **Rearview Driver Information Camera Replacement**
- **Inside Rearview Mirror Replacement**
- **Control Module References** for human machine interface control module replacement, programming, and setup.

POWER FOLDING MIRRORS RESETTING PROCEDURE

Initialization Procedure

Reset the power folding mirrors in the following scenarios:

- The mirrors are accidentally obstructed while folding.
- They are accidentally manually folded/unfolded.
- The mirrors will not stay in the unfolded position.
- The mirrors vibrate at normal driving speeds.

Until the motor assembly has been initialized, the express open and close switch inputs and manual open inputs are disregarded. During the process of initialization, anti-pinch detection is not active.

Resetting the Power Folding Mirrors:

Fold and unfold the mirrors one time using the mirror folding control to reset them to their normal position. A popping noise may be heard during the resetting of the power folding mirrors. This sound is normal after a manual folding operation.

OUTSIDE REARVIEW MIRROR INNER ACTUATOR REPLACEMENT

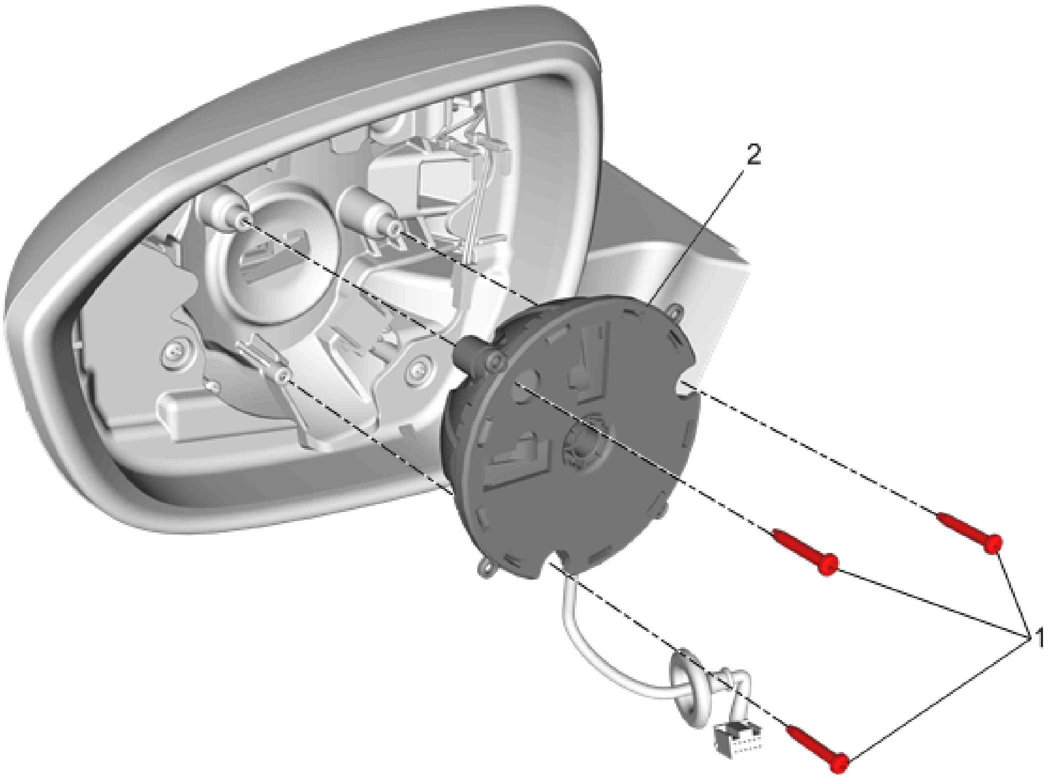

Fig. 9: Outside Rearview Mirror Inner Actuator
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Outside Rearview Mirror Glass Replacement	
1	Outside Rearview Mirror Inner Actuator Fastener **CAUTION:** Fastener Caution **Tighten** 1 N.m (9 lb in)
2	Outside Rearview Mirror Inner Actuator **Procedure** Disconnect the electrical connector.

OUTSIDE REARVIEW MIRROR GLASS REPLACEMENT

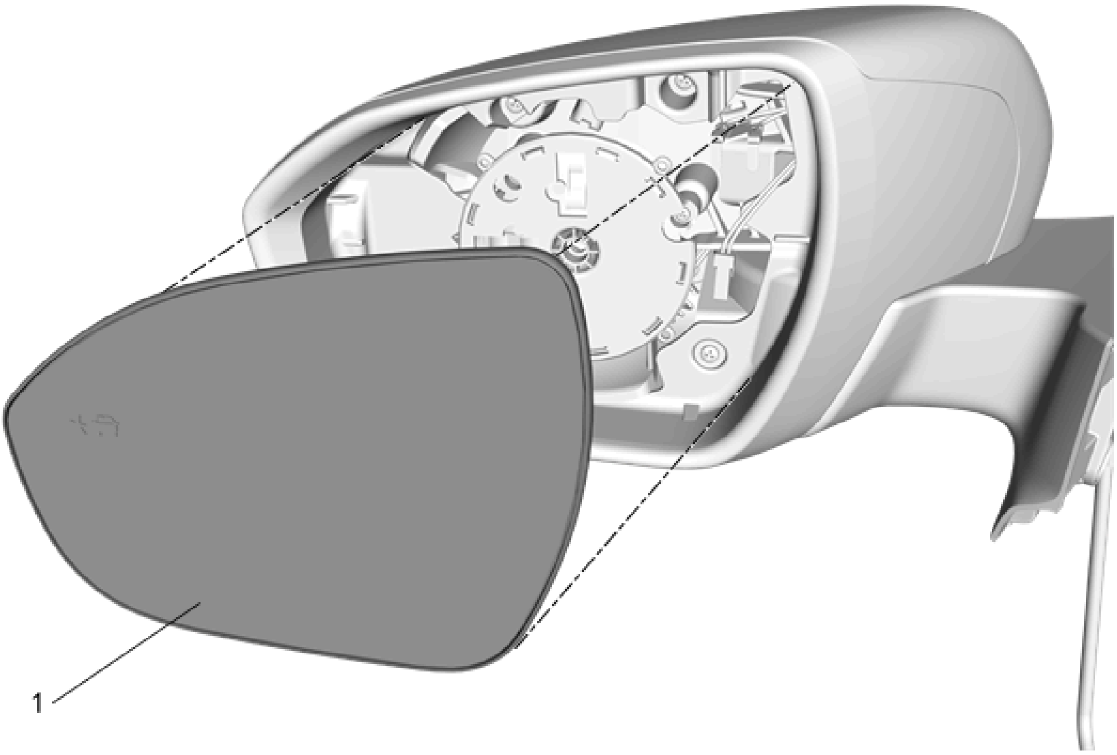

Fig. 10: Outside Rearview Mirror Glass
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Outside Rearview Mirror Glass **WARNING:** **Glass and Sheet Metal Handling Warning** **Procedure** 1. Push inward on the top of the mirror glass exposing a gap. Using a hook type tool, release the long retainer tabs that are accessible while pulling outward on the glass, once long retainer tabs are released, the glass will separate from the actuator. 2. Note the connector location for installation. 3. Disconnect the electrical connector. **NOTE:** **Wear gloves to prevent potentially damaging the new glass during installation. For installation, align the tabs on mirror with the actuator. Apply firm pressure across the surface until the mirror is locked in place.**

INSIDE REARVIEW MIRROR REPLACEMENT

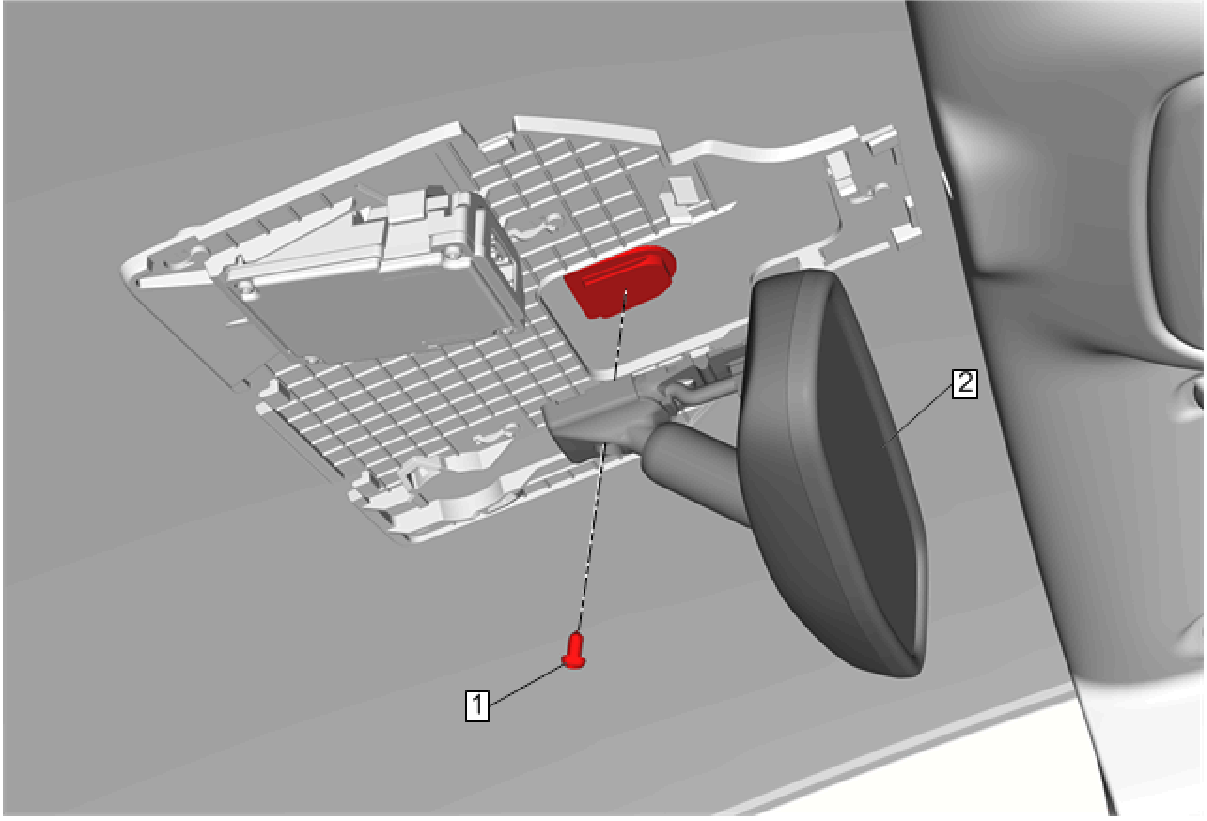

Fig. 11: Inside Rearview Mirror
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Windshield Multifunction Sensor Mount Bracket Cover Replacement (with Front View Camera) Windshield Multifunction Sensor Mount Bracket Cover Replacement (without Front View Camera)	
1	Inside Rearview Mirror Fastener **CAUTION:** **Refer to Fastener Caution .** **Tighten** 1.8 N.m (16 lb in)
2	Inside Rearview Mirror **Procedure** Disconnect the electrical connector.

DESCRIPTION AND OPERATION

AUTOMATIC DAY-NIGHT MIRROR DESCRIPTION AND OPERATION

Inside Rearview Mirror with the Automatic Day-Night Feature System Operation

The inside rearview mirror uses 2 photocell sensors. One sensor is the headlight sensor, located on the face side of the mirror. The headlight sensor is used to determine light conditions present at the mirror face. The other sensor is the ambient light sensor, located on the rear of the mirror or windshield side. The ambient light sensor is used to determine the exterior light conditions. With a low exterior light condition detected, and a high light condition from behind the car, at the headlight sensor, the inside rearview mirror will automatically darken the face of the mirror.

In the daytime, the mirror is in a normal state because of the high exterior light condition that is indicated by the ambient light sensor. With the gear selector lever in the REVERSE position and the Ignition ON/Vehicle in Service Mode, backup lamp supply voltage is supplied as an input to the inside rearview mirror. The mirror monitors this input to disable the automatic day-night feature. This allows the driver to see objects in the mirror clearly when backing up, even during the night.

Driver Outside Rearview Mirror with Automatic Day-Night System Operation (If Equipped)

The automatic day-night feature of the driver outside rearview mirror is controlled by the inside rearview mirror. The inside rearview mirror supplies control and low reference to the driver outside rearview mirror. At night, with the automatic day-night feature enabled, the driver outside rearview mirror will automatically darken with the inside rearview mirror to reduce glare from headlamps behind the vehicle.

Inside Rearview Camera Full Display Mirror System Operation

The inside rearview camera full display mirror is connected to the outside rearview camera via a shielded coaxial cable. When the tab under the inside rearview mirror is pulled rearward, a view of the area behind the vehicle displays on the mirror. Adjust the rearview mirror for a clear view of the area behind the vehicle before turning on full display mirror. Use the button on the back of the mirror to adjust the brightness of the display. Make sure the light sensor is not covered when adjusting the brightness.

The inside rearview camera full display mirror may not work properly or display a clear image if:

- It is dark.
- The sun or the beam of headlamps are shining directly into the camera lens.
- Ice, snow, mud, or anything else builds up on the camera lens. Clean the lens, rinse it with water, and wipe it with a soft cloth.

When the mirror detects that the camera is not sending a valid video signal, it "blue screens" with a "no video" decal for 3 seconds, then reverts back to the mirror. Meanwhile, if a blue screen keeps on displaying instead of the camera view, take the vehicle to your dealer for service.

B87	B87 Rearview Camera

OUTSIDE MIRROR DESCRIPTION AND OPERATION

Power Mirror System Components

The power mirror system consists of the following components:

- Outside rearview mirror switch
- Mirror selector switch
- Driver outside rearview mirror
- Passenger outside rearview mirror

Each of the outside rearview mirror contains two motors. The vertical motor operates the mirror in the up and down directions, and the horizontal motor operates the mirror in the left and right directions.

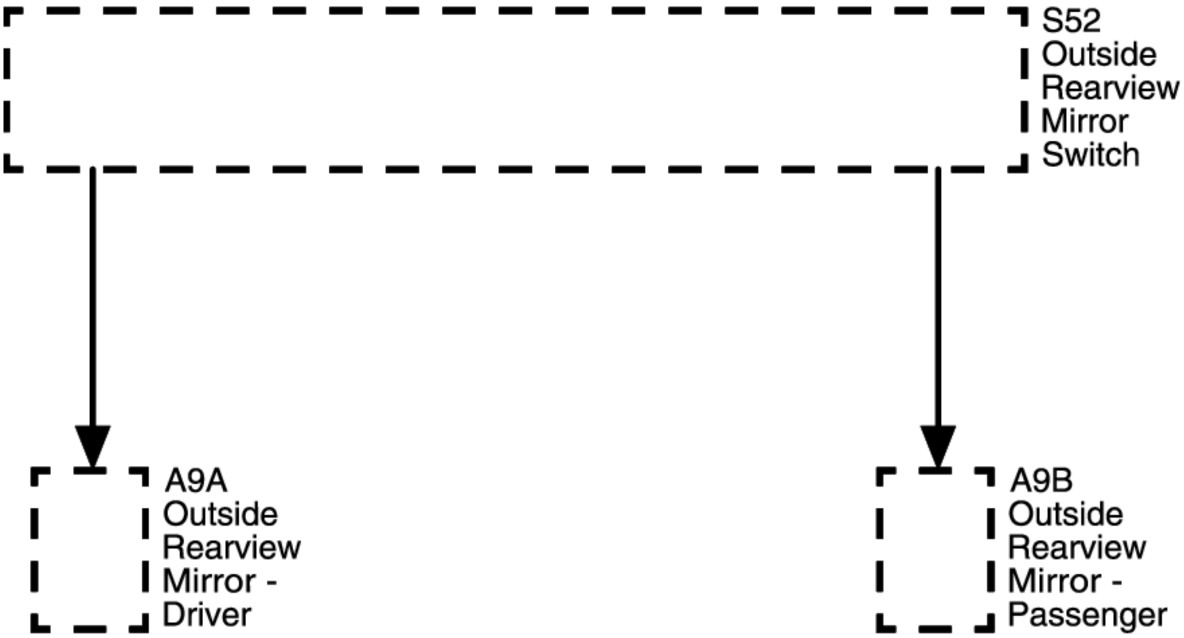

Fig. 13: Power Mirror System Diagram
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
S52	S52 Outside Rearview Mirror Switch
A9A	A9A Outside Rearview Mirror - Driver
A9B	A9B Outside Rearview Mirror - Passenger

Power Mirror System Controls

The outside rearview mirror switch is a four position directional switch: Up, Down, Left and Right.

The mirror select switch is a three position switch: left, neutral/fold, and right.

Power Mirror System Operation

The outside rearview mirror switch receives battery voltage from the underhood fuse block The power mirror switch also receives a constant ground.

The four positions of the direction switch have dual switch contacts. Each of the contacts are connected to opposing sides of the appropriate power mirror motors through the selector switch. The selector switch completes these circuits depending on the position of the selector switch, L or R.

If the selector switch is placed in the L position and the up switch is pressed, battery voltage will be supplied to the left outside rearview mirror vertical motor through the left mirror motor vertical control circuit and ground through the left mirror motor common control circuit. If the down switch is pressed, battery voltage will be supplied to the left outside rearview mirror vertical motor through the left mirror motor common control circuit and ground through the left mirror motor vertical control circuit.

The remainder of the mirror functions operate in the same manner as described above. Placing the power mirror switch in opposing positions, left/right or up/down, will reverse the polarity to the mirror motor, reversing the direction of movement.

Heated Mirrors (If Equipped)

The heated mirrors are controlled through the rear defog relay. Whenever the rear window defogger is turned on battery voltage is supplied to the mirror heater elements through the left and right mirror heater element control circuits.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B094C: RIGHT SIDE OBJECT DETECTION CONTROL MODULE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B094C

Right Side Object Detection Control Module

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Indicator Control - Left	B094C 39	1	2	-
Indicator Control - Right	B094C 39	3	4	-
Ground - Left	-	1	-	-
Ground - Right	-	3	-	-

1. Left side blind spot indicator inoperative
2. Left side blind spot indicator always on
3. Right side blind spot indicator inoperative
4. Right side blind spot indicator always on

Circuit/System Description

The side object sensor module - left communicates on a private communication data bus with the side object sensor module - right. The side object sensor module - left is the master and is responsible for communicating with other control modules on the vehicle, as well as setting DTCs for both side object sensor modules.

The side object sensor module - right is responsible for illuminating the left and right side blind spot indicators. The indicators are located on each outside rearview mirror glass. The indicators each receive ground at all times and are controlled by side object sensor module - right though a discrete control circuit. When a vehicle is located in the vehicle's blind spot or is in an adjacent lane, approaching the side of the vehicle, the side object sensor module - right will illuminate the indicator by applying voltage to the appropriate control circuit. If the driver turns on a turn signal, indicating an intention to change lanes, the side object sensor module - right will flash the indicator as an additional warning.

Conditions for Running the DTC

Vehicle in Service Mode.

Conditions for Setting the DTC

The side object sensor module - right has detected an internal malfunction or a malfunction with one of the indicator control circuits.

Action Taken When the DTC Sets

- The side object sensor system is disabled.
- A service message may be displayed on the driver information center.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the control module ignition cycle counter reaches the reset threshold of 40, without a repeat of the malfunction.

Diagnostic Aids

- The side object sensor module - left and side object sensor module - right are different parts and cannot be swapped from side to side.
- This DTC may be stored as a history DTC without affecting the operation of the side object sensor module - right. Do not replace side object sensor module - right based only on DTC B094C being set in history.
- The side object sensor module - right communicates on a private communication data bus with the side object sensor module - left. If programming is needed for module replacement, you must program the side object sensor module - left, which will then program the side object sensor module - right.

Description and Operation

Side Blind Zone Alert Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**

- Testing for Intermittent Conditions and Poor Connections
- Wiring Repairs

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that both side blind spot indicators turn ON and OFF when commanding the Object Detection Alert Indicators On and Off with a scan tool.
   - **If both indicators do not turn ON and OFF**

     Replace the B218R Side Object Sensor Module - Right.

   - **If one indicator does not turn ON and OFF**

     Refer to Circuit/System Testing.

   - **If both indicators turn ON and OFF**
3. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the appropriate X510 (Left) or X610 (Right) inline harness connector. It may take up to 2 mins for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 8 and ground.
   - **If 2 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the ground circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 2 Ω**
3. Vehicle in Service Mode.
4. Test for less than 1 V between the control circuit terminal 7 and ground.
   - **If 1 V or greater**
   1. Vehicle OFF, disconnect the harness connector at the B218R Side Object Sensor Module - Right.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 2 Ω, replace the B218R Side Object Sensor Module - Right.
   - **If less than 1 V**
5. Command the Object Detection Alert Indicators On with a scan tool.
6. Test for greater than 3 V between the control circuit terminal 7 and ground.
   - **If 3 V or less**
   1. Vehicle OFF, disconnect the harness connector at the B218R Side Object Sensor Module - Right.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground in the circuit.
      - If infinite resistance
   3. Vehicle OFF.
   4. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the B218R Side Object Sensor Module - Right.

- **If greater than 3 V**

7. Replace the appropriate E17 Outside Rearview Mirror Glass.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Outside Rearview Mirror Glass Replacement**
- Refer to **Control Module References** for control module replacement, programming, and setup.

DTC B094D OR B094E: LEFT/RIGHT SIDE OBJECT DETECTION INDICATOR CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC B094D

Left Side Object Detection Indicator Circuit

DTC B094E

Right Side Object Detection Indicator Circuit

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control - Left Indicator	B094D 02	B094D 04	B094D 01	-
Ground - Left Indicator	-	B094D 04	-	-
Control - Right Indicator	B094E 02	B094E 04	B094E 01	-
Ground - Right Indicator	-	B094E 04	-	-

Circuit/System Description

The side blind zone alert system sensors are located on the side of the rear fascia and detect and report objects on either side of the vehicle, within a specified blind spot area. The system alerts the presence of objects in the blind spot with a visual indicator on each outside rearview mirror. When the system detects a vehicle in the side blind zone while driving forward, an amber warning symbol will light up in the appropriate outside mirror. This indicates that it may be unsafe to change lanes. If the driver then activates the turn signal, the amber warning symbol will begin flashing and an audible alert will sound to give an extra warning not to change lanes.

Each indicator receives a constant ground and is controlled by the Side Object Sensor Module - Left and/or Right by applying voltage to the control circuit. When voltage is applied on the control circuit, the indicator will illuminate.

Conditions for Running the DTC

- Engine running.
- The side blind zone alert system is active.

Conditions for Setting the DTC

B094D 01

The Side Object Sensor Module has detected a short to voltage on the left indicator control circuit.

B094D 02

The Side Object Sensor Module has detected a short to ground on the left indicator control circuit.

B094D 04

The Side Object Sensor Module has detected an open in the left indicator control circuit.

B094E 01

The Side Object Sensor Module has detected a short to voltage on the right indicator control circuit.

B094E 02

The Side Object Sensor Module has detected a short to ground on the right indicator control circuit.

B094D 04

The Side Object Sensor Module has detected an open in the right indicator control circuit.

Action Taken When the DTC Sets

- The side blind zone alert system is disabled.
- A service message may be displayed on the driver information center.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle ON.
2. Verify the side blind zone alert indicators located in each outside rearview mirror briefly turn ON and OFF during the system self test immediately after the vehicle is turned ON.
    - **If either indicator does not briefly turn ON and OFF**

      Refer to Circuit/System Testing

    - **If both indicators briefly turn ON and OFF**

3. All OK.

Circuit/System Testing

NOTE: Make sure to use a high impedance test lamp like special tool EL-35616-210.

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the appropriate E17 Outside Rearview Mirror Glass. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 2 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle ON, connect a test lamp between the control circuit terminal 1 and the ground circuit terminal 2.
4. Verify the test lamp turns ON and OFF when commanding the appropriate Object Detection Indicator On and Off with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the harness connector at the appropriate B218 Side Object Sensor Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the B218 Side Object Sensor Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the harness connector at the B218 Side Object Sensor Module, vehicle ON.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the B218 Side Object Sensor Module.
    - **If the test lamp turns ON and OFF**
5. Test or replace the E17 Outside Rearview Mirror Glass.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Refer to Outside Rearview Mirror Glass Replacement
- Refer to Control Module References for parking assist control module replacement, programming and setup

DTC B0954, B0955, B0956, OR B0957: PARKING ASSIST FRONT SENSOR CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

Circuit/System Description

The object sensors are 3-wire sensors that are used to determine the distance between the vehicle and an object of interest. The parking assist control module supplies 9 V to the object sensors via the 9 V reference circuit and provides ground via the low reference circuit. The parking assist control module triggers the sensors in a sequential loop. After each sensor transmits, the parking assist control module uses the sensor echo received through the signal circuit to calculate the distance and position of an object.

Conditions for Running the DTC

- Vehicle ON
- The park assist is activated. The activation takes place through putting in the reverse gear or through operating the park assist switch.

Conditions for Setting the DTC

B0954 01, B0955 01, B0956 01, or B0957 01

The parking assist control module has detected the voltage at the sensor circuit is greater than 11.5 V or the object sensor is not grounded.

B0954 06, B0955 06, B0956 06, or B0957 06

The parking assist control module has detected the voltage at the sensor circuit is less than 0.5 V.

B0954 08, B0955 08, B0956 08, or B0957 08

The parking assist control module has received an invalid signal.

B0954 21, B0955 21, B0956 21, or B0957 21

The object sensor determines no change in the position of an object while the vehicle is in motion.

B0954 3A, B0955 3A, B0956 3A, or B0957 3A

The parking assist control module determines the wrong sensor type is installed.

Action Taken When the DTC Sets

- The parking assist is disabled.
- The driver information center displays SERVICE PARK ASSIST.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Circuit/System Verification

1. Vehicle ON.
2. Verify that DTC B1405 is not set.
    - **If the DTC is set**

Refer to DTC B1405

- **If the DTC is not set**

3. Verify that DTC B0954 01, B0955 01, B0956 01, B0957 01 B0954 21, B0955 21, B0956 21 or B0957 21 is not set.
   - **If the DTC is set**
   1. Verify the B78 Front Object Sensors are not contaminated with snow, mud, dirt, slush, or ice.
      - If contaminated, clean sensor.
      - If there is no contamination
   2. Refer to Circuit/System Testing.
   - **If the DTC is not set**
4. Verify that DTC B0954 3A, B0955 3A, B0956 3A or B0957 3A is not set.
   - **If the DTC is set**

     Replace the B78 Front Object Sensor with the correct sensor type.

   - **If the DTC is not set**
5. Vehicle ON, transmission in REVERSE.
6. Verify the scan tool Parking Assist System Status parameter displays Enabled.
   - **If the Parking Assist System displays Disabled**

     Refer to Circuit/System Testing.

   - **If the Parking Assist System displays Enabled**
7. All OK.

Circuit/System Testing

1. Vehicle OFF, scan tool disconnected, disconnect the harness at the appropriate B78 Front Object Sensor. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 2 and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF, disconnect the harness connector X3 at the K182 Parking Assist Control Module.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω replace the K182 Parking Assist Control Module.
   - **If less than 10 Ω**
3. Vehicle ON.
4. Test for 7.5 - 10.5 V between the 9 V reference circuit terminal 1 and ground.
   - **If less than 7.5 V**
   1. Vehicle OFF, disconnect the harness connector at the K182 Parking Assist Control Module.
   2. Test for infinite resistance between the 9 V reference circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the 9 V reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K182 Parking Assist Control Module.
   - **If greater than 10.5 V**
   1. Vehicle OFF, disconnect the harness connector at the K182 Parking Assist Control Module, Vehicle ON.
   2. Test for less than 1 V between the 9 V reference circuit and ground.

        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K182 Parking Assist Control Module.
    - **If between 7.5 - 10.5 V**
5. Test for 7.5 - 9.5 V between the signal circuit terminal 2 and ground.
    - **If less than 7.5 V**
    1. Vehicle OFF, disconnect the harness connector at the K182 Parking Assist Control Module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K182 Parking Assist Control Module.
    - **If greater than 9.5 V**
    1. Vehicle OFF, disconnect the harness connector at the K182 Parking Assist Control Module, Vehicle ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K182 Parking Assist Control Module.
    - **If between 7.5 - 9.5 V**
6. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Advanced Parking Assist Alarm Sensor Replacement (Front)Advanced Parking Assist Alarm Sensor Replacement (Rear)**
- Refer to **Control Module References** for parking assist control module replacement, programming and setup

DTC B095D OR B095E: PARKING ASSIST REAR SENSOR LEFT/RIGHT SIDE CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Right Rear Supplemental Object Sensor Signal	B095E 02, B095E 06	B095E 06	B095E 01	B095E 08, B095E 21
Low Reference	-	B095D 01, B095D 06, B095E 01, B095E 06	-	-

Circuit/System Description

The parking assist sensors are 3-wire ultrasonic sensors that are used to determine the distance between the vehicle and an object on the side of the vehicle, in the vehicle's blind spot. The parking assist control module supplies 12 V to the parking assist sensors via the 12 V reference circuit and provides ground via the low reference circuit. The parking assist control module triggers the sensors in a sequential loop. After each sensor transmits, the parking assist control module uses the sensor echo received through the signal circuit to calculate the distance and position of an object.

Conditions for Running the DTC

- Vehicle ON.
- The side blind spot system (if equipped) or parking assist system is activated.

Conditions for Setting the DTC

B095D 01, B095E 01

The parking assist control module has determined the sensor signal voltage is too high.

B095D 06, B095E 06

The parking assist control module has determined the sensor signal voltage is too low.

B095D 08, B095E 08

The parking assist control module has received an invalid signal.

B095D 21, B095E 21

The parking assist control module has determined no change in the position of an object while the vehicle is in motion.

B095D 3A, B095E 3A

The parking assist control module has determined the wrong sensor type is installed.

Action Taken When the DTC Sets

- The side blind spot system (if equipped) is disabled.
- The parking assist system is disabled.
- The driver information center may display a service message.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Diagnostic Aids

For symptom byte 21, the parking assist control module only runs the diagnostic when the vehicle is driven greater than 40 km/h (25 MPH). When diagnosing symptom byte 21, the vehicle must be driven greater than 40 km/h (25 MPH) after a repair to verify the concern has been corrected.

The following is a list of reasons this symptom byte 21 might have set:

- One or more of the sensors may be blocked by snow, mud, ice, or debris. This condition may occur after going through a car wash in cold weather.
- One or more of the sensors may be scratched or the paint maybe chipped.
- Excessive paint thickness on a sensor may cause an excessive sensor ring time. When replacing or refinishing a sensor, do not apply an excessive amount of paint or clear coat.
- The silicone insulator (ring) surrounding sensor maybe missing, cut, or twisted.
- The sensor may be improperly installed and not fully seated, or the sensor may be misaligned due to a tight wiring harness.

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC B1405 is not set.
    - **If the DTC is set**

      Refer to **DTC B1405**

    - **If the DTC is not set**
3. Verify DTC B095D 01, B095E 01, B095D 21, or B095E 21 is not set.
    - **If any of the DTCs are set**
    1. Verify none of the B306 Parking Assist Sensors - Rear are contaminated with snow, mud, dirt, slush, or ice.
        - If contaminated, clean the B306 Parking Assist Sensors - Rear.
        - If there is no contamination.
    2. Refer to Circuit/System Testing.
    - **If none of the DTCs are set**
4. Verify that DTC B095D 3A or B095E 3A is not set.
    - **If any of the DTCs are set**

      Replace the appropriate B306 Parking Assist Sensor - Rear with the correct sensor type.

    - **If none of the DTCs are set**
5. Vehicle ON.

6. Verify the scan tool Parking Assist System Status parameter is Enabled.
    - **If the Parking Assist System Status parameter is Disabled**

      Refer to Circuit/System Testing.

    - **If the Parking Assist System Status parameter is Enabled**
7. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness at the appropriate B306 Parking Assist Sensor. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 15 Ω between the low reference circuit terminal 3 and ground.
    - **If 15 Ω or greater**
    1. Vehicle OFF, disconnect the X2 harness connector at the K182 Parking Assist Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω replace the K182 Parking Assist Control Module.
    - **If less than 15 Ω**
3. Vehicle ON.
4. Test for greater than 9.7 V between the 12 V reference circuit terminal 1 and ground.
    - **If less than 9.7 V**
    1. Vehicle OFF, disconnect the X2 harness connector at the K182 Parking Assist Control Module.
    2. Test for infinite resistance between the 12 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the 9 V reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K182 Parking Assist Control Module.
    - **If greater than 9.7 V**
5. Test for 4 - 12.0 V between the signal circuit terminal 2 and ground.
    - **If less than 4 V**
    1. Vehicle OFF, disconnect the X2 harness connector at the K182 Parking Assist Control Module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K182 Parking Assist Control Module.
    - **If greater than 12 V**
    1. Vehicle OFF, disconnect the X2 harness connector at the K182 Parking Assist Control Module, vehicle ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K182 Parking Assist Control Module.
    - **If between 4 - 12.0 V**
6. Test or replace the B306 Parking Assist Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Rear Parking Assist Alarm Sensor Replacement**
- Refer to **Control Module References** for control module replacement, programming, and setup.

Circuit/System Description

The parking assist sensors are 3-wire sensors that are used to determine the distance between the vehicle and an object of interest. The parking assist control module supplies 12 V to the object sensors via the 12 V reference circuit and provides ground via the low reference circuit. The parking assist control module triggers the sensors in a sequential loop. After each sensor transmits, the parking assist control module uses the sensor echo received through the signal circuit to calculate the distance and position of an object.

Conditions for Running the DTC

- Vehicle ON
- The parking assist is activated. The activation takes place through putting in the reverse gear or through operating the park assist switch.

Conditions for Setting the DTC

B0958 01, B0960 01, or B0961 01

The parking assist control module has detected the voltage at the sensor circuit is shorted to voltage or the object sensor is not grounded.

B0958 02, B0960 02, or B0961 02

The parking assist control module has detected the voltage at the sensor is shorted to ground.

B0958 04, B0960 04, or B0961 04

The parking assist control module has detected the voltage at the sensor is too high.

B0958 08, B0960 08, or B0961 08

The parking assist control module has received an invalid signal.

B0958 18, B0960 18, or B0961 18

The parking assist control module has detected the voltage at the sensor has a low signal amplitude.

B0958 22, B0960 22, or B0961 22

The parking assist control module determines the sensor has too short of a low time.

B0958 3A, B0960 3A, or B0961 3A

The parking assist control module determines the wrong sensor type is installed.

B0958 3B, B0960 3A, or B0961 3B

The parking assist control module determines the sensor failed a self test.

Action Taken When the DTC Sets

- The parking assist is disabled.
- The driver information center displays SERVICE PARK ASSIST.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Circuit/System Verification

1. Vehicle ON.
2. Verify that DTC B1405 is not set.
   - **If the DTC is set**

     Refer to DTC B1405

   - **If the DTC is not set**
3. Verify that DTC B0958 01, B0960 01 or B0961 01 is not set.
   - **If the DTC is set**

     Check the appropriate B306 Parking Assist Sensor for contamination with mud. If no contamination is diagnosed, refer to Circuit/System Testing.

   - **If the DTC is not set**
4. Verify that DTC B0958 22, B0960 22 or B0961 22 is not set.
   - **If the DTC is set**

     Check the appropriate B306 Parking Assist Sensor for contamination with mud, ice or snow. If no contamination is diagnosed, replace the sensor.

   - **If the DTC is not set**
5. Verify that DTC B0958 3A, B0958 3B, B0960 3A B0960 3B B0961 3A or B0961 3B is not set.
   - **If the DTC is set**

     Replace the appropriate B306 Parking Assist Sensor with a sensor of the correct sensor type.

   - **If the DTC is not set**
6. Vehicle ON, transmission in REVERSE, verify the scan tool Parking Assist System Status parameter displays Enabled.
   - **If the Parking Assist System displays Disabled**

     Refer to Circuit/System Testing.

   - **If the Parking Assist System displays Enabled**
7. All OK.

Circuit/System Testing

1. Vehicle OFF for 1 min, scan tool must be disconnected for steps 1 and 2 to allow module to power down. Disconnect the harness connector at the affected rear object sensor.
2. Test for less than 10 Ω between the low reference circuit terminal 2 and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF, disconnect the harness connector X2 at the K182 Parking Assist Control Module.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω replace the K182 Parking Assist Control Module.
   - **If less than 10 Ω**
3. Vehicle ON.

4. Test for at least 9.7 V between the 12 V reference circuit terminal 1 and ground.
    - **If less than 9.7 V**
    1. Vehicle OFF, disconnect the harness connector at the K182 Parking Assist Control Module.
    2. Test for infinite resistance between the 12 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the 12 V reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K182 Parking Assist Control Module.
    - **If 9.7 V or greater**
5. Test for 4 - 12 V between the signal circuit terminal 3 and ground.
    - **If less than 4 V**
    1. Vehicle OFF, disconnect the harness connector at the K182 Parking Assist Control Module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K182 Parking Assist Control Module.
    - **If greater than 12 V**
    1. Vehicle OFF, disconnect the harness connector at the K182 Parking Assist Control Module, Vehicle ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K182 Parking Assist Control Module.
    - **If between 4 - 12 V**
6. Vehicle OFF, connect all of the B306 Parking Assist Sensors.
7. Vehicle ON.
8. Verify that DTC B0958, B0960, or B0961 is not set.
    - **If the DTC is set**

      Replace the appropriate B306 Parking Assist Sensor

    - **If the DTC is not set**
9. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair

- Refer to Rear Parking Assist Alarm Sensor Replacement
- Refer to Control Module References for control module replacement, programming and setup.

DTC B0967 OR B0968: PARKING ASSIST ON/OFF SWITCH CIRCUIT/PARKING ASSIST ON/OFF SWITCH INDICATOR CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

DTC Descriptor

DTC B0967

Parking Assist On/Off Switch Circuit

DTC B0968

Parking Assist On/Off Switch Indicator Circuit

For symptom byte information, refer to Symptom Byte List .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Parking Assist Switch Signal	B0967 02, 1	1	1	-
Parking Assist Switch Indicator Illumination	B0968 06, 2	B0968 06, 2	2	-
Parking Assist Switch Indicator Control	B0968 06, 2	B0968 06, 2	B0968 01,	-
Parking Assist Switch Ground	-	1	-	-
1. Parking Assist Switch Malfunction 2. Parking Assist Indicator Malfunction				

Circuit/System Description

The parking assist can be activated/deactivated by pressing the parking assist switch. By engaging the reverse gear the parking assist can also be activated. By subsequently pressing the parking assist switch the parking assist can be disabled again.

The indicator in the parking assist switch shows the status of the parking assist. If the lamp is ON, the parking assist is activated.

Conditions for Running the DTC

- Vehicle ON
- The parking assist is activated. The activation takes place by putting in the reverse gear or by pressing the parking assist switch.

Conditions for Setting the DTC

B0967 02

The parking assist control module has detected a short to ground.

B0968 01

The parking assist control module has detected a short to battery.

B0968 06

The parking assist control module has detected a short to ground or open.

Action Taken When the DTC Sets

- The parking assist is disabled.
- The driver information center displays SERVICE PARK ASSIST.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Circuit/System Verification

1. Vehicle ON.
2. Verify that DTC B0967 02 is not set.
    - **If the DTC is set**

      Refer to Parking Assist Switch Malfunction.

    - **If the DTC is not set**
3. Verify that B0968 01 or B0968 06 is not set.
    - **If the DTC is set**

      Refer to Parking Assist Switch Indicator Malfunction.

    - **If the DTC is not set**
4. Activate and deactivate the parking assist switch and verify the scan tool Park Assist Switch parameter changes between Active and Inactive.
    - **If the Parking Assist Switch parameter does not change between Active and Inactive**

      Refer to Circuit/System Testing.

    - **If the Parking Assist Switch parameter changes between Active and Inactive**
5. All OK.

Circuit/System Testing

Parking Assist Indicator Malfunction

1. Vehicle OFF, disconnect the harness connector at the S48D Multifunction Switch 2 - Instrument Panel. It may take up to 2 min for all vehicle systems to power down.
2. Test for 1.6 - 3.6 V between the control circuit terminal 6 and ground.
    - **If less than 1.6 V**
    1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, refer to **Interior Backlighting Malfunction** .

  - **If greater than 3.6 V**
    1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module, ignition ON.
    2. Test for less than 1 V between the control circuit and ground.
       - If 1 V or greater, repair the short to voltage on the circuit.
       - If less than 1 V, refer to **Interior Backlighting Malfunction** .
  - **If between 1.6 - 3.6 V**
3. Connect a test lamp between the control circuit terminal 7 and signal circuit terminal 6.
4. Verify the test lamp turns On and Off when commanding the Parking Assist Switch On and Off with a scan tool.
   - **If the test lamp is always OFF**
     1. Vehicle OFF, disconnect the harness connector at the K182 Parking Assist Control Module, Vehicle ON.
     2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit
        - If less than 1 V
     3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K182 Parking Assist Control Module.
   - **If the test lamp is always ON**
     1. Vehicle OFF, disconnect the harness connector at the K182 Parking Assist Control Module.
     2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground in the circuit.
        - If infinite resistance, replace the K182 Parking Assist Control Module.
   - **If the test lamp turns ON and OFF**
5. All OK.

Parking Assist Switch Malfunction

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S48D Multifunction Switch 2 - Instrument Panel. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 10 and ground.
   - **If 10 Ω or greater**
     1. Ignition OFF.
     2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Ignition ON.
4. Verify the scan tool Park Assist Switch parameter is Inactive.
   - **If not Inactive**
     1. Ignition OFF, disconnect the harness connector X1 at the K182 Parking Assist Control Module.
     2. Test for infinite resistance between the signal circuit terminal 2 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K182 Parking Assist Control Module.
   - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 2 and ground.
6. Verify the scan tool Park Assist Switch parameter is Active.
   - **If not Active**

1. Ignition OFF, disconnect the harness connector X1 at the K182 Parking Assist Control Module, ignition ON.
2. Test for less than 1 V between the signal circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V
3. Test for less than 2 Ω in the signal circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K182 Parking Assist Control Module.

- **If Active**

7. Test or replace the S48D Multifunction Switch 2 - Instrument Panel.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair

- Refer to **Instrument Panel Center Accessory Function Switch Replacement**
- Refer to **Control Module References** for control module replacement, programming and setup.

DTC B096B: PARKING ASSIST SWITCH PARALLEL PARKING CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B096B

Parking Assist Switch Parallel Parking Circuit

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Parallel Park Assist Switch Signal	B096B 02	1	-	-
Parallel Parking Assist Switch Ground	-	1	-	-
1. Parallel Parking Assist Switch Malfunction				

Circuit/System Description

The parallel parking assist can be activated/deactivated by pressing the parallel parking assist switch.

Conditions for Running the DTC

- Vehicle ON
- The parallel parking assist is activated. The activation takes place through pressing the parallel parking assist switch.

Conditions for Setting the DTC

The parking assist control module has detected a short to ground.

Action Taken When the DTC Sets

- The parallel parking assist is disabled.

- An indicator in the driver information center shows the parking assistance is not available.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S48D Multifunction Switch 2 - Instrument Panel. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 10 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the ground circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle ON.
4. Verify the scan tool Advanced Parking Assist Switch parameter is Inactive.
    - **If not Inactive**
    1. Vehicle OFF, disconnect the harness connector at the K182 Parking Assist Control Module.
    2. Test for infinite resistance between the S48D Multifunction Switch 2 - Instrument Panel signal circuit terminal 1 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K182 Parking Assist Control Module.
    - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and ground.
6. Verify the scan tool Advanced Parking Assist Switch parameter is Active.
    - **If not Active**
    1. Vehicle OFF, disconnect the harness connector at the K182 Parking Assist Control Module, vehicle ON.

        2. Test for less than 1 V between the S48D Multifunction Switch 2 - Instrument Panel signal circuit terminal 1 and ground.
            - If 1 V or greater, repair the short to voltage on the circuit.
            - If less than 1 V.
        3. Test for less than 2 Ω in the signal circuit end to end.
            - If 2 Ω or greater, repair the open/high resistance in the circuit.
            - If less than 2 Ω, replace the K182 Parking Assist Control Module.
    - **If Active**

7. Test or replace the S48D Multifunction Switch 2 - Instrument Panel.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Instrument Panel Center Accessory Function Switch Replacement**
- Refer to **Control Module References** for control module replacement, programming and setup.

DTC B096C OR B096D: PARKING ASSIST SIDE SENSOR LEFT/RIGHT FRONT CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

Circuit/System Description

The object sensors are 3-wire sensors that are used to determine the distance between the vehicle and an object of interest. The parking assist control module supplies 9 V to the object sensors via the 9 V reference circuit and provides ground via the low reference circuit. The parking assist control module triggers the sensors in a sequential loop. After each sensor transmits, the parking assist control module uses the sensor echo received though the signal circuit to calculate the distance and position of an object.

Conditions for Running the DTC

- Vehicle in Service Mode
- The parallel parking assist is activated. The activation takes place through operating the parallel parking assist switch.

Conditions for Setting the DTC

B096C 01 or B096D 01

The parking assist control module has detected the voltage at the sensor circuit is too high.

B096C 06 or B096D 06

The parking assist control module has detected the voltage at the sensor circuit is too low.

B096C 08 or B096D 08

The parking assist control module has received an invalid signal.

B096C 21 or B096D 21

The object sensor determines no change in the position of an object while the vehicle is in motion.

B096C 3A or B096D 3A

The parking assist control module determines the wrong sensor type is installed.

Action Taken When the DTC Sets

- The parallel parking assist is disabled.
- An indicator in the driver information center shows the parking assistance is not available.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC B1405 is not present.
    - **If the DTC is set**

      Refer to **DTC B1405**

    - **If the DTC does not set**
3. Verify that DTC B096C 01 or B096D 01 is not present.
    - **If the DTC is set**

      Check the appropriate sensor for contamination with mud, ice or snow. If no contamination is diagnosed, refer to Circuit/System Testing.

    - **If the DTC does not set**
4. Verify that DTC B096C 3A or B096D 3A is not present.
    - **If the DTC is set**

      Replace the appropriate sensor with a sensor by correct sensor type.

    - **If the DTC does not set**
5. Verify that DTC B096C 21 or B096D 21 is not present.
    - **If the DTC is set**

      Check the appropriate sensor for contamination with mud, ice or snow. If no contamination is diagnosed, replace the appropriate sensor.

    - **If the DTC does not set**
6. All OK.

Circuit/System Testing

1. Vehicle OFF for 30 s, disconnect the harness connector at the appropriate B94 Side Object Sensor - Front. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 3 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF, disconnect the harness connector at the K182 Parking Assist Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.

    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K182 Parking Assist Control Module.
  - **If less than 10 Ω**
3. Vehicle in Service Mode, engine running.
4. Test for 7.5 - 10.5 V between the 9 V reference circuit terminal 1 and ground.
  - **If less than 7.5 V**
  1. Vehicle OFF, disconnect the harness connector at the K182 Parking Assist Control Module.
  2. Test for infinite resistance between the 9 V reference circuit and ground.
     - If less than infinite resistance, repair the short to ground on the circuit.
     - If infinite resistance
  3. Test for less than 2 Ω in the 9 V reference circuit end to end.
     - If 2 Ω or greater, repair the open/high resistance in the circuit.
     - If less than 2 Ω, replace the K182 Parking Assist Control Module.
  - **If greater than 10.5 V**
  1. Vehicle OFF, disconnect the harness connector at the K182 Parking Assist Control Module, Vehicle in Service Mode.
  2. Test for less than 1 V between the 9 V reference circuit and ground.
     - If 1 V or greater, repair the short to voltage on the circuit.
     - If less than 1 V, replace the K182 Parking Assist Control Module.
  - **If between 7.5 - 10.5 V**
5. Test for 7.5 - 9.5 V between the signal circuit terminal 2 and ground.
  - **If less than 7.5 V**
  1. Vehicle OFF, disconnect the harness connector at the K182 Parking Assist Control Module.
  2. Test for infinite resistance between the signal circuit and ground.
     - If less than infinite resistance, repair the short to ground on the circuit.
     - If infinite resistance
  3. Test for less than 2 Ω in the signal circuit end to end.
     - If 2 Ω or greater, repair the open/high resistance in the circuit.
     - If less than 2 Ω, replace the K182 Parking Assist Control Module.
  - **If greater than 9.5 V**
  1. Vehicle OFF, disconnect the harness connector at the K182 Parking Assist Control Module, Vehicle in Service Mode.
  2. Test for less than 1 V between the signal circuit and ground.
     - If 1 V or greater, repair the short to voltage on the circuit.
     - If less than 1 V, replace the K182 Parking Assist Control Module
  - **If between 11.5 - 13.5 V**
6. Test or replace the appropriate B94 Side Object Sensor - Front.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Refer to Advanced Parking Assist Alarm Sensor Replacement (Front)Advanced Parking Assist Alarm Sensor Replacement (Rear)
- Refer to Control Module References for control module replacement, programming and setup.

DTC B0987: VEHICLE DIRECTION CAMERA INDICATOR CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

DTC Descriptor

DTC B0987 01

Vehicle Direction Camera Indicator Circuit Short to Battery

DTC B0987 06

Vehicle Direction Camera Indicator Circuit Low Voltage/Open

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Lane Departure Warning Switch Indicator Ignition	B0987 06	B0987 06	-	-
Lane Departure Warning Switch Indicator Control	B0987 06	B0987 06	B0987 01	-

Circuit/System Description

The lane departure warning is enabled and disabled through a switch located in the left steering wheel controls switch. When enabled, the frontview camera module will illuminate the indicator located in the switch.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

The frontview camera module has detected a short to battery or open/high resistance in the control circuit.

Action Taken When the DTC Sets

- Lane departure warning is disabled.
- SERVICE FRONT CAMERA is displayed on the driver information center.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Circuit/System Verification

1. Ignition ON.
2. Verify that DTC B356A is not set.
   - **If the DTC is set**

     Refer to **DTC B356A**.

   - **If the DTC is not set**
3. Verify the lane departure warning indicator turns ON and OFF while pressing and releasing the lane departure warning switch.
   - **If the indicator does not turn ON and OFF**

     Refer to Circuit/System Testing.

   - **If the indictor turns ON and OFF**
4. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the S70L Steering Wheel Controls Switch - Left, ignition ON.

NOTE: **Verify interior lighting dimming is turned all the way up.**

2. Test for 6.2 - 12.0 V between the dimming control circuit terminal 4 and ground.
   - **If less than 6.2 V**
   1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, refer to **Interior Backlighting Malfunction** .
   - **If greater than 12.0 V**
   1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module, ignition ON.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, refer to **Interior Backlighting Malfunction** .
   - **If between 6.2 - 12.0 V**
3. Connect a test lamp between the control circuit terminal 5 and B+.
4. Verify the test lamp turns ON and OFF when commanding the Lane Departure Warning Indicator parameter ON and OFF with a scan tool.
   - **If the test lamp is always OFF**
   1. Ignition OFF, disconnect the harness connector at the K109 Frontview Camera Module, ignition ON.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V
   3. Ignition OFF.

4. Test for less than 2 Ω in the control circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K109 Frontview Camera Module.
- **If the test lamp is always ON**
1. Ignition OFF, disconnect the harness connector at the K109 Frontview Camera Module.
2. Test for infinite resistance between the control circuit and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance, replace the K109 Frontview Camera Module.
- **If the test lamp turns ON and OFF**

5. Test or replace the S70L Steering Wheel Controls Switch - Left.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Cruise Control Switch Replacement** - Steering Wheel Controls Switch - Left replacement.
- Refer to **Control Module References** for control module replacement, programming and setup.

DTC B1008: CALIBRATION DATA NOT PROGRAMMED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B1008

Calibration Data Not Programmed

For symptom byte information refer to **Symptom Byte List** .

Circuit/System Description

When the ignition is turned ON, the frontview camera module performs a self-test to verify if a critical malfunction exists within the system. During the power-up mode, the frontview camera module checks for a valid calibration data set.

Conditions for Running the DTC

- DTC B1325 is not set
- Ignition voltage is between 9 - 16 volts

Conditions for Setting the DTC

- A valid calibration is not detected upon module power - up.
- The frontview camera module has been replaced and programmed, but not calibrated.

Action Taken When the DTC Sets

- Lane departure and forward collision alert system is disabled.
- The instrument panel cluster to display SERVICE FRONT CAMERA or SERVICE LANE DEPARTURE WARNING message in the driver information center and a chime will sound.
- All functions handled by the frontview camera module are inoperative

Conditions for Clearing

- The DTC will transition to history when the fault is no longer present.

- A history DTC will clear after 50 malfunction - free ignition cycles.

Diagnostic Aids

- This DTC will be set as current while performing calibration, and will remain set as current until calibration can be completed
- The frontview camera will not calibrate if not properly installed or mounted.

Circuit/System Verification

NOTE: **Do not diagnose this DTC if set in history**

1. Ignition ON.
2. Verify that DTC B101E 42 is not set.
    - **If DTC is set**

      Perform the **Front View Camera Module Programming and Setup** procedure.

    - **If the DTC is not set**
3. Perform the **Vehicle Yaw Sensor Learn** procedure.
4. Verify that DTC B1008 is not set.
    - **If DTC is set**
    1. Calibrate the front camera module. Refer to **Front View Camera Module Learn**.
    2. Verify the DTC does not set.
        - If the DTC sets, replace the B174W Frontview Camera - Windshield.
        - If the DTC does not set
    3. All OK.
    - **If the DTC is not set**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for control module replacement, programming, and setup.

DTC B1011: SYSTEM DISABLED INFORMATION STORED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B1011

System Disabled Information Stored

Circuit/System Description

The front view camera module permanently monitors the serial data bus for error messages. When a malfunction is detected by the front view camera module, the system will be disabled and an error message will be stored in the front view camera module disable history buffer which is used to store information about the front camera features that are disabled.

Conditions for Running the DTC

- Ignition ON
- Front view camera enabled

Conditions for Setting the DTC

The front view camera module detects a malfunction.

Action Taken When the DTC Sets

- The front view camera module is disabled.
- The front view camera module disable history buffer stores information why the system was disabled.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Diagnostic Aids

The front view camera module disable history buffers are used to store information about the front view camera module features that are disabled. The Buffers will only update if the disable condition changes.

Example: If the data received from the steering wheel angle sensor is Invalid across many ignition cycles then it will only appear in 1 history buffer and not all history buffers. If this condition is the current reason why the front view camera module is disabled then it will be set in front view camera module disable history buffer 1. If a new reason occurs, such as vehicle speed validity is invalid, then the invalid steering wheel angle sensor fault will shift into disable history buffer 2 and vehicle speed validity invalid will be in disable history buffer 1. Since there are only 4 disable history buffers, the invalid steering wheel angle sensor will age out if 4 other disable reasons occur since the last invalid steering wheel angle sensor event occurred. Front view camera module disable history buffer 1 contains the current reason that one of the front view camera module features is disabled.

The front view camera module disable history buffers can display the following values:

- Lane Departure Warning Indicator Malfunction
- Lane Departure Warning Switch Malfunction
- Camera Obstructed
- Accelerator Pedal Position Out of Range
- Driven Wheel Speed Signal Invalid
- Non-Driven Wheel Speed Signal Invalid

- Brake Pedal Moderate Travel Signal Invalid
- Brake Pedal Initial Travel Position Achieved
- Lost Communication with Steering Wheel Angle Sensor Module
- Invalid Data Received From Steering Wheel Angle Sensor Module
- Forward Collision Alert Switch Malfunction
- Clutch Pedal Position (CPP) Sensor Performance
- Clutch Pedal Position (CPP) Sensor Performance
- Transmission Gear Engaged
- Acceleration Sensor Longitudinal Signal
- Invalid Data Received From Yaw Rate Sensor Module
- Power Mode Controlled by Backup Device
- System Power Mode
- Overvoltage
- Undervoltage
- Undefined

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Verify no DTC is set.
    - If a DTC is present, diagnose this first. Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
2. Verify the scan tool Vehicle Direction Camera System parameter is NORMAL.
    - If not the specified value, refer to **Lane Departure Warning System Malfunction**, and **Forward Collision Alert System Malfunction**.
3. Verify the scan tool Vehicle Direction Camera Calibration Status parameter is CALIBRATED.
    - If not the specified value, calibrate the K109 Frontview Camera Module. Refer to **Front View Camera Module Learn**.

Circuit/System Testing

NOTE: **Perform the Circuit/System Verification before proceeding with the Circuit/System Testing.**

1. Verify the scan tool Front View Camera Module Disable History displays no current malfunction. Refer to Diagnostic Aids.
    - If a current malfunction is displayed, diagnose the system that sets the malfunction.
2. If no malfunction is displayed in the Front View Camera Module Disable History, refer to **Lane Departure Warning System Malfunction**, and **Forward Collision Alert System Malfunction**.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for front view camera module programming and setup

DTC B1015: VEHICLE IDENTIFICATION NUMBER INFORMATION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B1015

Vehicle Identification Number Information

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

When the ignition is turned ON, the advanced parking assist control module and the frontview camera module receive the vehicle identification number (VIN) from the body control module (BCM). The modules will compare the VIN received to the VIN stored in memory.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

The stored VIN does not match the received VIN.

Action Taken When the DTC Sets

- The parking assist system or the lane departure warning system is disabled.
- The driver information center may display a system service message.

Conditions for Clearing the DTC

The stored VIN matches the VIN stored in the body control module.

Circuit/System Verification

1. Ignition ON.
2. Verify that DTC B1015 is not set.
    - **If the DTC is set**
    1. Program the control module that set the DTC.
    2. Verify that DTC B1015 is not set.
        - If the DTC is set, replace the control module that set the DTC.
        - If the DTC is not set
    3. All OK
    - **If the DTC is not set**
3. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair

Refer to **Control Module References** for control module replacement, programming, and setup.

DTC B101D: ELECTRONIC CONTROL UNIT HARDWARE (DTC SET IN K109 FRONTVIEW CAMERA MODULE)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B101D

Electronic Control Unit Hardware

DTC B101D 3C

Electronic Control Unit Hardware Performance Internal Communications Failure

For symptom byte information, refer to **Symptom Byte List**

Circuit/System Description

The internal fault detection is handled inside the device. The symptom byte information is for engineering reference only. No external circuit diagnosis is involved.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

B101D

The frontview camera module has detected an internal malfunction

B101D 3C

The frontview camera module has detected a software malfunction

Action Taken When the DTC Sets

- Lane departure warning is disabled
- SERVICE LANE DEPARTURE SYSTEM is displayed on the DIC.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

    - **If DTC B101D symptom byte 3C is set as current**

      Reprogram the K109 Frontview Camera Module

    - **If DTC B101D symptom byte 3C is not set as current**
2. Verify that DTC B101D is not set as current.
    - **If DTC B101D is set as current**

      Replace the K109 Frontview Camera Module

    - **If DTC B101D is not set as current**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for control module replacement, setup, and programming

DTC B127B: REARVIEW CAMERA INPUT SIGNAL CIRCUIT MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

B127B 08

Rearview Camera Input Signal Circuit Malfunction

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	1	B127B 2B	-	-
Camera Module signal +	1	B127B 2B	1	-
Camera Module signal -	3	B127B 2B	1	-
Ground	-	B127B 2B	-	-
Shield	3	3	3	-
1. Rear Vision Camera Malfunction 2. Rear Vision Camera image always displayed 3. Poor Quality Image				

Circuit/System Description

When the vehicle is placed in reverse with the engine running, a video signal is sent from the rearview camera to the Radio. If the Radio does not see a signal from the camera it will set B127B 2B and display "Service Rear Vision System". The rearview camera is powered with ignition voltage and does not have a reverse signal circuit.

Conditions for Running the DTC

The vehicle must be in reverse with the engine running.

Conditions for Setting the DTC

B127B 08

Signal from the rearview camera not received by the Radio for 2.5 s.

Action Taken When the DTC Sets

- The Radio commands the driver information center to display "Service Rear Vision System".
- The Radio stores the DTC in memory.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 40 malfunction-free ignition cycles have occurred.

Diagnostic Aids

A poor video image can be caused by ice, snow, and mud buildup on the lens of the rearview camera. Also, extreme lighting conditions can affect performance, such as operating in the dark or with bright sunlight shining on the camera. Extreme high or low temperatures can also affect the image quality. An open in the shield of the video signal circuit can also cause a distorted screen.

Terminal fretting or incorrectly seated connectors can cause a poor image displayed condition. Check the circuit terminals for fretting or incorrectly seated connector. If the condition is intermittent or cannot be duplicated, disconnect the connectors and add Nyogel lubricant 760G. This procedure will correct the high resistance condition due to terminal fretting corrosion.

Circuit/System Verification

NOTE: **If the condition is intermittent or cannot be duplicated, disconnect the connectors and add Nyogel lubricant 760G. This procedure will correct the high resistance condition due to terminal fretting corrosion.**

1. Vehicle ON.
2. Verify that DTC B2545 is not set.
    - **If the DTC is set**

      Refer to **DTC B2545** .

    - **If the DTC is not set**
3. Verify the rearview camera has no debris on the lens and that the bezel and bezel seal are not damaged.
    - **If debris is found on the lens**

      Clean the lens. If the lens, bezel, or bezel seal are damaged, replace as necessary.

    - **If no debris on the lens**
4. Vehicle ON, transmission in R.
5. Verify the backup lamps are illuminated.
    - **If the backup lamps are not illuminated**

      Refer to **Backup Lamps Malfunction** .

    - **If the backup lamps are illuminated**
6. Verify a clear rear vision image is displayed on the P17 Info Display Module.
    - **If a clear image is not displayed**

      Refer to Circuit/System Testing.

- **If a clear image is displayed**

7. All OK.

Circuit/System Testing

NOTE: **Circuit/System Verification must be performed before Circuit/System Testing.**

1. Vehicle OFF, disconnect the harness connector at the B87 Rearview Camera. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 4 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle ON.
4. Verify a test lamp illuminates between the ignition circuit terminal 5 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse. Refer to **Power Mode Mismatch** .
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the B87 Rearview Camera.
    - **If the test lamp illuminates**
5. Vehicle OFF, disconnect the X1 harness connector at the A11 Radio, vehicle ON.
6. Test for less than 1 V between the signal circuit terminal listed below and ground:
    - B87 Rearview Camera signal (+) circuit terminal 15
    - B87 Rearview Camera signal (-) circuit terminal 14
    - **If 1 V or greater**

      Repair the short to voltage on the circuit.

    - **If less than 1 V**
7. Test for infinite resistance between the signal circuit terminal listed below and ground:
    - B87 Rearview Camera signal (+) circuit terminal 15
    - B87 Rearview Camera signal (-) circuit terminal 14
    - **If less than infinite resistance**

      Repair the short to ground on the circuit.

    - **If infinite resistance**
8. Test for less than 2 Ω in the signal (+) circuit end to end.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 2 Ω**

9. Test for less than 2 Ω in the signal (-) circuit end to end.
    - **If 2 Ω or greater**

      Test the signal circuit for an open/high resistance.

    - **If less than 2 Ω**
10. Replace the B87 Rearview Camera.
11. Vehicle ON, transmission in R,
12. Verify a clear rear vision image is displayed on the P17 Info Display Module.
    - **If a clear rear vision image is not displayed**

      Replace the A11 Radio.

    - **If a clear rear vision image is displayed**
13. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Rearview Driver Information Camera Replacement**
- Refer to **Control Module References** for control module replacement, programming and setup.

DTC B1405: CONTROL MODULE VOLTAGE REFERENCE OUTPUT 2 CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Circuit/System Description

The object sensors are 3-wire sensors that are used to determine the distance between the vehicle and an object of interest. The parking assist control module supplies 9 V to the object sensors via the object sensor supply voltage circuit and provides ground via the object sensor low reference circuit. The parking assist control module triggers the sensors in a sequential loop. After each sensor transmits, the parking assist control module uses the sensor echo received through the object sensor signal circuit to calculate the distance and position of an object.

Conditions for Running the DTC

- Ignition ON
- Transmission in REVERSE

Conditions for Setting the DTC

B1405 02

The parking assist control module has detected the object sensor supply voltage circuit is shorted to ground.

B1405 03

The parking assist control module has detected the object sensor supply voltage circuit is low.

B1405 07

The parking assist control module has detected the object sensor supply voltage circuit is high.

Action Taken When the DTC Sets

- The parking assist is disabled.
- The driver information center displays SERVICE PARK ASSIST.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Circuit/System Testing

1. Ignition OFF, disconnect the X2 and X3 harness connectors at the K41 Front and Rear Parking Assist Control Module.
2. Test for infinite resistance between the 12 V reference circuit terminal 4 X2 and ground.
    - **If less than infinite resistance**
    1. Ignition OFF, disconnect the harness connector at each of the B78 Rear Object Sensors.
    2. Test for infinite resistance between the 12 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If less than 2 Ω, replace the appropriate B78 Rear Object Sensor.
    - **If infinite resistance**
3. Test for infinite resistance between the 12 V reference circuit terminal 1 X3 and ground.
    - **If less than infinite resistance**
    1. Ignition OFF, disconnect the harness connector at each of the B78 Front Object Sensors.
    2. Test for infinite resistance between the 12 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If less than 2 Ω, replace the appropriate B78 Front Object Sensor.
    - **If infinite resistance**
4. Ignition ON.
5. Test for less than 1 V between the 12 V reference circuit terminal 4 X2 and ground.
    - **If greater than 1 V**
    1. Ignition OFF, disconnect the harness connector at each of the B78 Rear Object Sensors.
    2. Test for less than 1 V between the 12 V reference circuit and ground.
        - If greater than 1 V, repair the short to voltage on the circuit.
        - If less than 1 V, replace the appropriate B78 Front Object Sensor.
    - **If less than 1 V**
6. Test for less than 1 V between the 12 V reference circuit terminal 1 X3 and ground.
    - **If greater than 1 V**
    1. Ignition OFF, disconnect the harness connector at each of the B78 Front Object Sensors.
    2. Test for less than 1 V between the 12 V reference circuit and ground.
        - If greater than 1 V, repair the short to voltage on the circuit.
        - If less than 1 V, replace the appropriate B78 Front Object Sensor.
    - **If less than 1 V**
7. Connect the X2 and X3 harness connector at the K41 Front and Rear Parking Assist Control Module, ignition ON.
8. Verify DTC B1405 is not set.
    - **If DTC B1405 is set**
    1. Ignition OFF, disconnect the harness connector at each of the B78 Object Sensors.
    2. Verify DTC B1405 is not set.
        - If DTC B1405 is set

Replace the K41 Front and Rear Parking Assist Control Module.

- If DTC B1405 is not set.

3. Verify the DTC B1405 does not set while connecting the harness connector at each B78 Object Sensor, one at a time.

- If DTC B1405 does set

  Replace the B78 Object Sensor that was connected immediately before DTC B1405.

- If DTC B1405 does not set.

9. All OK.

- **If DTC B1405 is not set.**

10. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Rear Parking Assist Alarm Sensor Replacement**
- Refer to **Control Module References** for control module replacement, programming and setup

DTC B356A: VEHICLE DIRECTION WARNING SWITCH CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC B356A

Vehicle Direction Warning Switch Circuit

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Lane Departure Warning Switch Signal	B356A 02	1	B356A 05	-
Lane Departure Warning Switch Ground	-	1	-	-
1. Lane Departure Warning Malfunction				

Circuit/System Description

The lane departure warning system is controlled by the Frontview Camera - Windshield mounted on the windshield. Lane departure warning is enabled and disabled through a switch located on the steering wheel. When enabled, the Frontview Camera - Windshield or Active Safety Control Module will illuminate the indicator located in the switch.

When the system is operating and can detect the lane markings, the Frontview Camera - Windshield will request via serial data communications that the instrument panel cluster illuminate the green lane departure ready - to - assist indicator. If the Frontview Camera - Windshield detects that the vehicle has crossed a lane marking without the turn signal being used, the module will request that the instrument cluster flash the yellow lane departure warning indicator. An audible warning may also sound three times or the haptic seat (if equipped) may pulse when the yellow Instrument Cluster indicator is flashing. The driver can select between audible or haptic alerts in the vehicle personalization menu. See the Owner's Manual for more detailed information on vehicle personalization.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

DTC B356A 02

The Frontview Camera Module has detected a short to ground for more than 10 s.

DTC B356A 05

The Frontview Camera Module has detected a short to voltage or an open/high resistance for more than 10 s.

Action Taken When the DTC Sets

- Lane departure warning is disabled.
- Service Lane Departure is displayed on the driver information center.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Diagnostic Aids

Manually pressing the lane departure warning switch for an extended length of time will cause this DTC to set.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Lane Departure Warning Switch Status parameter changes between Open and Closed while cycling the lane departure warning switch.
    - **If the parameter does not change**

    Refer to Circuit/System Testing.

    - **If the parameter changes**

3. All OK.

Circuit/System Testing - Without MBM

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S70L Steering Wheel Controls Switch - Left.
2. Test for less than 10 Ω between the ground circuit terminal 1 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Ignition ON.
4. Verify the scan tool Vehicle Direction Warning Switch Status parameter is Open.
    - **If not Open**
    1. Ignition OFF, disconnect the harness connector at the B174W Frontview Camera - Windshield.
    2. Test for infinite resistance between the S70L Steering Wheel Controls Switch - Left signal circuit terminal 2 and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance, replace the B174W Frontview Camera - Windshield.
    - **If Open**
5. Install a 3 A fused jumper wire between the signal circuit terminal 2 and ground.
6. Verify within 10 s the scan tool Vehicle Direction Warning Switch Status parameter is Closed.
    - **If not Closed**
    1. Ignition OFF, disconnect harness connector at the B174W Frontview Camera - Windshield. Ignition ON.
    2. Test for less than 1 V between the S70L Steering Wheel Controls Switch - Left signal circuit terminal 2 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V.
    3. Test for less than 2 Ω in the signal circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the B174W Frontview Camera - Windshield.
    - **If Closed**
7. Test or replace the S70L Steering Wheel Controls Switch - Left.

Circuit/System Testing - with MBM

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S48D Multifunction Switch 2 - Instrument Panel.
2. Test for less than 10 Ω between the ground circuit terminal 10 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Ignition ON.

4. Verify the scan tool Vehicle Direction Warning Switch Status parameter is Open.
    - **If not Open**
    1. Ignition OFF, disconnect the harness connector at the B174W Frontview Camera - Windshield.
    2. Test for infinite resistance between the S48D Multifunction Switch 2 - Instrument Panel signal circuit terminal 3 and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance, replace the B174W Frontview Camera - Windshield.
    - **If Open**
5. Install a 3 A fused jumper wire between the signal circuit terminal 3 and ground.
6. Verify within 10 s the scan tool Vehicle Direction Warning Switch Status parameter is Closed.
    - **If not Closed**
    1. Ignition OFF, disconnect harness connector at the B174W Frontview Camera - Windshield. Ignition ON.
    2. Test for less than 1 V between the S48D Multifunction Switch 2 - Instrument Panel signal circuit terminal 3 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V.
    3. Test for less than 2 Ω in the signal circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the B174W Frontview Camera - Windshield.
    - **If Closed**
7. Test or replace the S48D Multifunction Switch 2 - Instrument Panel.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Cruise Control Switch Replacement**
- Refer to **Instrument Panel Center Accessory Function Switch Replacement**
- Refer to **Control Module References** for control module replacement, programming, and setup.

DTC B390D: FRONTVIEW CAMERA MODULE INCORRECT MOUNTING

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B390D 66

Frontview Camera Module Incorrect Mounting

Circuit/System Description

The frontview camera module has determined that it is not properly mounted.

Conditions for Running the DTC

Vehicle operating on the road.

Conditions for Setting the DTC

The frontview camera module was unable to see the road ahead.

Action Taken When the DTC Sets

- The frontview camera module is disabled.
- The Active Safety System is disabled.
- Service Driver Assist is displayed on the driver information center and/or heads up display.

Conditions for Clearing the DTC

The frontview camera module is successfully aligned.

Diagnostic Aids

- The frontview camera module needs to be securely mounted. Verify it is secured properly in it's mount.
- The frontview camera module needs to have a clear field of vision to the road ahead. Check for anything that can impair the camera's vision.

Circuit/System Verification

1. Ignition ON.
2. Verify there are no DTCs set, except for DTC B101E 4B in the B233B Radar Sensor Module - Long Rage or K109 Frontview Camera Module.
   - **If other DTCs are set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If no other DTCs are set**

NOTE: **Before conducting alignment, verify that the K109 Frontview Camera Module will not have difficulty seeing the lines on the road. If the view of the K109 Frontview Camera Module is blocked with mud, dirt, snow, ice, or slush, if the windshield is damaged, or if weather limits visibility, such as while driving in fog, rain, or snow conditions, the calibration procedure may not be able to be completed.**

3. Perform the calibration procedure. Refer to **Front View Camera Module Learn**.

4. Verify DTC B390D 66 is not set
    - **If DTC B390D 66 is set**

      Replace and calibrate the K109 Frontview Camera Module.

    - **If DTC B390D 66 is not set**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for frontview camera module replacement, programming, and setup.

DTC B390F: FRONTVIEW CAMERA

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B390F 08

Frontview Camera Performance - Signal Invalid

DTC B390F 66

Frontview Camera Wrong Mounting Position

DTC B390F 4B

Frontview Camera Calibration Not Learned

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
6 V Reference	B390F 08, B399A 02	B390F 08, 1	B399A 01	-
Video Signal +	1, 2	1	1, 2	-
Video Signal -	1, 2	1	1, 2	-
Low Reference	-	B390F 08, 1	-	-
1. Camera inoperative 2. Poor image quality displayed from camera				

Circuit/System Description

The video processing control module performs fault detection on itself and the cameras attached to it.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

B390F 08

The frontview camera video circuit is open, shorted to voltage, or shorted to ground.

B390F 66

The frontview camera is incorrectly mounted.

B390F 4B

The camera calibration is not learned.

Action Taken When the DTC Sets

- The Video Processing Control Module requests the instrument cluster to display "Service Surround Vision Camera".
- The Video Processing Control Module will disable the Surround Vision Camera System.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the control module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify DTC B390F 4B is not set.
   - **If the DTC is set**
   1. Program the K157 Video Processing Control Module.
   2. Verify DTC B390F 4B is not set after programming.
      - If the DTC sets after programming, replace the B174G Frontview Camera - Grille.
      - If the DTC does not set
   3. All OK.
   - **If both DTCs are not set**
3. Verify DTC B390F 66 is not set.
   - **If the DTC is set**

Remove the B174G Frontview Camera - Grille and reinstall

- **If the DTC is not set**

4. Verify DTC B390F 08 is not set.
   - **If DTC is set**

     Refer to Circuit/System Testing

   - **If DTC is not set**
5. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the B174G Frontview Camera - Grille harness connector. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 4 and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF, disconnect the harness connector at the K157 Video Processing Control Module.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K157 Video Processing Control Module.
   - **If less than 10 Ω**
3. Ignition ON.
4. Test for 4.8 - 7.2 V between the 6 V reference circuit terminal 5 and ground.
   - **If less than 4.8 V**
   1. Ignition OFF, disconnect the harness connector at the K157 Video Processing Control Module.
   2. Test for infinite resistance between the 6 V reference circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the 6 V reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K157 Video Processing Control Module.
   - **If greater than 7.2 V**
   1. Ignition OFF, disconnect the harness connector at the K157 Video Processing Control Module, ignition ON.
   2. Test for less than 1 V between the 6 V reference circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K157 Video Processing Control Module.
   - **If between 4.8 - 7.2 V**
5. Ignition ON.
6. Test for less than 10 V between the signal circuit terminals listed below and ground:
   - Vision Signal + signal circuit terminal 1
   - Vision Signal - signal circuit terminal 3
   - **If 10 V or greater**
   1. Ignition OFF, disconnect the X1 harness connector at the K157 Video Processing Control Module, ignition ON.
   2. Test for less than 1 V between the signal circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K157 Video Processing Control Module.
   - **If less than 10 V**

7. Ignition OFF.
8. Test for greater than 100 Ω between the signal circuit terminals listed below and ground:
    - Vision Signal + signal circuit terminal 1
    - Vision Signal - signal circuit terminal 3
    - **If less than 100 Ω**
    1. Disconnect the X1 harness connector at the K157 Video Processing Control Module.
    2. Test for infinite between the signal circuit and ground.
        - If less than infinite resistance, repair the short to voltage on the circuit.
        - If infinite resistance, replace the K157 Video Processing Control Module.
    - **If greater than 100 Ω**
9. Test for less than 2 Ω between the video signal circuit terminals listed below:
    - B174G Frontview Camera - Grille video signal (+) circuit terminal 1 and the K157 Video Processing Control Module video signal (+) circuit terminal 1 X1
    - B174G Frontview Camera - Grille video signal (-) circuit terminal 3 and the K157 Video Processing Control Module video signal (-) circuit terminal 11 X1
    - **If 2 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 2 Ω**
10. Ignition OFF, connect the harness connector at the B174G Frontview Camera - Grille.
11. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
12. Verify DTC B390F is not set.
    - **If DTC B390F is set**

      Replace the B174G Frontview Camera - Grille.

    - **If DTC B390F is not set**
13. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Front View Camera Replacement**
- Refer to **Control Module References** for control module replacement, programming, and setup.

DTC B395A: REARVIEW CAMERA

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B395A 08

Rearview Camera Performance - Signal Invalid

DTC B395A 66

Rearview Camera Wrong Mounting Position

DTC B395A 4B

Rearview Camera Calibration Not Learned

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
6 V Reference	B395A 02, B399B 08	B395A 08, 1	B399B 08	-
Video Signal +	1, 2	B395A 08, 1	1, 2	-
Video Signal -	1, 2	1	1, 2	-
Low Reference	-	B395A 08, 1	-	-
1. Camera inoperative 2. Poor image quality displayed from camera				

Circuit/System Description

The video processing control module performs fault detection on itself and the cameras attached to it.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

B395A 08

The rearview camera video circuit is open, shorted to voltage, or shorted to ground.

B395A 66

The rearview camera is incorrectly mounted.

B395A 4B

The camera calibration is not learned.

Action Taken When the DTC Sets

- The Video Processing Control Module requests the instrument cluster to display "Service Surround Vision Camera".
- The Video Processing Control Module will disable the camera and that cameras portion of the display.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the control module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Circuit/System Verification

1. Ignition ON.
2. Verify DTC B395A 4B is not set.
    - **If the DTC is set**
    1. Program the K157 Video Processing Control Module.
    2. Verify DTC B395A 4B is not set after programming.
        - If the DTC sets after programming, replace the B87 Rearview Camera.
        - If the DTC does not set
    3. All OK.
    - **If the DTC is not set**
3. Verify DTC B395A 66 is not set.
    - **If the DTC is set**

      Remove the B87 Rearview Camera and reinstall

    - **If the DTC is not set**
4. Verify DTC B395A 08 is not set.
    - **If DTC is set**

      Refer to Circuit/System Testing

    - **If DTC is not set**
5. Vehicle ON, transmission in R, verify a clear image is displayed on the P17 Info Display Module.
    - **If a clear image is not displayed**

      Refer to Circuit/System Testing

    - **If a clear image is displayed**
6. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the B87 Rearview Camera harness connector. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 4 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF, disconnect the harness connector at the K157 Video Processing Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K157 Video Processing Control Module.
    - **If less than 10 Ω**
3. Ignition ON.
4. Test for 4.8 - 7.2 V between the 6 V reference circuit terminal 5 and ground.
    - **If less than 4.8 V**

    1. Ignition OFF, disconnect the harness connector at the K157 Video Processing Control Module.
    2. Test for infinite resistance between the 6 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the 6 V reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K157 Video Processing Control Module.
    - **If greater than 7.2 V**
    1. Ignition OFF, disconnect the harness connector at the K157 Video Processing Control Module, ignition ON.
    2. Test for less than 1 V between the 5 V reference circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K157 Video Processing Control Module.
    - **If between 4.8 - 7.2 V**
5. Ignition ON.
6. Test for less than 10 V between the signal circuit terminals listed below and ground:
    - Vision Signal + signal circuit terminal 1
    - Vision Signal - signal circuit terminal 3
    - **If 10 V or greater**
    1. Ignition OFF, disconnect the X1 harness connector at the K157 Video Processing Control Module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K157 Video Processing Control Module.
    - **If less than 10 V**
7. Ignition OFF.
8. Test for greater than 100 Ω between the signal circuit terminals listed below and ground:
    - Vision Signal + signal circuit terminal 1
    - Vision Signal - signal circuit terminal 3
    - **If less than 100 Ω**
    1. Disconnect the X1 harness connector at the K157 Video Processing Control Module.
    2. Test for infinite between the signal circuit and ground.
        - If less than infinite resistance, repair the short to voltage on the circuit.
        - If infinite resistance, replace the K157 Video Processing Control Module.
    - **If greater than 100 Ω**
9. Test for less than 2 Ω between the video signal circuit terminals listed below:
    - B87 Rearview Camera video signal (+) circuit terminal 1 and the K157 Video Processing Control Module video signal (+) circuit terminal 4 X1
    - B87 Rearview Camera video signal (+) circuit terminal 3 and the K157 Video Processing Control Module video signal (+) circuit terminal 14 X1
    - **If 2 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 2 Ω**
10. Ignition OFF, connect the harness connector at the B87 Rearview Camera.
11. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
12. Verify DTC B395A is not set.
    - **If DTC B395A is set**

Replace the B87 Rearview Camera.

- **If DTC B395A is not set**

13. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Rearview Driver Information Camera Replacement**
- Refer to **Control Module References** for control module replacement, programming, and setup.

DTC B395B: SIDEVIEW CAMERA - LEFT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Circuit/System Verification

1. Ignition ON.
2. Verify DTC B395B 4B is not set.
    - **If the DTC is set**
    1. Program the K157 Video Processing Control Module.
    2. Verify DTC B395B 4B is not set after programming.
        - If the DTC sets after programming, replace the B225L Sideview Camera - Left.
        - If the DTC does not set
    3. All OK.
    - **If the DTC is not set**
3. Verify DTC B395B 66 is not set.
    - **If the DTC is set**

      Remove the B225L Sideview Camera - Left and reinstall

- **If the DTC is not set**

4. Verify DTC B395B 08 is not set.
    - **If DTC is set**

      Refer to Circuit/System Testing

    - **If DTC is not set**
5. Vehicle ON, transmission in R, verify a clear image is displayed on the P17 Info Display Module.
    - **If a clear image is not displayed**

      Refer to Circuit/System Testing

    - **If a clear image is displayed**
6. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the B225L Sideview Camera - Left harness connector. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 5 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF, disconnect the harness connector at the K157 Video Processing Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K157 Video Processing Control Module.
    - **If less than 10 Ω**
3. Ignition ON.
4. Test for 4.8 - 7.2 V between the 6 V reference circuit terminal 6 and ground.
    - **If less than 4.8 V**
    1. Ignition OFF, disconnect the harness connector at the K157 Video Processing Control Module.
    2. Test for infinite resistance between the 6 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the 6 V reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K157 Video Processing Control Module.
    - **If greater than 7.2 V**
    1. Ignition OFF, disconnect the harness connector at the K157 Video Processing Control Module, ignition ON.
    2. Test for less than 1 V between the 6 V reference circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K157 Video Processing Control Module.
    - **If between 4.8 - 7.2 V**
5. Ignition ON.
6. Test for less than 10 V between the signal circuit terminals listed below and ground:
    - Vision Signal + signal circuit terminal 1
    - Vision Signal - signal circuit terminal 4
    - **If 10 V or greater**
    1. Ignition OFF, disconnect the X1 harness connector at the K157 Video Processing Control Module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.

        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K157 Video Processing Control Module.
    - **If less than 10 V**
7. Ignition OFF.
8. Test for greater than 100 Ω between the signal circuit terminals listed below and ground:
    - Vision Signal + signal circuit terminal 1
    - Vision Signal - signal circuit terminal 4
    - **If less than 100 Ω**
    1. Disconnect the X1 harness connector at the K157 Video Processing Control Module.
    2. Test for infinite between the signal circuit and ground.
        - If less than infinite resistance, repair the short to voltage on the circuit.
        - If infinite resistance, replace the K157 Video Processing Control Module.
    - **If greater than 100 Ω**
9. Test for less than 2 Ω between the video signal circuit terminals listed below:
    - B225L Sideview Camera - Left video signal (+) circuit terminal 1 and the K157 Video Processing Control Module video signal (+) circuit terminal 5 X1
    - B225L Sideview Camera - Left video signal (+) circuit terminal 4 and the K157 Video Processing Control Module video signal (+) circuit terminal 15 X1
    - **If 2 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 2 Ω**
10. Ignition OFF, connect the harness connector at the B225L Sideview Camera - Left.
11. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
12. Verify DTC B395B is not set.
    - **If DTC B395B is set**

      Replace the B225L Sideview Camera - Left.

    - **If DTC B395B is not set**
13. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Side View Driver Information Camera Replacement**
- Refer to **Control Module References** for control module replacement, programming, and setup.

DTC B395C: SIDEVIEW CAMERA - RIGHT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

Low Reference	-	B395C 08, 1	-	-
1. Camera inoperative 2. Poor image quality displayed from camera				

Circuit/System Description

The video processing control module performs fault detection on itself and the cameras attached to it.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

B395C 08

The sideview camera - right video circuit is open, shorted to voltage, or shorted to ground.

B395C 66

The sideview camera - right is incorrectly mounted.

B395C 4B

The sideview camera - right is not learned.

Action Taken When the DTC Sets

- The Video Processing Control Module requests the instrument cluster to display "Service Surround Vision Camera".
- The Video Processing Control Module will disable the camera and that cameras portion of the display.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the control module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify DTC B395C 4B is not set.
    - **If the DTC is set**
    1. Program the K157 Video Processing Control Module.
    2. Verify DTC B395C 4B is not set after programming.
        - If the DTC sets after programming, replace the B225R Sideview Camera - Right.
        - If the DTC does not set
    3. All OK.
    - **If the DTC is not set**
3. Verify DTC B395C 66 is not set.
    - **If the DTC is set**

      Remove the B225R Sideview Camera - Right and reinstall

    - **If the DTC is not set**
4. Verify DTC B395C 08 is not set.
    - **If DTC is set**

      Refer to Circuit/System Testing

    - **If DTC is not set**
5. Vehicle ON, transmission in R, verify a clear image is displayed on the P17 Info Display Module.
    - **If a clear image is not displayed**

      Refer to Circuit/System Testing

    - **If a clear image is displayed**
6. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the B225R Sideview Camera - Right harness connector. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 5 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF, disconnect the harness connector at the K157 Video Processing Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K157 Video Processing Control Module.
    - **If less than 10 Ω**

3. Ignition ON.
4. Test for 4.8 - 7.2 V between the 6 V reference circuit terminal 6 and ground.
   - **If less than 4.8 V**
   1. Ignition OFF, disconnect the harness connector at the K157 Video Processing Control Module.
   2. Test for infinite resistance between the 6 V reference circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the 6 V reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K157 Video Processing Control Module.
   - **If greater than 7.2 V**
   1. Ignition OFF, disconnect the harness connector at the K157 Video Processing Control Module, ignition ON.
   2. Test for less than 1 V between the 6 V reference circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K157 Video Processing Control Module.
   - **If between 4.8 - 7.2 V**
5. Ignition ON.
6. Test for less than 10 V between the signal circuit terminals listed below and ground:
   - Vision Signal + signal circuit terminal 1
   - Vision Signal - signal circuit terminal 4
   - **If 10 V or greater**
   1. Ignition OFF, disconnect the X1 harness connector at the K157 Video Processing Control Module, ignition ON.
   2. Test for less than 1 V between the signal circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K157 Video Processing Control Module.
   - **If less than 10 V**
7. Ignition OFF.
8. Test for greater than 100 Ω between the signal circuit terminals listed below and ground:
   - Vision Signal + signal circuit terminal 1
   - Vision Signal - signal circuit terminal 4
   - **If less than 100 Ω**
   1. Disconnect the X1 harness connector at the K157 Video Processing Control Module.
   2. Test for infinite between the signal circuit and ground.
      - If less than infinite resistance, repair the short to voltage on the circuit.
      - If infinite resistance, replace the K157 Video Processing Control Module.
   - **If greater than 100 Ω**
9. Test for less than 2 Ω between the video signal circuit terminals listed below:
   - B225R Sideview Camera - Right video signal (+) circuit terminal 1 and the K157 Video Processing Control Module video signal (+) circuit terminal 8 X1
   - B225R Sideview Camera - Right video signal (+) circuit terminal 4 and the K157 Video Processing Control Module video signal (+) circuit terminal 18 X1
   - **If 2 Ω or greater**

     Repair the open/high resistance in the circuit.

   - **If less than 2 Ω**
10. Ignition OFF, connect the harness connector at the B225R Sideview Camera - Right.
11. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.

12. Verify DTC B395C is not set.
    - **If DTC B395C is set**

      Replace the B225R Sideview Camera - Right.

    - **If DTC B395C is not set**
13. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Side View Driver Information Camera Replacement**
- Refer to **Control Module References** for control module replacement, programming, and setup.

DTC B399A: FRONTVIEW CAMERA SUPPLY CIRCUIT SHORT TO BATTERY/GROUND

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B399A 01

Frontview Camera Supply Circuit Short to Battery

DTC B399A 02

Frontview Camera Supply Circuit Short to Ground

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
6 V Reference	B390F 08, B399A 02	B390F 08, 1	B399A 01	-
Video Signal +	1, 2	1	1, 2	-
Video Signal -	1, 2	1	1, 2	-
Low Reference	-	B390F 08, 1	-	-
1. Camera inoperative 2. Poor image quality displayed from camera				

Circuit/System Description

The video processing control module performs fault detection on itself and the cameras attached to it.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

B399A 01

The frontview camera 6 V reference circuit is shorted to voltage

B399A 02

The frontview camera 6 V reference circuit is shorted to ground

Action Taken When the DTC Sets

- The Video Processing Control Module requests the instrument cluster to display "Service Surround Vision Camera".
- The Video Processing Control Module will disable the camera and that cameras portion of the display.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the control module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Circuit/System Testing

1. Ignition OFF, disconnect the B174G Frontview Camera - Grille harness connector. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 4 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF, disconnect the harness connector at the K157 Video Processing Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K157 Video Processing Control Module.
    - **If less than 10 Ω**
3. Ignition ON.
4. Test for 4.8 - 7.2 V between the 6 V reference circuit terminal 5 and ground.
    - **If less than 4.8 V**
    1. Ignition OFF, disconnect the harness connector at the K157 Video Processing Control Module.
    2. Test for infinite resistance between the 6 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance

3. Test for less than 2 Ω in the 6 V reference circuit end to end.
   - If 2 Ω or greater, repair the open/high resistance in the circuit.
   - If less than 2 Ω, replace the K157 Video Processing Control Module.

- **If greater than 7.2 V**

1. Ignition OFF, disconnect the harness connector at the K157 Video Processing Control Module, ignition ON.
2. Test for less than 1 V between the 6 V reference circuit and ground.
   - If 1 V or greater, repair the short to voltage on the circuit.
   - If less than 1 V, replace the K157 Video Processing Control Module.

- **If between 4.8 - 7.2 V**

5. Ignition ON.
6. Test for less than 10 V between the signal circuit terminals listed below and ground:
   - Vision Signal + signal circuit terminal 1
   - Vision Signal - signal circuit terminal 3
   - **If 10 V or greater**
   1. Ignition OFF, disconnect the X1 harness connector at the K157 Video Processing Control Module, ignition ON.
   2. Test for less than 1 V between the signal circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K157 Video Processing Control Module.
   - **If less than 10 V**
7. Ignition OFF.
8. Test for greater than 100 Ω between the signal circuit terminals listed below and ground:
   - Vision Signal + signal circuit terminal 1
   - Vision Signal - signal circuit terminal 3
   - **If less than 100 Ω**
   1. Disconnect the X1 harness connector at the K157 Video Processing Control Module.
   2. Test for infinite between the signal circuit and ground.
      - If less than infinite resistance, repair the short to voltage on the circuit.
      - If infinite resistance, replace the K157 Video Processing Control Module.
   - **If greater than 100 Ω**
9. Test for less than 2 Ω between the video signal circuit terminals listed below:
   - B174G Frontview Camera - Grille video signal (+) circuit terminal 1 and the K157 Video Processing Control Module video signal (+) circuit terminal 1 X1
   - B174G Frontview Camera - Grille video signal (+) circuit terminal 3 and the K157 Video Processing Control Module video signal (+) circuit terminal 11 X1
   - **If 2 Ω or greater**

     Repair the open/high resistance in the circuit.

   - **If less than 2 Ω**
10. Ignition OFF, connect the harness connector at the B174G Frontview Camera - Grille.
11. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
12. Verify DTC B399A is not set.
    - **If DTC B399A is set**

      Replace the B174G Frontview Camera - Grille.

    - **If DTC B399A is not set**
13. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Front View Driver Information Camera Replacement**
- Refer to **Control Module References** for control module replacement, programming, and setup.

DTC B399B: REARVIEW CAMERA SUPPLY CIRCUIT SHORT TO BATTERY/GROUND

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B399B 01

Rearview Camera Supply Circuit Short to Battery

DTC B399B 02

Rearview Camera Supply Circuit Short to Ground

Circuit/System Testing

1. Ignition OFF, disconnect the B87 Rearview Camera harness connector. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 4 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF, disconnect the harness connector at the K157 Video Processing Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K157 Video Processing Control Module.
    - **If less than 10 Ω**
3. Ignition ON.
4. Test for 4.8 - 7.2 V between the 6 V reference circuit terminal 5 and ground.
    - **If less than 4.8 V**
    1. Ignition OFF, disconnect the harness connector at the K157 Video Processing Control Module.
    2. Test for infinite resistance between the 6 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the 6 V reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K157 Video Processing Control Module.
    - **If greater than 7.2 V**
    1. Ignition OFF, disconnect the harness connector at the K157 Video Processing Control Module, ignition ON.

        2. Test for less than 1 V between the 6 V reference circuit and ground.
            - If 1 V or greater, repair the short to voltage on the circuit.
            - If less than 1 V, replace the K157 Video Processing Control Module.
    - **If between 4.8 - 7.2 V**
5. Ignition ON.
6. Test for less than 10 V between the signal circuit terminals listed below and ground:
    - Vision Signal + signal circuit terminal 1
    - Vision Signal - signal circuit terminal 3
    - **If 10 V or greater**
    1. Ignition OFF, disconnect the X1 harness connector at the K157 Video Processing Control Module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K157 Video Processing Control Module.
    - **If less than 10 V**
7. Ignition OFF.
8. Test for greater than 100 Ω between the signal circuit terminals listed below and ground:
    - Vision Signal + signal circuit terminal 1
    - Vision Signal - signal circuit terminal 3
    - **If less than 100 Ω**
    1. Disconnect the X1 harness connector at the K157 Video Processing Control Module.
    2. Test for infinite between the signal circuit and ground.
        - If less than infinite resistance, repair the short to voltage on the circuit.
        - If infinite resistance, replace the K157 Video Processing Control Module.
    - **If greater than 100 Ω**
9. Test for less than 2 Ω between the video signal circuit terminals listed below:
    - B87 Rearview Camera video signal (+) circuit terminal 1 and the K157 Video Processing Control Module video signal (+) circuit terminal 4 X1
    - B87 Rearview Camera video signal (+) circuit terminal 3 and the K157 Video Processing Control Module video signal (+) circuit terminal 14 X1
    - **If 2 Ω or greater**

        Repair the open/high resistance in the circuit.

    - **If less than 2 Ω**
10. Ignition OFF, connect the harness connector at the B87 Rearview Camera.
11. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
12. Verify DTC B399B is not set.
    - **If DTC B399B is set**

        Replace the B87 Rearview Camera.

    - **If DTC B399B is not set**
13. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Rearview Driver Information Camera Replacement**
- Refer to **Control Module References** for control module replacement, programming, and setup.

DTC B399C: SIDEVIEW CAMERA - LEFT SUPPLY CIRCUIT SHORT TO BATTERY/GROUND

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B399C 01

Sideview Camera - Left Supply Circuit Short to Battery

DTC B399C 02

Sideview Camera - Left Supply Circuit Short to Ground

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance

Circuit/System Testing

1. Ignition OFF, disconnect the B225L Sideview Camera - Left harness connector. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 5 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF, disconnect the harness connector at the K157 Video Processing Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K157 Video Processing Control Module.
    - **If less than 10 Ω**
3. Ignition ON.
4. Test for 4.8 - 7.2 V between the 6 V reference circuit terminal 6 and ground.
    - **If less than 4.8 V**
    1. Ignition OFF, disconnect the harness connector at the K157 Video Processing Control Module.
    2. Test for infinite resistance between the 6 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the 6 V reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K157 Video Processing Control Module.
    - **If greater than 7.2 V**
    1. Ignition OFF, disconnect the harness connector at the K157 Video Processing Control Module, ignition ON.
    2. Test for less than 1 V between the 6 V reference circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K157 Video Processing Control Module.
    - **If between 4.8 - 7.2 V**
5. Ignition ON.
6. Test for less than 10 V between the signal circuit terminals listed below and ground:

   - Vision Signal + signal circuit terminal 1
   - Vision Signal - signal circuit terminal 4
   - **If 10 V or greater**
   1. Ignition OFF, disconnect the X1 harness connector at the K157 Video Processing Control Module, ignition ON.
   2. Test for less than 1 V between the signal circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K157 Video Processing Control Module.
   - **If less than 10 V**
7. Ignition OFF.
8. Test for greater than 100 Ω between the signal circuit terminals listed below and ground:
   - Vision Signal + signal circuit terminal 1
   - Vision Signal - signal circuit terminal 4
   - **If less than 100 Ω**
   1. Disconnect the X1 harness connector at the K157 Video Processing Control Module.
   2. Test for infinite between the signal circuit and ground.
      - If less than infinite resistance, repair the short to voltage on the circuit.
      - If infinite resistance, replace the K157 Video Processing Control Module.
   - **If greater than 100 Ω**
9. Test for less than 2 Ω between the video signal circuit terminals listed below:
   - B225L Sideview Camera - Left video signal (+) circuit terminal 1 and the K157 Video Processing Control Module video signal (+) circuit terminal 5 X1
   - B225L Sideview Camera - Left video signal (+) circuit terminal 4 and the K157 Video Processing Control Module video signal (+) circuit terminal 15 X1
   - **If 2 Ω or greater**

     Repair the open/high resistance in the circuit.

   - **If less than 2 Ω**
10. Ignition OFF, connect the harness connector at the B225L Sideview Camera - Left.
11. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
12. Verify DTC B399C is not set.
   - **If DTC B399C is set**

     Replace the B225L Sideview Camera - Left.

   - **If DTC B399C is not set**
13. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Side View Driver Information Camera Replacement**
- Refer to **Control Module References** for control module replacement, programming, and setup.

DTC B399D: SIDEVIEW CAMERA - RIGHT SUPPLY CIRCUIT SHORT TO BATTERY/GROUND

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B399D 01

Circuit/System Testing

1. Ignition OFF, disconnect the B225R Sideview Camera - Right harness connector. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 5 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF, disconnect the harness connector at the K157 Video Processing Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K157 Video Processing Control Module.
    - **If less than 10 Ω**
3. Ignition ON.
4. Test for 4.8 - 7.2 V between the 6 V reference circuit terminal 6 and ground.
    - **If less than 4.8 V**
    1. Ignition OFF, disconnect the harness connector at the K157 Video Processing Control Module.
    2. Test for infinite resistance between the 6 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the 6 V reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K157 Video Processing Control Module.
    - **If greater than 7.2 V**
    1. Ignition OFF, disconnect the harness connector at the K157 Video Processing Control Module, ignition ON.
    2. Test for less than 1 V between the 6 V reference circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K157 Video Processing Control Module.
    - **If between 4.8 - 7.2 V**
5. Ignition ON.
6. Test for less than 10 V between the signal circuit terminals listed below and ground:
    - Vision Signal + signal circuit terminal 1
    - Vision Signal - signal circuit terminal 4
    - **If 10 V or greater**
    1. Ignition OFF, disconnect the X1 harness connector at the K157 Video Processing Control Module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.

        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K157 Video Processing Control Module.
    - **If less than 10 V**

7. Ignition OFF.
8. Test for greater than 100 Ω between the signal circuit terminals listed below and ground:
    - Vision Signal + signal circuit terminal 1
    - Vision Signal - signal circuit terminal 4
    - **If less than 100 Ω**
    1. Disconnect the X1 harness connector at the K157 Video Processing Control Module.
    2. Test for infinite between the signal circuit and ground.
        - If less than infinite resistance, repair the short to voltage on the circuit.
        - If infinite resistance, replace the K157 Video Processing Control Module.
    - **If greater than 100 Ω**
9. Test for less than 2 Ω between the video signal circuit terminals listed below:
    - B225R Sideview Camera - Right video signal (+) circuit terminal 1 and the K157 Video Processing Control Module video signal (+) circuit terminal 8 X1
    - B225R Sideview Camera - Right video signal (+) circuit terminal 4 and the K157 Video Processing Control Module video signal (+) circuit terminal 18 X1
    - **If 2 Ω or greater**

        Repair the open/high resistance in the circuit.

    - **If less than 2 Ω**
10. Ignition OFF, connect the harness connector at the B225R Sideview Camera - Right.
11. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
12. Verify DTC B399D is not set.
    - **If DTC B399D is set**

        Replace the B225R Sideview Camera - Right.

    - **If DTC B399D is not set**
13. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Side View Driver Information Camera Replacement**
- Refer to **Control Module References** for control module replacement, programming, and setup.

DTC P15F6: FRONT OBJECT DETECTION CONTROL MODULE TORQUE REQUEST SIGNAL MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC P15F6

Front Object Detection Control Module Torque Request Signal Message Counter Incorrect

Circuit/System Description

The Frontview Camera Module communicates with the Engine Control Module (ECM), requesting engine speed or torque reduction as necessary.

Conditions for Running the DTC

Engine running.

Conditions for Setting the DTC

The ECM detects that the engine speed and torque modification messages from the Frontview Camera Module are either corrupted or intermittently missing.

Action Taken When the DTC Sets

- The Frontview Camera Module sends a serial data message to display the appropriate indicator message
- The Frontview Camera Module features are unavailable.

Conditions for Clearing the DTC

- The condition for the DTC is no longer present.
- The engine control module clears the history DTC when a current DTC is not detected in 40 consecutive drive cycles.

Diagnostic Aid

This is an informational DTC set by the engine control module. It is set to provide an indication that the Frontview Camera Module will not be able to perform as intended. Diagnose any other DTCs first. During normal diagnostic and/or repair verification technicians may find that a "Service Driver Assist System" message may be displayed by the Frontview Camera Module. Do not replace the Frontview Camera Module for this condition.

If the Service Driver Assist System message is displayed with no DTCs set, perform the following steps:

1. Remove the key from the ignition, open and close the driver's door to turn off retained accessory power, and wait 60 s.
2. Ignition ON, if the Service Driver Assist message is still present, operate the vehicle at speeds greater than 15 km/h (10 mph) to complete the self test. The Frontview Camera Module should request the message to turn off.
3. If the telltales remain on with no DTCs set after the drive cycle, disconnect the battery for at least 60 s, then reconnect the battery.
4. Operate the vehicle at speeds greater than 40 km/h (25 mph), the Frontview Camera Module should request all indicators to turn off.

Circuit/System Verification

NOTE:

- **DTC P15F6 is an informational DTC.**
- **Diagnose all other K20 Engine Control Module DTCs prior to DTC P15F6.**

1. Verify there are no other DTCs set in the K20 Engine Control Module and that there are no communication DTCs set in the vehicle.
    - **If any DTCs are set**

      Refer to Diagnostic Trouble Code (DTC) List - Vehicle

    - **If no DTCs are set**
2. Clear DTCs and operate the vehicle in the conditions that the customer experienced.
3. Verify DTC P15F6 does not set.
    - **If the DTC sets**

      Replace K109 Frontview Camera Module

    - **If the DTC does not set**
4. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Refer to Control Module References for control module replacement, programming, and setup.

SYMPTOMS - OBJECT DETECTION

NOTE: **The following steps must be completed before using the symptom lists.**

1. In order to verify that all of the following conditions are fulfilled before using the symptom lists perform the Diagnostic System Check:Diagnostic System Check - Vehicle
    - No DTCs Stored
    - The control modules can communicate via the serial data link.
2. Review the system description and operation in order to familiarize yourself with the system functions. Refer to:
    - Cross Traffic Alert Description and Operation
    - Forward Collision Alert Description and Operation
    - Lane Departure Warning Description and Operation
    - Lane Keep Assist Description and Operation
    - Parking Assist Description and Operation (with Rear Park Assist, UD7)Parking Assist Description and Operation (with Front and Rear Park Assist, UFQ)
    - Rear Vision Camera Description and Operation
    - Side Blind Zone Alert Description and Operation
    - Surround Vision Camera Description and Operation

Visual/Physical Inspection

- Inspect for aftermarket devices which may affect the operation of the system. Refer to:**Checking Aftermarket Accessories**
- Inspect the easily accessible or visible system components, for obvious damage or conditions, which may cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to:**Testing for Intermittent Conditions and Poor Connections**

Symptom List

For more information see:

- **Forward Collision Alert System Malfunction**
- **Parking Assist System Malfunction**
- **Parallel Parking Assist System Malfunction**
- **Rear Vision Camera System Malfunction**
- **Side Blind Zone Alert System Malfunction**

FORWARD COLLISION ALERT SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B0987 01

Vehicle Direction Camera Indicator Circuit Short to Battery

DTC B0987 06

Vehicle Direction Camera Indicator Circuit Low Voltage/Open

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Lane Departure Warning Switch Indicator Ignition	B0987 06	B0987 06	-	-
Lane Departure Warning Switch Indicator Control	B0987 06	B0987 06	B0987 01	-

Circuit/System Description

The lane departure warning is enabled and disabled through a switch located in the left steering wheel controls switch. When enabled, the frontview camera module will illuminate the indicator located in the switch.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

The frontview camera module has detected a short to battery or open/high resistance in the control circuit.

Action Taken When the DTC Sets

- Lane departure warning is disabled.
- SERVICE FRONT CAMERA is displayed on the driver information center.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Circuit/System Verification

1. Ignition ON.
2. Verify that DTC B356A is not set.
    - **If the DTC is set**

      Refer to **DTC B356A**.

    - **If the DTC is not set**
3. Verify the lane departure warning indicator turns ON and OFF while pressing and releasing the lane departure warning switch.
    - **If the indicator does not turn ON and OFF**

      Refer to Circuit/System Testing.

    - **If the indictor turns ON and OFF**
4. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the S70L Steering Wheel Controls Switch - Left, ignition ON.

NOTE: **Verify interior lighting dimming is turned all the way up.**

2. Test for 6.2 - 12.0 V between the dimming control circuit terminal 4 and ground.
    - **If less than 6.2 V**
    1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the control circuit and ground.

        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, refer to **Interior Backlighting Malfunction** .
    - **If greater than 12.0 V**
    1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module, ignition ON.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, refer to **Interior Backlighting Malfunction** .
    - **If between 6.2 - 12.0 V**
3. Connect a test lamp between the control circuit terminal 5 and B+.
4. Verify the test lamp turns ON and OFF when commanding the Lane Departure Warning Indicator parameter ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Ignition OFF, disconnect the harness connector at the K109 Frontview Camera Module, ignition ON.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Ignition OFF.
    4. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K109 Frontview Camera Module.
    - **If the test lamp is always ON**
    1. Ignition OFF, disconnect the harness connector at the K109 Frontview Camera Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K109 Frontview Camera Module.
    - **If the test lamp turns ON and OFF**
5. Test or replace the S70L Steering Wheel Controls Switch - Left.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Cruise Control Switch Replacement** - Steering Wheel Controls Switch - Left replacement.
- Refer to **Control Module References** for control module replacement, programming and setup.

PARKING ASSIST SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B0967

Parking Assist On/Off Switch Circuit

DTC B0968

Parking Assist On/Off Switch Indicator Circuit

For symptom byte information, refer to Symptom Byte List .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Parking Assist Switch Signal	B0967 02, 1	1	1	-
Parking Assist Switch Indicator Illumination	B0968 06, 2	B0968 06, 2	2	-

Parking Assist Switch Ground	-	1	-	-
1. Parking Assist Switch Malfunction 2. Parking Assist Indicator Malfunction				

Circuit/System Description

The parking assist can be activated/deactivated by pressing the parking assist switch. By engaging the reverse gear the parking assist can also be activated. By subsequently pressing the parking assist switch the parking assist can be disabled again.

The indicator in the parking assist switch shows the status of the parking assist. If the lamp is ON, the parking assist is activated.

Conditions for Running the DTC

- Vehicle ON
- The parking assist is activated. The activation takes place by putting in the reverse gear or by pressing the parking assist switch.

Conditions for Setting the DTC

B0967 02

The parking assist control module has detected a short to ground.

B0968 01

The parking assist control module has detected a short to battery.

B0968 06

The parking assist control module has detected a short to ground or open.

Action Taken When the DTC Sets

- The parking assist is disabled.
- The driver information center displays SERVICE PARK ASSIST.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Circuit/System Verification

1. Vehicle ON.
2. Verify that DTC B0967 02 is not set.
   - **If the DTC is set**

     Refer to Parking Assist Switch Malfunction.

   - **If the DTC is not set**
3. Verify that B0968 01 or B0968 06 is not set.
   - **If the DTC is set**

     Refer to Parking Assist Switch Indicator Malfunction.

   - **If the DTC is not set**
4. Activate and deactivate the parking assist switch and verify the scan tool Park Assist Switch parameter changes between Active and Inactive.
   - **If the Parking Assist Switch parameter does not change between Active and Inactive**

     Refer to Circuit/System Testing.

   - **If the Parking Assist Switch parameter changes between Active and Inactive**
5. All OK.

Circuit/System Testing

Parking Assist Indicator Malfunction

1. Vehicle OFF, disconnect the harness connector at the S48D Multifunction Switch 2 - Instrument Panel. It may take up to 2 min for all vehicle systems to power down.
2. Test for 1.6 - 3.6 V between the control circuit terminal 6 and ground.
   - **If less than 1.6 V**
   1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, refer to **Interior Backlighting Malfunction** .
   - **If greater than 3.6 V**

    1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module, ignition ON.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, refer to **Interior Backlighting Malfunction** .
    - **If between 1.6 - 3.6 V**
3. Connect a test lamp between the control circuit terminal 7 and signal circuit terminal 6.
4. Verify the test lamp turns On and Off when commanding the Parking Assist Switch On and Off with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the harness connector at the K182 Parking Assist Control Module, Vehicle ON.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit
        - If less than 1 V
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K182 Parking Assist Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the harness connector at the K182 Parking Assist Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground in the circuit.
        - If infinite resistance, replace the K182 Parking Assist Control Module.
    - **If the test lamp turns ON and OFF**
5. All OK.

Parking Assist Switch Malfunction

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S48D Multifunction Switch 2 - Instrument Panel. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 10 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Ignition ON.
4. Verify the scan tool Park Assist Switch parameter is Inactive.
    - **If not Inactive**
    1. Ignition OFF, disconnect the harness connector X1 at the K182 Parking Assist Control Module.
    2. Test for infinite resistance between the signal circuit terminal 2 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K182 Parking Assist Control Module.
    - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 2 and ground.
6. Verify the scan tool Park Assist Switch parameter is Active.
    - **If not Active**

1. Ignition OFF, disconnect the harness connector X1 at the K182 Parking Assist Control Module, ignition ON.
2. Test for less than 1 V between the signal circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V
3. Test for less than 2 Ω in the signal circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K182 Parking Assist Control Module.
- **If Active**

7. Test or replace the S48D Multifunction Switch 2 - Instrument Panel.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair

- Refer to **Instrument Panel Center Accessory Function Switch Replacement**
- Refer to **Control Module References** for control module replacement, programming and setup.

PARALLEL PARKING ASSIST SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B096B

Parking Assist Switch Parallel Parking Circuit

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Parallel Park Assist Switch Signal	B096B 02	1	-	-
Parallel Parking Assist Switch Ground	-	1	-	-
1. Parallel Parking Assist Switch Malfunction				

Circuit/System Description

The parallel parking assist can be activated/deactivated by pressing the parallel parking assist switch.

Conditions for Running the DTC

- Vehicle ON
- The parallel parking assist is activated. The activation takes place through pressing the parallel parking assist switch.

Conditions for Setting the DTC

The parking assist control module has detected a short to ground.

Action Taken When the DTC Sets

- The parallel parking assist is disabled.

- An indicator in the driver information center shows the parking assistance is not available.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S48D Multifunction Switch 2 - Instrument Panel. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 10 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the ground circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle ON.
4. Verify the scan tool Advanced Parking Assist Switch parameter is Inactive.
    - **If not Inactive**
    1. Vehicle OFF, disconnect the harness connector at the K182 Parking Assist Control Module.
    2. Test for infinite resistance between the S48D Multifunction Switch 2 - Instrument Panel signal circuit terminal 1 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K182 Parking Assist Control Module.
    - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and ground.
6. Verify the scan tool Advanced Parking Assist Switch parameter is Active.
    - **If not Active**
    1. Vehicle OFF, disconnect the harness connector at the K182 Parking Assist Control Module, vehicle ON.

        2. Test for less than 1 V between the S48D Multifunction Switch 2 - Instrument Panel signal circuit terminal 1 and ground.
            - If 1 V or greater, repair the short to voltage on the circuit.
            - If less than 1 V.
        3. Test for less than 2 Ω in the signal circuit end to end.
            - If 2 Ω or greater, repair the open/high resistance in the circuit.
            - If less than 2 Ω, replace the K182 Parking Assist Control Module.
    - **If Active**

7. Test or replace the S48D Multifunction Switch 2 - Instrument Panel.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Instrument Panel Center Accessory Function Switch Replacement**
- Refer to **Control Module References** for control module replacement, programming and setup.

REAR CROSS TRAFFIC ALERT SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Side Object Sensor - Left Ground	-	U0232	-	-
Side Object Sensor - Left B+	-	U0232	-	-
Side Object Sensor - Left Communication (terminal 7)	1	U0232	1	-
Side Object Sensor - Left Communication (terminal 2)	1	U0233	1	Ã,Â
Side Object Sensor - Right Ground (terminal 8)	-	U0233	1	-
Side Object Sensor - Right Ground (terminal 3)	-	U0233	1	Ã,Â
Side Object Sensor - Right B+	1	U0233	-	-
Side Object Sensor - Right Communication	1	U0232	1	-
1. Rear Cross Traffic Alert System Malfunction				

Circuit/System Description

The side object sensor modules are located on each side of the vehicle behind the rear fascia and are not directly visible from outside the vehicle. The sensors use radar to determine the presence of objects nearby. When an object is detected in the rear cross traffic zone, the module will send out a signal through serial data communication to turn on the visual icons on the rear vision camera screen and also audio chime notification for the appropriate side. Each sensor is supplied B+ and ground. The right sensor receives an additional ground. Both sensors communicate independently on the serial data line. The serial data enters the left sensor in a pass-thru configuration, that connects to the right sensor. The scan tool is able to individually communicate with each sensor.

Diagnostic Aids

- The rear cross traffic alert system uses the same side blind zone sensors so a malfunction may affect either or both systems.
- The conditions for disabling the rear cross traffic alert system are captured by DTCs. The drivers information center will display Service Side Detection System if one of the sensors has failed.
- The rear cross traffic system can be disabled if any off the following occur:
  - The driver has selected the Off mode through vehicle personalization menus. The selected mode is retained over ignition cycles. A driver information center message stating that the Rear Cross Traffic System Alert Off shall be displayed.
  - There is a loss of serial data communication with a sensor or between modules.
  - A blockage condition exists (i.e. mud/snow buildup in front of the sensor). A driver information message stating that the side detection system is temporarily unavailable will be displayed. The rear cross traffic system transitions back to the normal operating state when the blockage is removed. Bumper sticks, fascia damage, labels, and heavy rain storms may also cause this condition. The blockage determination is performed with the vehicle in a drive gear.
  - The rear cross traffic alert system will read the GPS latitude and longitude on the serial data bus and calculate if the vehicle is within a Radio Astronomy zone. These zones are located in Europe and Japan and require the sensors to be turned off. The "Side Detection System Unavailable" message will be displayed to the driver when this occurs.
- Because the sensors are identical, they may be swapped from one side of the vehicle to the other in an attempt to isolate a concern. Sensors should NOT be swapped from one vehicle to another.
- The rear cross traffic alert system is designed to ignore stationary objects; however, the system may occasionally detect pedestrians, shopping carts, or other objects. This is normal system operation and does not require service.
- The rear cross traffic alert system may indicate an object if a trailer is attached to the vehicle, or a bicycle or object is extending out to either side of the vehicle. The system may also temporarily disable the system and display the "Side Detection System Unavailable" message.

Circuit/System Verification

1. Vehicle ON.
2. Verify the scan tool can communicate with the right side object sensor.
   - **If the scan tool can not communicate with the right side object sensor**

     Refer to Circuit/System Testing - Right Side Object Sensor Malfunction.

- **If the scan tool can communicate with the right side object sensor**

3. Verify the scan tool can communicate with the left side object sensor.
    - **If the scan tool can not communicate with the left side object sensor**

      Refer to Circuit/System Testing - Left Side Object Sensor Malfunction.

    - **If the scan tool can communicate with the left side object sensor**
4. Verify that the rear cross traffic indicators alerts turn ON and then turn OFF when commanding the Object Detection Alert Indicators ON and OFF with a scan tool.
    - **If alert indicators do not turn ON and OFF**
    1. Verify the system is enabled.
        - If disabled, refer to diagnostic aids for cause of disable.
        - If enabled, test or replace the radio.
    - **If indicators turn ON and OFF**
5. All OK.

Circuit/System Testing

Left Side Object Sensor Malfunction

1. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Disconnect the harness connector at the Side Object Sensor - Left.
2. Test for less than 10 Ω between ground circuit terminal 8 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Verify a test lamp illuminates between the B+ circuit terminal 5 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle Off.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the Side Object Sensor - Left.
    - **If the test lamp illuminates**
4. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down.
5. Test for less than 2 Ω in each of the serial data circuits end to end between the control module harness connector terminal 2 and the DLC terminal 1.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 2 Ω**
6. Replace Side Object Sensor - Left.

Right Side Object Sensor Malfunction

1. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Disconnect the harness connector at the Side Object Sensor - Right.
2. Test for less than 10 Ω between the following ground circuit terminals and ground.
    - Terminal 3
    - Terminal 8
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Verify a test lamp illuminates between the B+ circuit terminal 5 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle Off.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the Side Object Sensor - Right.
    - **If the test lamp illuminates**
4. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down.
5. Test for less than 2 Ω in each of the serial data circuits end to end between the control module harness connector terminal 7 and the DLC terminal 1.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 2 Ω**
6. Replace Side Object Sensor - Right.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Refer to **Control Module References** control module replacement, programming and setup

REAR VISION CAMERA SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

B127B 08

Rearview Camera Input Signal Circuit Malfunction

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	1	B127B 2B	-	-
Camera Module signal +	1	B127B 2B	1	-
Camera Module signal -	3	B127B 2B	1	-
Ground	-	B127B 2B	-	-
Shield	3	3	3	-
1. Rear Vision Camera Malfunction 2. Rear Vision Camera image always displayed 3. Poor Quality Image				

Circuit/System Description

When the vehicle is placed in reverse with the engine running, a video signal is sent from the rearview camera to the Radio. If the Radio does not see a signal from the camera it will set B127B 2B and display "Service Rear Vision System". The rearview camera is powered with ignition voltage and does not have a reverse signal circuit.

Conditions for Running the DTC

The vehicle must be in reverse with the engine running.

Conditions for Setting the DTC

B127B 08

Signal from the rearview camera not received by the Radio for 2.5 s.

Action Taken When the DTC Sets

- The Radio commands the driver information center to display "Service Rear Vision System".
- The Radio stores the DTC in memory.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 40 malfunction-free ignition cycles have occurred.

Diagnostic Aids

A poor video image can be caused by ice, snow, and mud buildup on the lens of the rearview camera. Also, extreme lighting conditions can affect performance, such as operating in the dark or with bright sunlight shining on the camera. Extreme high or low temperatures can also affect the image quality. An open in the shield of the video signal circuit can also cause a distorted screen.

Terminal fretting or incorrectly seated connectors can cause a poor image displayed condition. Check the circuit terminals for fretting or incorrectly seated connector. If the condition is intermittent or cannot be duplicated, disconnect the connectors and add Nyogel lubricant 760G. This procedure will correct the high resistance condition due to terminal fretting corrosion.

Circuit/System Verification

NOTE: **If the condition is intermittent or cannot be duplicated, disconnect the connectors and add Nyogel lubricant 760G. This procedure will correct the high resistance condition due to terminal fretting corrosion.**

1. Vehicle ON.
2. Verify that DTC B2545 is not set.
    - **If the DTC is set**

      Refer to DTC B2545 .

    - **If the DTC is not set**
3. Verify the rearview camera has no debris on the lens and that the bezel and bezel seal are not damaged.
    - **If debris is found on the lens**

      Clean the lens. If the lens, bezel, or bezel seal are damaged, replace as necessary.

    - **If no debris on the lens**
4. Vehicle ON, transmission in R.
5. Verify the backup lamps are illuminated.
    - **If the backup lamps are not illuminated**

      Refer to Backup Lamps Malfunction .

    - **If the backup lamps are illuminated**
6. Verify a clear rear vision image is displayed on the P17 Info Display Module.
    - **If a clear image is not displayed**

      Refer to Circuit/System Testing.

    - **If a clear image is displayed**
7. All OK.

Circuit/System Testing

NOTE: **Circuit/System Verification must be performed before Circuit/System Testing.**

1. Vehicle OFF, disconnect the harness connector at the B87 Rearview Camera. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 4 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.

        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle ON.
4. Verify a test lamp illuminates between the ignition circuit terminal 5 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse. Refer to **Power Mode Mismatch** .
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the B87 Rearview Camera.
    - **If the test lamp illuminates**
5. Vehicle OFF, disconnect the X1 harness connector at the A11 Radio, vehicle ON.
6. Test for less than 1 V between the signal circuit terminal listed below and ground:
    - B87 Rearview Camera signal (+) circuit terminal 15
    - B87 Rearview Camera signal (-) circuit terminal 14
    - **If 1 V or greater**

      Repair the short to voltage on the circuit.

    - **If less than 1 V**
7. Test for infinite resistance between the signal circuit terminal listed below and ground:
    - B87 Rearview Camera signal (+) circuit terminal 15
    - B87 Rearview Camera signal (-) circuit terminal 14
    - **If less than infinite resistance**

      Repair the short to ground on the circuit.

    - **If infinite resistance**
8. Test for less than 2 Ω in the signal (+) circuit end to end.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 2 Ω**
9. Test for less than 2 Ω in the signal (-) circuit end to end.
    - **If 2 Ω or greater**

      Test the signal circuit for an open/high resistance.

    - **If less than 2 Ω**
10. Replace the B87 Rearview Camera.
11. Vehicle ON, transmission in R,
12. Verify a clear rear vision image is displayed on the P17 Info Display Module.
    - **If a clear rear vision image is not displayed**

      Replace the A11 Radio.

    - **If a clear rear vision image is displayed**
13. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Rearview Driver Information Camera Replacement**
- Refer to **Control Module References** for control module replacement, programming and setup.

SIDE BLIND ZONE ALERT SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control - Left Indicator	B094D 02	B094D 04	B094D 01	-
Ground - Left Indicator	-	B094D 04	-	-
Control - Right Indicator	B094E 02	B094E 04	B094E 01	-
Ground - Right Indicator	-	B094E 04	-	-

Circuit/System Description

The side blind zone alert system detects and reports objects on either side of the vehicle, within a specified blind spot zone. The system alerts with a visual indicator placed on each side rear view mirror, to the presence of objects that may not be visible in the inside rearview mirror and outside rearview mirrors. Although this system is intended to help drivers avoid lane change crashes, it does not replace driver vision and therefore should be considered a lane change aid. Even with the side blind zone system, the driver must check carefully for objects outside of the reporting zone (e.g., a fast approaching vehicle) before changing lanes. In the event that the system senses a malfunction through its diagnostic routines, the system will be disabled and the driver will be visually notified.

When the system detects a vehicle in the side blind zone while driving forward, independent if passing a vehicle or being passed, an amber warning symbol will light up in the appropriate outside mirror. This indicates that it may be unsafe to change lanes. If the driver then activates the turn signal, the amber warning symbol starts flashing as an extra warning not to change lanes.

Side blind zone alert is active when the vehicle is out of park or the parking brake is off on manual transmission vehicles and from speeds of 10 km/h (6.2 MPH) up to 140 km/h (87 MPH). Driving faster deactivates the system, indicated by dimly lighting the warning symbols in the mirrors. Driving under this speed again will turn off the warning symbols. If then a vehicle is detected in the blind zone, the warning symbols will turn on normally on the appropriate side. When the vehicle is started, both outside mirror displays will briefly come on to indicate that the system is operating.

Diagnostic Aids

- The conditions for disabling the side blind zone alert system are captured by DTCs. The drivers information center will display Service Side Detection System if one of the sensors has failed.
- The side blind zone system can be disabled if any off the following occur:
  - The driver has selected the Off mode through vehicle personalization menus. The selected mode is retained over ignition cycles. A driver information center message stating that the side blind zone system is off shall be displayed and the outside mirror indicators will be OFF.
  - There is a loss of serial data communication with a sensor or between modules.
  - A blockage condition exists (i.e. mud/snow buildup in front of the sensor). A driver information message stating that the side detection system is temporarily unavailable will be displayed. The rear cross traffic system transitions back to the normal operating state when the blockage is removed. Bumper sticks, fascia damage, labels, and heavy rain storms may

also cause this condition. The blockage determination is performed with the vehicle in a drive gear.
    - The side blind zone alert system will read the GPS latitude and longitude on the serial data bus and calculate if the vehicle is within a Radio Astronomy zone. These zones are located in Europe and Japan and require the sensors to be turned off. The "Side Detection System Unavailable" message will be displayed to the driver when this occurs.
- Because the sensors are identical, they may be swapped from one side of the vehicle to the other in an attempt to isolate a concern. Sensors should NOT be swapped from one vehicle to another.
- The side blind zone system is designed to ignore stationary objects; however, the system may occasionally detect guard rails, signs, trees, shrubs, or other stationary objects as an object in the blind zone. This is normal system operation and does not require service.
- The side blind zone system may indicate an object in the blind zone if a trailer is attached to the vehicle, or a bicycle or object is extending out to either side of the vehicle. The system may also temporarily disable the system and display the "Side Detection System Unavailable" message.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle ON.
2. Verify the scan tool can communicate with the left side object sensor.
    - **If the scan tool can not communicate with the left side object sensor**

      Refer to Circuit/System Testing - Left Side Object Sensor Malfunction.

    - **If the scan tool can communicate with the left side object sensor**
3. Verify the scan tool can communicate with the right side object sensor.
    - **If the scan tool can not communicate with the right side object sensor**

      Refer to Circuit/System Testing - Right Side Object Sensor Malfunction.

    - **If the scan tool can communicate with the right side object sensor**
4. Vehicle OFF, vehicle ON.
5. Verify that the side blind zone alert system indicator located in the appropriate outside rearview mirror turns ON and OFF when commanding the appropriate Object Detection Alert Indicator On and Off with a scan tool.
    - **If one or both indicators do not turn ON and OFF**

Refer to Circuit/System Testing - Side Object Indicator Malfunction.

- **If both indicators turn ON and OFF**

6. All OK.

Circuit/System Testing

Left Side Object Sensor Malfunction

1. Vehicle OFF and all vehicle systems OFF. Disconnect the harness connector at the B218L Side Object Sensor Module - Left. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between ground circuit terminal 8 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Verify a test lamp illuminates between the B+ circuit terminal 5 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle Off.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the B218L Side Object Sensor Module - Left.
    - **If the test lamp illuminates**
4. Vehicle OFF and all vehicle systems OFF. Disconnect the It may take up to 2 minutes for all vehicle systems to power down.
5. Test for less than 2 Ω between the serial data circuit terminal 2 and the DLC terminal 1.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 2 Ω**
6. Replace B218L Side Object Sensor Module - Left.

Right Side Object Sensor Malfunction

1. Vehicle OFF and all vehicle systems OFF. Disconnect the harness connector at the B218R Side Object Sensor Module - Right. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the following ground circuit terminals and ground.
    - Terminal 3
    - Terminal 8
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**

3. Verify a test lamp illuminates between the B+ circuit terminal 5 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle Off.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the B218R Side Object Sensor Module - Right.
    - **If the test lamp illuminates**
4. Vehicle OFF and all vehicle systems OFF. It may take up to 2 min for all vehicle systems to power down.
5. Test for less than 2 Ω between the serial data circuit terminal 7 and the DLC terminal 1.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 2 Ω**
6. Replace B218R Side Object Sensor Module - Right.

Side Object Indicator Malfunction

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector for the appropriate A9 Outside Rearview Mirror. It may take up to 2 min for all vehicle systems to power down.
    - X510 - Driver Door Harness to Outside Rearview Mirror
    - X610 - Passenger Door Harness to Outside Rearview Mirror
2. Test for less than 10 Ω between the ground circuit terminal 11 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle ON, connect a test lamp between the control circuit terminal 15 and the ground circuit terminal 11.
4. Verify the test lamp turns ON and OFF when commanding the Object Detection Alert Indicators ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the harness connector at the appropriate B218 Side Object Sensor Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the B218 Side Object Sensor Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the harness connector at the B218 Side Object Sensor Module, Vehicle ON.
    2. Test for less than 1 V between the control circuit and ground.

    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, replace the B218 Side Object Sensor Module.
  - **If the test lamp turns ON and OFF**

5. Test or replace the appropriate E17 Outside Rearview Mirror Glass.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Outside Rearview Mirror Glass Replacement**
- Refer to **Control Module References** for control module replacement, programming and setup.

LANE DEPARTURE WARNING SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC B356A

Vehicle Direction Warning Switch Circuit

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Lane Departure Warning Switch Signal	B356A 02	1	B356A 05	-
Lane Departure Warning Switch Ground	-	1	-	-
1. Lane Departure Warning Malfunction				

Circuit/System Description

The lane departure warning system is controlled by the Frontview Camera - Windshield mounted on the windshield. Lane departure warning is enabled and disabled through a switch located on the steering wheel. When enabled, the Frontview Camera - Windshield or Active Safety Control Module will illuminate the indicator located in the switch.

When the system is operating and can detect the lane markings, the Frontview Camera - Windshield will request via serial data communications that the instrument panel cluster illuminate the green lane departure ready - to - assist indicator. If the Frontview Camera - Windshield detects that the vehicle has crossed a lane marking without the turn signal being used, the module will request that the instrument cluster flash the yellow lane departure warning indicator. An audible warning may also sound three times or the haptic seat (if equipped) may pulse when the yellow Instrument Cluster indicator is flashing. The driver can select between audible or haptic alerts in the vehicle personalization menu. See the Owner's Manual for more detailed information on vehicle personalization.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

DTC B356A 02

The Frontview Camera Module has detected a short to ground for more than 10 s.

DTC B356A 05

The Frontview Camera Module has detected a short to voltage or an open/high resistance for more than 10 s.

Action Taken When the DTC Sets

- Lane departure warning is disabled.
- Service Lane Departure is displayed on the driver information center.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Diagnostic Aids

Manually pressing the lane departure warning switch for an extended length of time will cause this DTC to set.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Lane Departure Warning Switch Status parameter changes between Open and Closed while cycling the lane departure warning switch.
    - **If the parameter does not change**

      Refer to Circuit/System Testing.

    - **If the parameter changes**
3. All OK.

Circuit/System Testing - Without MBM

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S70L Steering Wheel Controls Switch - Left.

2. Test for less than 10 Ω between the ground circuit terminal 1 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Ignition ON.
4. Verify the scan tool Vehicle Direction Warning Switch Status parameter is Open.
    - **If not Open**
    1. Ignition OFF, disconnect the harness connector at the B174W Frontview Camera - Windshield.
    2. Test for infinite resistance between the S70L Steering Wheel Controls Switch - Left signal circuit terminal 2 and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance, replace the B174W Frontview Camera - Windshield.
    - **If Open**
5. Install a 3 A fused jumper wire between the signal circuit terminal 2 and ground.
6. Verify within 10 s the scan tool Vehicle Direction Warning Switch Status parameter is Closed.
    - **If not Closed**
    1. Ignition OFF, disconnect harness connector at the B174W Frontview Camera - Windshield. Ignition ON.
    2. Test for less than 1 V between the S70L Steering Wheel Controls Switch - Left signal circuit terminal 2 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V.
    3. Test for less than 2 Ω in the signal circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the B174W Frontview Camera - Windshield.
    - **If Closed**
7. Test or replace the S70L Steering Wheel Controls Switch - Left.

Circuit/System Testing - with MBM

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S48D Multifunction Switch 2 - Instrument Panel.
2. Test for less than 10 Ω between the ground circuit terminal 10 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Ignition ON.
4. Verify the scan tool Vehicle Direction Warning Switch Status parameter is Open.
    - **If not Open**
    1. Ignition OFF, disconnect the harness connector at the B174W Frontview Camera - Windshield.
    2. Test for infinite resistance between the S48D Multifunction Switch 2 - Instrument Panel signal circuit terminal 3 and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.

    - If infinite resistance, replace the B174W Frontview Camera - Windshield.
    - **If Open**
5. Install a 3 A fused jumper wire between the signal circuit terminal 3 and ground.
6. Verify within 10 s the scan tool Vehicle Direction Warning Switch Status parameter is Closed.
    - **If not Closed**
    1. Ignition OFF, disconnect harness connector at the B174W Frontview Camera - Windshield. Ignition ON.
    2. Test for less than 1 V between the S48D Multifunction Switch 2 - Instrument Panel signal circuit terminal 3 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V.
    3. Test for less than 2 Ω in the signal circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the B174W Frontview Camera - Windshield.
    - **If Closed**
7. Test or replace the S48D Multifunction Switch 2 - Instrument Panel.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Cruise Control Switch Replacement**
- Refer to **Instrument Panel Center Accessory Function Switch Replacement**
- Refer to **Control Module References** for control module replacement, programming, and setup.

REPAIR INSTRUCTIONS

FORWARD COLLISION ALERT DISPLAY REPLACEMENT

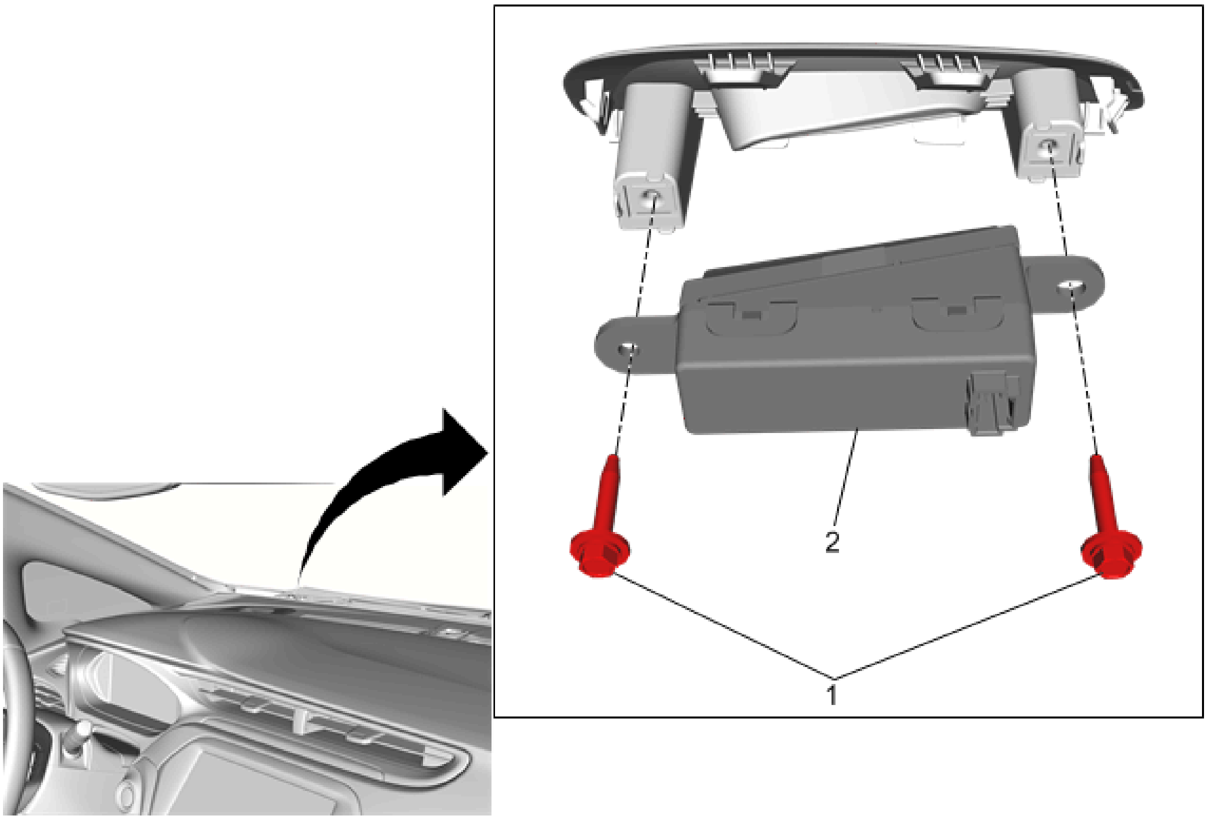

Fig. 11: Forward Collision Alert Display
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name

Callout	Component Name
Preliminary Procedure Remove Forward Collision Alert Display Bezel. Refer to Forward Collision Alert Display Bezel Replacement	
1	Forward Collision Alert Display Bolt (Qty: 2) **CAUTION:** **Refer to Fastener Caution** **Tighten** 2.5 N.m (22 lb in)
2	Forward Collision Alert Display **Procedure** Disconnect the electrical connector.

PARKING ASSIST CONTROL MODULE REPLACEMENT

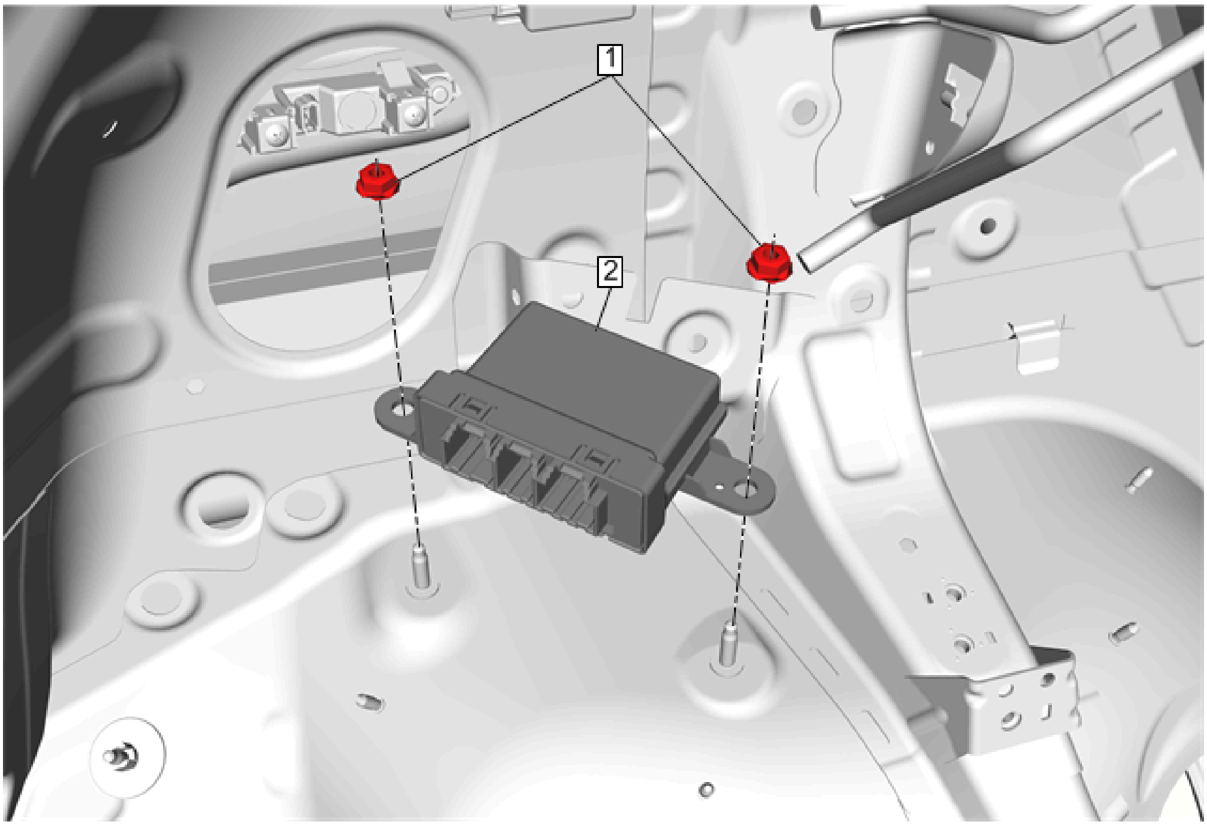

Fig. 12: Parking Assist Control Module
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Quarter Lower Rear Trim Panel - Left Side. Refer to Quarter Lower Rear Trim Panel Replacement	
1	Parking Assist Control Module Nut (Qty: 2) **CAUTION:** **Refer to Fastener Caution** **Tighten** 5 N.m (44 lb in)

Callout	Component Name
2	Parking Assist Control Module **Procedure** 1. Disconnect the electrical connector. 2. Perform the necessary programming and setup procedure. Refer to **Control Module References**

ADVANCED PARKING ASSIST ALARM SENSOR REPLACEMENT (FRONT)

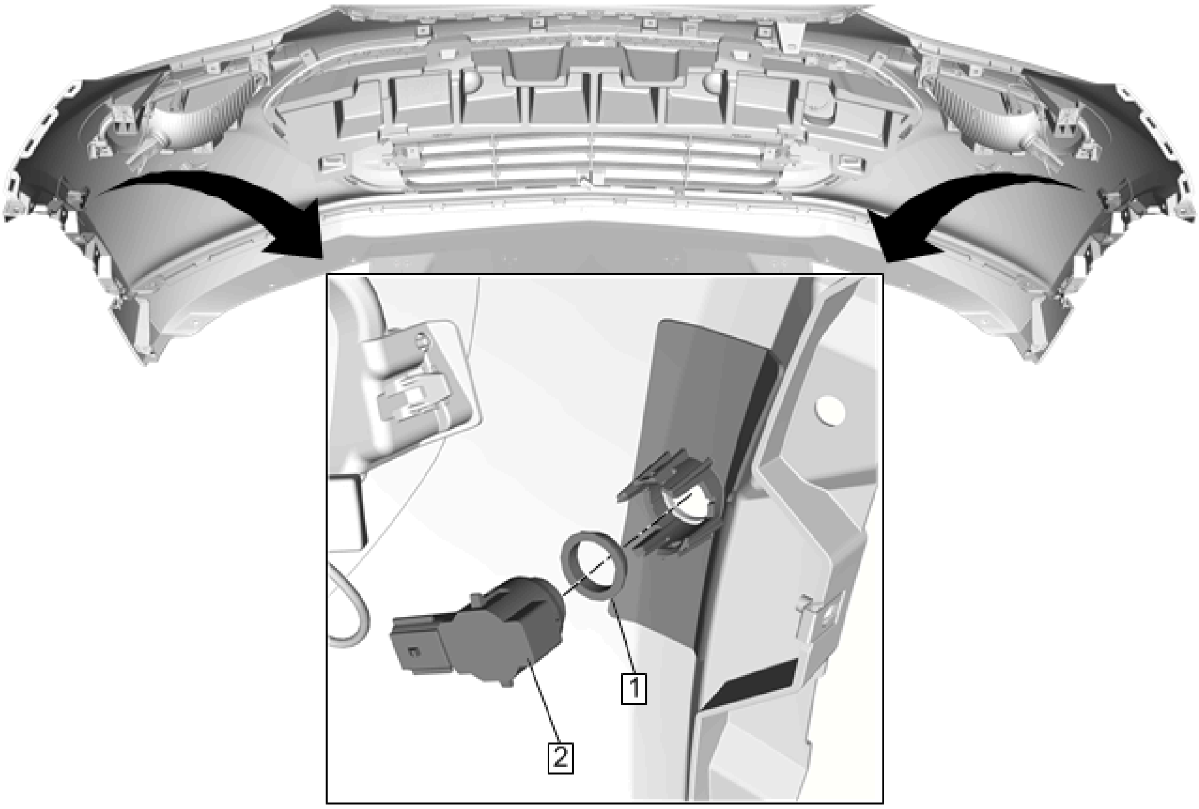

Fig. 13: Advanced Parking Assist Alarm Sensor (Front)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Front Bumper Fascia. Refer to **Front Bumper Fascia Replacement (North America)** **Front Bumper Fascia Replacement (Europe, Korea)**	
1	Advance Parking Assist Alarm Sensor Ring
2	Advance Parking Assist Alarm Sensor **CAUTION:** **When painting the park assist sensors, DO NOT exceed a paint thickness of 80-120 micrometer. The overall thickness of the paint coat on the park assist sensors should be between 80-120 micrometer. If this paint thickness is exceeded, it may result in poor functioning of the parking assist sensors.** **Procedure** 1. Disconnect the electrical connector. 2. Lift the locking tabs on the housing and remove the parking assist alarm sensor.

ADVANCED PARKING ASSIST ALARM SENSOR REPLACEMENT (REAR)

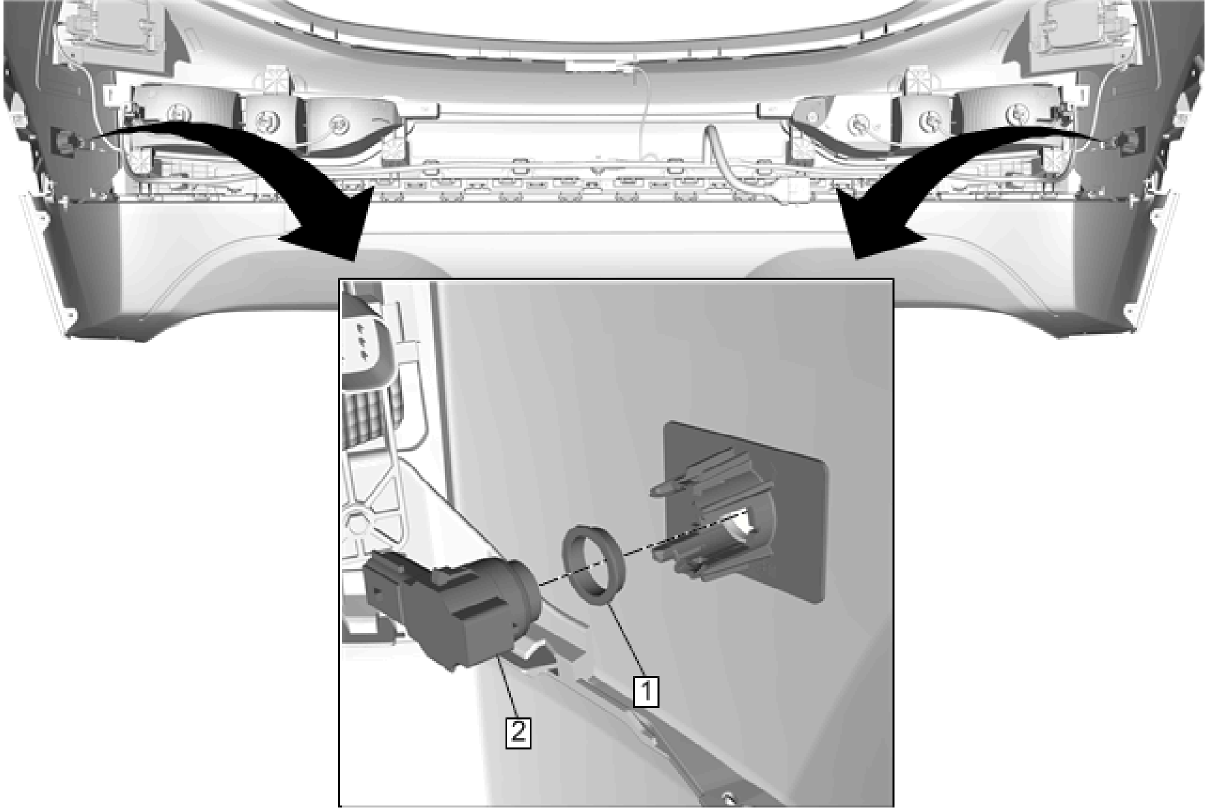

Fig. 14: Advanced Parking Assist Alarm Sensor (Rear)
Courtesy of GENERAL MOTORS COMPANY

<table>
<tr><th>Callout</th><th>Component Name</th></tr>
<tr><td colspan="2">Preliminary Procedure
Remove Rear Bumper Fascia. Refer to Rear Bumper Fascia Replacement</td></tr>
<tr><td>1</td><td>Advance Parking Assist Alarm Sensor Ring</td></tr>
<tr><td>2</td><td>Advance Parking Assist Alarm Sensor
CAUTION:
When painting the park assist sensors, DO NOT exceed a paint thickness of 80-120 micrometer. The overall thickness of the paint coat on the park assist sensors should be between 80-120 micrometer. If this paint thickness is exceeded, it may result in poor functioning of the parking assist sensors.
Procedure
1. Disconnect the electrical connector.
2. Lift the locking tabs on the housing and remove the parking assist alarm sensor.</td></tr>
</table>

FRONT PARKING ASSIST ALARM SENSOR REPLACEMENT

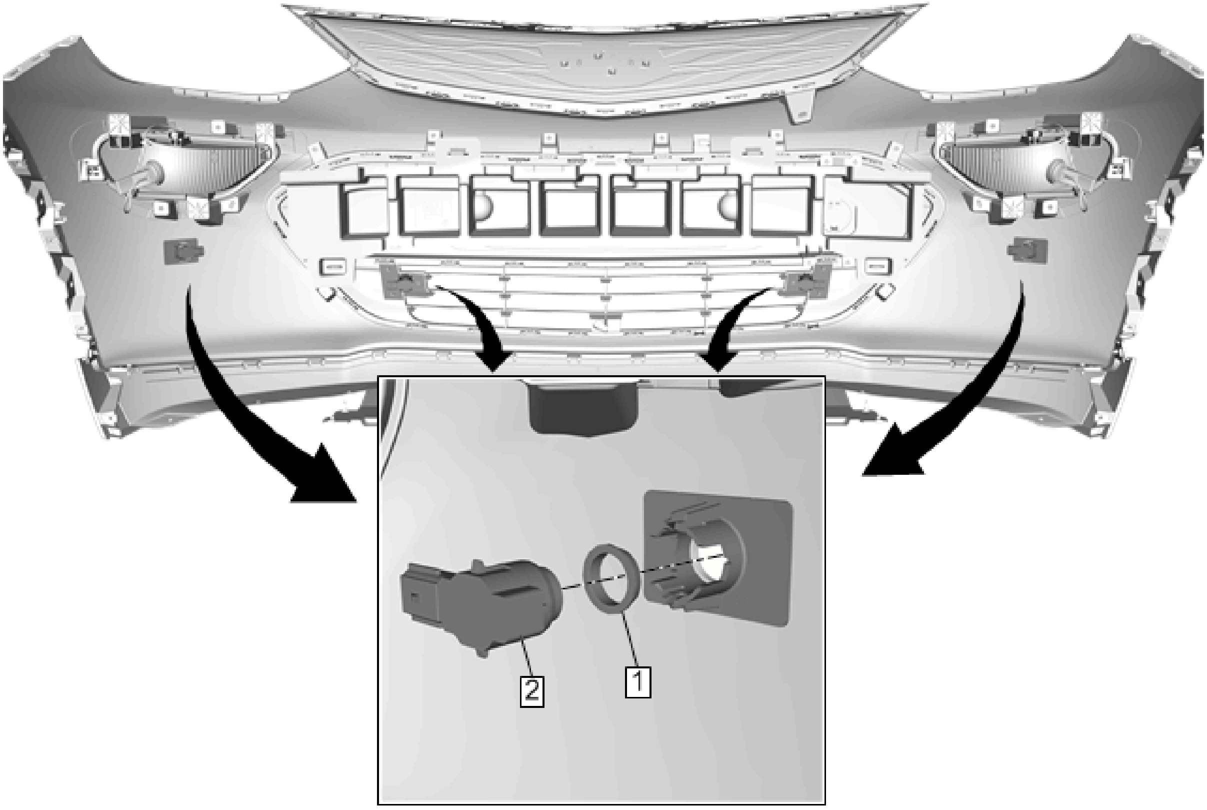

Fig. 15: Front Parking Assist Alarm Sensor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Front Bumper Fascia. Refer to **Front Bumper Fascia Replacement (North America)** **Front Bumper Fascia Replacement (Europe, Korea)**	
1	Front Parking Assist Alarm Sensor Ring
2	Front Parking Assist Alarm Sensor **CAUTION:** **When painting the park assist sensors, DO NOT exceed a paint thickness of 80-120 micrometer. The overall thickness of the paint coat on the park assist sensors should be between 80-120 micrometer. If this paint thickness is exceeded, it may result in poor functioning of the parking assist sensors.** **Procedure** 1. Disconnect the electrical connector. 2. Lift the locking tabs on the housing and remove the parking assist alarm sensor.

SIDE OBJECT SENSING ALERT MODULE REPLACEMENT

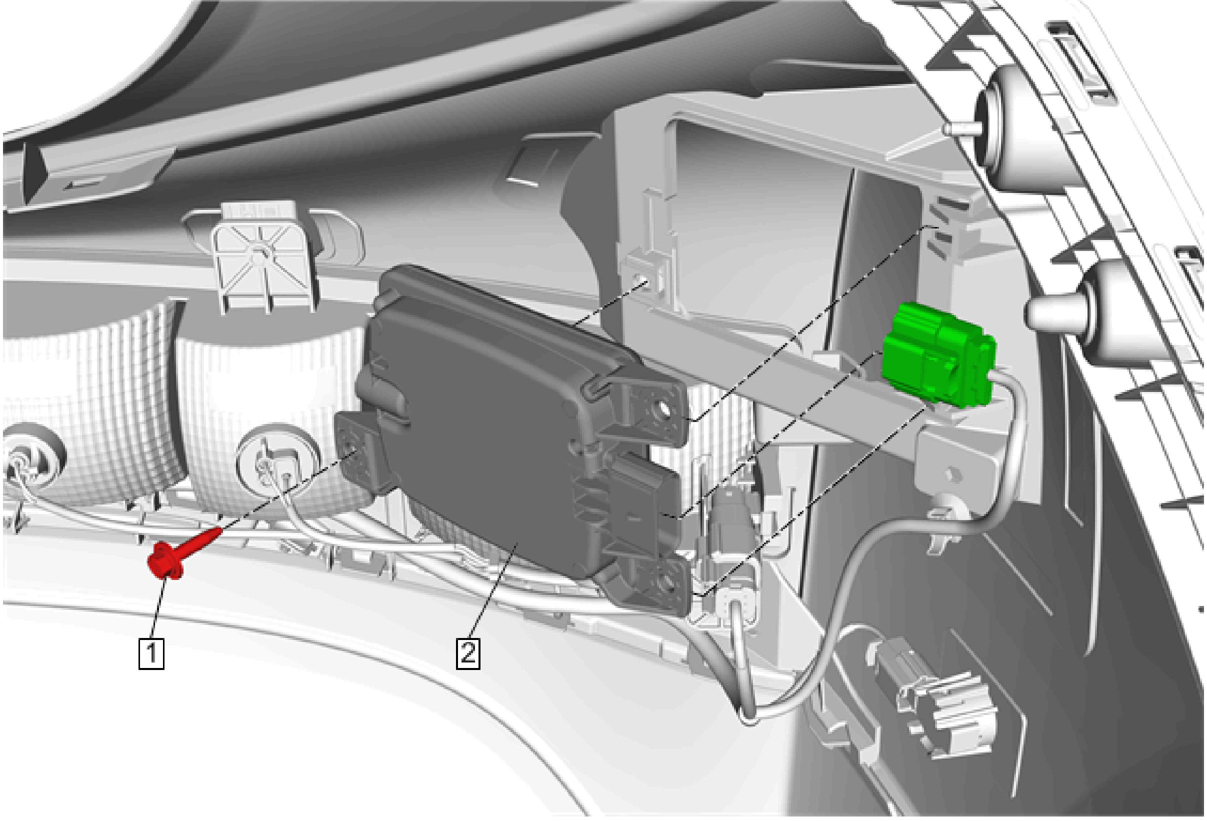

Fig. 16: Side Object Sensing Alert Module
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Rear Bumper Fascia Replacement	
1	Side Object Sensing Alert Module Bolt **CAUTION:** **Refer to Fastener Caution** **Tighten** 2.5 N.m (22 lb in)
2	Side Object Sensing Alert Module **Procedure** 1. Disconnect the electrical connector. 2. Perform the necessary programming and setup procedure. Refer to Control Module References

REAR PARKING ASSIST ALARM SENSOR REPLACEMENT

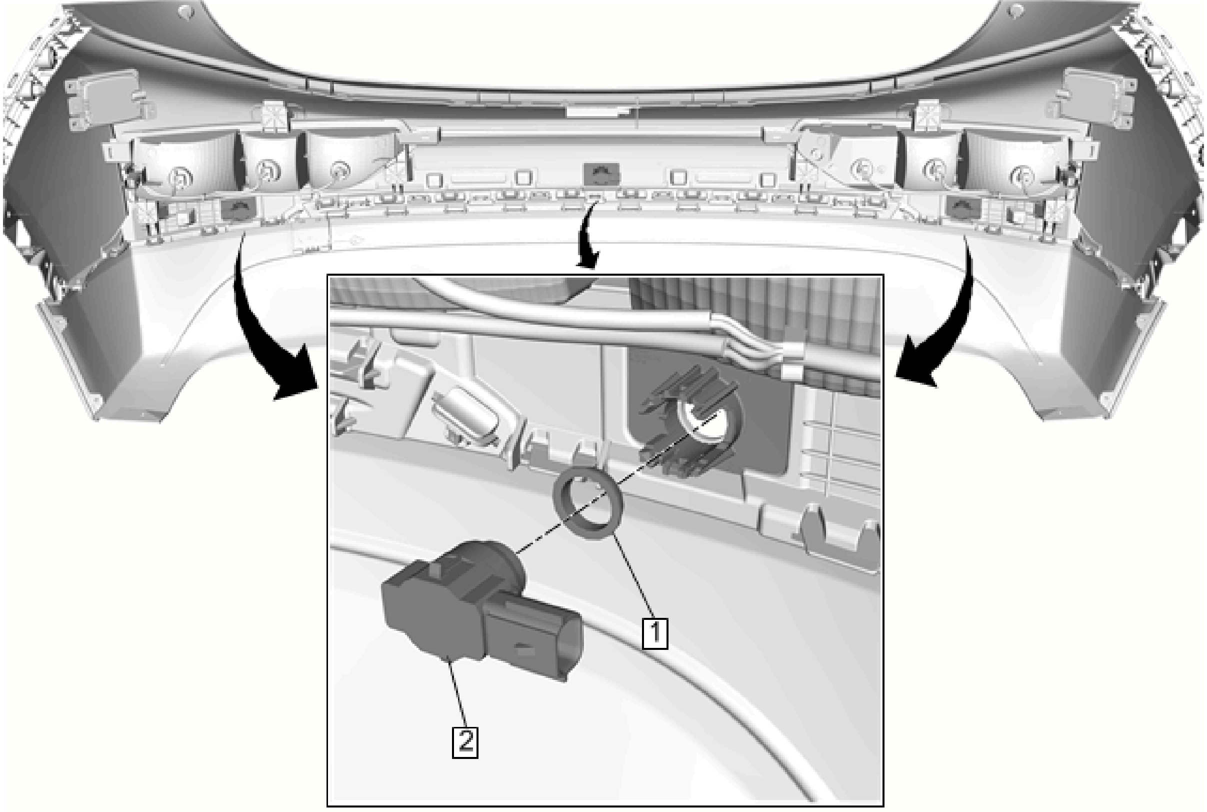

Fig. 17: Rear Parking Assist Alarm Sensor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Rear Bumper Fascia. Refer to **Rear Bumper Fascia Replacement**	
1	Rear Parking Assist Alarm Sensor Ring
2	Rear Parking Assist Alarm Sensor **CAUTION:** **When painting the park assist sensors, DO NOT exceed a paint thickness of 80-120 micrometer. The overall thickness of the paint coat on the park assist sensors should be between 80-120 micrometer. If this paint thickness is exceeded, it may result in poor functioning of the parking assist sensors.** **Procedure** 1. Disconnect the electrical connector. 2. Lift the locking tabs on the housing and remove the parking assist alarm sensor.

MULTIFUNCTION RELAY MODULE BRACKET REPLACEMENT (WITH FRONT VIEW CAMERA)

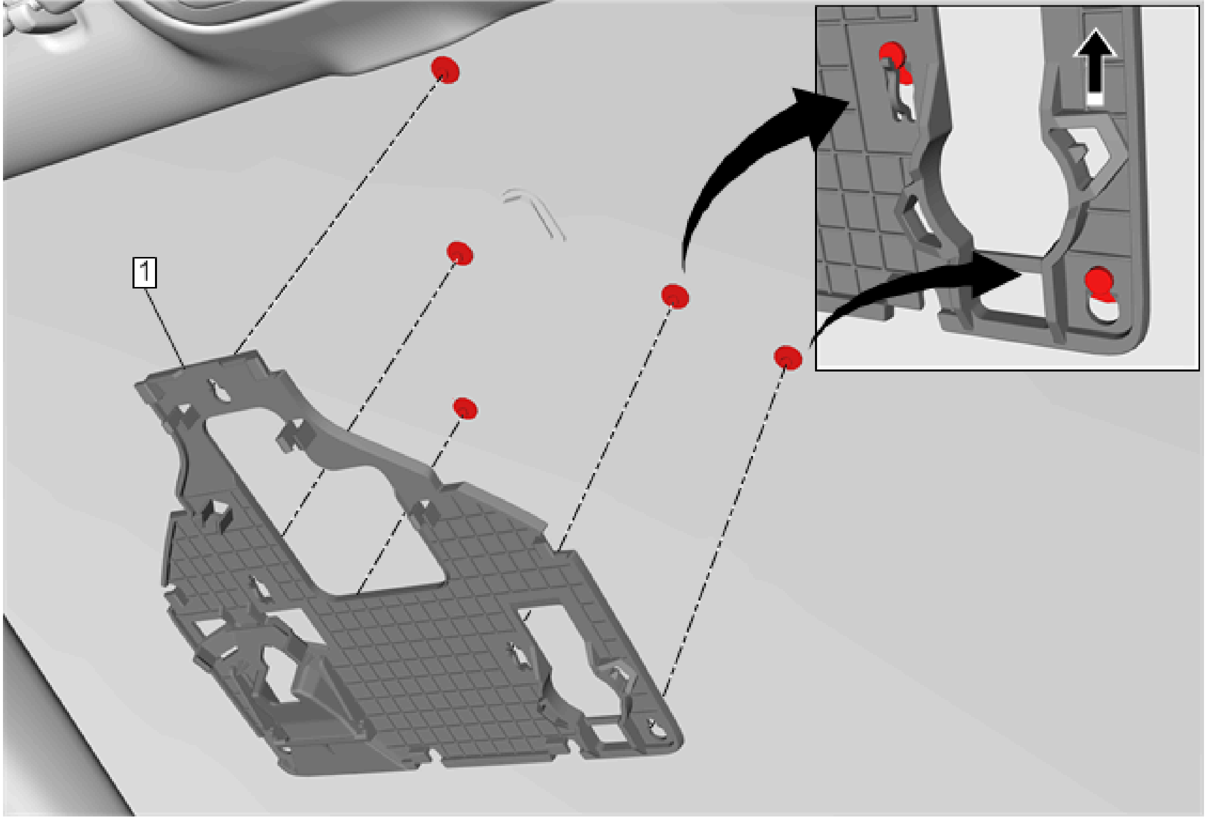

Fig. 18: Multifunction Relay Module Bracket (With Front View Camera)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove Front View Camera. Refer to Front View Camera Replacement 2. Remove Inside Air Moisture and Windshield Temperature Sensor (With Front View Camera). Refer to Inside Air Moisture and Windshield Temperature Sensor Replacement (With Front View Camera) 3. Remove Inside Rearview Mirror. Refer to Inside Rearview Mirror Replacement	
1	Multifunction Relay Module Bracket **Procedure** Slide the bracket upward to disengage tabs, gently pull from windshield.

MULTIFUNCTION RELAY MODULE BRACKET REPLACEMENT (WITHOUT FRONT VIEW CAMERA)

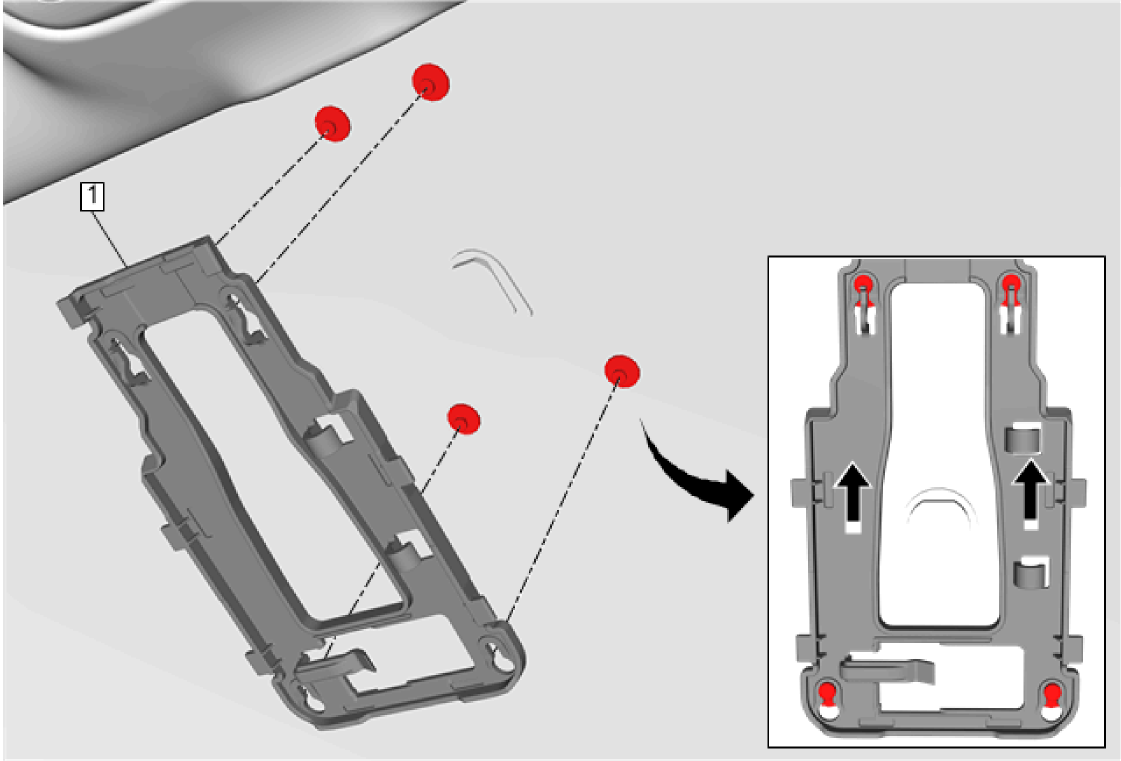

Fig. 19: Multifunction Relay Module Bracket (Without Front View Camera)
Courtesy of GENERAL MOTORS COMPANY

<table>
<tr><th>Callout</th><th>Component Name</th></tr>
<tr><td colspan="2">Preliminary Procedure
1. Remove Inside Air Moisture and Windshield Temperature Sensor (Without Front View Camera). Refer to Inside Air Moisture and Windshield Temperature Sensor Replacement (Without Front View Camera)
2. Remove Inside Rearview Mirror. Refer to Inside Rearview Mirror Replacement</td></tr>
<tr><td>1</td><td>Multifunction Relay Module Bracket
Procedure
1. Unclip wiring as necessary.
2. Slide the bracket upward to disengage tabs, gently pull from windshield.
NOTE:
Releasing the bracket is restricted by headliner. The bracket must be forced into the headliner and then released.</td></tr>
</table>

SIDE VIEW DRIVER INFORMATION CAMERA REPLACEMENT

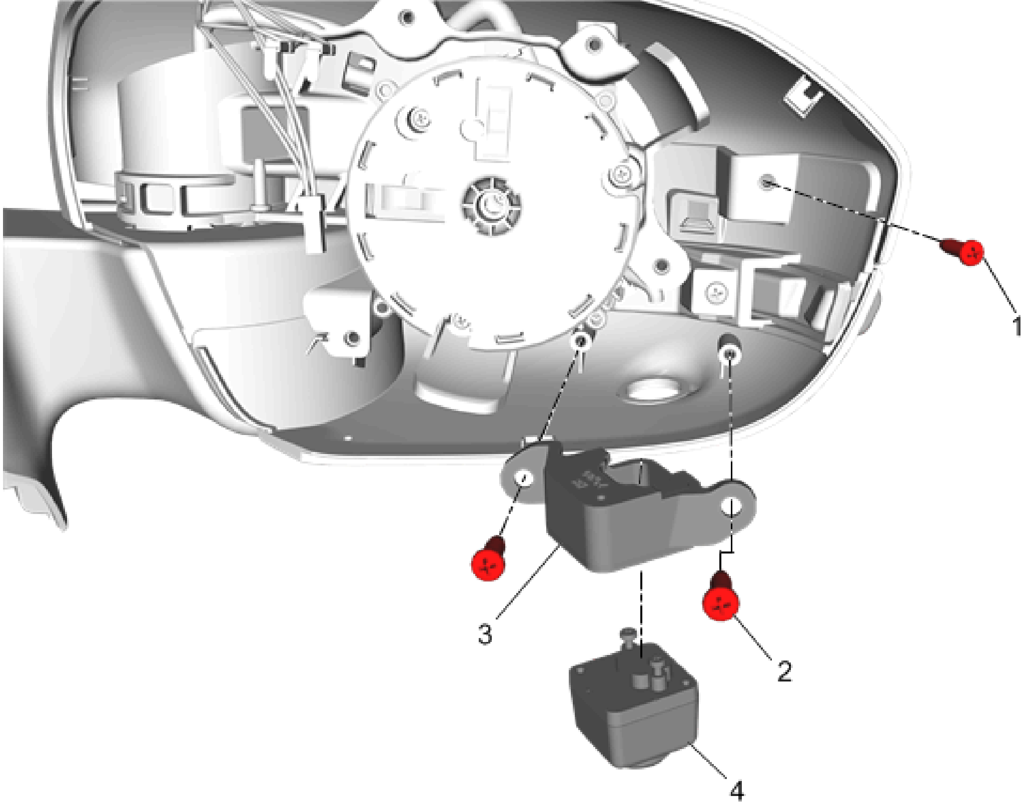

Fig. 20: Side View Driver Information Camera
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Outside Rearview Mirror Housing Bezel. Refer to Outside Rearview Mirror Housing Bezel Replacement	
1	Outside Rearview Mirror Housing Lower Cover Screw **CAUTION:** **Refer to Fastener Caution** **Tighten** 0.5 N.m (4 lb in)
2	Side View Driver Information Camera Screw (Qty: 2) **Tighten** 0.8 N.m (7 lb in)
3	Side View Driver Information Camera Bracket **Procedure** Slide off once camera is removed.
4	Side View Driver Information Camera **Procedure** 1. Separate the outside rearview mirror housing lower cover from upper cover. 2. Unclip and disconnect the electrical connector.

FRONT VIEW CAMERA REPLACEMENT

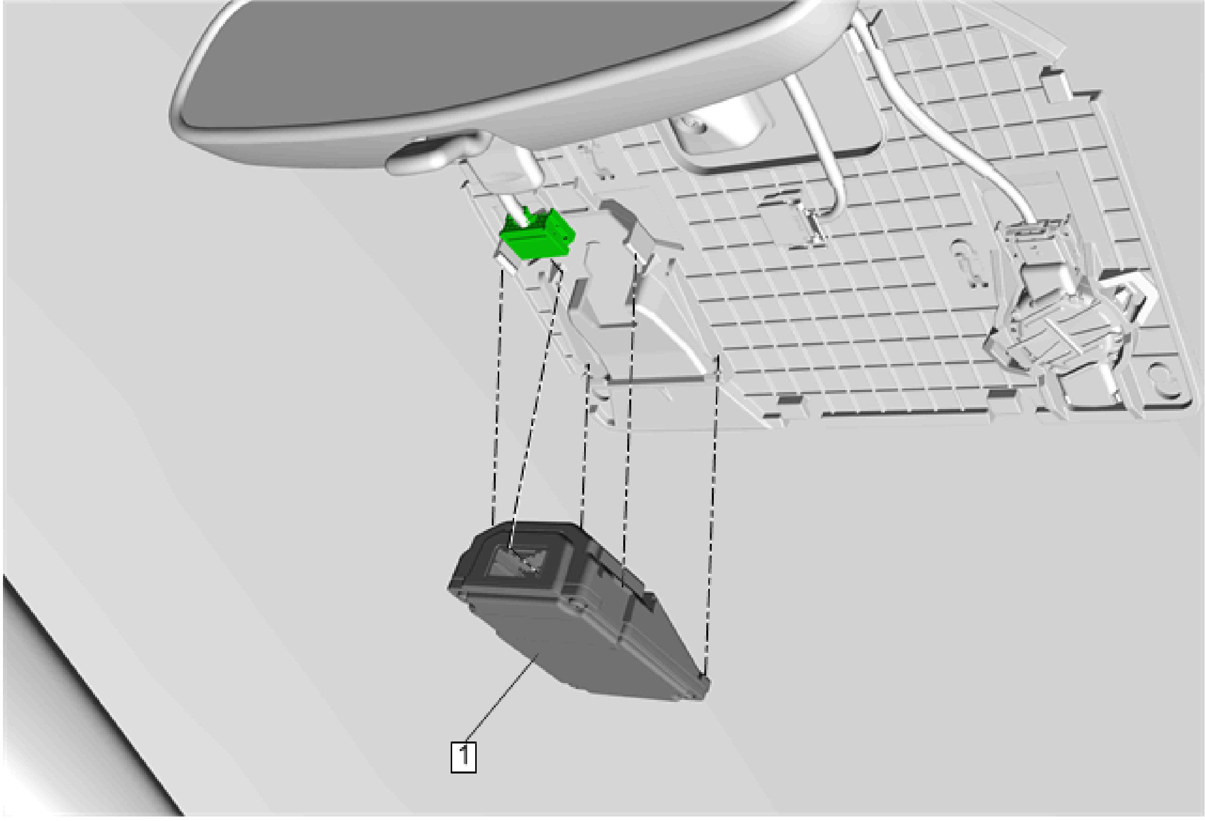

Fig. 21: Front View Camera
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Windshield Multifunction Sensor Mount Bracket Cover (with Front View Camera). Refer to **Windshield Multifunction Sensor Mount Bracket Cover Replacement (with Front View Camera)**	
1	Front View Camera **Procedure** 1. Gently release the retaining tabs on bracket. 2. Disconnect the electrical connector. 3. Perform all necessary programming and setup procedures for the control module. Refer to **Control Module References**

FRONT VIEW DRIVER INFORMATION CAMERA REPLACEMENT

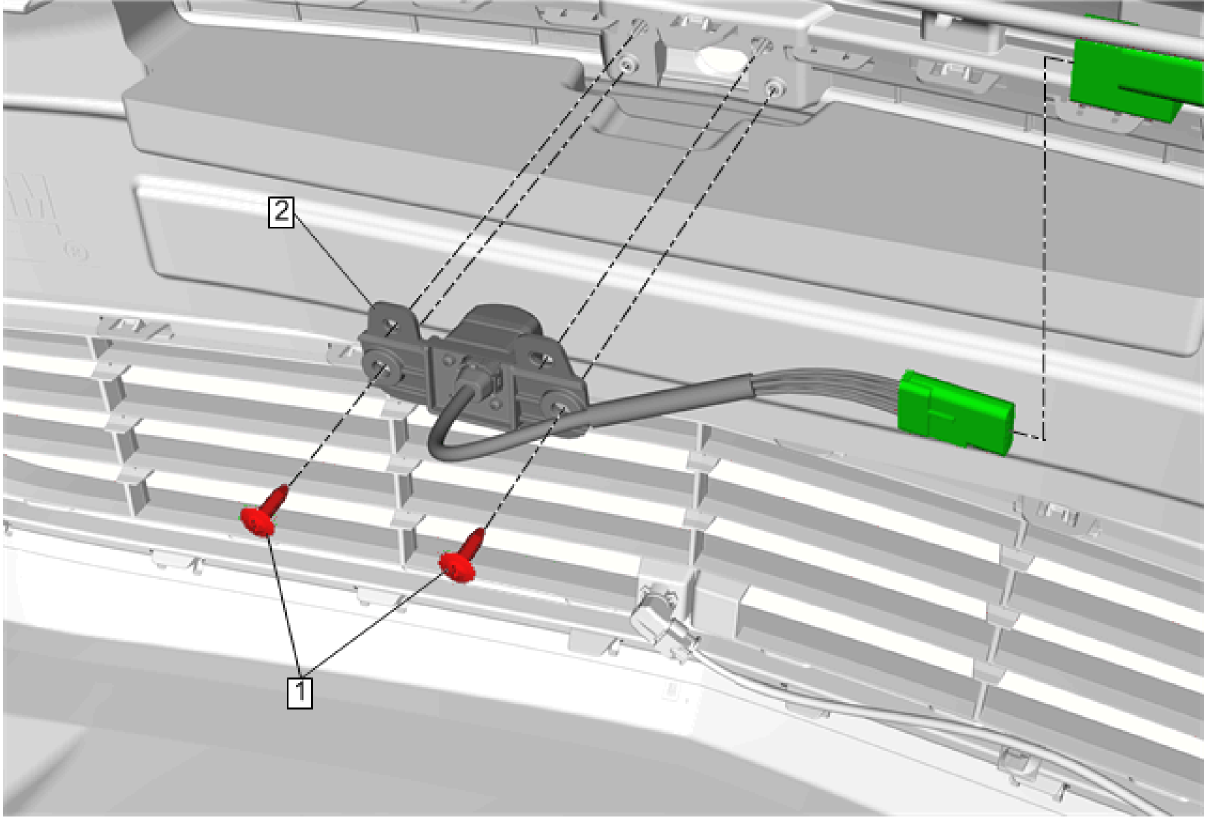

Fig. 22: Front View Driver Information Camera
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Front Bumper Fascia. Refer to Front Bumper Fascia Replacement (North America) Front Bumper Fascia Replacement (Europe, Korea)	
1	Front View Driver Information Camera Fastener (Qty: 2) **CAUTION:** **Refer to Fastener Caution** **Tighten** 2.5 N.m (22 lb in)
2	Front View Driver Information Camera **Procedure** Disconnect the electrical connector.

REARVIEW DRIVER INFORMATION CAMERA REPLACEMENT

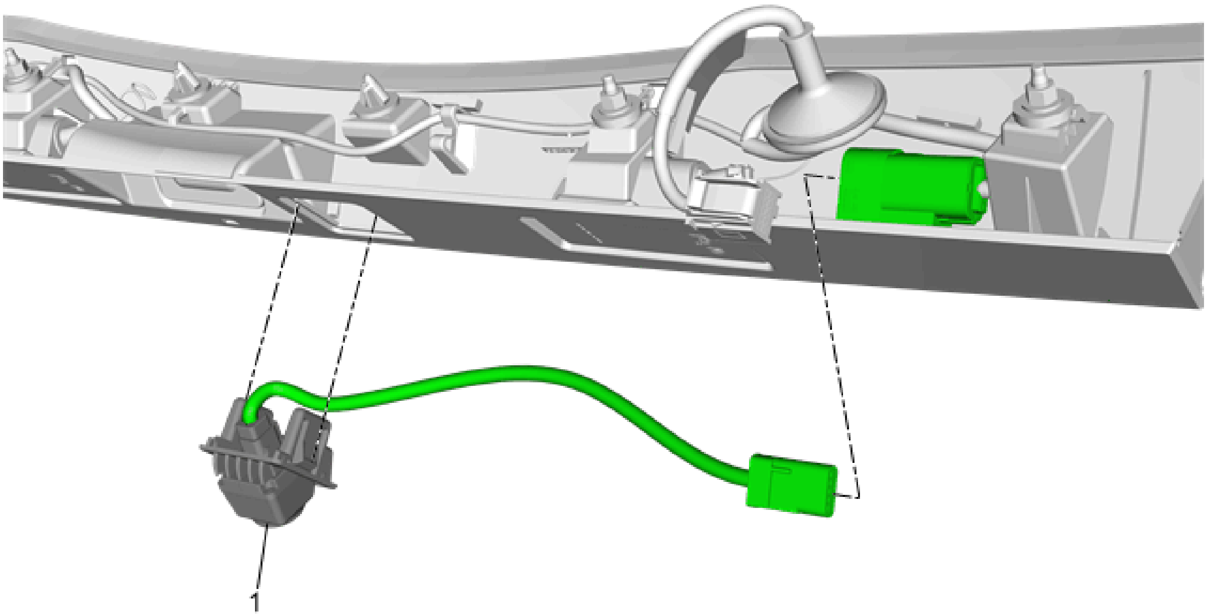

Fig. 23: Rearview Driver Information Camera
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Rear Closure Center Applique. Refer to **Rear Closure Center Applique Replacement**	
1	Rearview Driver Information Camera **Procedure** Disconnect the electrical connector.

FRONT VIEW CAMERA MODULE LEARN

Calibration

For North American SPS users, **Calibration will NOT start automatically** and will need to be initiated with GDS2. For European SPS users, **Calibration will start automatically** and will not need to be initiated with GDS2.

The calibration process for the front view camera system is necessary when a front view camera module is replaced by a new one. **This process is required when only replacing the windshield** and the frontview camera module has been mounted again properly. This process shall be completed within 3 - 5 minutes when the correct driving conditions are met. If conditions are not met, the K109 Frontview Camera Module will attempt to complete the service point calibration for 20 minutes after initialized. If the service point calibration does not complete within 20 minutes key-off the vehicle and the service point calibration will automatically restart on the next ignition cycle. This process shall work across ignition cycles and shall not be required to be re-initialized at start up. If the Lane Departure Warning or Lane Keep Assist Switch is pressed during calibration, the indictor will flash momentarily and then stay out - this is normal operation.

During this time the Lane Departure Warning or Lane Keep Assist amber indicator will illuminate.

To calibrate the front camera, operate the vehicle in the following conditions until the calibration is complete:

NOTE: **If the front view camera module calibration is not completed during the current ignition cycle, it will restart in next ignition cycle. "Service Front Camera" will be displayed until successful calibration and DTC B1008 4B may be active.**

When Lane Departure Warning is on, the indicator is green if Lane Departure Warning is available to warn of a lane departure. If the vehicle crosses a detected lane marking without using the turn signal in that direction, the indicator changes to amber and flashes. To verify if the system is working the indicator on the switch should remain illuminated once pressed, and when up to speeds greater than 35 mph (56 km/h), the lane departure indicator will illuminate on the instrument cluster.

The power mode be in ACCY for the calibration process to become enabled by using the scan tool. GDS2 will display a "loss of com" error message when the procedure is attempted in any power mode other than ACCY.

- Clean windshield.
- Avoid lane changes.
- Maintain vehicle speeds between 56 - 90 km/h (35 - 56 MPH).
- Ensure the road contains visible references (well defined lane markings, curbs, etc.).

Calibration Procedure (Required for North American SPS users)

1. Apply the parking brake.
2. Place the transmission in Park (if applicable)
3. **Place vehicle in ACCY Power Mode**
4. Install scan tool
5. Navigate to the module diagnostics menu
6. Select Frontview Camera Module
7. Select Configuration/Reset Functions menu Item
8. Select the Frontview Camera Learn procedure and follow the directions displayed on the screen.
9. Drive the vehicle to complete calibration.

Once the procedure is complete, the amber indicator will turn off. Shortly after the green ready to assist light should turn on as long as all conditions are met for normal operation. The system is then ready to assist.

If Slow to Calibrate

The ideal calibration condition is driving on a 2 lane divided highway with markings on both sides of the lane. One or more of the following conditions may increase the length of time required to complete the self-calibration procedure: :

- Camera not properly installed. Verify it is snapped into tabs and is secure. Refer to **Front View Camera Replacement**.
- Heavy traffic
- Stop and go traffic
- Mountain roads
- Curves in roadway
- Poor contrast lane markings
- Botts' Dots type lane markings
- Operating the vehicle speed is greater than 90 km/h (56 MPH)
- Driving through snow or fog, or driving directly into the sun

No Calibration

Conditions that will prevent completion of the self-calibration procedure:

- Camera not properly installed. Verify it is snapped into tabs and is secure. Refer to **Front View Camera Replacement**.
- Dirty windshield glass or obstruction on windshield

- Operating the vehicle with speed less than 56 km/h (35 MPH)
- No visible lane markings
- Severe weather where lane markings cannot be seen

PARKING ASSIST SENSOR LEARN CALIBRATION

Calibration

The calibration process for the Parking Assist system is necessary when a parking assist sensor has been replaced or improperly learned.

To calibrate the Parking Assist sensors:

NOTE: **Parking Assist Sensors should be at or near room temperature**

1. Select **Parking Assist Sensor Learn** in the scan tool
2. Operate the vehicle in the following conditions until the calibration is complete:
    - Nothing is within 50 cm of the parking assist sensors
    - Ensure the parking assist sensors are clean
3. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, open and close driver door. It may take up to 2 min for all vehicle systems to power down.
4. Verify Parking Assist system is operating correctly and there are no DTCs set.

No Calibration

Conditions that will prevent completion of the self-calibration procedure:

- Dirty or contaminated obstruction on the parking assist sensor
- Objects are within 50 cm of the parking assist sensors

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Refer to Control Module References for control module replacement, programming and setup

VIDEO PROCESSING MODULE REPLACEMENT

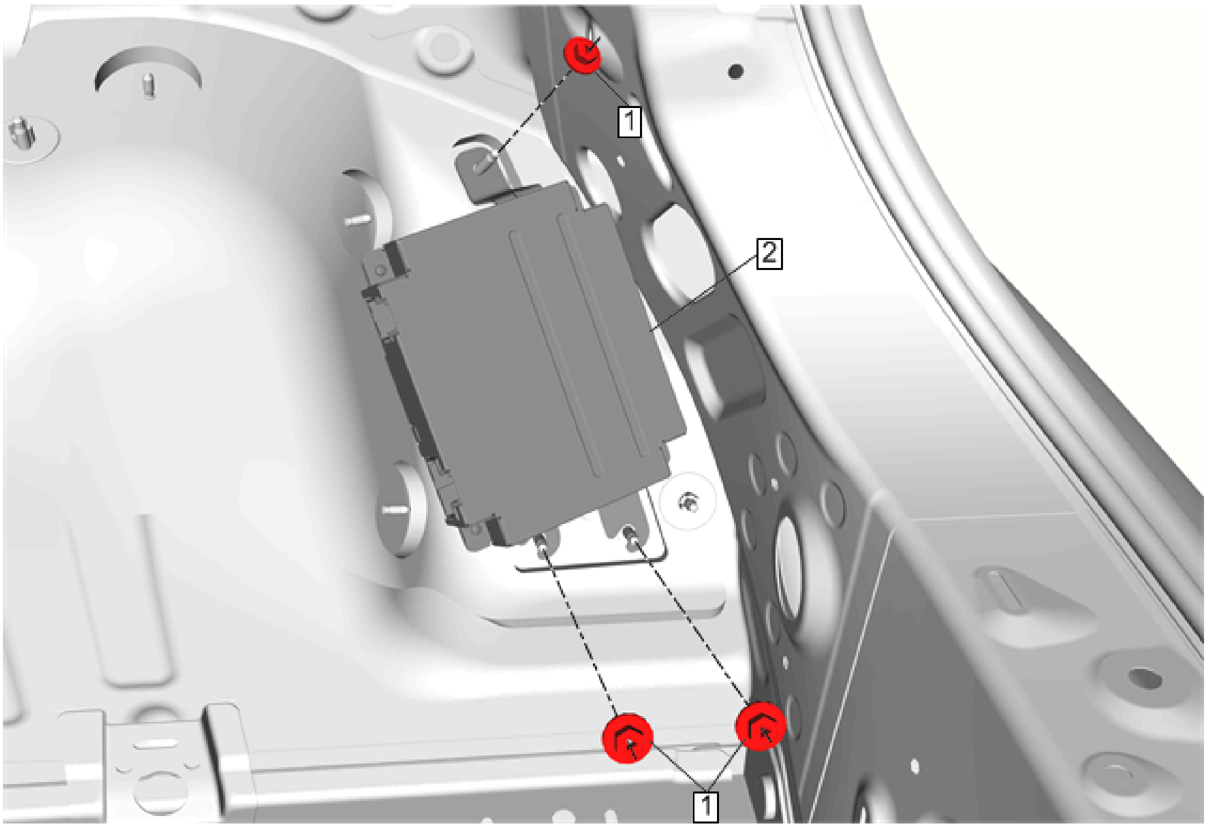

Fig. 24: Video Processing Module
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Quarter Lower Rear Trim Panel - Right Side. Refer to Quarter Lower Rear Trim Panel Replacement	
1	Video Processing Module Nut (Qty: 3) **CAUTION:** **Refer to Fastener Caution** **Tighten** 8 N.m (71 lb in)
2	Video Processing Module **Procedure** 1. Disconnect the electrical connector. 2. Perform the necessary programming and setup procedure. Refer to Control Module References

VIDEO PROCESSING CONTROL MODULE CALIBRATION

NOTE: **Image will be slightly distorted at all times, the camera(s) lens is a fish-eye lens meant to capture as much as possible.**

The calibration procedure is to have the Video Processing Control Module learn the new cameras and their positions. The calibration does not start automatically or if manual initialization is desired, calibration can be initiated by selecting Video Processing Control Module Camera Learn in the scantool.

Radio Display Prompt Example

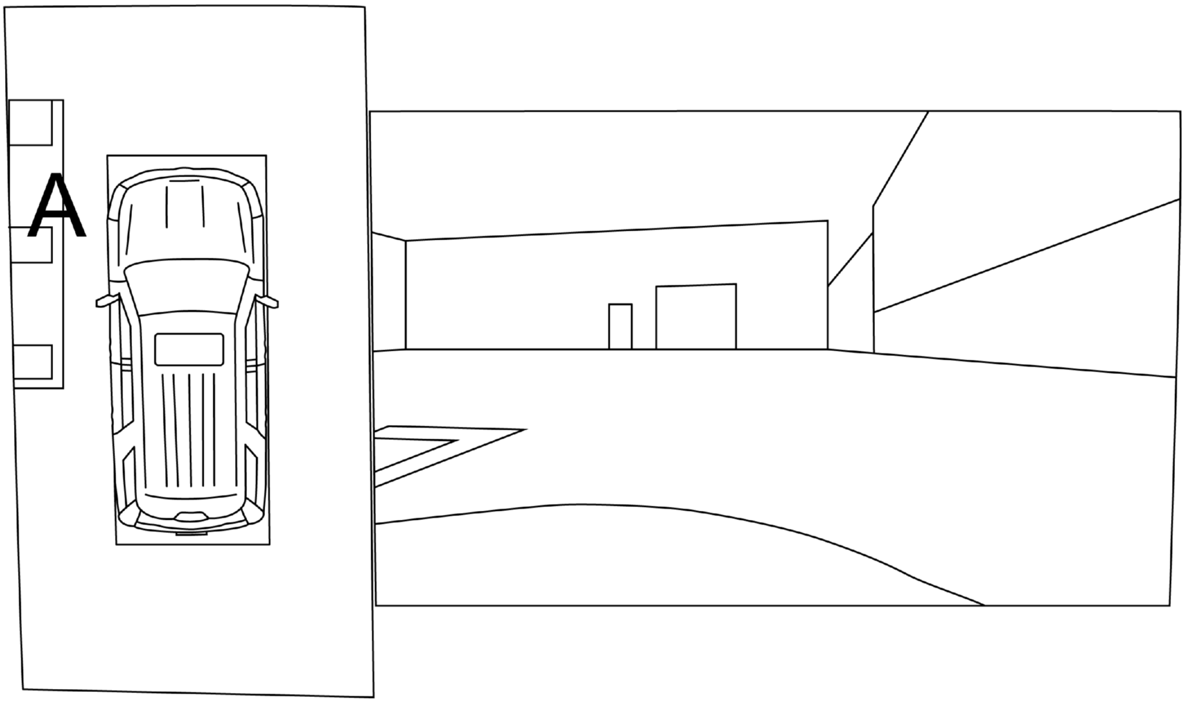

Fig. 25: Radio Display Prompt Example
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Only ONE EL-51372 Camera Calibration Mat is required for calibration.**

The left side of the screen will display where the **EL-51372** Camera Calibration Mat should be located for each step. The right side of the display is the view from the camera that is being learned during that step.

Mat Position Reference

- Position A is the left front
- Position B is the right front
- Position C is the left rear
- Position D is the right rear

Diagnostic Aids

- If any one of the cameras is replaced on the Surround Vision Camera System, the displayed image may not be correctly stitched due to a change in the location or orientation of the camera. The only way to correct an incorrectly stitched image is to perform the calibration procedure.
- Tires must be inflated properly
- Vehicle must be on a level surface
- Mirrors must be folded out
- It is a good practice to wipe camera lens' clean prior to alignment
- Interfering objects or glare from overhead lighting will fail an alignment
- All points of access to the inside of the vehicle **Must** be closed, including hood.
- **Finalize** is the very last step, this saves all the data from the alignment

Calibration

NOTE: **Diagnostic Aids MUST be followed prior to Calibration**

This is the calibration process for the Surround Vision Camera system. When the Video Processing Control Module is replaced, calibration must be performed. If the following occurs, calibration is recommended but not required:

- If a camera is replaced
- If mirrors or fascias are replaced, removed, or physically adjusted

To calibrate the cameras, operate the vehicle in the following conditions until the calibration is complete:

- Clean camera lenses.
- Follow the on screen instructions with regards to EL-51372 camera mat placement
- Vehicle must be ignition ON or Vehicle ON

NOTE:

- **Camera Calibration Mat location is very critical for the cameras to learn. If the image displayed is heavily distorted, the mat position was not correct. For correct mat location, refer to the box EL-51372 came in. Place the mat 50 cm from the vehicle when performing calibration or camera learn. For Fore/Aft alignment, place the mat so the distance from the closest edge of the center square, to the bumper, is 70 cm.**
- **Camera Calibration Mat must be as flat as possible. Wrinkles in the matt will cause a distorted view for the camera.**
- **When an exclamation (!) is seen on the radio display, camera learn was not completed or there was an error. To clear this, press Retry**
- **At any point where the Calibration is stuck and radio display does not show any camera images, clicking Cancel from the**

scan tool learn screen will resolve the issue and will return to previous learn position

- **If at any point in the calibration procedure the alignment process is interrupted, clicking Retry from the scan tool learn screen will cancel the current learn process and can be procedure can be restarted**
- **DO NOT Click Finalize prior to step 7**

1. Using the scan tool, select the desired camera to calibrate, or all cameras if necessary.
2. Click Initiate on the scan tool learn screen. This starts the calibration process.
3. The radio display will show the desired EL-51372 camera calibration mat position.

NOTE: **Mat must be flat on the floor**

4. Place the EL-51372 camera mat in the position shown on the display. Use the box EL-51372 came as a ruler to align the mat with the vehicle correctly.

NOTE: **In an event of an error, click the Retry button to reset the image and try a new capture. DO NOT Click Finalize until step 7**

5. Once the mat is correctly positioned, Click **Capture** on the scan tool learn screen. This captures the image.
    - If a red "X" is displayed, correct the EL-51372 camera mat position
    - If a green checkmark is displayed, the image was accepted.
6. Leave the EL-51372 camera mat in that position until the camera display prompts for it to be moved to the next position, or if calibration is complete.
7. Once the last camera image has been capture, click Finalize on the scan tool learn screen. This completes the learn.

Sequence of Camera Alignment

Left Camera Alignment Learn:

1. Captures an image at Position C
2. Captures an image at Position A

Right Camera Alignment Learn:

1. Captures an image at Position D
2. Captures an image at Position B

Front Camera Alignment Learn:

1. Captures an image at Position A
2. Captures an image at Position B

Rear Camera Alignment Learn:

1. Captures an image at Position D
2. Captures an image at Position C

All Cameras Alignment Learn:

1. Captures an image at Position A
2. Captures an image at Position B
3. Captures an image at Position C
4. Captures an image at Position D

Error Codes during alignment

Error Code	Cause	Possible Repair
0101 Front Camera 0103 Front Camera 0201 Right Camera 0203 Right Camera 0301 Rear Camera 0303 Rear Camera 0401 Left Camera 0403 Left Camera	Lighting Issue, Obstructed View of Target, Target Position out of Range, Poor Camera installation	Correct Lighting, Reposition Target, Verify Camera correctly installed and clean.
0102 Front 0202 Right 0302 Rear 0402 Left	Lighting Issue, Obstructed View of Target, Target Position out of Range	Correct Lighting, Reposition Target, Verify Camera is clean.
0104 Front 0204 Right 0304 Rear 0404 Left	Camera Position incorrect	Correct camera position
0120 Front 0220 Right 0320 Rear 0420 Left	NTSC error detected	Verify camera electrical connection
FFF0 Passenger Door FFF1 Left Rear Door FFF2 Right Rear Door FFF3 Driver Door FFF4 Trunk FFF5 Hood FFF6 Liftglass	Hood, Door, Liftgate, Trunk or other part of car OPEN	Close all doors, Hood, Liftgate, and Trunk

VIDEO DISPLAY INSIDE REARVIEW MIRROR CAMERA REPLACEMENT

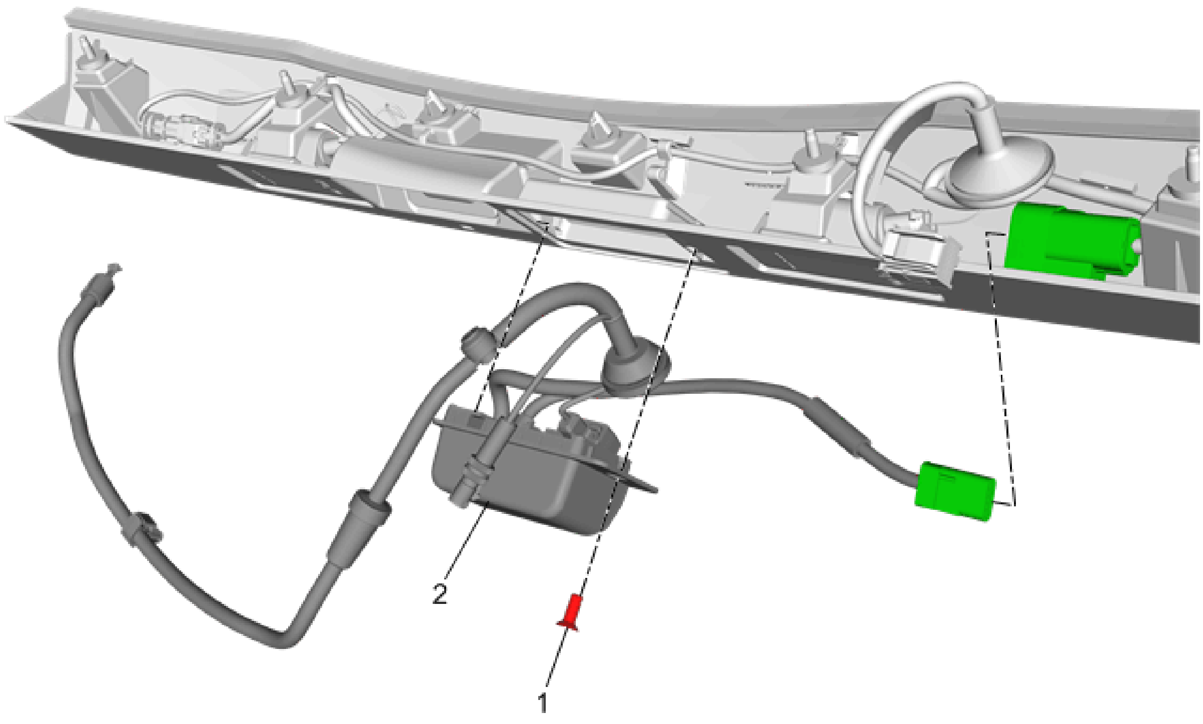

Fig. 26: Video Display Inside Rearview Mirror Camera
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Rear Closure Center Applique. Refer to Rear Closure Center Applique Replacement	

Callout	Component Name
1	Video Display Inside Rearview Mirror Camera Screw **CAUTION:** **Refer to Fastener Caution**
2	Video Display Inside Rearview Mirror Camera **Procedure** Unclip and Disconnect the electrical connector.

DESCRIPTION AND OPERATION

PARKING ASSIST DESCRIPTION AND OPERATION (WITH REAR PARK ASSIST, UD7)

The ultrasonic parking assist system is designed to identify and notify the driver of an object in the vehicles path when reversing at speeds of less than 8 km/h (5 MPH). The distance and location of the object is determined by 4 object sensors located in the rear bumper. The parking assist system will notify the driver using an audible beep signal through the radio rear speakers.

The parking assist system is made up of the following components:

- Parking assist control module
- Rear object alarm sensors

Parking Assist Control Module

The parking assist control module provides an 8 V reference and a low reference to the four object alarm sensors. The parking assist control module receives individual signals from each of the four sensors and determines the location and distance of an object based on these inputs. When an object is detected, the parking assist control module will send a data message via CAN-Bus to the radio requesting an audible alert.

Rear Object Alarm Sensors

The object alarm sensors are located in the rear bumper of the vehicle. The sensors are used to determine the distance between an object and the bumper. Each sensor emits an ultrasonic frequency which is reflected off any object located behind the vehicle. These reflections are received by the sensors. The time difference between the emission of the frequency and when the reflection is received is known as sensor echo time, it is used to determine the distance to the object. The sensors report this information to the parking assist control module.

Rear Parking Assist Operation

When the vehicle is first placed into reverse there will be one audible beep through the rear speakers, to indicate that the system is working. If rear speakers are inoperable no audible signals will occur.

When backing up at speed of less than 8 km/h (5 MPH), the system is constantly monitoring for object of interest located behind the vehicle. The rear parking assist system can detect objects greater than 7.6 cm (3 in) wide and 25.4 cm (10 in) tall. The system cannot detect objects below the bumper, underneath the vehicle. If an object is detected within 2.5 m (8 ft) there will be a audible beep notification out of both rear speakers based upon the distance to the object. As the vehicle gets closer to an object, the time between the beeps become shorter.

If the vehicle stops in a range zone the beeping will stop after 5 s. When the distance between the object and the vehicle changes, beeping will start again.

If the rear parking assist system detects a malfunction the single audible beep will not chime when put into reverse along with a DTC being stored. The object alarm module will send a serial data message to the instrument panel cluster to display the SERVICE PARK ASSIST message on the driver information center.

Parking Assist System Driver Information Center Messages

SERVICE PARK ASSIST

The driver information center displays SERVICE PARK ASSIST when the parking assist control module detects a malfunction in the rear parking assist system and the system is disabled. The driver information center also displays SERVICE PARK ASSIST when a loss of communication occurs with the parking assist control module.

PARK ASSIST OFF

The PARK ASSIST OFF message is displayed in the driver information center when the parking assist system is disabled due to conditions that disable or inhibit the system. The parking assist control module requests the driver information center display PARK ASSIST OFF when it detects that one of the following conditions:

- The rear parking assist system is manually disabled by the vehicle operator through the audio system personalization menu.
- The park brake is applied or not fully released.
- An object is attached to the rear of the vehicle, such as a trailer, bicycle rack, trailer hitch receiver, or tow bar. Also, an object extending beyond a lowered endgate will disable the system.
- The parking assist sensors are covered by snow, mud, dirt or ice.
- The vehicle bumper is damaged.
- Excessive paint thickness on a replacement parking assist sensor.
- The parking assist sensors are disrupted by vibrations, like those caused by a large nearby vehicle or from heavy equipment such as a jackhammer.

PARKING ASSIST DESCRIPTION AND OPERATION (WITH FRONT AND REAR PARK ASSIST, UFQ)

The parking assist system is designed to identify and notify the driver of an object in the vehicle path when moving forward or reversing at speeds of less than 8 km/h (5 MPH). The distance and location of the object is determined by 8 object sensors: 4 located in the rear bumper and 4 located in the front bumper. The parking assist system will notify the driver using an audible beep signal through the radio.

The parking assist system is made up of the following components:

- Advanced parking assist control module
- Front object alarm sensors
- Rear object alarm sensors
- Parking assist switch
- Parking assist switch indicator

Advanced Parking Assist Control Module

The advanced parking assist control module provides a reference voltage and a low reference to the 8 object alarm sensors. The advanced parking assist control module receives individual signals from each of the 8 sensors and determines the location and distance of an object based on these inputs. When an object is detected, the advanced parking assist control module will send a data message via CAN-Bus to the radio requesting an audible alert.

Object Alarm Sensors

The object alarm sensors are located in the front and rear bumpers of the vehicle. The sensors are used to determine the distance between an object and the bumper. Each sensor emits an ultrasonic frequency which is reflected off any object located in front of or behind the vehicle. These reflections are received by the sensors. The time difference between the emission of the frequency and when the reflection is received is known as sensor echo time, it is used to determine the distance to the object. The sensors report this information to the advanced parking assist control module.

Parking Assist Switch

The parking assist can be activated and deactivated by pressing the parking assist switch. By engaging the reverse gear the parking assist can also be activated. By subsequently pressing the parking assist switch the parking assist can be disabled again.

Parking Assist Switch Indicator

The indicator in the parking assist switch shows the status of the parking assist. If the lamp is ON, the parking assist is activated.

Parking Assist Operation

When an object is within the measuring range of the sensor, the ultrasonic pulse is reflected and is received by the sending or a neighboring sensor. The sensor converts this signal into a voltage signal and sends this signal to the parking assist control module. The advanced parking assist control module evaluates the received sensor signals. As soon as an object is within the measuring range, the advanced parking assist control module sends a message via CAN-Bus to the radio in order to give out the acoustic distance signal.

The parking assist system can detect objects greater than 7.6 cm (3 in) wide and 25.4 cm (10 in) tall. The system cannot detect objects below the bumper, underneath the vehicle. If an object is detected, one of the following will occur:

- The measuring range of the front object alarm sensors is between 30 - 120 cm (11.8 - 47.2 in). From a distance of 120 cm (47.2 in), the acoustic signal is active. The frequency of the beep sound increases with decreasing distance. From a distance less than 30 cm (11.8 in), the sound becomes continuous.
- The measuring range of the rear object alarm sensors is between 30 - 250 cm (11.8 - 98.4 in). From a distance of 250 cm (98.4 in), the acoustic signal is active. The frequency of the beep sound increases with decreasing distance. From a distance less than 30 cm (11.8 in), the sound becomes continuous.

The parking assist can be activated and deactivated by pressing the parking assist switch. When REVERSE gear is selected, park assist automatically is engaged for both front and rear sensors. When the vehicle is put into DRIVE from REVERSE the front assist sensors will be active up to speeds of 8 km/h (5 MPH) to assist with parking maneuvers. Once the vehicle is above 8 km/h (5 MPH) the front sensors are disabled and will not be re-enabled until either REVERSE gear is selected or the parking assist switch is pressed to activate the system. Once the parking assist switch is pressed during a key cycle the front sensors become active at speeds under 8 km/h (5 MPH). If the park assist switch is pressed again in the same key cycle the message "Park Assist Off" will be displayed in the driver information center if the vehicle speed is under 8 km/h (5 MPH) and front sensors detect an object within 120 cm (47.2 in). The LED indicator on the parking assist switch provides the ON/OFF state of the system. If the indicator is ON, the system is active and ready to assist.

The advanced parking assist control module carries out a self test and monitors the sensors for electrical and mechanical faults. Monitored is the power supply of each sensor and the sensor signals, which need to alter when the vehicle moves. If this is not the case, the sensor is acoustically blocked or faulty. Mud, ice and snow may cause obstruction of the function of the sensors. Besides that the advanced parking assist control module checks whether the correct type of sensor is installed. If any of these tests fails, a DTC with corresponding symptom is set, the parking assist is deactivated and the parking assist indicator in the instrument panel cluster is activated.

Parking Assist System Driver Information Center Messages

SERVICE PARK ASSIST

The driver information center displays SERVICE PARK ASSIST when the advanced parking assist control module detects a malfunction in the parking assist system and the system is disabled. The driver information center also displays SERVICE PARK ASSIST when a loss of communication occurs with the advanced parking assist control module.

PARK ASSIST OFF

The PARK ASSIST OFF message is displayed in the driver information center when the parking assist system is disabled due to conditions that disable or inhibit the system. The advanced parking assist control module requests the driver information center display PARK ASSIST OFF when it detects that one of the following conditions:

- The parking assist system is manually disabled using the parking assist switch.
- An object is attached to the rear of the vehicle, such as a trailer, bicycle rack, trailer hitch receiver, or tow bar. Also, an object extending beyond a lowered tailgate will disable the system.
- The parking assist sensors are covered by snow, mud, dirt, slush, or ice.
- The vehicle bumper is damaged.
- Excessive paint thickness on a replacement parking assist sensor.
- The parking assist sensors are disrupted by vibrations, like those caused by a large nearby vehicle or from heavy equipment such as a jackhammer.

LANE DEPARTURE WARNING DESCRIPTION AND OPERATION

The lane departure warning system is a convenience feature of the front view camera that issues a warning when the system detects that the vehicle has unintentionally crossed a lane marking. The front view camera is located behind the windshield, looking out at the road ahead and detecting any lane markings. When the vehicle unintentionally leaves a detected lane, a visual and audible alert is given to the driver.

The lane departure warning system is made up of the following components:

- Front view camera module
- Lane departure warning switch
- Instrument cluster/Vehicle Direction Display
- Radio

Front View Camera Module

The camera detects visual queues such as lane markings. When it is determined that the vehicle has unintentionally moved outside of the lane, a visual and audible warning is given to the driver. The front view camera module receives an input from the lane departure warning switch and controls the lane departure warning switch indicator output. The front view camera module also communicates via serial data with the instrument cluster and radio to request visual and audible alerts.

Lane Departure Warning Switch

The lane departure warning switch provides an input to the front view camera module to turn the lane departure warning system ON and OFF. The front view camera module provides a signal voltage to the normally open momentary switch. When the switch is pressed, the signal circuit is pulled to ground, indicating to the front view camera module that the system has been requested to turn ON or OFF. The lane departure warning switch also contains the lane departure warning switch indicator, which is controlled by the front view camera module to indicate the ON and OFF status of the lane departure warning system. When the system has been enabled by the lane departure warning switch, the front view camera module applies ground to the switch indicator and illuminates the LED. The location of the lane departure warning switch can vary with different vehicles. For the exact location please refer to the user's manual.

Instrument Cluster

The vehicle direction display contains green and amber lane departure warning indicators. These indicate to the driver the current status of the lane departure warning system and are controlled via serial data by the front view camera module. When the vehicle speed is above 56 km/h (35 MPH) and the system has detected the required lane markings and is ready to assist, the green indicator will be illuminated on the vehicle direction display. If the vehicle has unintentionally left the lane, the amber indicator will flash.

Radio

The radio controls the audible alert for the lane departure warning. If the vehicle has unintentionally left the lane, the radio will command three beeps as an audible alert to the driver.

Lane Departure Warning Operation

System operation can be describe by the following modes:

- Off State: The system has been turned off by the driver, using the lane departure warning switch. The lane departure warning indicator will not be illuminated.
- Not Ready To Assist: The system is enabled and the lane departure warning indicator is illuminated, but not ready to assist when any of the following conditions is true:
  - Vehicle speed is less than 56 km/h (35 MPH). The system is designed to function at speeds greater than 56 km/h (35 MPH).
  - The system cannot detect lane markings. This may be because there are no lane markings, as on a country road or that the lane markings cannot be determined due to snow, rain, or other driving conditions.
  - The windshield area in front of the camera or the camera lens is blocked by fog, dirt, damage to the windshield or other elements that may prevent the camera from detecting lane markings.
- Ready To Assist: The system is enabled and ready to warn of the unintentional lane crossing. The system is ready to assist when the green lane departure warning indicator is illuminated on the vehicle direction display.

Lane Crossing Alerts

- When one of the following conditions are met, the system will not give alerts:
  - The correct turn signal is activated. An activated turn signal is interpreted as an intentional lane crossing.
  - The operator makes an intentional steering maneuver.
  - The operator makes an intentional accelerating maneuver.
  - The operator makes an intentional braking maneuver.
- Lane crossing alert consists of the following:
  - Three chimes are activated through the radio.
  - The amber lane departure warning indicator will flash.

Lane Departure Warning System Driver Information Center Messages

The front view camera module can command the driver information center to display the various messages to alert the driver of a system concern or status information. For detailed information about the possible messages please refer to the user's manual.

LANE KEEP ASSIST DESCRIPTION AND OPERATION

NOTE:

- **The Lane Keep Assist system DOES NOT continuously steer the vehicle**
- **The Lane Keep Assist system replaces Lane Departure Warning System**
- **Lane Departure Warning will have more alerts than Lane Keep Assist (visual, audible, and haptic warning**

The system assists driver to keep vehicle in-lane by providing a steering push back to the vehicle when an unintended lane departure is detected. See the user's manual for more detailed information on vehicle personalization.

The lane keep assist system is made up of the following components:

- Front view camera module

- Lane Keep Assist switch/control indicator
- Instrument cluster/Vehicle Direction Display
- Radio
- Safety Alert Seat (if equipped)
- Yaw rate sensor
- Electric power steering

Front View Camera Module

The camera detects visual queues such as lane markings. When it is determined that the vehicle has unintentionally moved outside of the lane, visual, and audible or haptic warning is given to the driver. The front view camera module receives an input from the lane keep assist switch and controls the lane keep assist switch indicator output. The front view camera module also communicates via serial data with the instrument cluster, radio, and memory seat module to request visual, and audible or haptic alerts.

Lane Keep Assist Switch

The lane keep assist switch provides an input to the front view camera module to turn the lane keep assist system ON and OFF. The front view camera module provides a signal voltage to the normally open momentary switch. When the switch is pressed, the signal circuit is pulled to ground, indicating to the front view camera module that the system has been requested to turn ON or OFF. The lane keep assist switch also contains the lane keep assist switch indicator, which is controlled by the front view camera module to indicate the ON and OFF status of the lane keep assist system. When the system has been enabled by the lane keep assist switch, the front view camera module applies ground to the switch indicator and illuminates the LED. The location of the lane keep assist switch can vary with different vehicles. For the exact location please refer to the user's manual.

Instrument Cluster

The vehicle direction display contains green and amber lane keep assist indicators. These indicate to the driver the current status of the lane keep assist system and are controlled via serial data by the front view camera module. When the vehicle speed is above 56 km/h (35 MPH) and the system has detected the required lane markings and is ready to assist, the green indicator will be illuminated on the vehicle direction display. If the vehicle has unintentionally left the lane, the amber indicator will flash.

Radio

The radio controls the audible alert for the lane keep assist. If the vehicle has unintentionally left the lane, the radio will command three beeps as an audible alert to the driver.

Safety Alert Seat (if equipped)

The memory seat module controls the haptic alert provided by the seats. If the vehicle has unintentionally left the lane, and the Electric Power Steering determines the corrective action requires an above threshold amount of effort, the memory seat module will command three pulses to the left or right side of the seat, depending on the lane departure direction.

Yaw Rate Sensor

The steering intervention is based on the forward looking sensor outputs, such as lateral offset of the vehicle, relative yaw angle and time to line crossing. Over that, other vehicle dynamics signals are needed, e.g. velocity, steering angle, yaw rate for the purpose of a driver suppression.

Electric Power Steering

The electric power steering uses a torque sensor to detect driver inputs and relays that information to the frontview camera module. The electric power steering is used to provide steering push back.

Lane Keep Assist Operation

There is two stages of warning/intervention for the driver: The first stage is the steering push back, if the lane keep assist system detects that the vehicle will cross the lane marking despite it is intervening, a second stage warning shall be issued. The second stage warning is a chime or a haptic seat vibration, **if equipped** with haptic seats. If a haptic seat vibration is used as stage 2 warning, the vibration shall take place on the side of the seat, where the lane departure happened.

System operation can be described by the following modes:

- Off State: The system has been turned off by the driver using the lane keep assist switch. The lane keep assist indicator will not be illuminated.
- Not Ready To Assist: The system is enabled and the lane keep assist indicator is illuminated, but not ready to assist when any of the following conditions is true:
  - Vehicle speed is less than 37 MPH (60 km/h). The system is designed to function at speeds greater than 37 MPH (60 km/h).
  - The system cannot detect lane markings. This may be because there are no lane markings, as on a country road or that the lane markings cannot be determined due to snow, rain, or other driving conditions.
  - The windshield area in front of the camera or the camera lens is blocked by fog, dirt, damage to the windshield or other elements that may prevent the camera from detecting lane markings.
- Ready To Assist: The system is enabled and ready to warn of the unintentional lane crossing. The system is ready to assist when the green lane keep assist indicator is illuminated on the vehicle direction display.

Lane Crossing Alerts

- When one of the following conditions are met, the system will not give alerts:
  - The correct turn signal is activated. An activated turn signal is interpreted as an intentional lane crossing.
  - The operator makes an intentional steering maneuver.
  - The operator makes an intentional accelerating maneuver.
  - The operator makes an intentional braking maneuver.
- Lane crossing alert consists of the following:
  - The amber lane keep assist indicator will flash.
  - "push-back" steering torque input (or nudge) from Electric Power Steering to help prevent a lane departure
  - Three chimes are activated through the radio.
  - or **if equipped** , three pulses to the left or right side of the seat.

Lane Keep Assist System Driver Information Center Messages

The front view camera module can command the driver information center to display the various messages to alert the driver of a system concern or status information. For detailed information about the possible messages please refer to the user's manual.

The rear cross traffic alert system is a feature that utilized two side object sensor modules to provide enhanced customer convenience while backing up by sensing and providing warnings to the driver on impending rear cross traffic. The rear cross traffic alert system is designed to detect and track moving objects as small as a 125cc motorcycle with rider within a specified coverage zone behind the vehicle. The system is designed to alert the driver, with a visual display and either an audible sound or a haptic warning, if equipped and enabled, to the presence of moving objects of interest that may cause a collision with the host vehicle. Although the system is intended to assist drivers in backing up, it does not replace driver's vision. The driver is responsible to check carefully for objects outside of the coverage zone (e.g., a fast approaching vehicle) for a safe backing maneuver.

Rear Cross Traffic Alert System Components

The side blind zone alert system is made up of the following components:

- Left side object sensor module
- Right side object sensor module
- Visual Display Icons located on the infotainment display screen
- Audio system chime
- Haptic safety seat (if equipped)

Side Object Sensor Modules

The side object sensor modules are located on each side of the vehicle behind the rear fascia and are not directly visible from outside the vehicle. The sensors use radar to determine the presence of moving objects nearby. The left side object sensor is the master that communicates on serial data. There is a private communication network between the left and right sensors. The scan tool is able to communicate only with the left sensor.

When a moving object is detected in the left rear cross traffic zone while the engine is running and the transmission in reverse, the side object sensor module sends a serial data message to the human interface module and memory seat module to provide alerts. Each sensor is supplied B+ and ground.

Display Icons

The rear cross traffic alert system visual alert display consists of two visual icons, one on each side of the display screen of the rearview camera display, that are used to alert the driver on rear cross traffic from each side of the host vehicle respectively. In addition to visual indicators, the audio system will beep (if enabled) and the haptic safety seat will vibrate (if equipped and enabled). Refer to owner's manual for vehicle customization.

Audio or Haptic Notification

The alert output type can be driver selected to either audio or haptic. The chime location will be left rear for left rear cross traffic alert and right rear for right rear cross traffic alert. The haptic seat system response will be to generate 3 repetitions of haptic vibration in the left rear area of the seat for left cross traffic alert and right rear area of the seat for right cross traffic alert. If there is a problem with the haptic seats, the audio chime will be substituted.

Rear Cross Traffic Alert Operation

The rear cross traffic alert system is designed to detect moving objects of interest as small as a 125cc motorcycle with rider. The detection zone extends approximately 30 m (99 ft) from the rear corner of the car and covers an area from behind the vehicle to 125 degrees towards the front at a height of 0.45 m (1.5 ft) to 2 m (6.5 ft) above ground. The system operates when vehicle speed is 10 kph (6 mph) or less and is designed to detect objects moving at speeds up to 36 kph (22 mph).

When the vehicle is backing up, the side object sensors receive energy that is reflected from external objects and determine if the objects are objects of interest or not. The system may at times detect pedestrians, shopping carts, or similar moving objects. This is normal and should not be considered as a false alert or problem with the system. The rear cross traffic alert system will estimate vehicle travel trajectory and use the information in conjunction with object travel trajectory information to determine if there is a potential collision between the vehicle and the object of interest. The rear cross traffic alert function will only alert on objects of interest that pose a potential collision with the host vehicle. The system is not designed to provide an alert to objects that have no potential collision with vehicle. In addition, the system will not alert to stationary objects such as signs, parked cars, etc.

If the vehicle is towing a trailer or has an object such as a bicycle rack attached to the rear of the vehicle, the rear cross traffic alert system may not function properly.

Foul weather may affect the operation of the rear cross traffic alert system. Occasional missed alerts can occur under normal circumstances and will increase in wet conditions. The number of missed alerts will increase with increased rainfall or road spray. Heavy rainfall, as well as mud, dirt, snow, ice, or slush build-up on the rear fascia, can completely disable the system.

Rear Cross Traffic Alert Driver Information Center Messages

REAR CROSS TRAFFIC ALERT OFF

This message indicates that the system has been disabled through the driver information center. Refer to the vehicle owners manual for instructions on how to set personalization options on the driver information center.

SERVICE SIDE DETECTION SYSTEM

This message indicates that the system requires service. Since the side object sensors are also used for side blind zone alert and/or lane change alert, these feature will also be inoperative. Check vehicle for DTCs to determine the cause of this notification.

SIDE DETECTION SYSTEM TEMPORARILY UNAVAILABLE

This message indicates that the system has been temporarily disabled because the sensors are blocked or can otherwise not accurately detect vehicles or objects. Verify there is no damage to rear fascia or there are any bumper stickers that may interfere with the radar signals. Ask the customer if any of the following circumstances that present when the system became unavailable: mud, dirt, snow, ice, or slush build-up on the rear fascia, heavy rainfall, or excessive road spray.

SIDE BLIND ZONE ALERT DESCRIPTION AND OPERATION

The side blind zone alert system is a lane-changing aid that assists drivers with avoiding crashes that occur with vehicles in the side blind zone (or spot) areas. When the vehicle is moving forward, the left or right side mirror display will illuminate if a vehicle is detected in the blind zone. If the turn signal is activated and a vehicle is also detected on the same side, the display will flash as an extra warning not to change lanes. The side blind zone alert monitors the blind sport area along side the vehicle, approximately 3.5 m (11 ft) from the side of the vehicle, extending 5 m (16 ft) behind the mid-point of the vehicle.

The lane change alert system is a lane-changing aid that assists drivers with avoiding lane change crashes that occur with vehicles rapidly approaching the side blind zone (or spot) areas from behind. The lane change alert warning display will illuminate in the corresponding outside rearview mirror and will flash as an extra warning not to change lanes if the turn signal is on. The lane change alert system monitors the lane area along side the vehicle, approximately 3.5 m (11 ft) from the side of the vehicle, extending up 70 m (230 ft) beyond the rear bumper.

While in reverse, the rear cross traffic alert system displays a triangle with a left or right pointing arrow on the info display module to warn of traffic coming from the left or right. This system detects objects coming from up to 20 m (65 ft) from the left or right side of the vehicle. When an object is detected, either three beeps sound from the left or right or three safety alert seat pulses occur on the left or right side, depending on the direction of the detected vehicle.

Side Blind Zone Alert System Components

The side blind zone alert system is made up of the following components:

- Side object sensor module - left
- Side object sensor module - right
- Driver outside rearview mirror
- Passenger outside rearview mirror
- Infotainment system
- Safety alert seat

Side Object Sensor Module

The side object sensor modules are located on each side of the vehicle behind the rear fascia and are not directly visible from outside the vehicle. The sensors use radar to determine the presence of objects nearby. The side object sensor module - left is the master that communicates on vehicle serial data bus. There is a private serial data bus between the left and right sensors. The scan tool is able to communicate only with the left sensor. The sensors are unique and not interchangeable from side to side.

The side object sensor module - right controls both side blind zone indicators located on the left and right outside rearview mirrors. Each indicators receives ground at all times. When an object has been detected in the vehicle's blind spot or a vehicle is fast approaching from the rear, the side object sensor module - right will apply voltage to the appropriate indicator, illuminating it. If the turn signal is on, indicating the driver intends to change lanes, side object sensor module - right will flash the appropriate indicator as an additional means of alert.

Outside Rearview Mirrors

The outside rearview mirrors contain an icon that is backlit with high intensity, amber-colored LED's located on the mirror surface. The display brightness adapts to day and night conditions. The side object sensor module - right controls both side blind zone indicators.

Infotainment System

The infotainment system controls the audible alerts for the rear cross traffic alert system. If cross traffic is present, the side object sensor module - left will command the infotainment system issue an audible alert to the driver. The audible alert will sound from the side of the vehicle where traffic is approaching from.

The infotainment system also includes the info display module. When in R, any cross traffic warnings will be overlaid over the rear vision camera image on the info display module.

Safety Alert Seat

The memory seat module controls the haptic alert provided by the seats. If cross traffic is present, the side object sensor module - left will command the safety alert seat issue a haptic alert to the driver on the side of the seat where traffic is approaching from.

Side Blind Zone Alert Operation

When the vehicle is started, both side blind zone indicators located on the left and right outside rearview mirrors will briefly illuminate to indicate that the system is operating. The system is designed to detect objects in an area approximately between 0.5 m (1.5 ft) and 2 m (6 ft) off the ground. The side blind zone alert monitors the blind sport area along side the vehicle, approximately 3.5 m (11 ft) from the side of the vehicle, extending 5 m (16 ft) behind the mid-point of the vehicle. The system may light up an indicator due to guardrails, signs, trees, shrubs, and other non-moving objects. This is normal system operation; the vehicle does not need service.

When the system detects a vehicle in the side blind zone while driving forward, an amber warning symbol will illuminate on the appropriate outside mirror. This indicates that it may be unsafe to change lanes. If the driver activates the turn signal, the amber warning symbol starts flashing as an extra warning not to change lanes.

Foul weather may affect the operation of the side blind zone system. Occasional missed alerts can occur under normal circumstances and will increase in wet conditions. The number of missed alerts will increase with increased rainfall or road spray. Heavy rainfall, as well as mud, dirt, snow, ice, or slush build-up on the rear fascia, can completely disable the system.

If the vehicle is towing a trailer or has an object such as a bicycle rack attached to the rear of the vehicle, the side blind zone system may not function properly and the indicators may illuminate intermittently or remain illuminated all the time.

Lane Change Alert Operation

The lane change alert system shall detect and report objects in the driver's blind zone, or approaching on either side of the vehicle, within a specified lane change zone. The system is designed to alert the driver, with a visual display placed on the side view mirror, to the presence of objects of interest that may not be visible in the inside rearview mirror and outside rear view mirrors. Although this system is intended to help drivers avoid lane change crashes, it does not replace driver vision and therefore should be considered a lane change aid. Even with the lane change alert system, the driver must check carefully for objects outside of the reporting zone before changing lanes. In the event that the system senses a malfunction through its diagnostic routines, the system will be disabled and the driver will be visually notified.

When the vehicle is started, both outside mirror displays will briefly come on to indicate that the system is operating. The warning symbols will vary brightness based on the ambient light conditions. Lane change alert is active when the vehicle is out of park or the parking brake is off on manual transmission vehicles. When the system detects a vehicle in the side blind zone or approaching in the lane change alert zone while driving forward, an amber warning symbol will light up in the appropriate outside mirror. This indicates that it may be unsafe to change lanes. If the driver then activates the turn signal, the amber warning symbol starts flashing as an extra warning not to change lanes.

The system is designed to detect objects of interest as small as a 125cc motorcycle with rider. The detection zone starts at the outside rearview mirror and extends out to 3.5 m (11 ft) at the back corner of the vehicle and 70 m (230 ft) behind the vehicle at a height between 0.5 m (1.5 ft) and 2.0 m (6 ft) above the ground. The system may light up an indicator due to guardrails, signs, trees, shrubs, and other non-moving objects. This is normal system operation; the vehicle does not need service.

If the vehicle is towing a trailer or has an object such as a bicycle rack attached to the rear of the vehicle, the lane change alert system may not function properly and the indicators may illuminate intermittently or remain illuminated all the time. The driver information center may display "SIDE DETECTION SYSTEM UNAVAILABLE".

Foul weather may affect the operation of the lane change alert system. Occasional missed alerts can occur under normal circumstances and will increase in wet conditions. The number of missed alerts will increase with increased rainfall or road spray. Heavy rainfall, as well as mud, dirt, snow, ice, or slush build-up on the rear fascia, can completely disable the system. The warning symbols will vary brightness based on the ambient light conditions.

Rear Cross Traffic Alert Operation

The rear cross traffic alert system is designed to detect moving objects approaching the side of the vehicle while backing up. The detection zone extends approximately 30 m (99 ft) from the rear corner of the car and covers an area from behind the vehicle to 125 degrees towards the front at a height of 0.45 m (1.5 ft) to 2 m (6.5 ft) above ground. The system operates when vehicle speed is 10 km/h (6 mph) or less and is designed to detect objects moving at speeds up to 36 km/h (22 mph).

When the vehicle is backing up, the side object sensors receive energy that is reflected from external objects and determine if the objects are objects of interest or not. The system may at times detect pedestrians, shopping carts, or similar moving objects. This is normal and should not be considered as a false alert or problem with the system. The rear cross traffic alert system will estimate vehicle travel trajectory and use the information in conjunction with object travel trajectory information to determine if there is a potential collision between the vehicle and the object of interest. The rear cross traffic alert function will only alert on objects that pose a potential collision with the host vehicle. The system is not designed to provide an alert to objects that have no potential collision with vehicle.

If the vehicle is towing a trailer or has an object such as a bicycle rack attached to the rear of the vehicle, the rear cross traffic alert system may not function properly.

Foul weather may affect the operation of the rear cross traffic alert system. Occasional missed alerts can occur under normal circumstances and will increase in wet conditions. The number of missed alerts will increase with increased rainfall or road spray. Heavy rainfall, as well as mud, dirt, snow, ice, or slush build-up on the rear fascia, can completely disable the system.

Side Blind Zone Alert Driver Information Center Messages

SIDE BLIND ZONE ALERT OFF

This message indicates that the system has been disabled through the driver information center. Refer to the vehicle owners manual for instructions on how to set personalization options on the driver information center.

LANE CHANGE ALERT OFF

This message indicates that the system has been disabled through the driver information center. Refer to the vehicle owners manual for instructions on how to set personalization options on the driver information center.

REAR CROSS TRAFFIC ALERT OFF

This message indicates that the system has been disabled through the driver information center. Refer to the vehicle owners manual for instructions on how to set personalization options on the driver information center.

SERVICE SIDE DETECTION SYSTEM

This message indicates that the system requires service. When the message is displayed, the indicators will remain illuminated at all times, notifying the driver that the side blind zone and lane change alert should not be relied upon when changing lanes and the rear cross traffic alert will also be inoperative

SIDE DETECTION SYSTEM UNAVAILABLE

This message indicates that the system has been temporarily disabled because the sensor is blocked or can otherwise not accurately detect vehicles or objects. Such instances may be mud, dirt, snow, ice, or slush build-up on the rear fascia, heavy rainfall, excessive road spray, fascia damage or stickers.

The rear cross traffic alert system will read the GPS latitude and longitude on the serial data bus and calculate if the vehicle is within a Radio Astronomy zone. These zones are located in Europe and Japan and require the sensors to be turned off. The "Side Detection System Unavailable" message will be displayed to the driver when this occurs.

FORWARD COLLISION ALERT DESCRIPTION AND OPERATION

The forward collision alert system is a convenience feature of the frontview camera module that issues a warning to the driver when a potential collision risk exists. The frontview camera module is located behind the windshield, looking toward the roadway ahead and detecting vehicles within a distance of approximately 60 meters (197 ft). The forward collision alert system is always active and operates at speeds above 40 kph (25 mph).

When the frontview camera module detects a vehicle in the path ahead, the green vehicle ahead indicator in the vehicle direction display is illuminated. When following a vehicle ahead too closely, the amber collision alert indicator will illuminate and stay on until the following distance is increased. The green vehicle ahead indicator will then be illuminated again. When approaching another vehicle too rapidly, the collision alert symbol will flash in the vehicle direction display and an audible alert sounds. The forward collision alert sensitivity can be adjusted using the forward collision alert switch in the left steering wheel controls.

Front Automatic Braking (if equipped)

When the system detects a vehicle ahead in your path that is traveling in the same direction that you may be about to crash into, it can provide a boost to braking or automatically brake the vehicle. This can help avoid or lessen the severity of crashes when driving in a forward gear. Depending on the situation, the vehicle may automatically brake moderately or hard. This front automatic braking can only occur if a vehicle is detected.

The system works when driving in a forward gear between 5 mph (8 km/h) and 37 mph (60 km/h). It can detect vehicles up to approximately 197 ft (60 m).

Forward collision does not provide a warning to help avoid a crash unless it detects a vehicle. Forward collision alert may not detect a vehicle ahead if the frontview camera module is blocked by dirt, snow, or ice, or if the windshield is damaged. It may also not detect a vehicle on winding or hilly roads, or in conditions that can limit visibility such as fog, rain, or snow, or if the headlamps or windshield are not cleaned or in proper condition. Ensure the windshield, headlamps, and frontview camera module are clean and in good repair. In some cases the forward collision alert system may provide unnecessary alerts for turning vehicles, vehicles in other lanes, objects that are not vehicles, or shadows. These alerts are normal operation and the vehicle does not need service.

The forward collision alert system is made up of the following components:

- Frontview camera module
- Forward collision alert switch
- Instrument cluster/Vehicle direction display
- Infotainment system

Frontview Camera Module

The frontview camera module detects vehicles in front of the host vehicle. The frontview camera module communicates via serial data to the instrument cluster to illuminate the appropriate indicators in the vehicle direction display. The frontview camera module also communicates via serial data with the driver information center to display messages and the radio to request audible alerts.

Forward Collision Alert Switch

The forward collision alert switch provides an input to the frontview camera module to select between four alert timing sensitivity settings. These setting will change the sensitivity for both the following too closely and forward collision alert indicators. In addition to the sensitivity setting, the alert distance will change based upon vehicle speed. The frontview camera module provides a signal voltage to the normally open switch. When the switch is pressed, the signal circuit is pulled to ground through a resistor, indicating to the frontview camera module that the system has been requested to change the alert timing sensitivity. The first button press shows the current alert timing setting on the driver information center. With every button press, the alert timing sensitivity is changed. The current alert timing setting will be maintained until it is changed. The preset alert timing setting is displayed in the top line of the driver information center. The position of the forward collision alert switch can vary with different vehicles. For the exact position please refer to the owner's manual.

Instrument Cluster

The vehicle direction display contains the indicators for the collision alert system and are controlled by the instrument cluster via serial data messages from the frontview camera module. The green vehicle ahead indicator indicates to the driver that the frontview camera module system has detected a vehicle in the driving path ahead. The amber collision alert indicator will illuminated continuously if the system determines that the vehicle ahead is too close. When approaching another vehicle too rapidly, the red collision alert symbol will flash.

Infotainment System

The infotainment system controls the audible alert for the forward collision alert system and is activated via serial data from the frontview camera module. If the host vehicle is approaching another vehicle too rapidly, the infotainment system will command an audible alert to the driver.

Forward Collision Alert System Driver Information Center Messages

The frontview camera module can command the driver information center to display the various messages to alert the driver of a system concern or status information. For detailed information about the possible messages please refer to the owner's manual.

- FORWARD COLLISION ALERT OFF
- SERVICE FRONT CAMERA

REAR VISION CAMERA DESCRIPTION AND OPERATION

Rear Vision Camera System Operation

The rear vision camera system consists of a video camera/module located at the rear of the vehicle and the infotainment display.

When the transmission is placed into REVERSE, a 12 volt signal is sent to the rear vision camera by the body control module (BCM). This signal indicates to the camera that the vehicle is in reverse and image display is requested. The rear vision camera receives ignition voltage and a constant ground to power the camera. Video signal + and video signal - circuits carry the video image from the rear vision camera to the infotainment display. Additionally, the video signal circuits are shielded to prevent any interference which may lead to a loss of video signal resolution and a degraded video image. The shield is provided a ground path by the rear vision camera.

The following conditions may cause a degraded rear vision camera image:

- Ice, snow, or mud has built up on the rear vision camera
- Dark conditions
- Extreme light conditions, such as glare from the sun or the headlights of another vehicle
- Damage to the rear of the vehicle
- Extreme high temperatures or extreme temperature changes

If a malfunction is detected in the system, Service Rear Vision Camera may be displayed on the infotainment display as an indicator to the customer that a problem exists that requires service.

SURROUND VISION CAMERA DESCRIPTION AND OPERATION

WARNING: **The Surround Vision cameras have blind spots and will not display all objects near the corners of the vehicle. Folding side mirrors that are out of position will not display surround view correctly. Always check around the vehicle when parking or backing.**

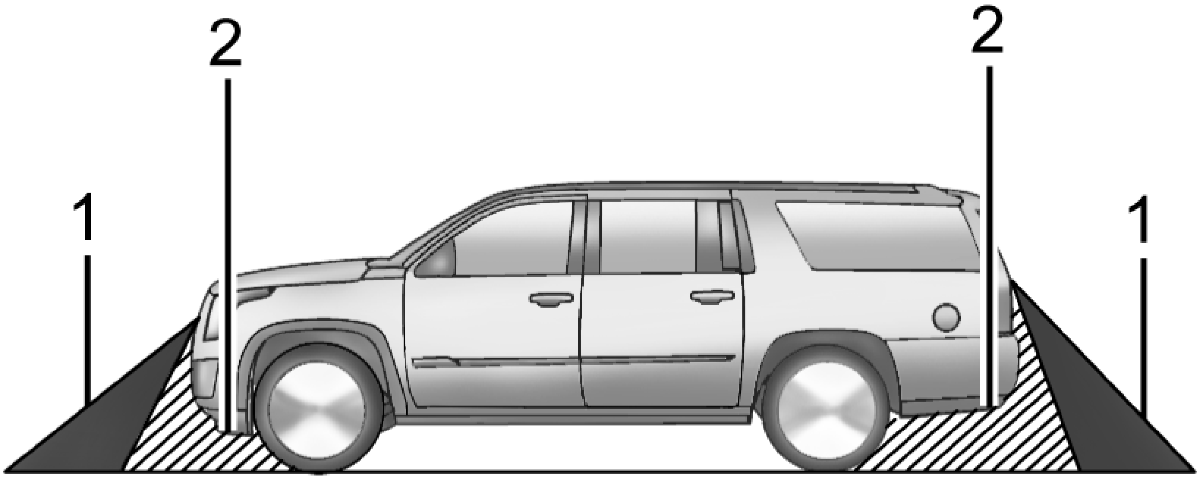

Fig. 28: Surround Vision Camera View And Area
Courtesy of GENERAL MOTORS COMPANY

1. View Displayed by the Surround Vision Camera
2. Area Not Shown

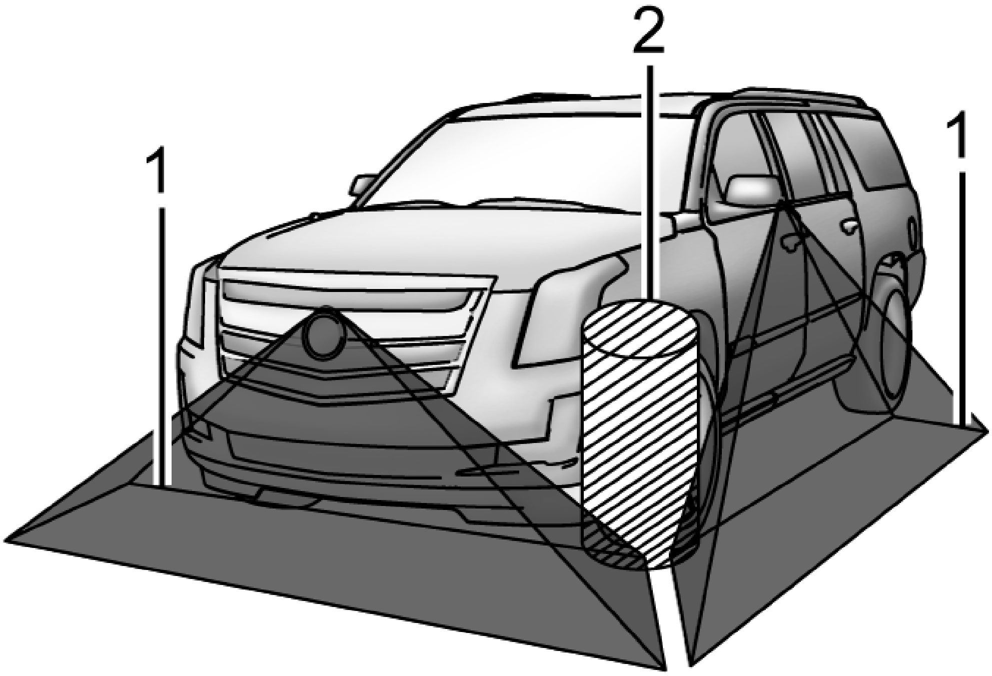

Fig. 29: Surround Vision Camera View And Area
Courtesy of GENERAL MOTORS COMPANY

1. View Displayed by the Surround Vision Camera
2. Area Not Shown

The surround vision camera system consists of the following components:

- B87 Rearview Camera
- B174G Frontview Camera - Grille

- K157 Video Processing Control Module
- A11 Radio **OR** K74 Human Machine Interface Module
- B225L Sideview Camera - Left
- B225R Sideview Camera - Right

When the vehicle is traveling at speeds slower than 6 mph (10 kph) the video processing control module will power up the cameras and send a video signal to the radio or human machine interface module.

The following conditions may cause a degraded surround vision camera image:

- Ice, snow, or mud has built up on the rear vision camera
- Dark conditions
- Extreme light conditions, such as glare from the sun or the headlights of another vehicle
- Damage to the rear of the vehicle
- Extreme high temperatures or extreme temperature changes

Surround Vision displays an overhead view of the area surrounding the vehicle, along with the front or rear camera views in the center stack. The front camera is in the grille or near the front emblem, the side cameras are on the bottom of the outside rearview mirrors, and the rear vision camera is above the license plate.

Features of the Surround Vision System

- Rear camera (B87 Rearview Camera) view alongside overhead view is displayed in reverse
- Front camera (B174G Frontview Camera - Grille) view alongside overhead view is displayed after shifting out of reverse to Neutral or Drive
- Will display front view when front park assist object is within trigger range calibration value (30 cm (12 in) in a forward gear
- Image is removed from display when vehicle speed exceeds speed calibration (10 kph/6 mph) or button press/screen touch

System Operation

The video processing control module sends voltage and a constant ground to power the cameras. Video signal + and video signal - circuits carry the video image from the cameras to the video processing control module for processing. The video processing control module will then send the processed image output to infotainment system by Video signal + and video signal - circuits. Additionally, all the video signal circuits are twisted and shielded to prevent any interference which may lead to a loss of video signal resolution and cause a degraded video image. These circuits must not be spliced/removed from shielding or will cause image degradation.

The video processing control module receives CAN information from Rear Park Assist object detection module and Steering Wheel angle from body control module during Reverse. A warning triangle may display during the 360 surround view screen if Rear Parking Assist has detected an object during a reverse. This triangle changes from amber to red and increases in size the closer the object. Also a dynamic guideline is displayed in Reverse to show the projected path of the vehicle.

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - MOBILE DEVICE WIRELESS CHARGER

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.
- Review the system description and operation in order to familiarize yourself with the system functions. Refer to **Mobile Device Wireless Charger Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which can affect the operation of the power outlets. Refer to **Checking Aftermarket Accessories**
- Inspect the accessible system components or the visible system components for obvious damage or for obvious conditions which can cause the symptom.

Intermittent

Electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections**

Symptom List

Refer to **Mobile Device Wireless Charger Malfunction (with EL-51755)** in order to diagnose the system.

SYMPTOMS - POWER OUTLETS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Visual/Physical Inspection

- Inspect for aftermarket devices which can affect the operation of the power outlets. Refer to **Checking Aftermarket Accessories** .
- Inspect the accessible system components or the visible system components for obvious damage or for obvious conditions which can cause the symptom.

Intermittent

Electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to **Power Outlet Receptacle Malfunction** in order to diagnose the system.

MOBILE DEVICE WIRELESS CHARGER MALFUNCTION (WITH EL-51755)

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	1	1	-	-
Signal	3	2	-	-
Ground	-	1	-	-

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
1. T22 Mobile Device Wireless Charger Module = Inoperative 2. Wireless Charging Indicator = Off 3. Wireless Charging Indicator = On				

Circuit/System Description

For an overview of the component/system, refer to: **Mobile Device Wireless Charger Description and Operation**

Circuit	Description
Ignition	Supplied from a relay.
Signal	The control module input circuit has an internal resistance connected to 12 V. When the switch is closed it will pull the signal voltage low.
Ground	Chassis Ground

Component	Description
T22 Mobile Device Wireless Charger Module	Inductive charging, also known as "wireless charging", uses a magnetic field to transfer energy between two objects. The wireless charger has an induction coil to create an alternating magnetic field. A second induction coil in a portable device takes power from the magnetic field and converts it back into electric current to charge the battery. The two induction coils in proximity work similar as an electrical transformer.
K9 Body Control Module	The module controls various vehicle functions like lighting, central door locking, power windows, etc. The control module also reads various switches and sensors and makes their values available via serial data.

The T22 Mobile Device Wireless Charger Module is controlled by an ignition operated relay and is operational when the ignition is in the Accessory or On position. When a wireless charging device is placed on the charging pad/pocket the charging of the device battery will start. The K9 Body Control Module detects the device battery is charging and sends a serial data message to the P17 Info Display Module which illuminates the charge indicator.

Diagnostic Aids

- Verify the mobile device can be charged with the proper wireless charging adapter. To check for phone or other device compatibility, refer to GM Total Connect website.
- Verify the charging pad/pocket is free from debris or any obstruction that may impede charging.
- The component T22 contains an internal temperature switch that will open if it exceeds 85Â°C (185Â°F).
- The ambient operating temperature is between -20 and 60Â°C (-4 and 140Â°F) for the charging system and between 0 and 35Â°C (32 and 95Â°F) for the mobile device. If the mobile device temperature exceeds 35Â°C (95Â°F) the mobile device may stop accepting a charge (this may vary with different mobile devices).
- Verify the mobile device is positioned correctly on the charging pad/pocket and there are no foreign objects between the mat and the mobile device. It may be necessary to move the device around slightly or rotate 180 degrees to properly align it on the charging pad/pocket until the device starts to charge. The use of a protective case may require more precise device placement to allow charging or may inhibit charging. Try removing the protective case.

- The mobile device may not charge if the charge mat is NOT completely flat or has an air gap which can be verified by a finger push at the target graphic located at the center of the mat. If the charge mat is NOT flat, replace the charge mat/rubber liner.
- While operating the vehicle in rough conditions, it is possible for the device to move out of position, repositioning of the device may be necessary.
- If the mobile device battery is fully charged, the charge indicator on the P17 Info Display Module may not illuminate.

Special Tools

EL-51755 Inductive Charging Test Tool

Equivalent regional tools: **Special Tools**

Circuit/System Verification

WARNING: **Remove all objects from the charging pad before charging your mobile device. Objects, such as coins, keys, rings, paper clips, or cards, between the phone and charging pad will become very hot. On the rare occasion that the charging system does not detect an object, and the object gets wedged between the phone and charger, remove the phone and allow the object to cool before removing it from the charging pad, to prevent burns.**

1. Ignition - On / Vehicle - In Service Mode
2. Verify the charging pad is clear of any wireless device.

   Verify the function: Wireless Charging Indicator = Off

   - If the indicator is On

     Refer to: Circuit/System Testing

   - If the indicator is Off

NOTE: **There is a charging coil located in the center of the Charging Pad/Pocket. The EL-51755 Inductive Charging Test Tool has a charging coil in the center of the tool. These coils must be aligned in order for the test tool to illuminate.**

To complete successfully, the procedure may need to be repeated 5 times. Between each attempt, remove the tool and wait 3 s.

On a charging pad, align the EL-51755 Inductive Charging Test Tool against the alignment rib. In a pocket, insert the EL-51755 Inductive Charging Test Tool until it stops. For both the pad and pocket, ensure that the flat side (non-LED side) of the EL-51755 Inductive Charging Test Tool aligns against the flat charging surface.

3. Install the special tool: EL-51755 Inductive Charging Test Tool at Charging Pad/Pocket

   Verify the function: Special Tools LED (Light Emitting Diode) = On

   - If the special tool is Off

     Refer to: Circuit/System Testing

   - If the special tool is On
4. Verify the function: Wireless Charging Indicator = On
   - If the indicator is Off

     Refer to: Circuit/System Testing

   - If the indicator is On

NOTE: **The customer's device may not be compatible or is defective.**

5. All OK.

Circuit/System Testing

NOTE: **It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.**

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the electrical connector: T22 Mobile Device Wireless Charger Module
3. Test for less than 10 Ω between the test points: Ground circuit terminal 2 & Ground
   - **If 10 Ω or greater**
   1. Disconnect ground terminal.
   2. Test for less than 2 Ω between the test points: Ground circuit terminal 2 at Component harness & The other end of the circuit at Ground terminal
      - If 2 Ω or greater - Repair the open/high resistance in the circuit.
      - If less than 2 Ω - Repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
4. Ignition - On / Vehicle - In Service Mode
5. Verify a test lamp turns On between the test points: Ignition circuit terminal 1 & Ground
   - **If the test lamp does not turn On and the circuit fuse is OK**
   1. Remove - Test Lamp
   2. Test for less than 2 Ω between the test points: Ignition circuit terminal 1 & Output terminal at Fuse
      - If 2 Ω or greater - Repair the open/high resistance in the circuit.
      - If less than 2 Ω Refer to: Retained Accessory Power Malfunction
   - **If the test lamp does not turn On and the circuit fuse is open**
   1. Remove - Test Lamp
   2. Test for infinite resistance between the test points: Ignition circuit terminal 1 & Ground
      - If less than infinite resistance - Repair the short to ground on the circuit.
      - If infinite resistance - Replace the component: T22 Mobile Device Wireless Charger Module.

- **If the test lamp turns On**

6. Verify the function: Wireless Charging Indicator = Off
    - **If the indicator is On**
    1. Ignition/Vehicle - Off
    2. Disconnect the electrical connector: K9 Body Control Module
    3. Test for infinite resistance between the test points: Signal circuit terminal 3 at Component harness & Ground
        - If less than infinite resistance - Repair the short to ground on the circuit.
        - If infinite resistance - Replace the component: K9 Body Control Module
    - **If the indicator is Off**
7. Connect a 3 A fused jumper wire between the test points: Signal circuit terminal 3 & Ground circuit terminal 2
8. Verify the function: Wireless Charging Indicator = On
    - **If the indicator is Off**
    1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
    2. Disconnect the electrical connector: K9 Body Control Module
    3. Ignition - On / Vehicle - In Service Mode
    4. Test for less than 1 V between the test points: Signal circuit terminal 3 at Component harness & Ground
        - If 1 V or greater - Repair the short to voltage on the circuit.
        - If less than 1 V
    5. Ignition/Vehicle - Off
    6. Test for less than 2 Ω between the test points: Signal circuit terminal 3 at Component harness & The other end of the circuit at Control module harness
        - If 2 Ω or greater - Repair the open/high resistance in the circuit.
        - If less than 2 Ω - Replace the component: K9 Body Control Module
    - **If the indicator is On**
9. Test or replace the component: T22 Mobile Device Wireless Charger Module

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: **Diagnostic Repair Verification**

Wireless Charging System Module Replacement - T22 Mobile Device Wireless Charger Module

POWER OUTLET RECEPTACLE MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	1	1	-	-
Ground	-	1	-	-
1. Accessory Power Receptacle Malfunction				

Circuit/System Description

The vehicle is fitted with a 12 V accessory power receptacle. The accessory power outlets are controlled by an ignition operated relay. The accessory power receptacle is operational when Vehicle in Service Mode or Vehicle ON.

Diagnostic Aids

It may be helpful to discuss with the customer the usage of any device that may have drawn too much current and caused an open fuse.

Circuit/System Verification

1. Vehicle in Service Mode, connect an appropriate device to the X80 Accessory Power Receptacle.
2. Verify the device is powered by the X80 Accessory Power Receptacle.
    - **If the device is not powered**

      Refer to Circuit/System Testing

    - **If the device is powered**
3. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the appropriate X80 Accessory Power Receptacle or E32 Cigarette Lighter Receptacle.
2. Test for less than 10 Ω between the ground circuit terminal C and ground.
    - **If greater than 10 Ω**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify that a test lamp illuminates between the control circuit terminal A and ground.
    - **If the test lamp does not illuminate and the circuit fuse/circuit breaker is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the control circuit end to end.
        - If greater than 2 Ω, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse/circuit breaker is not open and there is voltage at the fuse/circuit breaker. Refer to **Retained Accessory Power Malfunction** .
    - **If the test lamp does not illuminate and the circuit fuse/circuit breaker is open**
    1. Vehicle OFF.

2. Test for infinite resistance between the control circuit terminal A and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance, replace the appropriate X80 Accessory Power Receptacle.
  - **If the test lamp illuminates**
5. Replace the appropriate X80 Accessory Power Receptacle or E32 Cigarette Lighter Receptacle.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the X92 USB Receptacle. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 4 and ground.
    - **If greater than 10 Ω**

        1. Ignition OFF.
        2. Test for less than 2 Ω in the ground circuit end to end.
            - If 2 Ω or greater, repair the open/high resistance in the circuit.
            - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**

3. Ignition ON.
4. Verify that a test lamp illuminates between the control circuit terminal 6 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
        1. Ignition OFF.
        2. Test for less than 2 Ω in the control circuit end to end.
            - If greater than 2 Ω, repair the open/high resistance in the circuit.
            - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse. Refer to **Retained Accessory Power Malfunction** .
    - **If the test lamp does not illuminate and the circuit fuse is open**
        1. Ignition OFF.
        2. Test for infinite resistance between the control circuit terminal 6 and ground.
            - If less than infinite resistance, repair the short to ground on the circuit.
            - If infinite resistance, replace the X92 USB Receptacle.
    - **If the test lamp illuminates**
5. Test or replace the X92 USB Receptacle.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Dual Charge Only Receptacle Replacement.

ACCESSORY POWER RECEPTACLE REPLACEMENT

Special Tools

EL-42059 Cigar Lighter Socket Remover

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

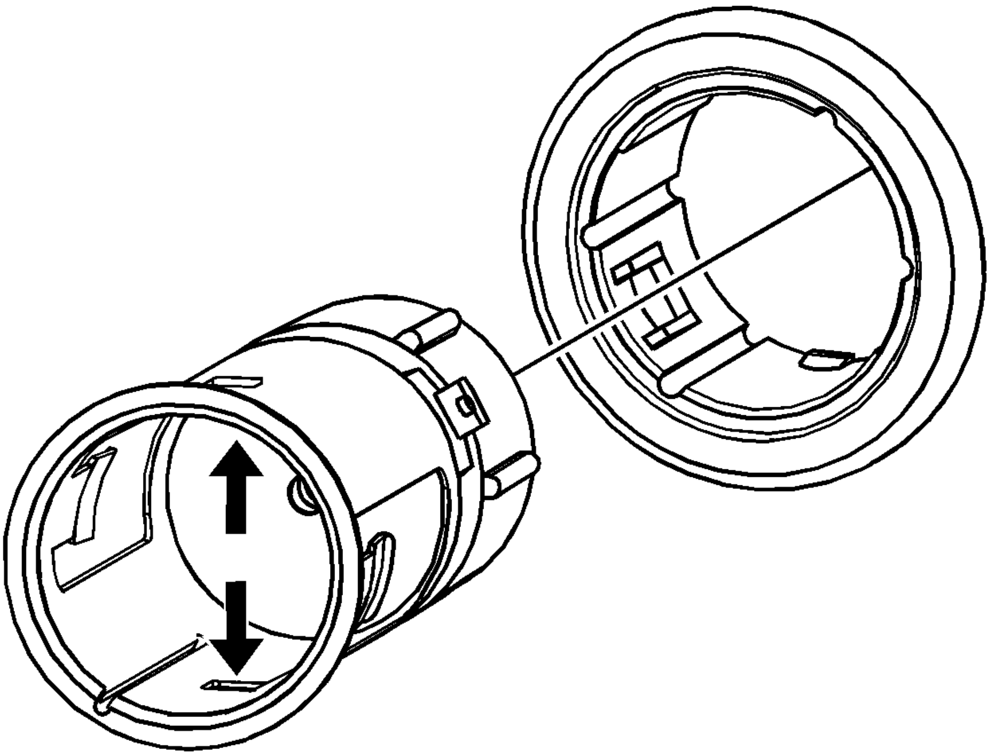

Fig. 10: Cigar Lighter Socket/Accessory Power Outlet
Courtesy of GENERAL MOTORS COMPANY

1. Remove the front floor console compartment trim plate. **Front Floor Console Compartment Trim Plate Replacement**
2. Remove the receptacle:
    1. Look into the receptacle. There are two 3 mm (0.11 in) tab windows 12 mm (0.47 in) from the front of the receptacle. The **EL-42059** remover pushes the plastic latches from these tab windows and the receptacle can be pulled straight out.
    2. Place one side of the "T" portion of the **EL-42059** remover into the tab window. The **EL-42059** remover will not fit straight into the receptacle. Angle the slightly for insertion into the receptacle.
    3. Insert the other side of the "T" into the opposite tab window.

        You must move the **EL-42059** remover handle toward horizontal to engage the other tab window.

    4. Use the **EL-42059** remover to pull the receptacle straight out.

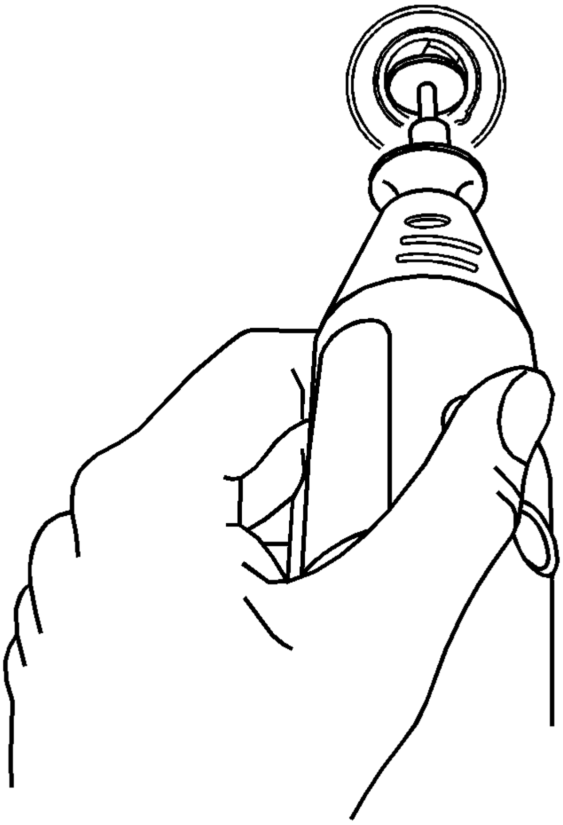

Fig. 11: Removing Cigar Housing Using Grinding Tool
Courtesy of GENERAL MOTORS COMPANY

3. If **EL-42059** remover tool fails to release the lighter socket from the retainer, perform the following alternate method:
    1. Insert a small grinding tool with a cutoff wheel into the socket.
    2. Remove the plastic latches in the 3 mm (0.11 in) square windows.
    3. Use the **EL-42059** remover as directed above to remove the socket.

Installation Procedure

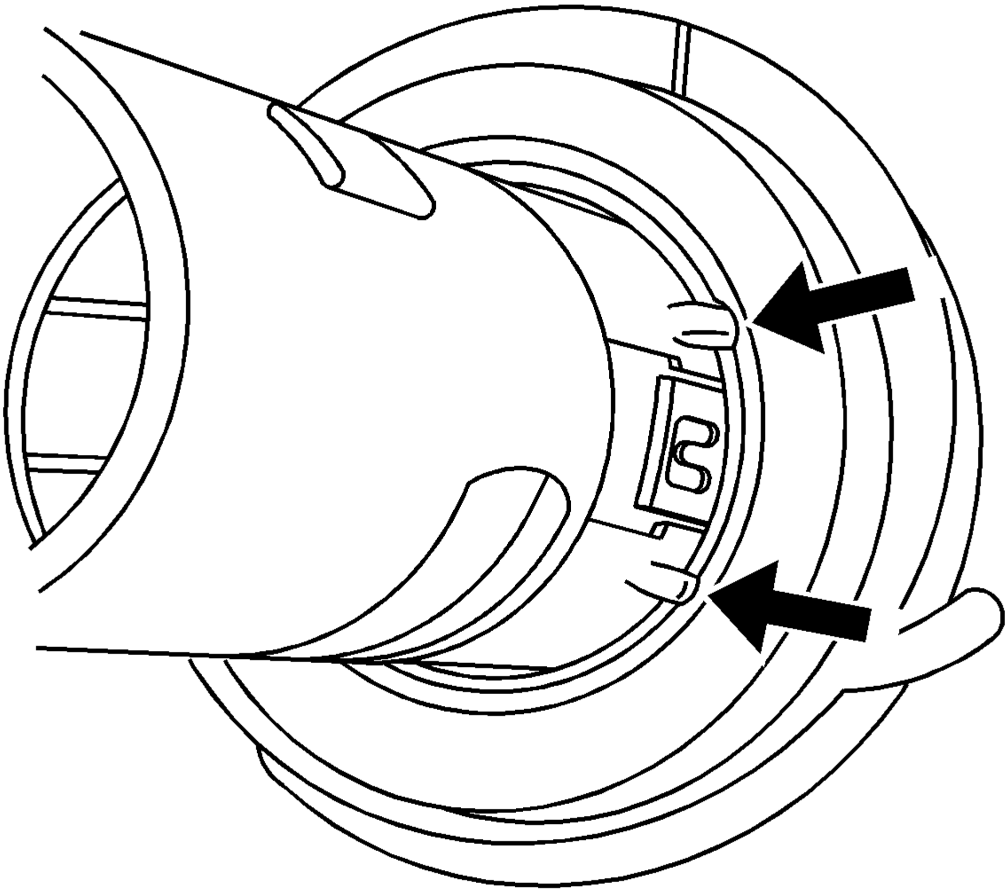

Fig. 12: Receptacle Tabs & Retainer Slots
Courtesy of GENERAL MOTORS COMPANY

1. Route the connector through the retainer. Align the accessory power receptacle retainer to the slot in the opening.
2. Install the retainer by pressing into place fully seated.
3. Align the tabs on the receptacle to the slots in the retainer. Install the accessory power receptacle by pressing into place until fully seated.
4. Install the front floor console compartment trim plate. Front Floor Console Compartment Trim Plate Replacement

DUAL CHARGE ONLY RECEPTACLE REPLACEMENT

DESCRIPTION AND OPERATION

MOBILE DEVICE WIRELESS CHARGER DESCRIPTION AND OPERATION

Mobile Device Wireless Charging System

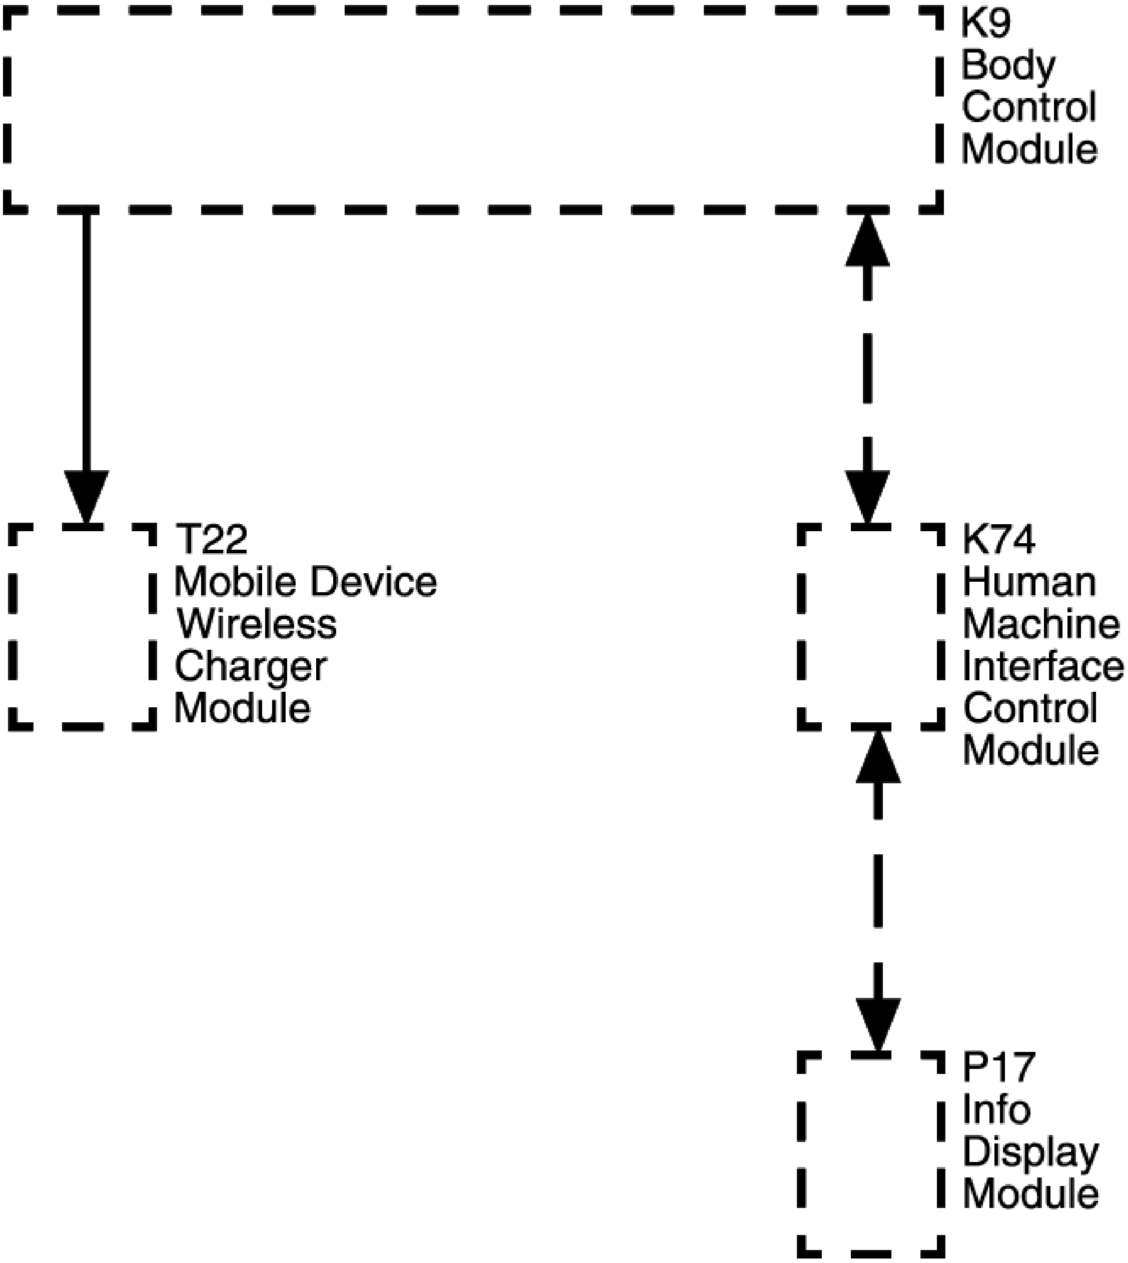

Fig. 14: Mobile Device Wireless Charging System Diagram
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
K9	K9 Body Control Module
T22	Mobile Device Wireless Charger Module
K74	Human Machine Interface Control Module
P17	P17 Info Display Module

The Mobile Device Wireless Charging System (WCS) is an system for wirelessly charging mobile devices. It is capable of charging the batteries of compatible mobile devices. A compatible device is one that is compliant with Power Matters Alliance (PMA) or Wireless Power Consortium (WPC) Standard, meaning that it is equipped with a PMA or WPC wireless charge "receiver" that will work with the charge "transmitter" installed in the vehicle. The devices may utilize built-in charging circuitry or an adapter (external plug-in device which contains the charging circuitry). To check for phone or other device compatibility, refer to GM Total Connect.

WARNING: **Remove all objects from the charging pad before charging your mobile device. Objects, such as coins, keys, rings, paper clips, or cards, between the phone and charging pad will become very hot. On the rare occasion that the charging system does not detect an object, and the object gets wedged between the phone and charger, remove the phone and allow the object to cool before removing it from the charging pad, to prevent burns.**

Charging

To charge a device, place it on the charging surface in the vehicle. There is a charging coil located in the center of the charging surface. The device has a charging coil typically near the center of the device. These coils must be lined up in order for charging to proceed. When the interruptible retained accessory power (IRAP) relay is closed (this is true typically when vehicle ignition is in Run or Accessory position), the WCS will detect the device, establish communications with the device to confirm it is a compatible device, and then deliver charging power to the device via wireless interface. The WCS will be able to deliver up to 5W of power to compatible devices. It shall only enter a charging state if communication is established and a compatible device is identified.

The WCS shall not enter a charging state if there is no communication established with a compatible device. If a non-compatible device or metallic foreign object is detected, the WCS will not transfer power. The charger monitors its internal temperature and will shut down if the charger temperature exceeds 185F (85C).

Indicator

The body control module will detect the device battery is charging and send a serial data message on the GMLAN bus to the radio display. The radio display will indicate a device is currently charging. When the indicator is toggling on and off this indicates a thermal limit has been reached and the device will not charge. For more information refer to the infotainment owners manual.

POWER OUTLETS DESCRIPTION AND OPERATION

System Description

The vehicle is fitted with a cigarette lighter and/or with a 12 V accessory power receptacle. The cigarette lighter and accessory power outlets are controlled by an ignition operated relay. The accessory power receptacle and cigarette lighter are operational when the ignition is turned to either the On or the Accessories positions. To operate the cigarette lighter, press in the lighter knob. When the element is hot, the lighter automatically pops out and is ready for use.

USB Receptacle Description and Operation (USS)

The vehicle is fitted with USB charge port receptacles at the rear of the floor console. These USB receptacles are for charging devices only. The USB receptacles are controlled by an ignition operated relay and are operational when the ignition is turned to either the On or the Accessories positions.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B305D: CHALLENGE ACTIVE CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

DTC Descriptors

DTC B305D

Challenge Active Circuit

For symptom byte information refer to Symptom Byte List

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Challenge Active	B305D 02	-	B305D 01	-

Circuit/System Description

The body control module (BCM) communicates with the remote control door lock receiver through the keyless entry challenge active circuit. The challenge active signal is activated by the keyless entry control module and sent to the BCM when active communication between the vehicle and the keyless entry transmitter is initiated.

Conditions for Running the DTC

- System voltage between 9 - 16 V

- Signal output activated by the keyless entry control module

Conditions for Setting the DTC

B305D 01

A short to voltage is detected on the challenge active circuit.

B305DB 02

A short to ground is detected on the challenge active circuit.

Action Taken When the DTC Sets

No action is taken.

Conditions for Clearing the DTC

- The current DTC will clear when the malfunction is no longer present.
- A history DTC will clear after 50 malfunction-free ignition cycles.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the KR76 Retained Accessory Power Relay. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 3 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Ignition ON, connect a test lamp between the control circuit terminal 5 and ground circuit terminal 3.
4. Verify the test lamp turns ON and OFF when switching the ignition ON and OFF.

- **If the test lamp is always OFF**

1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K84 Keyless Entry Control Module.
2. Test for infinite resistance between the control circuit and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance
3. Test for less than 2 Ω in the control circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K84 Keyless Entry Control Module.

- **If the test lamp is always ON**

1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
2. Test for less than 1 V between the control circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, replace the K84 Keyless Entry Control Module.

- **If the test lamp turns ON and OFF**

5. Test or replace the KR76 Retained Accessory Power Relay.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Relay Replacement (Attached to Wire Harness)** **Relay Replacement (Within an Electrical Center)**
- Refer to **Control Module References** for keyless entry control module replacement, programming and setup.

DTC B3101: KEYLESS ENTRY DATA LINK CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B3101

Keyless Entry Data Link Circuit

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	B3101 00	B3101 00	-	-
Serial Data - Enable Line	B3101 00	B3101 00	B3101 00	B3101 00
Serial Data - Receive	B3101 00	B3101 00	B3101 00	B3101 00
Low Reference	-	B3101 00	-	-

Circuit/System Description

The body control module communicates with the remote control door lock receiver through the keyless entry serial data circuits. When any button on the keyless entry transmitter is pressed, the transmitter sends a signal to the remote control door lock receiver. The remote control door lock receiver sends a function request to the body control module, depending on which button is pressed on the transmitter. The body control module receives the message and performs the appropriate function.

Conditions for Running the DTC

The body control module monitors for this DTC at all times.

Conditions for Setting the DTC

No response is received from the remote control door lock receiver after the body control module requests information from or sends configuration commands to the remote control door lock receiver.

Action Taken When the DTC Sets

In the case of power loss, the remote control door lock receiver is disabled for 65 s. Otherwise no action is taken.

Conditions for Clearing the DTC

- A current DTC will clear when the fault is no longer present.
- A history DTC will clear after 40 consecutive ignition cycles without a fault present.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, scan tool disconnected, disconnect the harness connector at the K77 Remote Control Door Lock Receiver. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 30 Ω between the low reference circuit terminal 1 and ground.
   - **If 30 Ω or greater**
   1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If less than 30 Ω**
3. Ignition ON.
4. Test for greater than 11.5 V between the B+ circuit terminal 4 and ground.

   - **If 11.5 V or less**
   1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If Infinite resistance.
   3. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If greater than 11.5 V**
5. Test for 1 - 6 V between the serial data circuit terminal 2 and ground.
   - **If less than 1 V**
   1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the serial data circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the serial data circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If greater than 6 V**
   1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module, ignition ON.
   2. Test for less than 1 V between the serial data circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K9 Body Control Module.
   - **If between 1 - 6 V**
6. Ignition OFF, disconnect the X1 and X2 harness connectors at the K9 Body Control Module, ignition ON.
7. Test for less than 1 V between the K9 Body Control Module serial data circuit terminal 26 X1 and ground.
   - **If 1 V or greater**

     Repair the short to voltage on the circuit.

   - **If less than 1 V**
8. Ignition OFF.
9. Test for infinite resistance between the K9 Body Control Module serial data circuit terminal 26 X1 and ground.
   - **If less than infinite resistance**

     Repair the short to ground on the circuit.

   - **If infinite resistance**
10. Test for less than 2 Ω between the K9 Body Control Module serial data circuit terminal 26 X1 and the K77 Remote Control Door Lock Receiver serial data circuit terminal 3.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 2 Ω**
11. Replace the K77 Remote Control Door Lock Receiver.
12. Verify DTC B3101 does not set while operating the vehicle under the conditions for running the DTC.
    - **If the DTC sets**

Replace the K9 Body Control Module

- **If the DTC does not set**

13. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for body control module or remote control door lock receiver replacement, programming, and setup.

DTC B3105: KEYLESS ENTRY TRANSMITTERS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B3105

Keyless Entry Transmitters

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

The body control module monitors the number of keyless entry transmitters programmed. Until at least one transmitter is programmed, the body control module determines a malfunction condition exists.

Conditions for Running the DTC

The body control module has been set up without transmitters being programmed.

Conditions for Setting the DTC

No keyless entry transmitter programmed to the body control module.

Action Taken When the DTC Sets

The keyless entry system is inoperative.

Conditions for Clearing the DTC

A current DTC is cleared when at least one transmitter has been programmed to the body control module.

Circuit/System Verification

1. Verify that the transmitter is a correct transmitter for the vehicle. This can be accomplished by comparing the part number printed on the transmitter to the appropriate part number in the parts catalog.
    - **If the transmitter is incorrect**

      Replace the transmitter.

    - **If the transmitter is correct**
2. Program the transmitter. Refer to Key with Integrated Transmitter Programming .
3. Verify the transmitter has successfully completed the programming procedure.
    - **If the transmitter does not program successfully**

      Replace the transmitter.

    - **If the transmitter programs successfully**
4. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Refer to Key with Integrated Transmitter Programming

DTC B3106: KEYLESS ENTRY DATA LINK

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

DTC Descriptor

DTC B3106

Keyless Entry Data Link

For symptom byte information, refer to Symptom Byte List .

Circuit/System Description

The body control module communicates with the remote control door lock receiver through the keyless entry serial data circuits. When any button on the keyless entry transmitter is pressed, the transmitter sends a signal to the remote control door lock receiver. The remote control door lock receiver sends a function request to the body control module, depending on which button is pressed on the transmitter. The body control module receives the message and performs the appropriate function.

Conditions for Running the DTC

A keyless transmitter button is pressed.

Conditions for Setting the DTC

The transmitter that is sending a signal to the remote control door lock receiver is different from those transmitters stored in the body control module.

Action Taken When the DTC Sets

No action is taken.

Conditions for Clearing the DTC

- A current DTC will clear when the fault is no longer present and the ignition switch is cycled.
- A history DTC will clear after 40 consecutive ignition cycles without a fault present.

DTC B3111

Keyless Entry Transmitter 3 Battery

DTC B3112

Keyless Entry Transmitter 4 Battery

DTC B3113

Keyless Entry Transmitter 5 Battery

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

With each press of a keyless entry transmitter button, a message containing the current battery state of the transmitter is sent to the remote control door lock receiver, along with the commanded keyless entry function. The remote control door lock receiver sends this to the body control module to perform the requested function.

Conditions for Running the DTC

A keyless transmitter button is pressed.

Conditions for Setting the DTC

Three consecutive low battery signals are received from the same transmitter.

Action Taken When the DTC Sets

The keyless entry system is inoperative.

Conditions for Clearing the DTC

The DTC is cleared when a normal transmitter voltage signal is received from the transmitter that set the DTC.

2. All OK.

DTC B3119: KEYLESS ENTRY ANTENNA 1

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC B3119

Keyless Entry Antenna 1

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Keyless Entry Antenna Signal - Driver Door	B3119 02	B3119 05	B3119 05	-
Keyless Entry Antenna Low Reference - Driver Door	B3119 02	B3119 05	B3119 05	-

Circuit/System Description

The driver door handle antenna is located in the driver door handle assembly and is used to establish low frequency communications with the keyless entry transmitter. As a vehicle with locked doors is approached with a keyless entry transmitter and the exterior door handle button is pressed, the keyless entry control module communicates with the driver door handle keyless entry antenna.

Conditions for Running the DTC

The exterior driver door handle button is pressed within 15 min of last door closing.

Conditions for Setting the DTC

B3119 02

The keyless entry control module detects a short to ground on the driver door keyless entry antenna signal circuit.

B3119 05

The keyless entry control module detects a short to voltage or an open on the driver door keyless entry antenna signal circuit.

Action Taken When the DTC Sets

Doors will not unlock/lock when the driver exterior door handle button is pressed.

Conditions for Clearing the DTC

- A current DTC will clear when the conditions for setting the DTC are no longer present.
- A history DTC will clear after 40 malfunction-free ignition cycles.

Circuit/System Verification

1. Ignition ON.
2. Verify DTC B3122, B3123, or B3124 is not set.
    - **If any of the DTCs are set**

      Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

    - **If none of the DTCs are set**
3. Refer to Circuit/System Testing.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the T10L Keyless Entry Antenna - Driver Door Handle, ignition ON.
2. Test for less than 1 V between the signal circuit terminal 1 and ground.
    - **If 1 V or greater**
    1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K84 Keyless Entry Control Module.
    - **If less than 1 V**

NOTE: **When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.**

3. Ignition OFF, install a DMM between the signal circuit terminal 1 and ground. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 000.0 V.
4. Lock the vehicle doors using the keyless entry transmitter. Activate the antenna by pressing the exterior door handle button.
5. Verify the MAX voltage captured by the DMM is greater than 1 V.
    - **If 1 V or less**
    1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K84 Keyless Entry Control Module.
    - **If greater than 1 V**
6. Test for less than 1 V between the low reference circuit terminal 2 and ground.
    - **If 1 V or greater**

    1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
    2. Test for less than 1 V between the low reference circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K84 Keyless Entry Control Module.
    - **If less than 1 V**

NOTE: **When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.**

7. Install a DMM between the signal circuit terminal 1 and the low reference circuit terminal 2. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 000.0 V.
8. Lock the vehicle doors using the keyless entry transmitter. Activate the antenna by pressing the exterior door handle button.
9. Verify the MAX voltage captured by the DMM is greater than 1 V.
    - **If 1 V or less**
    1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
    2. Test for infinite resistance between the low reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K84 Keyless Entry Control Module.
    - **If greater than 1 V**
10. Replace the T10L Keyless Entry Antenna - Driver Door Handle.
11. Lock the vehicle doors using the keyless entry transmitter. Activate the antenna by pressing the exterior door handle button.
12. Verify DTC B3119 is not set.
    - **If DTC B3119 is set**

      Replace the K84 Keyless Entry Control Module.

    - **If DTC B3119 is not set**
13. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Front Side Door Outside Handle Bracket Replacement**
- Refer to **Control Module References** for module replacement, programming, and setup

DTC B3120: KEYLESS ENTRY ANTENNA 2

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC B3120

Keyless Entry Antenna 2

For symptom byte information, refer to Symptom Byte List .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Keyless Entry Antenna Signal - Passenger Door	B3120 02	B3120 05	B3120 05	-
Keyless Entry Antenna Low Reference - Passenger Door	B3120 02	B3120 05	B3120 05	-

Circuit/System Description

The passenger front door handle antenna is located in the passenger front door handle assembly and is used to establish low frequency communications with the keyless entry transmitter. As a vehicle with locked doors is approached with a keyless entry transmitter and the exterior door handle button is pressed, the keyless entry control module communicates with the passenger front door handle keyless entry antenna.

Conditions for Running the DTC

The exterior door handle button in the passenger front door handle is pressed within 15 min of the last change of door ajar status for any door.

Conditions for Setting the DTC

B3120 02

The keyless entry control module detects a short to ground on the passenger front door keyless entry antenna signal circuit.

B3120 05

The keyless entry control module detects a short to B+ or an open on the passenger front door keyless entry antenna signal circuit.

Action Taken When the DTC Sets

Doors will not unlock/unlock when the passenger exterior door handle button is pressed.

Conditions for Clearing the DTC

- A current DTC will clear when the conditions for setting the DTC are no longer present.
- A history DTC will clear after 40 malfunction-free ignition cycles.

1. Ignition OFF, disconnect the harness connector at the T10R Keyless Entry Antenna - Passenger Door Handle, ignition ON.
2. Test for less than 1 V between the signal circuit terminal 1 and ground.
   - **If 1 V or greater**
   1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
   2. Test for less than 1 V between the signal circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K84 Keyless Entry Control Module.
   - **If less than 1 V**

NOTE: **When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.**

3. Ignition OFF, install a DMM between the signal circuit terminal 1 and ground. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 000.0 V.
4. Lock the vehicle doors using the keyless entry transmitter. Activate the antenna by pressing the exterior door handle button.
5. Verify the MAX voltage captured by the DMM is greater than 1 V.
   - **If 1 V or less**
   1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
   2. Test for infinite resistance between the signal circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K84 Keyless Entry Control Module.
   - **If greater than 1 V**
6. Test for less than 1 V between the low reference circuit terminal 2 and ground.
   - **If 1 V or greater**
   1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
   2. Test for less than 1 V between the low reference circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.

        - If less than 1 V, replace the K84 Keyless Entry Control Module.
    - **If less than 1 V**

NOTE: **When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.**

7. Install a DMM between the signal circuit terminal 1 and the low reference circuit terminal 2. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 000.0 V.
8. Lock the vehicle doors using the keyless entry transmitter. Activate the antenna by pressing the exterior door handle button.
9. Verify the MAX voltage captured by the DMM is greater than 1 V.
    - **If 1 V or less**
    1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
    2. Test for infinite resistance between the low reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K84 Keyless Entry Control Module.
    - **If greater than 1 V**
10. Replace the T10R Keyless Entry Antenna - Passenger Door Handle.
11. Lock the vehicle doors using the keyless entry transmitter. Activate the antenna by pressing the exterior door handle button.
12. Verify DTC B3120 is not set.
    - **If DTC B3120 is set**

      Replace the K84 Keyless Entry Control Module.

    - **If DTC B3120 is not set**
13. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Front Side Door Outside Handle Bracket Replacement**
- Refer to **Control Module References** for module replacement, programming, and setup

DTC B3121: KEYLESS ENTRY ANTENNA 3

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC B3121

Keyless Entry Antenna 3

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Keyless Entry Antenna Signal - Rear Fascia	B3121 02	B3121 05	B3121 05	-
Keyless Entry Antenna Low Reference - Rear Fascia	B3121 02	B3121 05	B3121 05	-

Circuit/System Description

The rear fascia antenna is located in the rear fascia assembly and is used to establish low frequency communications with the keyless entry transmitter. As a vehicle with locked doors is approached with a keyless entry transmitter and the exterior rear closure touch pad is pressed, the keyless entry control module communicates with the rear fascia keyless entry antenna.

Conditions for Running the DTC

- The rear closure touch pad is pressed.
- The scan tool activates a device control function to simulate the above action.

Conditions for Setting the DTC

B3121 02

The keyless entry control module detects a short to ground on the rear fascia keyless entry antenna signal circuit.

B3121 05

The keyless entry control module detects a short to B+ or an open on the rear fascia keyless entry antenna signal circuit.

Action Taken When the DTC Sets

Rear closure will not open when rear closure touch pad is pressed.

Conditions for Clearing the DTC

- A current DTC will clear when the conditions for setting the DTC are no longer present.
- A history DTC will clear after 40 malfunction-free ignition cycles.

Circuit/System Verification

1. Ignition ON.
2. Verify that DTC B3122, B3123, or B3124 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If none of the DTCs are set**
3. Refer to Circuit/System Testing.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the T10G Keyless Entry Antenna - Rear Fascia, ignition ON.
2. Test for less than 1 V between the signal circuit terminal 1 and ground.
    - **If 1 V or greater**
    1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K84 Keyless Entry Control Module.
    - **If less than 1 V**

NOTE: **When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.**

3. Ignition OFF, install a DMM between the signal circuit terminal 1 and ground. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 000.0 V.
4. Lock the vehicle doors using the keyless entry transmitter. Activate the antenna by pressing the rear closure touch pad.
5. Verify the MAX voltage captured by the DMM is greater than 1 V.
    - **If 1 V or less**
    1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K84 Keyless Entry Control Module.
    - **If greater than 1 V**
6. Test for less than 1 V between the low reference circuit terminal 2 and ground.
    - **If 1 V or greater**
    1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
    2. Test for less than 1 V between the low reference circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K84 Keyless Entry Control Module.
    - **If less than 1 V**

NOTE: **When using the MIN MAX function, autorange on the DMM may not**

function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.

7. Install a DMM between the signal circuit terminal 1 and the low reference circuit terminal 2. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 000.0 V.
8. Lock the vehicle doors using the keyless entry transmitter. Activate the antenna by pressing the rear closure touch pad.
9. Verify the MAX voltage captured by the DMM is greater than 1 V.
    - **If 1 V or less**
    1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
    2. Test for infinite resistance between the low reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K84 Keyless Entry Control Module.
    - **If greater than 1 V**
10. Replace the T10G Keyless Entry Antenna - Rear Fascia.
11. Lock the vehicle doors using the keyless entry transmitter. Activate the antenna by pressing the rear closure touch pad.
12. Verify DTC B3121 is not set.
    - **If DTC B3121 is set**

      Replace the K84 Keyless Entry Control Module.

    - **If DTC B3121 is not set**
13. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Refer to Low Frequency Rear Bumper Antenna Replacement
- Refer to Control Module References for keyless entry control module replacement, programming, and setup

DTC B3122: KEYLESS ENTRY ANTENNA 4

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

DTC Descriptors

DTC B3122

Keyless Entry Antenna 4

For symptom byte information, refer to Symptom Byte List .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Keyless Entry Antenna Signal - Center Console Front	B3122 02	B3122 05	B3122 05	-
Keyless Entry Antenna Low Reference - Center Console Front	B3122 02	B3122 05	B3122 05	-

Circuit/System Description

The front center console antenna is located in front of the center console assembly and is used to establish low frequency communications with the keyless entry transmitter. When the driver attempts to change the ignition status of the vehicle, the keyless entry control module communicates with the front center console antenna.

Conditions for Running the DTC

Pressing the ignition mode switch.

Conditions for Setting the DTC

B3122 02

The keyless entry control module detects a short to ground on the front center console keyless entry antenna signal circuit.

B3122 05

The keyless entry control module detects a short to B+ or an open on the front center console keyless entry antenna signal circuit.

Action Taken When the DTC Sets

Vehicle will not detect the transmitter in some locations inside the vehicle. If the transmitter is not detected then vehicle will not change ignition modes when ignition mode switch is pressed.

Conditions for Clearing the DTC

- A current DTC will clear when the conditions for setting the DTC are no longer present.
- A history DTC will clear after 40 malfunction-free ignition cycles.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the T10J Keyless Entry Antenna - Center Console Front, ignition ON.
2. Test for less than 1 V between the signal circuit terminal 1 and ground.
    - **If 1 V or greater**
        1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
        2. Test for less than 1 V between the signal circuit and ground.
            - If 1 V or greater, repair the short to voltage on the circuit.
            - If less than 1 V, replace the K84 Keyless Entry Control Module.
    - **If less than 1 V**

NOTE: **When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.**

3. Ignition OFF, install a DMM between the signal circuit terminal 1 and ground. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 000.0 V.
4. Activate the antenna by pressing the ignition mode switch.
5. Verify the MAX voltage captured by the DMM is greater than 1 V.
    - **If 1 V or less**
        1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
        2. Test for infinite resistance between the signal circuit and ground.
            - If less than infinite resistance, repair the short to ground on the circuit.
            - If infinite resistance
        3. Test for less than 2 Ω in the signal circuit end to end.
            - If 2 Ω or greater, repair the open/high resistance in the circuit.
            - If less than 2 Ω, replace the K84 Keyless Entry Control Module.
    - **If greater than 1 V**
6. Test for less than 1 V between the low reference circuit terminal 2 and ground.
    - **If 1 V or greater**
        1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
        2. Test for less than 1 V between the low reference circuit and ground.
            - If 1 V or greater, repair the short to voltage on the circuit.
            - If less than 1 V, replace the K84 Keyless Entry Control Module.
    - **If less than 1 V**

NOTE: **When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.**

7. Install a DMM between the signal circuit terminal 1 and the low reference circuit terminal 2. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 000.0 V.
8. Activate the antenna by pressing the ignition mode switch.
9. Verify the MAX voltage captured by the DMM is greater than 1 V.
    - **If 1 V or less**
        1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
        2. Test for infinite resistance between the low reference circuit and ground.

        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K84 Keyless Entry Control Module.
    - **If greater than 1 V**

10. Replace the T10J Keyless Entry Antenna - Center Console Front.
11. Activate the antenna by pressing the ignition mode switch.
12. Verify DTC B3122 is not set.
    - **If DTC B3122 is set**

      Replace the K84 Keyless Entry Control Module.

    - **If DTC B3122 is not set**
13. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Low Frequency Instrument Panel Antenna Replacement**
- Refer to **Control Module References** for keyless entry control module replacement, programming, and setup

DTC B3123: KEYLESS ENTRY ANTENNA 5

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC B3124: KEYLESS ENTRY ANTENNA 6

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC B3124

Keyless Entry Antenna 6

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Keyless Entry Antenna Signal - Rear Compartment	B3124 02	B3124 05	B3124 05	-
Keyless Entry Antenna Low Reference - Rear Compartment	B3124 02	B3124 05	B3124 05	-

Circuit/System Description

The rear compartment antenna is located on the rear compartment floor near the seat back, centered, and is used to establish low frequency communications with the keyless entry transmitter. When the driver attempts to change the ignition status of the vehicle, the keyless entry control module communicates with the rear compartment antenna.

Conditions for Running the DTC

Pressing the ignition mode switch.

Conditions for Setting the DTC

B3124 02

The keyless entry control module detects a short to ground on the rear compartment keyless entry antenna signal circuit.

B3124 05

The keyless entry control module detects a short to B+ or an open on the rear compartment keyless entry antenna signal circuit.

Action Taken When the DTC Sets

Vehicle will not detect the transmitter in some locations inside the vehicle. If the transmitter is not detected then vehicle will not change ignition modes when ignition mode switch is pressed.

Conditions for Clearing the DTC

- A current DTC will clear when the conditions for setting the DTC are no longer present.

- A history DTC will clear after 40 malfunction-free ignition cycles.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the T10E Keyless Entry Antenna - Rear Compartment, ignition ON.
2. Test for less than 1 V between the signal circuit terminal 1 and ground.
    - **If 1 V or greater**
    1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K84 Keyless Entry Control Module.
    - **If less than 1 V**

NOTE: **When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.**

3. Ignition OFF, install a DMM between the signal circuit terminal 1 and ground. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 000.0 V.
4. Activate the antenna by pressing the ignition mode switch.
5. Verify the MAX voltage captured by the DMM is greater than 1 V.
    - **If 1 V or less**
    1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K84 Keyless Entry Control Module.
    - **If greater than 1 V**

6. Test for less than 1 V between the low reference circuit terminal 2 and ground.
    - **If 1 V or greater**
    1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
    2. Test for less than 1 V between the low reference circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K84 Keyless Entry Control Module.
    - **If less than 1 V**

NOTE: **When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.**

7. Install a DMM between the signal circuit terminal 1 and the low reference circuit terminal 2. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 000.0 V.
8. Activate the antenna by pressing the ignition mode switch.
9. Verify the MAX voltage captured by the DMM is greater than 1 V.
    - **If 1 V or less**
    1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
    2. Test for infinite resistance between the low reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K84 Keyless Entry Control Module.
    - **If greater than 1 V**
10. Replace the T10E Keyless Entry Antenna - Rear Compartment.
11. Activate the antenna by pressing the ignition mode switch.
12. Verify DTC B3124 is not set.
    - **If DTC B3124 is set**

      Replace the K84 Keyless Entry Control Module.

    - **If DTC B3124 is not set**
13. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Low Frequency Rear Compartment Antenna Replacement**
- Refer to **Control Module References** for module replacement, programming, and setup

SYMPTOMS - REMOTE FUNCTIONS

IMPORTANT: The following steps must be completed before using the symptom tables.

1. Perform **Diagnostic System Check - Vehicle** before using the Symptom Tables in order to verify that all of the following are true:
    - There are no DTCs set.
    - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Keyless Entry System Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Keyless Entry System. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

Keyless Entry System Malfunction

NO REMOTE DETECTED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Keyless Entry Antenna Signal - Center Console Front	B3122 02	B3122 05	B3122 05	-
Keyless Entry Antenna Low Reference - Center Console Front	B3122 02	B3122 05	B3122 05	-
Keyless Entry Antenna Signal - Center Console Rear	B3123 02	B3123 05	B3123 05	-
Keyless Entry Antenna Low Reference - Center Console Rear	B3123 02	B3123 05	B3123 05	-
Keyless Entry Antenna Signal - Rear Compartment	B3124 02	B3124 05	B3124 05	-
Keyless Entry Antenna Low Reference - Rear Compartment	B3124 02	B3124 05	B3124 05	-

Circuit/System Description

When a transmitter authentication is requested, the front console, rear console, and rear compartment antennas simultaneously broadcast a challenge within the passenger compartment to the transmitter. If the response from the transmitter via radio frequency (RF) is a valid response, the body control module (BCM) determines there is a transmitter within the vehicle. If no response is received, the BCM determines that no transmitter is in the vehicle, and NO REMOTE DETECTED will be displayed on the DIC.

Diagnostic Aids

A low transmitter battery or radio frequency (RF) interference from aftermarket devices such as 2-way radios, power inverters, cellular phone chargers, computers, 12 V power outlet USB converters, etc. may cause a system malfunction. High RF traffic areas, such as gas stations which use pay-at-the-pump RF transponders, may also cause interference that could lead to a malfunction.

Conditions caused by external influences such are these are considered to be normal. Following this diagnostic will not diagnose an RF interference condition. If RF interference is suspected, question the customer about the conditions or location where the NO REMOTE DETECTED condition occurs.

Description and Operation

Keyless Entry System Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

NOTE: **This condition may be caused by low vehicle battery voltage. If the battery is not sufficiently charged (above 10 volts), the system will have difficulties detecting the transmitter and the NO REMOTE DETECTED message will be displayed. Correct the low battery voltage condition to eliminate this condition.**

1. Verify that DTC B3119, B3120, B3121, B3122, B3123, or B3124 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If none of the DTCs are set**
2. Lock the vehicle using the keyless entry transmitter.
3. Verify that each door unlocks and opens by approaching the vehicle with a valid transmitter and operating their respective exterior door handle button.
    - **If both doors do not unlock/unlatch and open**

      Refer to **Keyless Entry System Malfunction**.

    - **If both doors unlock/unlatch and open**
4. Verify the vehicle starts with the transmitter located in the key pocket/slot.
    - **If the vehicle does not start**

      Perform the **Remote Control Door Lock and Theft Deterrent Transmitter Programming** procedure.

    - **If the vehicle starts**
5. Verify the NO REMOTE DETECTED message is not displayed on the DIC while attempting to start the vehicle, placing the keyless entry transmitter in various locations within the vehicle interior at each start attempt. The vehicle should start.
    - **If the NO REMOTE DETECTED message is displayed at any time**

Refer to Circuit/System Testing.

- **If the NO REMOTE DETECTED message is not displayed and the vehicle starts**

6. Inspect for any sources of RF interference such as cell phone chargers, power supplies, etc. that would interrupt transmitter and antenna communication. If inspection does not reveal any items causing RF interference, discuss with the customer the conditions or location where the NO REMOTE DETECTED condition occurs. Discuss any devices that are normally kept in the vehicle, such as a laptop or cell phone charger, which may have been removed when the vehicle was brought in for service. It may be necessary to explain to the customer how RF interference degrades the performance of the system.

Circuit/System Testing

NOTE: **To determine the appropriate T10 Keyless Entry Antenna to disconnect and diagnose, place the transmitter in various location within the vehicle's interior and attempt to start. The location of the transmitter when the NO REMOTE DETECTED message occurs will correspond with the T10 Keyless Entry Antenna that requires diagnosis.**

1. Ignition OFF, disconnect the harness connector at the appropriate T10 Keyless Entry Antenna, ignition ON.
2. Test for less than 1 V between the signal circuit terminal 1 and ground.
   - **If 1 V or greater**
   1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
   2. Test for less than 1 V between the signal circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K84 Keyless Entry Control Module.
   - **If less than 1 V**

NOTE: **When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.**

3. Ignition OFF, install a DMM between the signal circuit terminal 1 and ground. Set the DMM to capture DC voltage using the MIN MAX function.
4. Activate the antenna by pressing the ignition mode switch.
5. Verify the MAX voltage captured by the DMM is greater than 1 V.
   - **If 1 V or less**
   1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
   2. Test for infinite resistance between the signal circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K84 Keyless Entry Control Module.
   - **If greater than 1 V**
6. Test for less than 1 V between the low reference circuit terminal 2 and ground.
   - **If 1 V or greater**
   1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
   2. Test for less than 1 V between the low reference circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K84 Keyless Entry Control Module.

- **If less than 1 V**

NOTE: **When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.**

7. Install a DMM between the signal circuit terminal 1 and the low reference circuit terminal 2. Set the DMM to capture DC voltage using the MIN MAX function.
8. Activate the antenna by pressing the ignition mode switch.
9. Verify the MAX voltage captured by the DMM is greater than 1 V.
    - **If 1 V or less**
    1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
    2. Test for infinite resistance between the low reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K84 Keyless Entry Control Module.
    - **If greater than 1 V**
10. Replace the appropriate T10 Keyless Entry Antenna.
11. Activate the antenna by pressing the ignition mode switch.
12. Verify the NO REMOTE DETECTED message is not displayed and the vehicle starts.
    - **If the NO REMOTE DETECTED message is displayed and the vehicle does not start**

      Replace the K84 Keyless Entry Control Module.

    - **If the NO REMOTE DETECTED message is not displayed and the vehicle starts**
13. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Refer to Low Frequency Instrument Panel Antenna Replacement
- Refer to Low Frequency Console Antenna Replacement
- Refer to Low Frequency Rear Compartment Antenna Replacement
- Refer to Control Module References for module replacement, programming, and setup

KEYLESS ENTRY SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

Circuit/System Description

The keyless entry transmitter is part of the vehicle key. The keyless entry system will unlock the vehicle doors or open/unlock the rear compartment when a corresponding button on the keyless entry transmitter is pressed. This is accomplished by the keyless entry transmitter sending a radio frequency to the remote control door lock receiver, which then sends the signal to the body control module (BCM). The BCM interprets the signal and activates the requested function. A low transmitter battery or radio frequency (RF) interference from aftermarket devices such as 2-way radios, power inverters, cellular phone chargers, computers, etc. may cause a system malfunction. High RF traffic areas, such as gas stations which use pay-at-the-pump RF transponders, may also cause interference that could lead to a malfunction.

Diagnostic Aids

- Unwanted or inadvertent door lock/unlock activation may be requested by the OnStarÃ‚Â® Remote Link app. It is possible that a customer may be unaware of account usage, result in an unwanted or phantom door lock/unlock. If normal system diagnosis does results in an inability to verify the customer's concern, contact Technical Assistance Center (TAC).
- If available, the EL 43241 Keyless Entry Tester may be used to diagnose a low transmitter battery or a malfunctioning transmitter. To test, place the transmitter on the test pad of the EL 43241 and press each transmitter button one at a time, holding each button for three seconds. If the green light on the tester does not illuminate and a tone does not sound, first replace the transmitter battery and retest. If the malfunction continues after replacing the transmitter battery, replace the transmitter.
- When using the EL 43241 Keyless Entry Tester, first inspect the keyless entry transmitter part number to determine that it is the correct model for the vehicle. An incorrect part number transmitter may pass the test, but it will not activate the keyless entry system.
- When the vehicle key is in the ignition, the keyless entry functions are disabled from all keyless entry transmitters.

Scan Tool Reference

Control Module References for remote control door lock receiver scan tool information

Special Tools

EL 43241 Keyless Entry Tester

Circuit/System Verification

1. Verify that the vehicle key is correct for the vehicle. This can be accomplished by comparing the part number printed on the key to the appropriate part number in the parts catalog.
   - **If the vehicle key is incorrect**

     Replace the vehicle key.

   - **If the vehicle key is correct**
2. Verify the K77 Remote Control Door Lock Receiver scan tool 5 V Ignition Switch parameter displays OFF.
   - **If the 5 V Ignition Switch parameter does not display OFF**

     Refer to **Vehicle Will Not Change Power Mode** .

- **If the 5 V Ignition Switch parameter displays OFF**

3. Operate the transmitter while observing the scan tool Key Fob Function parameter for the appropriate transmitter.
4. Verify the K77 Remote Control Door Lock Receiver scan tool Key Fob Function parameter corresponds with the function selected on the transmitter.
    - **If the Key Fob Function parameter does not correspond with the transmitter selection**

      NOTE: **Before replacing the transmitter, inspect the transmitter battery contacts for any corrosion or damage. If no corrosion or damage is found, replace the transmitter battery and retest before replacing the transmitter.**

    1. Replace the vehicle key.
    2. Operate the new transmitter while observing the K77 Remote Control Door Lock Receiver scan tool Key Fob Function parameter for the transmitter.
    3. Verify the K77 Remote Control Door Lock Receiver scan tool Key Fob Function parameter correspond with the function selected on the transmitter.
        - **If the Key Fob Function parameter does not correspond with the transmitter selection**

          Perform Circuit/System Testing.

        - **If the Key Fob Function parameter corresponds with the transmitter selection**
    4. All OK.
    - **If the Key Fob Function parameter corresponds with the transmitter selection**
5. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, scan tool disconnected, disconnect the harness connector at the K77 Remote Control Door Lock Receiver. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 30 Ω between the low reference circuit terminal 1 and ground.
    - **If 30 Ω or greater**
    1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If less than 30 Ω**
3. Ignition ON.
4. Test for greater than 11.5 V between the B+ circuit terminal 4 and ground.
    - **If 11.5 V or less**
    1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If Infinite resistance.
    3. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If greater than 11.5 V**
5. Test for 0.1 - 6 V between the serial data circuit terminal 2 and ground.
    - **If less than 0.1 V**
    1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the serial data circuit and ground.

        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the serial data circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If greater than 6 V**
    1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module, ignition ON.
    2. Test for less than 0.1 V between the serial data circuit and ground.
        - If 0.1 V or greater, repair the short to voltage on the circuit.
        - If less than 0.1 V, replace the K9 Body Control Module.
    - **If between 0.1 - 6 V**
6. Ignition OFF, disconnect the X1 and X2 harness connectors at the K9 Body Control Module, ignition ON.
7. Test for less than 0.1 V between the K9 Body Control Module serial data circuit terminal 26 X1 and ground.
    - **If 0.1 V or greater**

      Repair the short to voltage on the circuit.

    - **If less than 0.1 V**
8. Ignition OFF.
9. Test for infinite resistance between the K9 Body Control Module serial data circuit terminal 26 X1 and ground.
    - **If less than infinite resistance**

      Repair the short to ground on the circuit.

    - **If infinite resistance**
10. Test for less than 2 Ω between the K9 Body Control Module serial data circuit terminal 26 X1 and the K77 Remote Control Door Lock Receiver serial data circuit terminal 3.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 2 Ω**
11. Replace the K77 Remote Control Door Lock Receiver.
12. Verify the keyless entry functions operate.
    - **If the keyless entry functions do not operate**

      Replace the K9 Body Control Module

    - **If the keyless entry functions operate**
13. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Refer to Key with Integrated Transmitter Programming
- Refer to Control Module References for module replacement, programming, and setup

REMOTE VEHICLE START MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.

- Review **Strategy Based Diagnosis** for an overview of each diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Circuit/System Description

Remote start begins as a radio frequency message sent from a keyless entry transmitter to the remote control door lock receiver. The message is then transferred to the body control module (BCM). The BCM monitors system conditions such as content theft deterrent, hood ajar status, and body DTCs to determine if a remote start event will occur. If conditions are determined to be acceptable, the BCM will activate the appropriate vehicle systems.

Diagnostic Aids

- The scan tool Body Control Module Remote Vehicle Start Disable History 1 Data and Remote Vehicle Start Disable History 2 Data lists can be used to help isolate an intermittent malfunction with remote vehicle starting. These data lists identify the status of various items that may disable remote vehicle starting during the past two remote vehicle start attempts. Any parameters that does not equal the expected result required for remote vehicle starting should be diagnosed in their respective subsection.
- Only the first and second vehicle transmitters are able to control the remote vehicle start function.
- Unwanted or inadvertent door lock/unlock activation may be requested by the OnStarÃ‚Â® Remote Link application. It is possible that a customer may be unaware of account usage, resulting in an unwanted or phantom door lock/unlock. If normal system diagnosis results in an inability to verify the customer's concern, contact Technical Assistance Center (TAC).
- If the vehicle has a current vehicle DTC that illuminates the malfunction indicator lamp, the cause of the DTC must be diagnosed before proceeding with the remote start malfunction diagnostic.

Control Module References for scan tool information

Circuit/System Verification

1. Verify the scan tool Body Control Module Push Button Ignition Switch parameter changes between Active and Inactive when pressing and releasing the S38 Vehicle On/Off Switch.
    - **If the parameter does not change**

      Refer to **Vehicle Will Not Change Power Mode** .

    - **If the parameter changes**
2. Verify that remote vehicle start is enabled through vehicle personalization.

- **If remote vehicle start is not enabled through vehicle personalization**

  Use vehicle personalization to turn on remote vehicle start functionality. Refer to the vehicle owners manual.

- **If remote vehicle start is enabled**

3. Verify that the keyless entry functions operate with all available keyless entry transmitters.
   - **If the keyless entry functions do not operate properly**

     Refer to Keyless Entry System Malfunction.

   - **If the keyless entry functions operate properly**
4. Verify none of the following conditions exist on the vehicle:
   - A current vehicle DTC that illuminates the malfunction indicator lamp (MIL)
   - The vehicle is in valet mode
   - More than two remote starts have been attempted
   - The hazard switch is in the ON position
   - A current hazard switch DTC is set
   - The vehicle hood is ajar
   - A current hood ajar DTC is set
   - The content theft deterrent system detects an alarm trigger
   - Accelerator pedal position greater than 0 percent
   - Vehicle not in park
   - Immobilizer malfunction
   - A current automatic transmission shift lock control system DTC is set
   - A vehicle speed sensor signal is detected by the ECM
   - The vehicle power moding is being controlled by a backup device
   - **If any of the conditions are present**

     Refer to the appropriate subsection in which the failure occurred.

   - **If none of the conditions are present**
5. All OK.

ELECTRONIC TOLL COLLECTION SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
Ignition	1	1	-
Ground	-	1	1
1. Electronic Toll Collection System Inoperative			

Circuit/System Description

The electronic toll collection system uses power and ground from the inside rearview mirror. The components of the electronic toll collection system are internal to the inside rearview mirror and not serviceable.

Reference Information

Connector End View Reference

COMPONENT CONNECTOR END VIEWS - INDEX

Description and Operation

Electronic Toll Collection System Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the A10 Inside Rearview Mirror. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 5 and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
   - If 2 Ω or greater, repair the open/high resistance in the circuit.
   - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Ignition ON.
4. Verify a test lamp illuminates between the ignition circuit terminal 2 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition OFF.
   2. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition OFF.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the A10 Inside Rearview Mirror.
   - **If the test lamp illuminates**
5. Replace the A10 Inside Rearview Mirror.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Inside Rearview Mirror Replacement**

REPAIR INSTRUCTIONS

LOW FREQUENCY INSTRUMENT PANEL ANTENNA REPLACEMENT

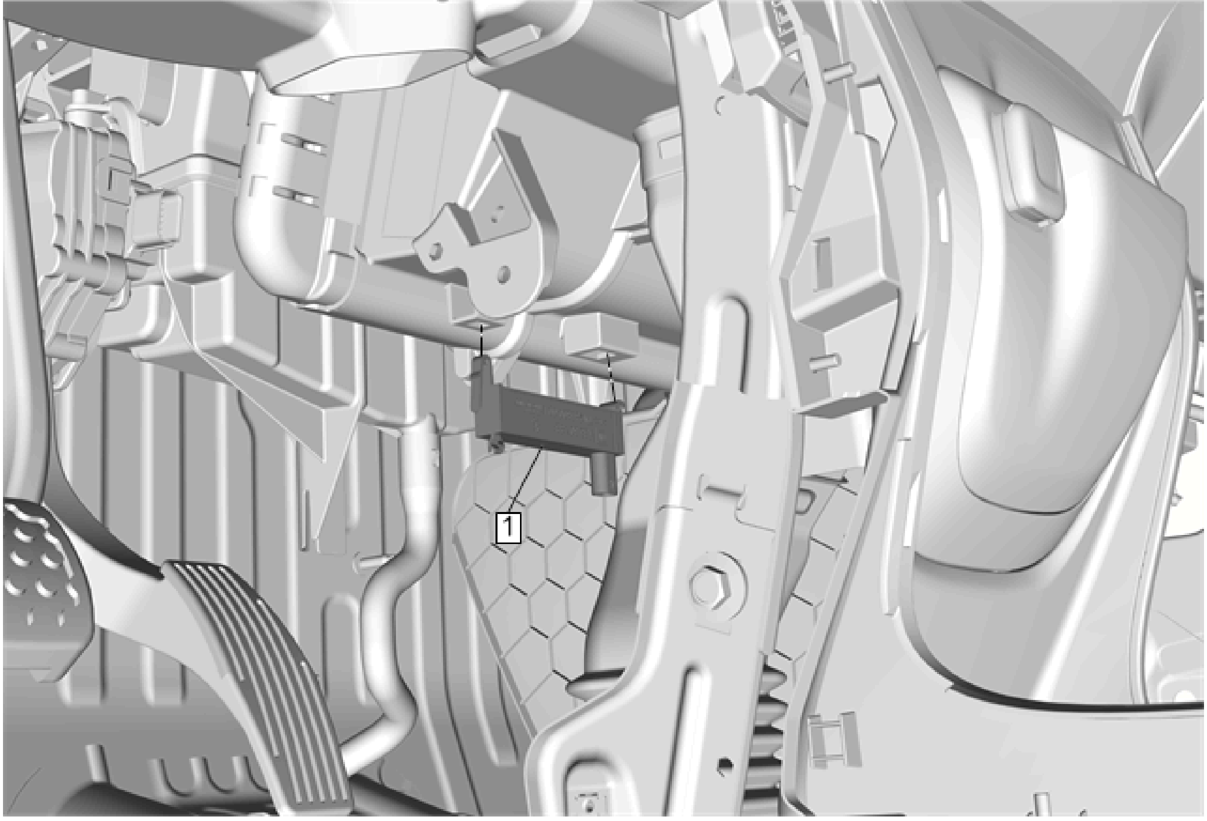

Fig. 3: Low Frequency Instrument Panel Antenna
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Front Floor Console. Refer to Front Floor Console Replacement	
1	Low Frequency Instrument Panel Antenna **Procedure** Disconnect the electrical connector.

LOW FREQUENCY CONSOLE ANTENNA REPLACEMENT

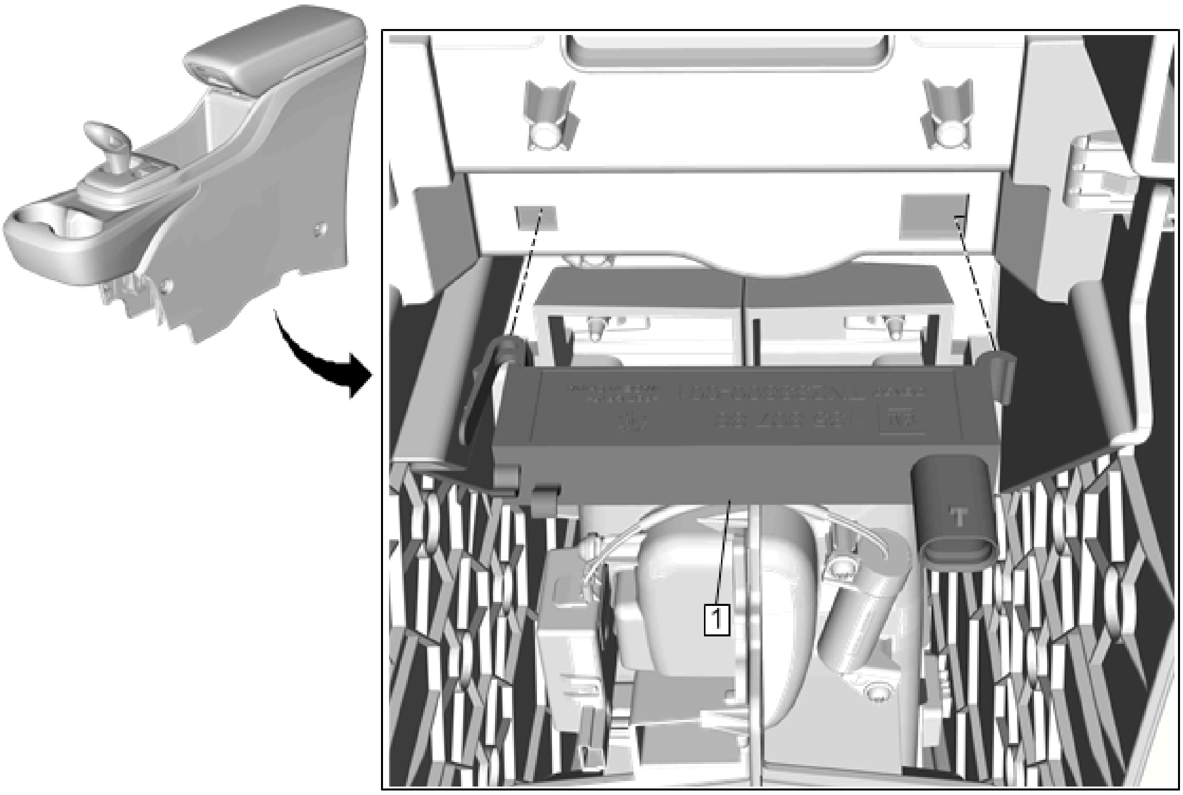

Fig. 4: Low Frequency Console Antenna
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Rear Floor Console. Refer to Rear Floor Console Replacement	
1	Low Frequency Console Antenna **Procedure** Disconnect the electrical connector.

LOW FREQUENCY REAR COMPARTMENT ANTENNA REPLACEMENT

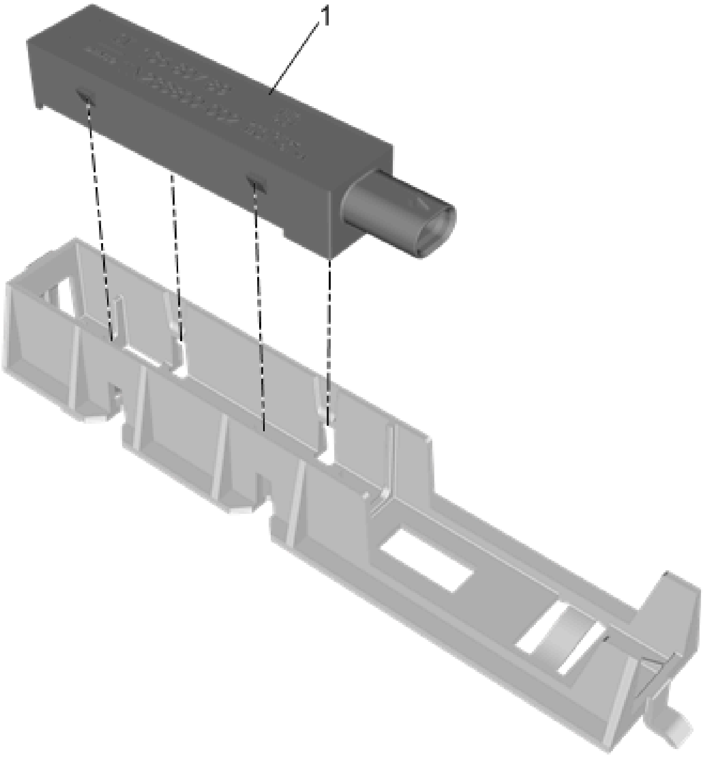

Fig. 5: Low Frequency Rear Compartment Antenna
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Low Frequency Rear Compartment Antenna Bracket. Refer to Low Frequency Rear Compartment Antenna Bracket Replacement	
1	Low Frequency Rear Compartment Antenna **Procedure** Using a suitable tool, release the retaining tabs and remove the low frequency antenna.

LOW FREQUENCY REAR BUMPER ANTENNA REPLACEMENT

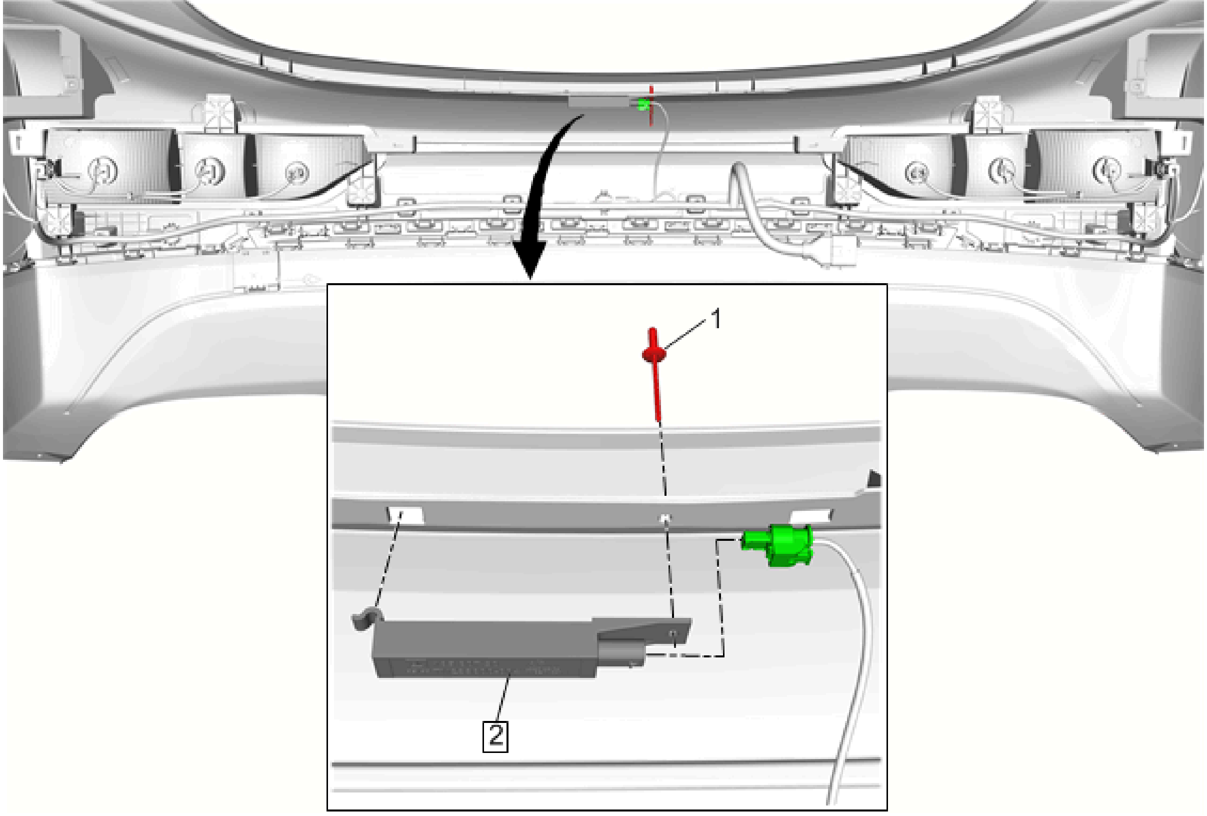

Fig. 6: Low Frequency Rear Bumper Antenna
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Rear Bumper Fascia. Refer to **Rear Bumper Fascia Replacement**	
1	Low Frequency Rear Bumper Antenna Rivet **WARNING:** **Eye protection must be worn when drilling rivets to reduce the chance of personal injury.** **Procedure** 1. Disconnect the electrical connector. 2. Drill out the rivet on the low frequency rear bumper antenna.
2	Low Frequency Rear Bumper Antenna

KEYLESS ENTRY CONTROL MODULE REPLACEMENT

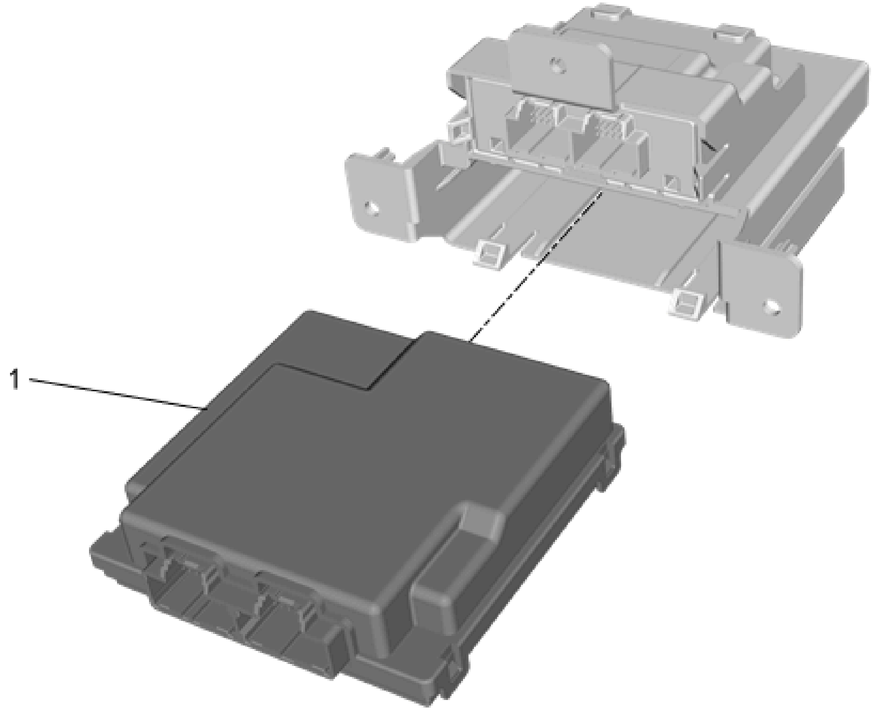

Fig. 7: Keyless Entry Control Module
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Keyless Entry Control Module Bracket. Refer to Keyless Entry Control Module Bracket Replacement	
1	Keyless Entry Control Module **Procedure** 1. Release the retaining tabs. 2. Perform the necessary programming and setup procedure. Refer to Control Module References

KEYLESS ENTRY CONTROL MODULE BRACKET REPLACEMENT

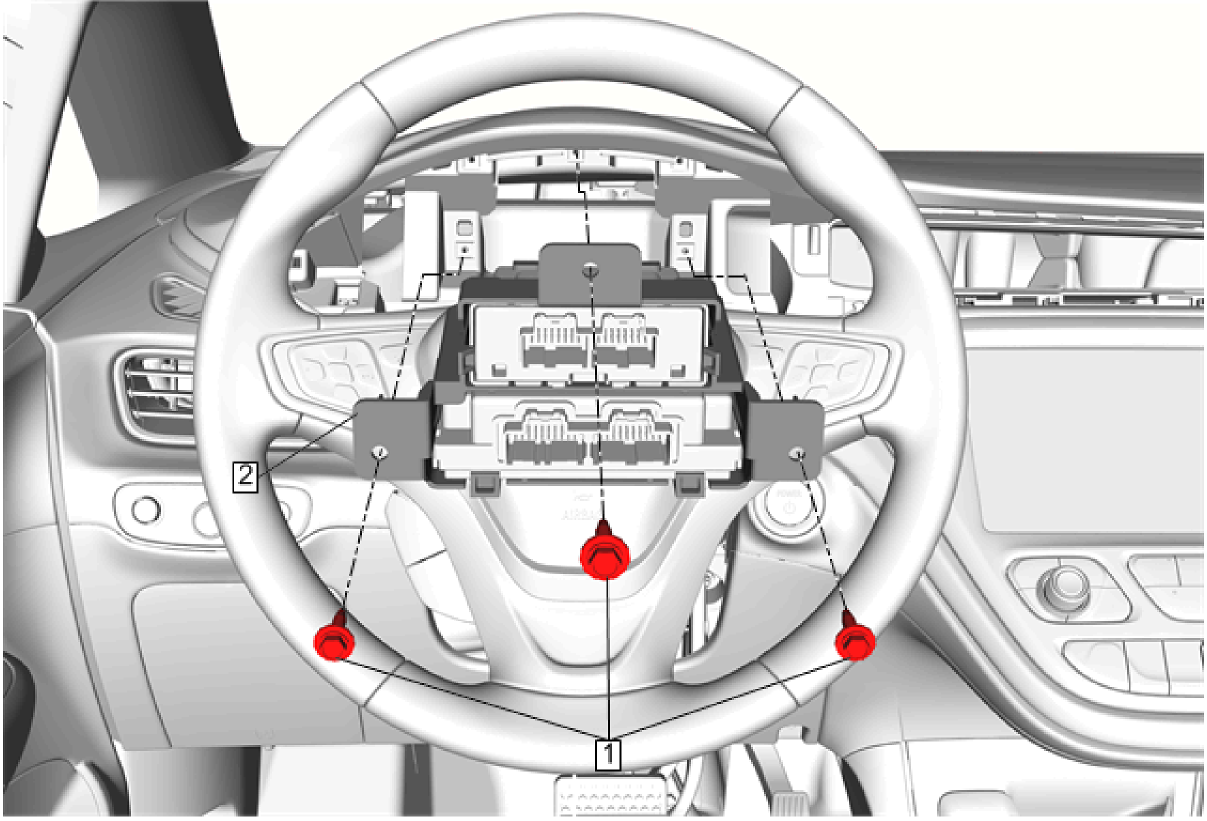

Fig. 8: Keyless Entry Control Module Bracket
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove Instrument Cluster. Refer to Instrument Cluster Replacement 2. Disconnect the electrical connectors for keyless entry control module and serial data gateway module.	
1	Keyless Entry Control Module Bracket Bolt (Qty: 3) **CAUTION:** **Refer to Fastener Caution** **Tighten** 2.5 N.m (22 lb in)
2	Keyless Entry Control Module Bracket **Procedure** Transfer keyless entry control module and serial data gateway module as necessary.

REMOTE CONTROL DOOR LOCK RECEIVER REPLACEMENT

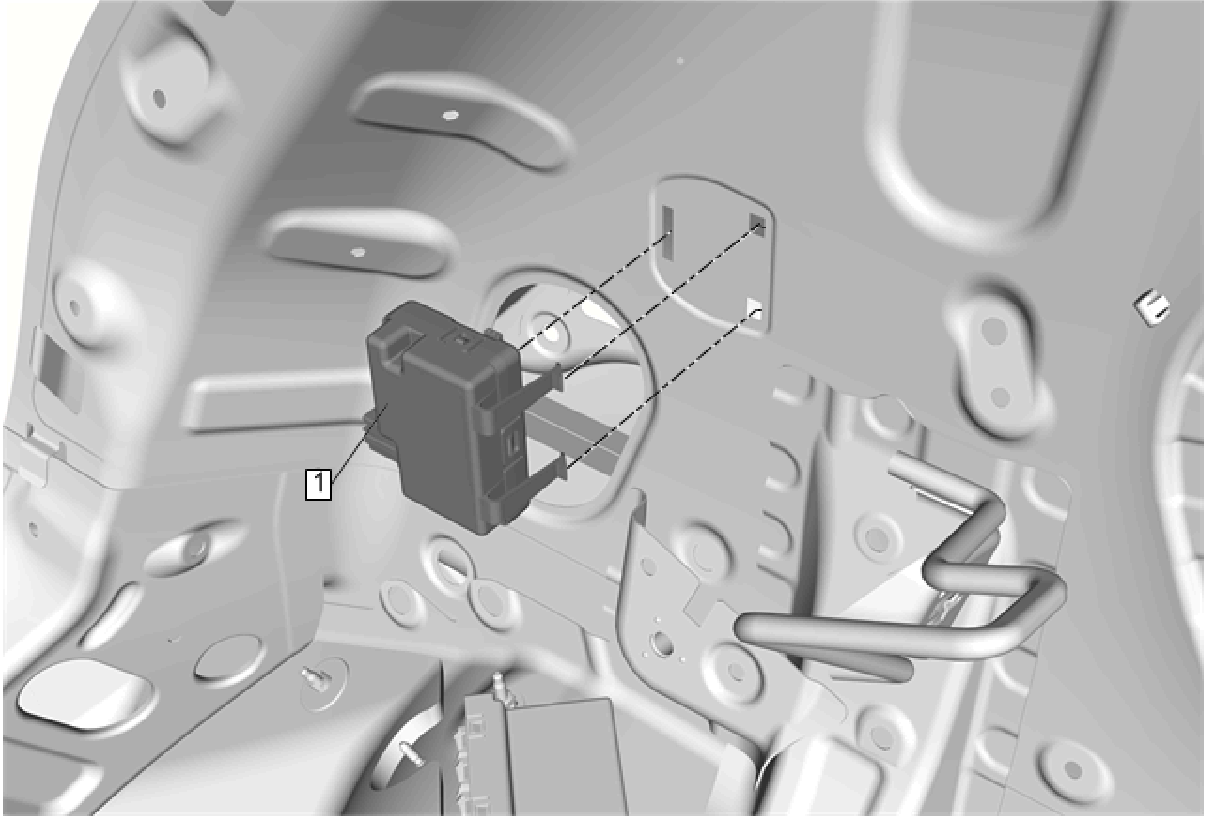

Fig. 9: Remote Control Door Lock Receiver
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Quarter Lower Rear Trim Panel - Left Side. Refer to Quarter Lower Rear Trim Panel Replacement	
1	Remote Control Door Lock Receiver **Procedure** Disconnect the electrical connector.

UHF SHORT RANGE LOW ENERGY REMOTE CONTROL ACCESS TRANSCEIVER REPLACEMENT

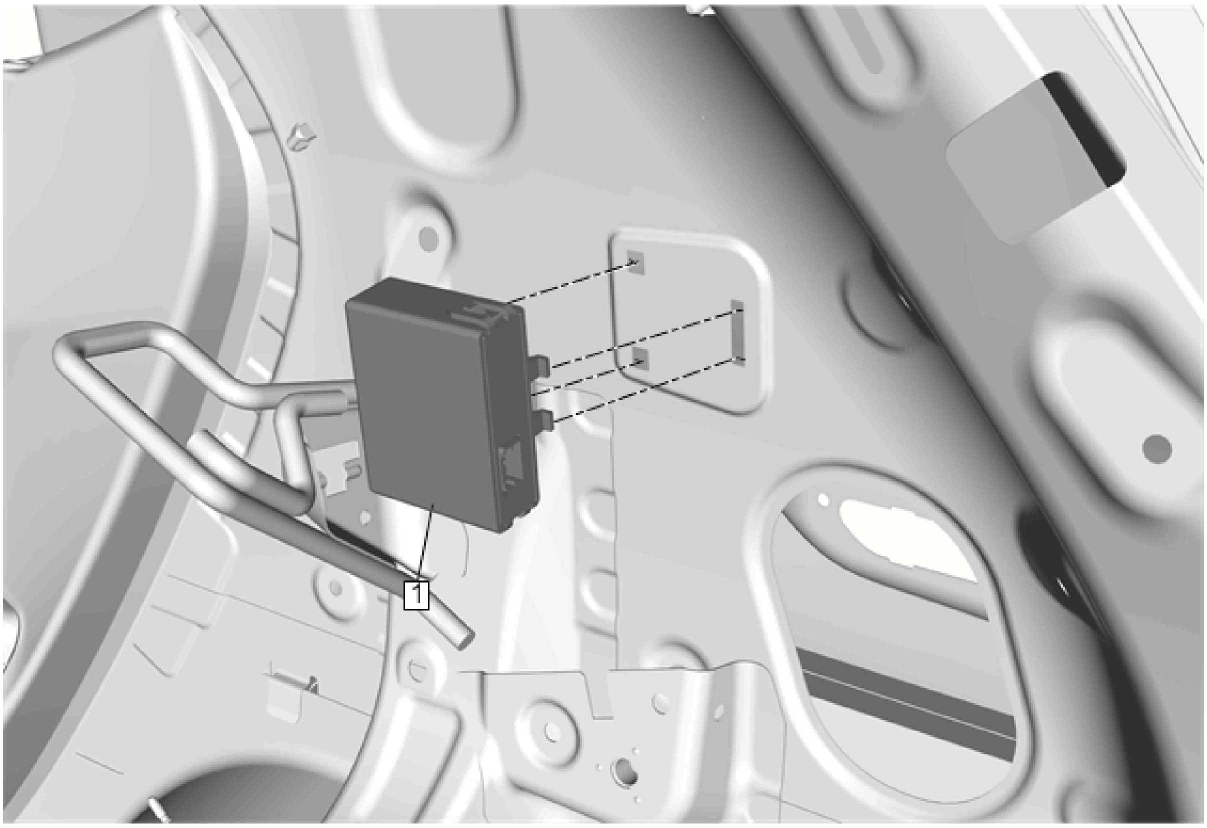

Fig. 10: UHF Short Range Low Energy Remote Control Access Transceiver
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Quarter Lower Rear Trim Panel - Right Side. Refer to **Quarter Lower Rear Trim Panel Replacement**	
1	UHF Short Range Low Energy Remote Control Access Transceiver **Procedure** Disconnect the electrical connector.

LOW FREQUENCY REAR COMPARTMENT ANTENNA BRACKET REPLACEMENT

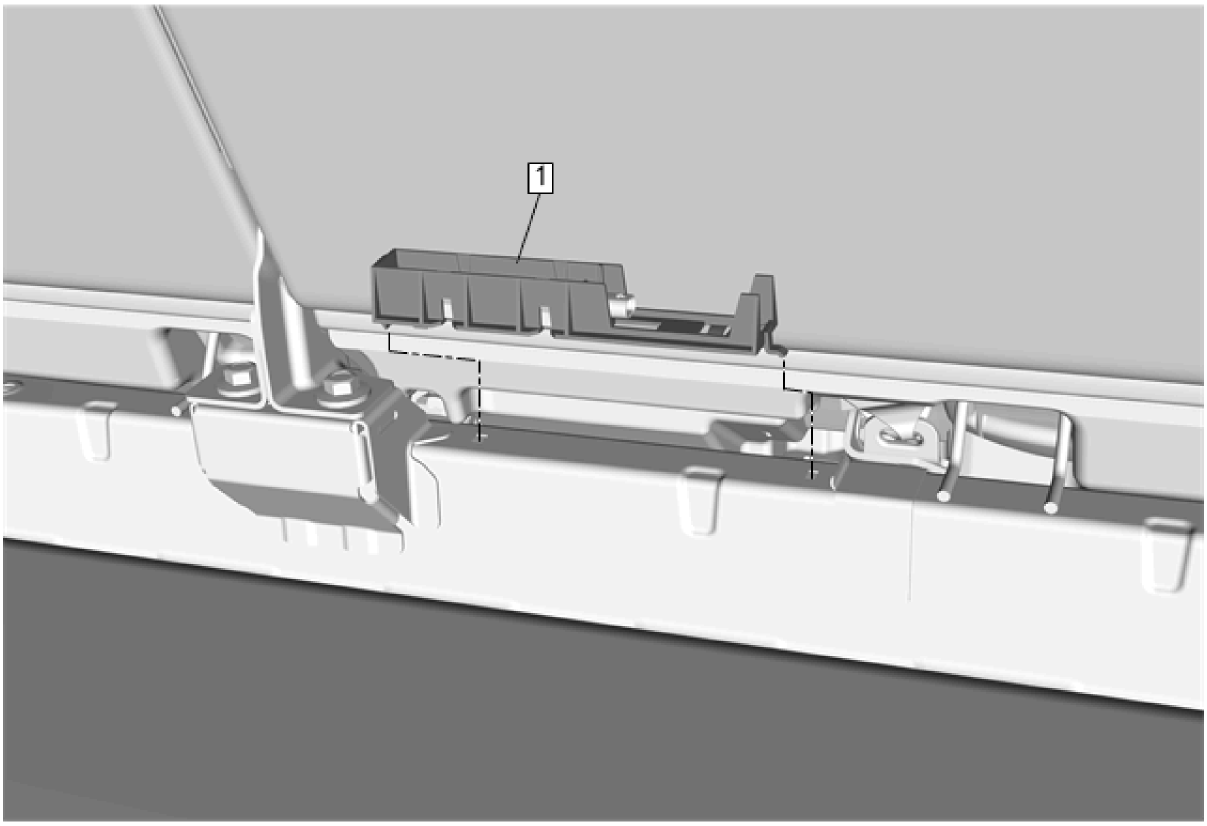

Fig. 11: Low Frequency Rear Compartment Antenna Bracket
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Load Floor Trim Panel. Refer to **Load Floor Trim Panel Replacement**	
1	Low Frequency Rear Compartment Antenna Bracket **Procedure** 1. Disconnect the electrical connector. 2. Transfer components as necessary.

REMOTE CONTROL DOOR LOCK AND THEFT DETERRENT TRANSMITTER PROGRAMMING

Keys can be programming in various ways using the procedures outlined below. Using the Replacing Keys procedure will first erase all the known keys from the vehicle. Any existing keys and any new keys will then be programmed. This procedure should be used any time a key is required to be unlearned or erased from a vehicle. If a new key is being learned to a vehicle to replace a damaged, inoperative, missing, or stolen key, the Replacing Keys procedure must be used. This ensures that the old key cannot be used to access or start the vehicle after programming.

The Adding Keys procedure does not erase any keys prior to programming. The procedure will simply program the key into the next available slot. The Adding Keys procedure should only be used when adding an additional keys to the vehicle. The Adding Keys procedure should never be used to program a key to a vehicle that is having a key replaced, regardless of the cause for the replacement.

Replacing Keys (Without SPS)

NOTE:

- **This procedure will unlearn all previously learned keys. All keys that are to be programmed must be with the vehicle.**
- **A total of eight keys maybe be learned to a single vehicle.**
- **This procedure will only learn the vehicle key information. This procedure will not learn any immobilizer information between the body control module (BCM) and engine control module (ECM).**
- **This procedure may be used with or without existing learned keys being present. If existing keys are present, keep the keys away from the vicinity of the vehicle. Failure to keep learned keys away from the vehicle will result in the learn changing to the Adding Keys procedure.**
- **The keys to be learned must duplicate the mechanical cut of the current key.**

1. Insert the mechanical key of the new key into the key lock cylinder located on the outside of the driver door and turn the key to the unlock position five times within ten seconds. The Driver Information Center (DIC) will display Remote Learn Pending, Please Wait.
2. After ten minutes, the DIC will display Press Engine Start Button To Learn. Press the ignition mode switch. The DIC will again display Remote Learn Pending, Please Wait.
3. Repeat Step 2 two additional times, for a total of thirty minutes. All previously known keys have now been unlearned. Remaining keys can be learned during the next steps. The DIC display will now display Ready For Remote # 1.

NOTE: **The key pocket is located inside the front cupholder.**

4. Place the new key into the key pocket.

NOTE: **If the programming does not complete or hangs during the programming operation, refer to Unable to Complete Programming below.**

5. Press the ignition mode switch. When the key is learned the DIC will indicate that it is ready to program the next key.
6. Remove the key from the key pocket and press the unlock button. To program additional keys, repeat Steps 4 through 6.
7. When all additional keys are programmed, press and hold the ignition mode switch for 5 seconds to exit programming mode.

Replacing Keys (With SPS)

NOTE:

- **This procedure will unlearn all previously learned keys. All keys that are to be programmed must be with the vehicle.**
- **This procedure may be used with or without existing learned keys being present. If no existing keys are available, this procedure must be used.**
- **A total of eight keys maybe be learned to a single vehicle.**
- **This procedure will only learn the vehicle key information. This procedure will not learn any immobilizer information between the body control module (BCM) and engine control module (ECM).**

- **If the battery voltage is low, charge the battery before continuing with the procedure.**

1. Connect a scan tool to the vehicle and access SPS.
2. Ensure that all power consuming devices are turned OFF on the vehicle.
3. Select the SPS application and follow the on-screen instructions.
4. Select Reprogram ECU.
5. Select IMMO Immobilizer Learn - Setup.
6. Select the Program Transponder or Remote Key (Delete) function.

NOTE:

- **At multiple times during the learn procedure, SPS will instruct you to turn the ignition to the run position. Make sure the vehicle is actually in the run mode before continuing on the SPS terminal. If the ignition is not in the run mode, the learn procedure will fail.**
- **The key pocket is located inside the front cupholder.**

7. Follow the on-screen instructions.

NOTE: **If the programming does not complete or hangs during the programming operation, refer to Unable to Complete Programming below.**

8. After programming all keys, Programming Complete, is displayed.
9. Press and hold the ignition mode switch for 15 seconds.
10. Press the lock and unlock button on each key that was programmed. This will awaken each key and allow passive and active keyless entry functions to be established.
11. With a scan tool, clear any DTCs.
12. Verify each key is operating properly. Operate each of the keyless entry functions using the buttons on the key and then start the vehicle. When verifying operation, make sure that no other keys are near the vehicle.

Adding Keys (Without SPS)

NOTE:

- **To initiate, this procedure requires that 2 learned keys be available.**
- **A total of eight keys maybe be learned to a single vehicle.**
- **This procedure adds keys only. The procedure does not erase previously learned keys.**
- **The keys to be learned must duplicate the mechanical cut of the current key.**

1. Place the recognized keys in the vehicle cupholder.
2. Insert the mechanical key of the new key into the key lock cylinder located on the outside of the driver door and turn the key to the unlock position five times within ten seconds. The Driver Information Center (DIC) will display Ready For Remote #2, 3, 4 or 5.

NOTE: **The key pocket is located inside the front cupholder.**

3. Place the new key into the key pocket.
4. Press the ignition mode switch. When the key is learned the DIC will indicate that it is ready to program the next key.

NOTE: **If the programming does not complete or hangs during the programming operation, refer to Unable to Complete Programming**

below.

5. Remove the key from the key pocket and press the unlock button. To program additional keys, repeat Steps 3 through 5.
6. When all additional keys are programmed, press and hold the ignition mode switch for 5 seconds to exit programming mode.

Adding Keys (With SPS)

NOTE:

- **This procedure may be used with or without existing learned keys being present. If no existing keys are available, this procedure must be used.**
- **A total of eight keys maybe be learned to a single vehicle.**
- **This procedure will only learn the vehicle key information.**
- **If the battery voltage is low, charge the battery before continuing with the procedure.**

1. Connect a scan tool to the vehicle and access SPS.
2. Ensure that all power consuming devices are turned OFF on the vehicle.
3. Select the SPS application and follow the on-screen instructions.
4. Select Reprogram ECU.
5. Select IMMO Immobilizer Learn - Setup.
6. Select the Program Transponder or Remote Key (Add) function.

   NOTE:

   - **At multiple times during the learn procedure, SPS will instruct you to turn the ignition to the run position. Make sure the vehicle is actually in the run mode before continuing on the SPS terminal. If the ignition is not in the run mode, the learn procedure will fail.**
   - **The key pocket is located inside the front cupholder.**

7. Follow the on-screen instructions.

   NOTE: **If the programming does not complete or hangs during the programming operation, refer to Unable to Complete Programming below.**

8. After programming all keys, Programming Complete, is displayed.
9. Press and hold the ignition mode switch for 15 seconds.
10. Press the lock and unlock button on each key that was programmed. This will awaken each key and allow passive and active keyless entry functions to be established.
11. With a scan tool, clear any DTCs.
12. Verify each key is operating properly. Operate each of the keyless entry functions using the buttons on the key and then start the vehicle. When verifying operation, make sure that no other keys are near the vehicle.

Unable to Complete Programming

When attempting to program immobilizer components, various conditions may prevent the programming operation from completing. These conditions may be caused by normal system operation, a system malfunction, or an external influence. Common symptoms of a incomplete programming is receiving an error message during the attempt or having the SPS application become unresponsive.

- DTCs are set in the body control module (BCM)

The immobilizer system is a function of the BCM software. If immobilizer DTCs are set in the BCM, such as DTC B2955, a fault has been identified in the immobilizer system. If this is not corrected before attempting to program components, the programming may not complete. Correct all immobilizer DTCs before attempting to program any immobilizer components.

- The key has been programmed to another vehicle or is not the correct type for the vehicle

  A key can only be programmed to a single vehicle. Once a key is programming to a vehicle, it is paired for the life of the key. The key can be learned to the same vehicle again and again, but it is not able to be programmed to a different vehicle.

  Many vehicle are available with both a base keyless entry system and an optional passive entry system. These keys typically look identical but cannot be substituted for one another. To verify the key is correct, compare the part number that is etched on the key to the part number identified in the parts catalog. The key should be correct for the system installed in the vehicle.

- The theft deterrent module is not properly secured or the key is not properly positioned in the pocket/slot.

  A theft deterrent module that is not fully seated or is otherwise not properly secured may prevent a coupling between the transponder located in the key and the theft deterrent module. Being out of place by as little as 1 mm may prevent programming from completing. Make sure the theft deterrent module is properly installed and fully seated in it's clip.

  The key should be positioned in the proper orientation so that it lays flat in the pocket. If a large key ring or other item attached to the key prevents the key from laying flat, remove the key ring.

  To determine if the theft deterrent module is properly secured, remove the battery from the key and place the key into the pocket/slot. Attempt to change the vehicle mode by pressing the vehicle ON/OFF switch. The vehicle should change modes. If the NO REMOTE DETECTED message is displayed on the DIC, the theft deterrent module may not be properly secured.

- External interference is interrupting the programming operation

  External RF interference and EMI may interrupt the low frequency coupling between the key and theft deterrent module. This interference may come from many different locations. Devices plugged into the vehicle power outlets such as cell phone chargers, laptop computers, GPS devices, etc. may cause interference. Vehicle location may also cause interference. Locations near airports and military installations may causer interference. Remove all customer installed devices and, if necessary, move the vehicle if interference is suspected.

DESCRIPTION AND OPERATION

KEYLESS ENTRY SYSTEM DESCRIPTION AND OPERATION

T10N	Keyless Entry Antenna - Passenger Door Handle
15	Keyless Entry Transmitter

Keyless Entry System Description and Operation - Active

The keyless entry system is a vehicle entry device. The keyless entry system is used in conjunction with the door locks to unlock the vehicle. Keyless entry will lock/unlock the vehicle doors or open the rear compartment lid when a corresponding button on the keyless entry transmitter is pressed. This is accomplished by the transmitter sending a radio frequency to the remote control door lock receiver antenna that has a direct link to the body control module (BCM). The BCM interprets the signal and activates the requested function or requests the appropriate control module to activate the function via a serial data message. A low transmitter battery or radio frequency interference from aftermarket devices, such as 2-way radios, power inverters, computers, etc., may cause a system malfunction. High radio frequency traffic areas, such as gas stations that use pay-at-the-pump radio frequency transponders, may also cause interference that could lead to a malfunction. Keyless entry allows you to operate the following features:

- Door lock/unlock

- Remote start
- Illuminated entry lamps
- Panic alarm/vehicle locator
- Remote vehicle start

Keyless Entry System Description and Operation - Passive

Passive keyless entry allows entry to a locked vehicle without pressing any buttons on the keyless entry transmitter. You must only have the transmitter with you. The passive entry system use low frequency antennas in several different areas on the vehicle to determine the location of the transmitter. When passively opening a locked door or the rear compartment, you must have a programmed transmitter with you in your pocket, purse, or briefcase.

When an exterior door handle button is pressed or the rear compartment touch pad is pressed, the low frequency antenna sends out a challenge to the keyless entry transmitter. Because of the low frequency, communication range is limited. The antenna will emit the challenge in a one meter range. The transmitter must be within this range to receive the challenge. The transmitter receives this challenge and emits it's response as an RF message, which is received by the remote control door lock receiver. If the response is correct, the door or rear compartment will unlock and open.

As a customer convenience feature, the keyless entry system will notify the driver if the transmitter has been left in the vehicle after exiting by chirping the vehicle horn three times. This may be turned off using vehicle personalization. Also, if the transmitter is left in the vehicle after the central door lock switch has been used to lock the vehicle, the driver door will remain unlocked after exiting the vehicle. This is intended to prevent locking the transmitter in the vehicle and being unable to access it.

Keyless Entry System Description and Operation - Keyless Start

The keyless start portion of the keyless entry system allows vehicle starting, having only the transmitter as your key. The keyless start system uses low frequency antennas in three different locations on the vehicle to determine the location of the transmitter. Multiple antennas are used to ensure complete coverage of the vehicle interior and rear compartment. When using the keyless start system, a programmed transmitter must be in the vehicle's interior, such as the driver's pocket, purse, or briefcase.

When the ignition mode switch is pressed, the low frequency antennas emit a challenge to the keyless entry transmitter. The transmitter receives this challenge and emits it's response as an RF message, which is received by the remote control door lock receiver. If the response is correct, vehicle starting will be allowed. If RF communication is interrupted, a "No Remote Detected" message will be displayed on the DIC. In these cases, the extended transmitter key blade can be placed in the transmitter slot located in the upper instrument panel storage compartment, under the rubber mat. The immobilizer antenna coil is located directly beneath the transmitter slot. Placing the extended key blade in the slot will create a low powered coupling between the transmitter and immobilizer antenna, allowing communications to occur and enabling vehicle starting.

The keyless entry system has the following components:

- Vehicle key with integrated keyless entry transmitter
- Driver and front passenger door antennas (part of the door handle assembly)
- Driver and front passenger door handle switches (part of the door handle assembly)
- Rear fascia antenna
- Front instrument panel console antenna
- Center console antenna
- Rear compartment antenna
- Body control module (BCM)
- Keyless entry control module
- Immobilizer antenna coil
- Remote control door lock receiver
- Short range remote control transceiver

Keyless Entry Transmitters

The keyless entry transmitters are used to lock and unlock the vehicle door while away from the immediate are of the vehicle. Keyless entry functions may work at up to 20 m (65 ft) from the vehicle. The keyless entry transmitter is an integral part of the vehicle key.

Keypass

Keypass is a function of the vehicle owner's cell phone. It can perform the same functions as the keyless entry transmitters. In some model year and vehicle applications it can support additional functions.

Door Antenna

The keyless entry door antennas are used to transmit low frequency communications to the keyless entry transmitters.

The keyless entry door antennas are located in the left front and right front exterior door handle bracket. The antennas are serviced as part of the door handle assembly. The antennas are controlled by the keyless entry control module. When the exterior door handle button is pressed, the respective antenna will send out a challenge to the keyless entry transmitter, which begins the passive entry communications.

Rear Fascia Antenna

The rear fascia antenna is used to transmit low frequency communication to the keyless entry transmitters for entry to rear compartment.

The rear fascia antenna is located behind the rear fascia. The antenna is controlled by the keyless entry control module. When the rear compartment touch pad is pressed, the antenna sends out a challenge to the keyless entry transmitter, which begins the passive entry communications.

Front Console Passive (Instrument Panel) Antenna

This antenna is located in the lower instrument panel near the front of the center console.

The front console antenna is used for vehicle starting functions. When the ignition mode switch is pressed, the antenna is energized or "pinged". This emits a low frequency challenge signal that is received by the keyless entry transmitter. The transmitter will then reply to this challenge with a response and, if correct, vehicle starting will occur.

Center Console Antenna

This antenna is located in the rear of the center console.

The rear console antenna is used for vehicle starting functions. When the ignition mode switch is pressed, the antenna is energized or "pinged". This emits a low frequency challenge signal that is received by the keyless entry transmitter. The transmitter will then reply to this challenge with a response and, if correct, vehicle starting will occur.

Rear Compartment Antenna

This antenna is located in the center of the rear compartment metal floor pan, near the seatback.

The rear compartment antenna is used for vehicle starting functions. When the ignition mode switch is pressed, the antenna is energized or "pinged". This emits a low frequency challenge signal that is received by the keyless entry transmitter. The transmitter will then reply to this challenge with a response and, if correct, vehicle starting will occur.

Remote Control Door Lock Receiver

The remote control door lock receiver is located on the vehicle windshield, directly in front of the inside rearview mirror.

The remote control door lock receiver is control by and directly communicates with the body control module (BCM). When the transmitter receives a low frequency challenge from an antenna, it responds with an RF message. This RF message is received by the remote control door lock receiver and communicated to the BCM. If the RF message is a valid response to the low frequency challenge, vehicle access or starting will be allowed.

Immobilizer Antenna Coil Assembly

The keyless entry immobilizer coil assembly is located in the upper instrument panel, directly beneath the upper instrument panel storage compartment. If the transmitter battery is dead, weak, or the RF signal is being interrupted, the extended transmitter key blade can be placed in the transmitter slot located in the upper instrument panel storage compartment, under the rubber mat, to create a low powered coupling between the transmitter and immobilizer antenna, allowing communications to occur and enabling vehicle starting.

The immobilizer antenna coil is controlled by the BCM. The immobilizer control module is also active when learning vehicle keys.

Keyless Entry Control Module

The keyless entry control module is a multi-function module which performs the following keyless entry system functions:

- Activating vehicle antennas for passive keyless entry functions
- Activating vehicle antennas for keyless start functions
- Backup control for the ECM accessory wakeup and the run/crank relay
- If equipped, controls the electronic steering column lock
- Receiver of the exterior door handle switch inputs and door open switch (not the door ajar switch)
- Ignition mode switch monitoring

Short Range Remote Control Transceiver

The short range remote control transceiver is an additional communication device to provide communication between the vehicle owner's cell phone and the keyless entry control module.

OnStarÃ‚Â® Remote Link (if equipped)

A vehicle operator may have the ability to perform some of the keyless entry functions using applications on personal devices such as but not limited to smart phones. A condition may appear as if there is a malfunction in the vehicle. If it is suspected that this may be the case contact Technical Assistance if a condition cannot be determined through normal vehicle diagnostics.

Body Control Module (BCM)

The BCM is a multi-function module that performs the following functions:

- Receive and authenticate active transmitter and keyless start signals from the remote control door lock receiver
- Determines the functionality requested by the transmitter signal
- Performs the function requested by the transmitter signal

Unlock Driver Door Only - Active

Momentarily press the transmitter UNLOCK button to perform the following functions:

- Unlock only the driver door
- Illuminate the interior lamps for a determined length of time or until the ignition mode switch is pressed
- Flash the exterior lights, if enabled through personalization
- Disarm the content theft deterrent system
- Deactivate the content theft deterrent system when in the alarm mode

Unlock All Doors - Second Operation - Active

Momentarily press the transmitter UNLOCK button a second time, within 5 seconds of the first press, to perform the following function:

Unlock the remaining doors and rear compartment

Unlock Driver Door Only - Passive

If enabled through personalization, approach the driver door with a valid keyless entry transmitter and press the door handle button to perform the following functions:

- Unlock and open only the driver door when door handle is operated
- Disarm the content theft deterrent system, if equipped
- Deactivate the content theft deterrent system when in the alarm mode

Unlock All Doors - Passive

Approach any non driver door (front or rear) or, if enabled through personalization, the driver door with a valid keyless entry transmitter and press the door handle button to perform the following functions:

- Unlock all vehicle doors and rear compartment
- Disarm the content theft deterrent system, if equipped
- Deactivate the content theft deterrent system when in the alarm mode

Lock All Doors - Active

Press the transmitter LOCK button to perform the following functions:

- Lock all vehicle doors
- Immediately turn off the interior lamps
- Flash the exterior lights, if enabled through personalization
- Chirp the horn, if enabled through personalization
- Arm the content theft deterrent system

Lock All Doors - Passive

Exit the vehicle (with vehicle off) with the keyless entry transmitter to automatically perform the following functions, if equipped.

- Lock all vehicle doors and rear compartment after a delay
- Flash the exterior lights, if enabled through personalization
- Chirp horn, if enabled through personalization
- Arm the content theft deterrent system

When all doors are closed, they can also be locked from the exterior by pressing the door handle button while having a valid transmitter within range.

If more than one keyless entry transmitter is within a vehicle and the keyless entry system detects that one or more transmitters have been left in the vehicle after vehicle is locked, any transmitter left within the vehicle will be temporarily deactivated until:

- A button on the deactivated transmitter is pressed (will only activate the transmitter whose button is pressed)
- A passive unlock of vehicle occurs
- Change in power mode occurs

Rear Compartment Release - Passive

Approach the rear of the vehicle with a valid keyless entry transmitter. Press the trunk release touch pad. The trunk will open.

Vehicle Locator/Panic Alarm/Active

A single press of the panic button performs the following functions. Some functions may be dependent on personalization settings:

- Pulses the horn three times
- Flashes the exterior lamps three times

A press and hold of the panic button performs the following functions:

- Pulses the horn and flashes the parking lamps for 30 second or until the following conditions occur:
  - The panic button is pressed
  - The ignition mode switch is pressed with a valid key in the vehicle

Remote Start

The remote vehicle start function allows engine starting while not in the vehicle. It also allows the vehicle HVAC system and other vehicle systems to enable, providing a comfortable vehicle upon entry. The remote vehicle start sequence begins by pressing and releasing the lock button and then pressing and holding the remote vehicle start buttons on the keyless entry transmitter. The turn signal lamps will illuminate to indicate the vehicle has received the remote start request. Each time a remote vehicle start is performed, the vehicle doors are locked, however they may then be unlocked/locked with the transmitter at any time. Only the first and second vehicle transmitters are able to control the remote vehicle start function. Any additional remote transmitters programmed to the vehicle will perform all other remote functions. Once activated, the engine is allowed to run for 10 minutes. The remote vehicle start time may be extended by an additional 10 minutes by again pressing and releasing the lock button and then pressing and holding the remote vehicle start buttons on the transmitter. This feature is called a remote vehicle start continue and allows a maximum of 20 minutes of engine running. If the remote vehicle start continue is performed at 7 minutes into the initial 10 minute time-out, a total of 17 minutes of engine running would occur. The remote vehicle start event may be suspended at any time by pressing only the remote vehicle start button on the transmitter or by entering the vehicle and turning ON the hazard lamps.

In between ignition cycles, only two remote start events may occur or be attempted. Once two events or attempts have been made, future remote start events will be suspended until the vehicle is operated using the ignition mode switch.

Enable/Disable Remote Start

Using the driver information center, remote start may be enabled or disabled as a part of vehicle personalization. Refer to the vehicle owners manual for more information.

Remote Start System Disabled

If any of the conditions listed below occur, a remote start event may be aborted or canceled:

- Vehicle is in valet mode
- Vehicle doors are ajar
- Rear compartment lid is ajar
- The hood is open
- The doors are not locked
- The hazard switch is ON
- Vehicle power mode is incorrect
- Vehicle speed is greater than 0
- Transmission is not in P
- Excessive engine coolant temperature
- Low oil pressure
- The malfunction indicator lamp (MIL) is commanded ON
- The low fuel level indicator lamp is commanded ON
- Engine crank time is greater than 30 seconds

- Excessive engine speed
- Accelerator pedal position too high
- Remote start timer equals 0
- Immobilizer system indicates a theft attempt
- Vehicle propulsion system fault conditions
- High voltage battery fault conditions

Keyless Entry Personalization

Vehicle lock/unlock functions and remote start settings may be personalized for the vehicle. For functional descriptions and programming instructions, refer to the vehicle owners manual.

Replace Battery in Remote Key Message

A REPLACE BATTERY IN REMOTE KEY message may be seen on the driver information center when the transmitter's battery voltage has been lower than 2.16 volts for three consecutive ignition cycles.

ELECTRONIC TOLL COLLECTION SYSTEM DESCRIPTION AND OPERATION

The electronic toll collection system is an in vehicle communication system to remotely perform the transaction between a toll road collector and the vehicle operator. The system has a module contained within the mirror assembly. The module uses an antenna to send and receive an RF (radio frequency) signal. The RF message is sent to the toll road's toll collector system and an RF message is sent back to the vehicle telling the electronic toll collection system in the vehicle that the toll requirement has been satisfied. The electronic toll collection system informs the vehicle operator if the toll requirement has not been satisfied.

The electronic toll collection system uses bidirectional RF communication operating at 5.8 GHz.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B191A OR B191B: HEATED SEAT MODULE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B191A 39

Front Heated Seat Module

DTC B191B 39

Rear Heated Seat Module

Circuit/System Description

An internal fault is detected inside the control module. No external circuits are involved.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

The control module detects an internal fault.

Action Taken When the DTC Sets

The seat heating control module will disable all heated seat functions.

Conditions for Clearing the DTC

- The DTC clears when the diagnostic runs and passes.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Circuit/System Verification

DTC B191A

1. Ignition ON.
2. Verify DTC B191A is not set.
    - **If the DTC is set**

      Replace the K29F Seat Heating Control Module - Front.

    - **If the DTC is not set**
3. All OK.

DTC B191B

1. Ignition ON.
2. Verify DTC B191B is not set.
    - **If the DTC is set**

      Replace the K29R Seat Heating Control Module - Rear.

    - **If the DTC is not set**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for K29F Seat Heating Control Module - Front or K29R Seat Heating Control Module - Rear replacement, programming and setup

SYMPTOMS - SEAT HEATING AND COOLING

IMPORTANT: The following steps must be completed before using the symptom tables.

1. Perform the **Diagnostic System Check - Vehicle** before using the symptom tables in order to verify that all of the following are true:
    - There are no DTCs set.
    - The control module(s) can communicate via the serial data link.
2. Refer to the system description and operation from the following list in order to familiarize yourself with the system functions:
    - **Heated Seats Description and Operation**
    - **Rear Heated Seats Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the power seats. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Inspect the seat adjuster track for conditions which may cause binding or objects within the seat adjustment range which obstruct movement or interfere with wiring.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Front Heated Seat Malfunction**
- **Rear Heated Seat Malfunction**

FRONT HEATED SEAT MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

1. Driver and passenger heated seats are inoperative.
2. Driver heated seat is inoperative
3. Driver seat back heat function is inoperative
4. Driver seat cushion heat function is inoperative
5. Degraded driver heated seat operation
6. Passenger heated seat is inoperative
7. Passenger seat back heat function is inoperative
8. Passenger seat cushion heat function is inoperative
9. Degraded passenger heated seat operation

Circuit/System Description

The driver and passenger heated seats switches are located on the infotainment display. When a heated seat switch is pressed, a serial data message is sent from the infotainment display to the body control module (BCM) indicating the heated seat command. The BCM serves as the heated seat system master to determine the requested operating mode. The BCM then sends a serial data message to the seat heating control module indicating the heated seat command. In response to this message, the seat heating control module attempts to drive the appropriate seat heating elements per the BCM command. The BCM also controls the seat temperature and mode indicators, via the serial data line, used to provide the operator with feedback as to the operating status of the system.

The seat heating control module controls heated seat operation for the driver and passenger seats. When active, power is applied to the seat cushion and back heater elements through a common pulse width modulated (PWM) voltage supply control circuit. Each individual heater element is switched to ground by the module through a common low side drive control circuit.

The seat back and cushion temperature sensors (thermistors) are packaged with the seat heating elements located just under the seat covers. The seat heating control module supplies each temperature sensor with a 5 V reference signal circuit and a low reference circuit. The module monitors the voltage from the signal circuit to determine the temperature of the seat.

The temperature sensor varies in resistance based on the temperature of the heating element causing the signal voltage to change. Once the module senses the seat reached the set temperature, it will then begin regulate the current flow through the heater elements in order to maintain the desired seat temperature based on the feedback voltage from the sensor.

Diagnostic Aids

- A short to ground or B+ in either the heating element voltage control circuit or ground control circuit will cause both the driver and front passenger heated seats to be inoperative.
- An open in either the voltage control circuit or ground control circuit between the module and the splice will cause the seat cushion and seat back the heated seat function to be inoperative for that seat.
- A short to ground on either the seat cushion or seat back temperature sensor signal circuit will cause the heated seat function to be inoperative for that seat.
- An open in either the voltage control circuit or ground control circuit between the splice and the heating element will cause just that one heating element to be inoperative.
- The following faults will cause a degraded heated seat operation for both the seat back and seat cushion.
  - An open or a short to voltage on either the seat cushion or seat back temperature sensor signal circuit.
  - An open in either the seat cushion or seat back temperature sensor low reference circuit.
  - A fault in either the seat cushion or seat back temperature sensor.
- A broken wire in a heating element may cause a degraded heated seat operation for that particular heating element.
- When inactive the seat heating control module connects the heating element low side outputs to a common reference point internal to the module which is biased to approximately 3.5 V. The module uses this biased voltage in order to check the high side and low side control circuits for a short to battery or ground before enabling the driver and passenger seat heating elements.
- With both the seat cushion and seat back heater elements disconnected, if the high side output of the module is measured it will display a low current 12 V bleed off voltage. This bleed off voltage does not have a meaningful diagnostic purpose. With one or both of the heater elements connected you would just see the 3.5 V biased voltage from this circuit.
- If the heated seats are on high, the temperature level may automatically be lowered after approximately 30 min of operation.

Control Module References for scan tool information

Circuit/System Verification

NOTE: **Review the Diagnostic Fault Information table and Diagnostic Aids in order to get a better understanding of the possible heated seat system faults before proceeding Circuit/System Verification and Circuit/System Testing.**

1. Vehicle ON.
2. Verify the scan tool Body Control Module Driver Seat Heating/Venting/Cooling Mode parameter changes between OFF and Seat Back and Cushion Heating when pressing the driver heated seat switch.
    - **If the parameter does not change**

      Replace the P17 Info Display Module.

    - **If the parameter changes**
3. Verify the scan tool Passenger Seat Heating/Venting/Cooling Mode parameter changes between OFF and Seat Back and Cushion Heating when pressing the passenger heated seat switch.
    - **If the parameter does not change**

      Replace the P17 Info Display Module.

    - **If the parameter changes**
4. Verify the driver and front passenger heated seats operate.
    - **If the driver and front passenger heated seats are inoperative**

      Refer to Circuit/System Testing - Both Heated Seats are Inoperative

    - **If the seat cushion and back heating elements are inoperative of one seat**

      Refer to Circuit/System Testing - One Heated Seat Inoperative

    - **If just one of the heating elements is inoperative**

      Refer to Circuit/System Testing - One Heating Element is Inoperative.

    - **If the driver seat exhibits a degraded heated seat operation**

      Refer to Circuit/System Testing - Degraded Heated Seat Operation Driver Seat

    - **If the passenger seat exhibits a degraded heated seat operation**

      Refer to Circuit/System Testing - Degraded Heated Seat Operation Passenger Seat

    - **If both heated seats operate**
5. All OK.

Circuit/System Testing

Both Heated Seats are Inoperative

NOTE: **Circuit/System Verification must be performed before proceeding with Circuit/System Testing.**

1. Vehicle OFF, disconnect the X1 harness connector at the K29F Seat Heating Control Module - Front, Vehicle ON.
2. Verify a test lamp illuminates between each B+ circuit terminal listed below and ground.
    - Terminal 7
    - Terminal 10
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF, remove the test lamp.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF, remove the test lamp.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K29F Seat Heating Control Module - Front.
    - **If the test lamp illuminates**
3. Vehicle OFF.
4. Test for infinite resistance between each control circuit terminal listed below and ground, one at a time.
    - Terminal 2
    - Terminal 3
    - Terminal 4
    - Terminal 6
    - **If less than infinite resistance**

      Repair the short to ground on the circuit.

    - **If infinite resistance**
5. Vehicle ON.
6. Test for less than 1 V between each control circuit terminal listed below and ground, one at a time.
    - Terminal 2
    - Terminal 3
    - Terminal 4
    - Terminal 6
    - **If 1 V or greater**

      Repair the short to voltage on the circuit.

    - **If less than 1 V**
7. Replace the K29F Seat Heating Control Module - Front.

One Heated Seat is Inoperative

NOTE: **Circuit/System Verification must be performed before proceeding with Circuit/System Testing**

1. Vehicle OFF, disconnect the X1 harness connector at the K29F Seat Heating Control Module - Front, Vehicle ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 7 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF, remove the test lamp
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF, remove the test lamp.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K29F Seat Heating Control Module - Front.
    - **If the test lamp illuminates**
3. Vehicle OFF, connect the X1 harness connector at the K29F Seat Heating Control Module - Front. Disconnect the harness connector at the E14 Seat Heating Element - Cushion and the E14 Seat Heating Element - Back, Vehicle ON.

NOTE: **When performing this test ensure that you are testing from the correct terminal. Testing from the incorrect terminal will cause a misdiagnosis of the circuit. Three of the four terminals in this connector will not only display a voltage reading but a different voltage reading.**

4. Test for 4.8 - 5.2 V between each signal circuit terminal listed below and ground, one at a time.
    - E14 Seat Heating Element - Cushion terminal 2
    - E14 Seat Heating Element - Back terminal 2
    - **If less than 4.8 V**
    1. Vehicle OFF, disconnect the X2 harness connector at the K29F Seat Heating Control Module - Front.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K29F Seat Heating Control Module - Front.
    - **If greater than 5.2 V**
    1. Vehicle OFF, disconnect the X2 harness connector at the K29F Seat Heating Control Module - Front, Vehicle ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K29F Seat Heating Control Module - Front.
    - **If between 4.8 - 5.2 V**
5. Connect a test lamp between control circuit terminal 1 and control circuit terminal 4 of the E14 Seat Heating Element - Back, Vehicle ON.

NOTE: **The test lamp should turn ON for approximately 10 s after the heated seat is commanded ON.**

6. Verify the test lamp turns ON after pressing the heated seat switch.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, remove the test lamp, disconnect the X1 harness connector at the K29F Seat Heating Control Module - Front.

        2. Test for less than 2 Ω in each control circuit end to end.
            - If 2 Ω or greater, repair the open/high resistance in the circuit.
            - If less than 2 Ω, replace the K29F Seat Heating Control Module - Front.
    - **If the test lamp turns ON**
7. Vehicle OFF, connect the harness connector at the E14 Seat Heating Element - Cushion, Vehicle ON.
8. Verify the test lamp turns ON after pressing the heated seat switch.
    - **If the test lamp is always OFF**

        NOTE: **Because of the type of material used in the heater element, a reliable resistance value is unavailable for a component test.**

        Test or replace the E14 Seat Heating Element - Cushion.

    - **If the test lamp turns ON**

    NOTE: **Because of the type of material used in the heater element, a reliable resistance value is unavailable for a component test.**

9. Test or replace the E14 Seat Heating Element - Back.

One Heating Element is Inoperative

NOTE: **Circuit/System Verification must be performed before proceeding with Circuit/System Testing.**

1. Vehicle OFF, disconnect the harness connector at the appropriate E14 Seat Heating Element.
2. Connect a test lamp between control circuit terminal 1 and control circuit terminal 4, Vehicle ON.
3. Verify the test lamp turns ON after pressing the heated seat switch.
    - **If the test lamp is always OFF**
        1. Vehicle OFF, remove the test lamp, disconnect the X1 harness connector at the K29F Seat Heating Control Module - Front.
        2. Test for less than 2 Ω in each control circuit end to end.
            - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - **If the test lamp turns ON**

    NOTE: **Because of the type of material used in the heater element, a reliable resistance value is unavailable for a component test.**

4. Test or replace the E14 Seat Heating Element.

Degraded Heated Seat Operation Driver Seat

NOTE: **Circuit/System Verification must be performed before proceeding with Circuit/System Testing**

1. Vehicle OFF, disconnect the harness connector at each component listed below. It may take up to 2 min for all vehicle systems to power down.
    - E14B Seat Heating Element - Driver Cushion
    - E14A Seat Heating Element - Driver Back
2. Test for less than 40 Ω between each low reference circuit terminal listed below and ground, one at a time.
    - E14B Seat Heating Element - Driver Cushion terminal 3
    - E14A Seat Heating Element - Driver Back terminal 3
    - **If 40 Ω or greater**

1. Vehicle OFF, disconnect the X2 harness connector at the K29F Seat Heating Control Module - Front.
2. Test for less than 2 Ω in the low reference circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K29F Seat Heating Control Module - Front.

- **If less than 40 Ω**

3. Vehicle ON.
4. Test for 4.8 - 5.2 V between each signal circuit terminal listed below and ground, one at a time.
    - E14B Seat Heating Element - Driver Cushion terminal 2
    - E14A Seat Heating Element - Driver Back terminal 2
    - **If less than 4.8 V**

    1. Vehicle OFF, disconnect the X2 harness connector at the K29F Seat Heating Control Module - Front.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K29F Seat Heating Control Module - Front.

    - **If greater than 5.2 V**

    1. Vehicle OFF, disconnect the X2 harness connector at the K29F Seat Heating Control Module - Front, Vehicle ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K29F Seat Heating Control Module - Front.

    - **If between 4.8 - 5.2 V**

5. Vehicle OFF, connect the harness connector at the E14B Seat Heating Element - Driver Cushion and the E14A Seat Heating Element - Driver Back. Disconnect the X2 harness connector at the K29F Seat Heating Control Module - Front.
6. Test for 500 Ω - 300 kΩ between the signal circuit and the low reference circuit terminals listed below, one at a time.
    - E14B Seat Heating Element - Driver Cushion terminal 6 and terminal 1
    - E14A Seat Heating Element - Driver Back terminal 3 and terminal 1
    - **If not between 500 Ω - 300 kΩ**

      Replace the E14 Seat Heating Element.

    - **If between 500 Ω - 300 kΩ**
7. Replace the K29F Seat Heating Control Module - Front.

Degraded Heated Seat Operation Passenger Seat

NOTE: **Circuit/System Verification must be performed before proceeding with Circuit/System Testing**

1. Vehicle OFF, disconnect the harness connector at each component listed below. It may take up to 2 min for all vehicle systems to power down.
    - E14D Seat Heating Element - Passenger Cushion
    - E14C Seat Heating Element - Passenger Back
2. Test for less than 40 Ω between each low reference circuit terminal listed below and ground, one at a time.
    - E14D Seat Heating Element - Passenger Cushion terminal 3
    - E14C Seat Heating Element - Passenger Back terminal 3

   - **If 40 Ω or greater**
   1. Vehicle OFF, disconnect the X2 harness connector at the K29F Seat Heating Control Module - Front.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K29F Seat Heating Control Module - Front.
   - **If less than 40 Ω**
3. Vehicle ON.
4. Test for 4.8 - 5.2 V between each signal circuit terminal listed below and ground, one at a time.
   - E14D Seat Heating Element - Passenger Cushion terminal 2
   - E14C Seat Heating Element - Passenger Back terminal 2
   - **If less than 4.8 V**
   1. Vehicle OFF, disconnect the X2 harness connector at the K29F Seat Heating Control Module - Front.
   2. Test for infinite resistance between the signal circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K29F Seat Heating Control Module - Front.
   - **If greater than 5.2 V**
   1. Vehicle OFF, disconnect the X2 harness connector at the K29F Seat Heating Control Module - Front, Vehicle ON.
   2. Test for less than 1 V between the signal circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K29F Seat Heating Control Module - Front.
   - **If between 4.8 - 5.2 V**
5. Vehicle OFF, connect the harness connector at the E14D Seat Heating Element - Passenger Cushion and the E14C Seat Heating Element - Passenger Back. Disconnect the X2 harness connector at the K29F Seat Heating Control Module - Front.
6. Test for 500 Ω - 300 kΩ between the signal circuit and the low reference circuit terminals listed below, one at a time.
   - E14D Seat Heating Element - Passenger Cushion terminal 5 and terminal 2
   - E14C Seat Heating Element - Passenger Back terminal 4 and terminal 2
   - **If not between 500 Ω - 300 kΩ**

     Replace the E14 Seat Heating Element.

   - **If between 500 Ω - 300 kΩ**
7. Replace the K29F Seat Heating Control Module - Front.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Driver Information Display Replacement**
- **Driver or Passenger Seat Back Heater Replacement**
- **Front Seat Cushion Heater Replacement (Korea)Front Seat Cushion Heater Replacement (North America)**
- **Control Module References** for K29F Seat Heating Control Module - Front replacement, programming and setup

REAR HEATED SEAT MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

1. Left and right rear heated seats are inoperative
2. Left rear heated seat is inoperative
3. Degraded left rear heated seat operation
4. Right rear heated seat is inoperative
5. Degraded right rear heated seat operation
6. Rear heated seat switch indicator malfunction
7. The heated seat is always ON
8. No effect

Circuit/System Description

When a heated seat switch is pressed, the heated seat switch signal circuit from the body control module (BCM) is pulled low indicating the heated seat command. The BCM serves as the heated seat system master to determine the requested operating mode. The BCM then sends a LIN bus serial data message to the rear seat heating control module indicating the heated seat command. In response to this message, the seat heating control module attempts to drive the appropriate seat heating element per the BCM command.

The rear seat heating control module controls heated seat operation for the left and right rear seats. When active, power is applied to the seat cushion heater element through a pulse width modulated (PWM) voltage supply control circuit. The heater element is switched to ground by the module through a low side drive control circuit.

The seat cushion temperature sensor (thermistor) is packaged with the seat heating element located just under the seat cover. The rear seat heating control module supplies the temperature sensor with a 5 V reference signal circuit and a low reference circuit. The module monitors the voltage from the signal circuit to determine the temperature of the seat.

The temperature sensor varies in resistance based on the temperature of the heating element causing the signal voltage to change. Once the module senses the seat reached the set temperature, it will then begin regulate the current flow through the heater elements in order to maintain the desired seat temperature based on the feedback voltage from the sensor.

Diagnostic Aids

- A short to ground or B+ in either the heating element voltage control circuit or ground control circuit will cause both rear heated seats to be inoperative.
- A short to ground on the seat cushion temperature sensor signal circuit will cause the heated seat function to be inoperative for that seat.
- The following faults will cause a degraded heated seat operation.
  - An open or a short to voltage on the seat cushion temperature sensor signal circuit.
  - An open in the seat cushion temperature sensor low reference circuit.
  - A fault in the seat cushion temperature sensor.
- A broken wire in a heating element may cause a degraded heated seat operation for that particular heating element.
- When inactive the seat heating control module connects the heating element low side outputs to a common reference point internal to the module which is biased to approximately 3.5 V. The module uses this biased voltage in order to check the high side and low side control circuits for a short to battery or ground before enabling the left and right rear seat heating elements.
- With the seat cushion heater element disconnected, if the high side output of the control module is measured it will display a low current 12 V bleed off voltage. This bleed off voltage does not have a meaningful diagnostic purpose. With the heater elements connected you would just see the 3.5 V biased voltage from this circuit.
- If the heated seats are on high, the temperature level may automatically be lowered after approximately 30 min of operation.

Circuit/System Verification

1. Vehicle ON.

   NOTE: **Review the Diagnostic Fault Information table and Diagnostic Aids in order to get a better understanding of the possible heated seat system faults before proceeding Circuit/System Verification and Circuit/System Testing.**

2. Verify the scan tool Body Control Module Left Rear Seat Heating/Venting/Cooling Mode parameter changes between Off and Seat Back and Cushion Heating when pressing the left rear heated seat switch.
   - **If the parameter does not change**

     Refer to Circuit/System Testing - Heated Seat Switch Circuit Test.

   - **If the parameter changes**
3. Verify the scan tool Right Rear Seat Heating/Venting/Cooling Mode parameter changes between Off and Seat Back and Cushion Heating when pressing the right rear heated seat switch.
   - **If the parameter does not change**

     Refer to Circuit/System Testing - Rear Heated Seat Switch Circuit Test.

   - **If the parameter changes**
4. Verify the left and right rear heated seats operate.
   - **If both rear heated seats are inoperative**

     Refer to Circuit/System Testing - Both Rear Heated Seats are Inoperative

   - **If just one of the rear heated seats is inoperative**

     Refer to Circuit/System Testing - One Rear Heated Seat is Inoperative

   - **If the left rear seat exhibits a degraded heated seat operation**

     Refer to Circuit/System Testing - Degraded Heated Seat Operation Left Rear Seat

   - **If the right rear seat exhibits a degraded heated seat operation**

     Refer to Circuit/System Testing - Degraded Heated Seat Operation Right Rear Seat

   - **If both heated seats operate**
5. Verify the rear heated seat switch indicator illuminates after pressing the rear seat heating switch.
   - **If the indicator does not illuminate**

     Refer to Circuit/System Testing - Heated Seat Switch Indicator Circuit Test.

   - **If the indicator illuminates**
6. All OK.

Circuit/System Testing

Rear Heated Seat Switch Circuit Test

NOTE: **Circuit/System Verification must be performed before proceeding**

with Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the appropriate S32 Seat Heating Switch - Rear. It may take up to 2 min for all vehicle system to power down.
2. Test for less than 10 Ω between the ground circuit terminal 1 and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Vehicle ON.
4. Verify the appropriate scan tool Rear Seat Heating/Venting/Cooling Mode parameter is Off.
   - **If not Off**
   1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the signal circuit terminal 3 and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K9 Body Control Module.
   - **If Off**
5. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the ground circuit terminal 1.
6. Verify the scan tool scan tool Rear Seat Heating/Venting/Cooling Mode parameter is Seat Back and Cushion Heating - High.
   - **If not Seat Back and Cushion Heating - High**
   1. Vehicle OFF, remove the jumper wire, disconnect the X4 harness connector at the K9 Body Control Module, Vehicle ON.
   2. Test for less than 1 V between the signal circuit terminal 3 and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If Seat Back and Cushion Heating - High**
7. Test or replace the S32 Seat Heating Switch - Rear.

Both Heated Seats are Inoperative

NOTE: **Circuit/System Verification must be performed before proceeding with Circuit/System Testing.**

1. Vehicle OFF and all vehicle systems OFF, disconnect the X1 harness connector at the K29R Seat Heating Control Module - Rear, Vehicle ON.
2. Verify a test lamp illuminates between each B+ circuit terminal listed below and ground.
   - Terminal 7
   - Terminal 10
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Vehicle OFF, remove the test lamp.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF, remove the test lamp.

    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K29R Seat Heating Control Module - Rear.
    - **If the test lamp illuminates**
3. Vehicle OFF.
4. Test for infinite resistance between each control circuit terminal listed below and ground, one at a time.
    - Terminal 2
    - Terminal 6
    - **If less than infinite resistance**

      Repair the short to ground on the circuit.

    - **If infinite resistance**
5. Vehicle ON.
6. Test for less than 1 V between each control circuit terminal listed below and ground, one at a time.
    - Terminal 2
    - Terminal 6
    - **If 1 V or greater**

      Repair the short to voltage on the circuit.

    - **If less than 1 V**
7. Replace the K29R Seat Heating Control Module - Rear.

One Heated Seat is Inoperative

NOTE: **Circuit/System Verification must be performed before proceeding with Circuit/System Testing**

1. Vehicle OFF, disconnect the X1 harness connector at the K29R Seat Heating Control Module - Rear, Vehicle ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 7 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF, remove the test lamp
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF, remove the test lamp.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K29R Seat Heating Control Module - Rear.
    - **If the test lamp illuminates**
3. Vehicle OFF, connect the X1 harness connector at the K29R Seat Heating Control Module - Rear and disconnect the harness connector at the appropriate E14 Seat Heating Element - Rear Cushion, Vehicle ON.

NOTE: **When performing this test ensure that you are testing from the correct terminal. Testing from the incorrect terminal will cause a misdiagnosis of the circuit. Three of the four terminals in this connector will not only display a voltage reading but a different voltage reading.**

4. Test for 4.8 - 5.2 V between the signal circuit terminal 2 and ground.

    - **If less than 4.8 V**
    1. Vehicle OFF, disconnect the X2 harness connector at the K29R Seat Heating Control Module - Rear.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K29R Seat Heating Control Module - Rear.
    - **If greater than 5.2 V**
    1. Vehicle OFF, disconnect the X2 harness connector at the K29R Seat Heating Control Module - Rear, Vehicle ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K29R Seat Heating Control Module - Rear.
    - **If between 4.8 - 5.2 V**

5. Connect a test lamp between control circuit terminal 1 and control circuit terminal 4, Vehicle ON.

NOTE: **The test lamp should turn ON for approximately 20 s after the heated seat is commanded ON.**

6. Verify the test lamp turns ON after pressing the rear heated seat switch.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, remove the test lamp, disconnect the X1 harness connector at the K29R Seat Heating Control Module - Rear.
    2. Test for less than 2 Ω in each control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K29R Seat Heating Control Module - Rear.
    - **If the test lamp turns ON**

NOTE: **Because of the type of material used in the heater element, a reliable resistance value is unavailable for a component test.**

7. Test or replace the E14 Seat Heating Element - Rear Cushion.

Degraded Heated Seat Operation Left Rear Seat

NOTE: **Circuit/System Verification must be performed before proceeding with Circuit/System Testing**

1. Vehicle OFF, disconnect the harness connector at the E14F Seat Heating Element - Left Rear Cushion. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 40 Ω between the low reference circuit terminal 3 and ground.
    - **If 40 Ω or greater**
    1. Vehicle OFF, disconnect the X2 harness connector at the K29R Seat Heating Control Module - Rear.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K29R Seat Heating Control Module - Rear.
    - **If less than 40 Ω**
3. Vehicle ON.
4. Test for 4.8 - 5.2 V between the signal circuit terminal 2 and ground.
    - **If less than 4.8 V**

   1. Vehicle OFF, disconnect the X2 harness connector at the K29R Seat Heating Control Module - Rear.
   2. Test for infinite resistance between the signal circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K29R Seat Heating Control Module - Rear.
   - **If greater than 5.2 V**
   1. Vehicle OFF, disconnect the X2 harness connector at the K29R Seat Heating Control Module - Rear, Vehicle ON.
   2. Test for less than 1 V between the signal circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K29R Seat Heating Control Module - Rear.
   - **If between 4.8 - 5.2 V**
5. Vehicle OFF, connect the harness connector at the E14F Seat Heating Element - Left Rear Cushion and disconnect the X2 harness connector at the K29R Seat Heating Control Module - Rear.
6. Test for 500 Ω - 300 kΩ between the signal circuit terminal 6 and the low reference circuit terminal 1.
   - **If not between 500 Ω - 300 kΩ**

     Replace the E14F Seat Heating Element - Left Rear Cushion.

   - **If between 500 Ω - 300 kΩ**
7. Replace the K29R Seat Heating Control Module - Rear.

Degraded Heated Seat Operation Right Rear Seat

NOTE: **Circuit/System Verification must be performed before proceeding with Circuit/System Testing**

1. Vehicle OFF, disconnect the harness connector at the E14H Seat Heating Element - Right Rear Cushion. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 40 Ω between the low reference circuit terminal 3 and ground.
   - **If 40 Ω or greater**
   1. Vehicle OFF, disconnect the X2 harness connector at the K29R Seat Heating Control Module - Rear.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K29R Seat Heating Control Module - Rear.
   - **If less than 40 Ω**
3. Vehicle ON.
4. Test for 4.8 - 5.2 V between the signal circuit terminal 2 and ground.
   - **If less than 4.8 V**
   1. Vehicle OFF, disconnect the X2 harness connector at the K29R Seat Heating Control Module - Rear.
   2. Test for infinite resistance between the signal circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K29R Seat Heating Control Module - Rear.

- **If greater than 5.2 V**

  1. Vehicle OFF, disconnect the X2 harness connector at the K29R Seat Heating Control Module - Rear, Vehicle ON.
  2. Test for less than 1 V between the signal circuit and ground.
     - If 1 V or greater, repair the short to voltage on the circuit.
     - If less than 1 V, replace the K29R Seat Heating Control Module - Rear.

- **If between 4.8 - 5.2 V**

5. Vehicle OFF, connect the harness connector at the E14H Seat Heating Element - Right Rear Cushion and disconnect the X2 harness connector at the K29R Seat Heating Control Module - Rear.
6. Test for 500 Ω - 300 kΩ between the signal circuit terminal 5 and the low reference circuit terminal 2.
   - **If not between 500 Ω - 300 kΩ**

     Replace the E14H Seat Heating Element - Right Rear Cushion.

   - **If between 500 Ω - 300 kΩ**
7. Replace the K29R Seat Heating Control Module - Rear.

Heated Seat Switch Indicator Circuit Test

NOTE: **Circuit/System Verification must be performed before proceeding with Circuit/System Testing.**

1. Vehicle OFF, disconnect the harness connector at the appropriate S32 Seat Heating Switch - Rear, Vehicle ON.

   NOTE: **The test lamp in the following step will illuminate at LOW intensity. This is normal circuit operation and does not indicate a circuit malfunction.**

2. Verify a test lamp illuminates at LOW intensity between the control circuit terminal 6 and ground.
   - **If the test lamp does not illuminate**
     1. Vehicle OFF, remove the test lamp, disconnect the X1 harness connector at the K9 Body Control Module.
     2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
     3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module
   - **If the test lamp illuminates at FULL intensity**
     1. Vehicle OFF, remove the test lamp, disconnect the X1 harness connector at the K9 Body Control Module, Vehicle ON.
     2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
   - **If the test lamp illuminates at LOW intensity**
3. Connect a test lamp illuminate between control circuit terminal 6 and control circuit terminal 4.
4. Verify the test lamp Does Not illuminate.
   - **If the test lamp illuminates**
     1. Vehicle OFF, remove the test lamp, disconnect the X5 harness connector at the K9 Body Control Module.
     2. Test for infinite resistance between the control circuit terminal 4 and ground.

        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module.
    - **If the test lamp does not illuminate**

5. Verify the test lamp illuminates when commanding the Rear Seat Heating Indicator Active with a scan tool.
    - **If the test lamp does not illuminate**
    1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, Vehicle ON.
    2. Test for less than 1 V between the control circuit terminal 4 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp illuminates**
6. Test or replace the S32 Seat Heating Switch - Rear.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Rear Seat Heater Switch Replacement**
- **Rear Seat Cushion Heater Replacement**
- **Control Module References** for K29R Seat Heating Control Module - Rear replacement, programming and setup

REPAIR INSTRUCTIONS

FRONT SEAT HEATER CONTROL MODULE BRACKET REPLACEMENT

Use a heat gun to loosen the glue : moving slowly from one end to the other, slowly peeling the heater mat up as you go. This makes removal easier and ensures minimum damage to the underlying foam. Be careful not to use overly high temperatures or hold the heat gun in one place for too long as this can damage the foam.**

DESCRIPTION AND OPERATION

HEATED SEATS DESCRIPTION AND OPERATION

Heated Seat Components

The heated seat system consists of the following components:

- Heated seat switches
- Body control module
- Seat heating control module

- Driver seat cushion heating element
- Driver seat cushion temperature sensor
- Driver seat back heating element
- Driver seat back temperature sensor
- Passenger seat cushion heating element
- Passenger seat cushion temperature sensor
- Passenger seat back heating element
- Passenger seat back temperature sensor

Heated Seat Switches

The driver and passenger heated seats switches are located on the infotainment display. The vehicle must be ON to operate the heated seat system. When a heated seat switch is pressed, a serial data message is sent from the infotainment display to the body control module (BCM) indicating the heated seat command. The BCM serves as the heated seat system master to determine the requested operating mode. The BCM then sends a serial data message to the seat heating control module indicating the heated seat command. In response to this message, the seat heating control module attempts to drive the appropriate seat heating elements per the BCM command. The BCM also controls the seat temperature and mode indicators, via the serial data line, used to provide the operator with feedback as to the operating status of the system.

Heated Seat Operation

The seat heating control module controls heated seat operation for the driver and passenger seats. When active, power is applied to the seat cushion and back heater elements through a common pulse width modulated (PWM) voltage supply control circuit. Each individual heater element is switched to ground by the module through a common low side drive control circuit.

When inactive the seat heating control module connects the heating element low side outputs to a common reference point internal to the module which is biased to approximately 3.5 V. The module uses this biased voltage in order to check the high side and low side control circuits for a short to battery or ground before enabling the driver and passenger seat heating elements. During heated seat operation, the seat heating control module interrupts control of the heating elements every 10 s for approximately 10 ms to make this biased voltage check.

With both the seat cushion and seat back heater elements disconnected, if the high side output of the module is measured it will display a low current 12 V bleed off voltage. This bleed off voltage does not have a meaningful diagnostic purpose. With one or both of the heater elements connected you would just see the 3.5 V biased voltage from this circuit.

Temperature Regulation

The seat back and cushion temperature sensors (thermistors) are packaged with the seat heating elements located just under the seat covers. The seat heating control module supplies each temperature sensor with a 5 V reference signal circuit and a low reference circuit. The module monitors the voltage from the signal circuit to determine the temperature of the seat.

The temperature sensor varies in resistance based on the temperature of the heating element causing the signal voltage to change. Once the module senses the seat reached the set temperature, it will then begin regulate the current flow through the heater elements in order to maintain the desired seat temperature based on the feedback voltage from the sensor.

If the heated seats are on high, the temperature level may automatically be lowered after approximately 30 min of operation.

REAR HEATED SEATS DESCRIPTION AND OPERATION

Heated Seat Components

The rear heated seat system consists of the following components:

- Rear heated seat switches

- Body control module
- Rear seat heating control module
- Left rear seat cushion heating element
- Left rear seat cushion temperature sensor
- Right rear seat cushion heating element
- Right rear seat cushion temperature sensor

Heated Seat Switches

When a heated seat switch is pressed, the heated seat switch signal circuit from the body control module (BCM) is pulled low indicating the heated seat command. The BCM serves as the heated seat system master to determine the requested operating mode. The BCM then sends a LIN bus serial data message to the rear seat heating control module indicating the heated seat command. In response to this message, the seat heating control module attempts to drive the appropriate seat heating element per the BCM command.

Rear Heated Seat Operation

The rear seat heating control module controls heated seat operation for the left and right rear seats. When active, power is applied to the seat cushion and back heater elements through a common pulse width modulated (PWM) voltage supply control circuit. Each individual heater element is switched to ground by the module through a common low side drive control circuit.

When inactive the rear seat heating control module connects the heating element low side outputs to a common reference point internal to the control module which is biased to approximately 3.5 V. The control module uses this biased voltage in order to check the high side and low side control circuits for a short to battery or ground before enabling either the left or right rear seat heating element. During heated seat operation, the control module interrupts control of the heating elements every 10 s for approximately 10 ms to make this biased voltage check.

Temperature Regulation

The seat cushion temperature sensor (thermistors) is packaged with the seat heating element located just under the seat cover. The rear seat heating control module supplies the temperature sensor with a 5 V reference signal circuit and a low reference circuit. The control module monitors the voltage from the signal circuit to determine the temperature of the seat.

The temperature sensor varies in resistance based on the temperature of the heating element causing the signal voltage to change. Once the rear seat heating control module senses the seat reached the set temperature, it will then begin regulate the current flow through the heater elements in order to maintain the desired seat temperature based on the feedback voltage from the sensor.

The temperature level may automatically be lowered after approximately 30 min of operation.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B3622: STEERING WHEEL CONTROLS SIGNAL CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B3622

Steering Wheel Controls Signal Circuit

For symptom byte information refer to Symptom Byte List .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	U1510 00	U1510 00	-	-
Volume Up Signal-Terminal 8	B3622 39, B3622 59	1	-	-
Volume Down Signal-Terminal 7	B3622 39, B3622 59	1	-	-
Next Preset Signal-Terminal 9	B3622 39, B3622 59	1	-	-
Previous Preset Signal-Terminal 10	B3622 39, B3622 59	1	-	-
Serial Data	U1510 00, B3622 59	U1510 00	U1510 00, B3622 59	-
Low Reference	-	U1510 00	-	-
1. Steering Wheel Controls Inoperative				

Circuit/System Description

The steering wheel controls are divided into a right-hand set and left-hand set. The right - hand switch communicates with the instrument cluster through serial data and provides input from the rear left - hand switch and rear right - hand switch. The instrument cluster identifies the switch selection and activates the feature.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

B3622 39

An internal electrical malfunction has been detected in the steering wheel controls switch.

B3622 59

A stuck switch has been detected in the steering wheel controls switch.

Action Taken When the DTC Sets

No action is taken.

Conditions for Clearing the DTC

The DTC will clear when the conditions for setting the DTC are no longer present.

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify all the associated primary controls on the radio (Volume, Mute, Seek, etc.) operate properly.
    - **If any of the primary controls do not function properly**

      Refer to **Symptoms - Entertainment** .

    - **If all of the primary controls function properly**
3. Verify the scan tool Steering Wheel Control Switches parameter changes when pressing the S70R Steering Wheel Controls Switch - Right buttons.
    - **If the parameter does not change for some of the S70R Steering Wheel Controls Switch - Right switches**

      Replace S70R Steering Wheel Controls Switch - Right.

    - **If the parameter does not change for all of the S70R Steering Wheel Controls Switch - Right switches**

      Refer to S70R Steering Wheel Controls Switch Circuit/System Testing.

    - **If the parameter changes for all S70R Steering Wheel Controls Switch - Right buttons**
4. Verify the scan tool Steering Wheel Control Switches parameter changes between Volume Up and Volume Down when depressing the S70F Steering Wheel Controls Switch - Radio Volume switch.
    - **If the parameter does not change**

      Refer to S70F Steering Wheel Controls Switch - Radio Volume Circuit/System Testing.

    - **If the parameter changes**
5. Verify the scan tool Steering Wheel Control Switches parameter changes between Next Preset and Previous Preset when depressing the S70E Steering Wheel Controls Switch - Radio Presets switch.
    - **If the parameter does not change**

      Refer to S70E Steering Wheel Controls Switch - Radio Presets Circuit/System Testing.

    - **If the parameter changes**
6. All OK.

Circuit/System Testing

S70F Steering Wheel Controls Switch - Radio Volume

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S70F Steering Wheel Controls Switch - Radio Volume. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 3 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.

- **If less than 10 Ω**

3. Ignition ON.
4. Test for greater than 4.5 V between the signal circuit terminals listed below and ground:
    - Terminal 1
    - Terminal 2
    - **If 4.5 V or less**
    1. Ignition OFF, disconnect the harness connector at the S70R Steering Wheel Controls Switch - Right.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, test or replace the S70R Steering Wheel Controls Switch - Right.
    - **If greater than 4.5 V**
5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the ground circuit terminal 3.
6. Verify the scan tool Steering Wheel Control Switches parameter is Volume Down Button.
    - **If not Volume Down Button**

      Test or replace the S70R Steering Wheel Controls Switch - Right.

    - **If Volume Down Button**
7. Remove the jumper wire. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the ground circuit terminal 3.
8. Verify the scan tool Steering Wheel Control Switches parameter is Volume Up Button.
    - **If not Volume Up Button**

      Test or replace the S70R Steering Wheel Controls Switch - Right.

    - **If Volume Up Button**
9. Test or replace the S70F Steering Wheel Controls Switch - Radio Volume.

S70E Steering Wheel Controls Switch - Radio Presets

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S70E Steering Wheel Controls Switch - Radio Presets. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 1 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Ignition ON.
4. Test for greater than 4.5 V between the signal circuit terminals listed below and ground:
    - Terminal 2
    - Terminal 3
    - **If 4.5 V or less**
    1. Ignition OFF, disconnect the harness connector at the S70R Steering Wheel Controls Switch - Right.
    2. Test for infinite resistance between the signal circuit and ground.

        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, test or replace the S70R Steering Wheel Controls Switch - Right.
    - **If greater than 4.5 V**
5. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the ground circuit terminal 1.
6. Verify the scan tool Steering Wheel Control Switches parameter is Next Preset.
    - **If not Next Preset**

      Test or replace the S70R Steering Wheel Controls Switch - Right.

    - **If Next Preset**
7. Remove the jumper wire. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the ground circuit terminal 1.
8. Verify the scan tool Steering Wheel Control Switches parameter is Previous Preset.
    - **If not Previous Preset**

      Test or replace the S70R Steering Wheel Controls Switch - Right.

    - **If Previous Preset**
9. Test or replace the S70E Steering Wheel Controls Switch - Radio Presets.

S70R Steering Wheel Controls Switch-Right

1. Ignition OFF, disconnect the harness connector X1 at the P16 Instument Cluster.
2. Disconnect the harness connector at the S70R Steering Wheel Controls Switch - Right. Ignition ON.
3. Test for less than 1 V between the S70R Steering Wheel Controls Switch - Right serial data circuit terminal 2 and ground.
    - **If greater than 1 V**

      Repair the short to voltage on the circuit.

    - **If less than 1 V**
4. Ignition OFF.
5. Test for infinite resistance between the serial data circuit terminal 2 and ground.
    - **If less than infinite resistance**

      Repair the short to ground on the circuit.

    - **If infinite resistance**
6. Replace the S70R Steering Wheel Controls Switch - Right.

Component Testing

1. Ignition OFF, disconnect the harness connector at the S70F Steering Wheel Controls Switch - Radio Volume.
2. Test for infinite resistance between the following signal terminals and the ground terminal 3 with the switch in the open position.
    - Terminal 1
    - Terminal 2
    - **If less than infinite resistance on either circuit**

      Replace the S70F Steering Wheel Controls Switch - Radio Volume.

  - **If infinite resistance**

3. Test for less than 10 Ω between the following signal terminals and the ground terminal 3 with the S70F Steering Wheel Controls Switch - Radio Volume in the Up position or Down position.
    - Terminal 1
    - Terminal 2
    - **If 10 Ω or greater**

      Replace the S70F Steering Wheel Controls Switch - Radio Volume.

    - **If less than 10 Ω**
4. Ignition OFF, disconnect the harness connector at the S70E Steering Wheel Controls Switch - Radio Presets.
5. Test for infinite resistance between the following signal terminals and the ground terminal 1 with the switch in the open position.
    - Terminal 2
    - Terminal 3
    - **If less than infinite resistance on either circuit**

      Replace the S70E Steering Wheel Controls Switch - Radio Presets.

    - **If infinite resistance**
6. Test for less than 10 Ω between the following signal terminals and the ground terminal 1 with the S70E Steering Wheel Controls Switch - Radio Presets in the Up position or Down position.
    - Terminal 2
    - Terminal 3
    - **If 10 Ω or greater**

      Replace the S70E Steering Wheel Controls Switch - Radio Presets.

    - **If less than 10 Ω**
7. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Steering Wheel Spoke Cover Replacement

SYMPTOMS - SECONDARY AND CONFIGURABLE CUSTOMER CONTROLS

NOTE: **The following steps must be completed before using the symptom tables.**

1. Perform the **Diagnostic System Check - Vehicle** before using the symptom tables in order to verify that all of the following are true:
    - There are no DTCs set.
    - The control modules can communicate via the serial data link.
2. Review the system description and operation in order to familiarize yourself with the system functions. Refer to **Steering Wheel Controls Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the steering wheel controls. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components, for obvious damage or conditions, which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

Refer to **Steering Wheel Controls Malfunction** in order to diagnose the symptom.

STEERING WHEEL CONTROLS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Verification

1. Ignition ON. Verify the driver information center (DIC) illuminates.
    - **If the DIC does not illuminate**

      Test or replace the instrument cluster.

    - **If the DIC illuminates**
2. Verify all the associated primary controls on the radio (Volume, Mute, Seek, etc.) operate properly.
    - **If any of the primary controls do not function properly**

      Refer to **Symptoms - Entertainment** .

    - **If all of the primary controls function properly**
3. Verify the scan tool Steering Wheel Control Switches parameter changes when pressing the S70R Steering Wheel Controls Switch - Right buttons.
    - **If the parameter does not change for some of the S70R Steering Wheel Controls Switch - Right switches**

      Replace S70R Steering Wheel Controls Switch - Right.

    - **If the parameter does not change for all of the S70R Steering Wheel Controls Switch - Right switches**

      Refer to S70R Steering Wheel Controls Switch Circuit/System Testing.

    - **If the parameter changes for all S70R Steering Wheel Controls Switch - Right buttons**
4. Verify the scan tool Steering Wheel Control Switches parameter changes between Volume Up and Volume Down when depressing the S70F Steering Wheel Controls Switch - Radio Volume switch.
    - **If the parameter does not change**

      Refer to S70F Steering Wheel Controls Switch - Radio Volume Circuit/System Testing.

    - **If the parameter changes**
5. Verify the scan tool Steering Wheel Control Switches parameter changes between Next Preset and Previous Preset when depressing the S70E Steering Wheel Controls Switch - Radio Presets switch.
    - **If the parameter does not change**

      Refer to S70E Steering Wheel Controls Switch - Radio Presets Circuit/System Testing.

    - **If the parameter changes**
6. All OK.

Circuit/System Testing

S70F Steering Wheel Controls Switch - Radio Volume

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S70F Steering Wheel Controls Switch - Radio Volume. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 3 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.

        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Ignition ON.
4. Test for greater than 4.5 V between the signal circuit terminals listed below and ground:
    - Terminal 1
    - Terminal 2
    - **If 4.5 V or less**
    1. Ignition OFF, disconnect the harness connector at the S70R Steering Wheel Controls Switch - Right.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, test or replace the S70R Steering Wheel Controls Switch - Right.
    - **If greater than 4.5 V**
5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the ground circuit terminal 3.
6. Verify the scan tool Steering Wheel Control Switches parameter is Volume Down Button.
    - **If not Volume Down Button**

      Test or replace the S70R Steering Wheel Controls Switch - Right.

    - **If Volume Down Button**
7. Remove the jumper wire. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the ground circuit terminal 3.
8. Verify the scan tool Steering Wheel Control Switches parameter is Volume Up Button.
    - **If not Volume Up Button**

      Test or replace the S70R Steering Wheel Controls Switch - Right.

    - **If Volume Up Button**
9. Test or replace the S70F Steering Wheel Controls Switch - Radio Volume.

S70E Steering Wheel Controls Switch - Radio Presets

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S70E Steering Wheel Controls Switch - Radio Presets. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 1 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Ignition ON.
4. Test for greater than 4.5 V between the signal circuit terminals listed below and ground:
    - Terminal 2
    - Terminal 3
    - **If 4.5 V or less**
    1. Ignition OFF, disconnect the harness connector at the S70R Steering Wheel Controls Switch - Right.

      2. Test for infinite resistance between the signal circuit and ground.
         - If less than infinite resistance, repair the short to ground on the circuit.
         - If infinite resistance
      3. Test for less than 2 Ω in the signal circuit end to end.
         - If 2 Ω or greater, repair the open/high resistance in the circuit.
         - If less than 2 Ω, test or replace the S70R Steering Wheel Controls Switch - Right.
   - **If greater than 4.5 V**
5. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the ground circuit terminal 1.
6. Verify the scan tool Steering Wheel Control Switches parameter is Next Preset.
   - **If not Next Preset**

     Test or replace the S70R Steering Wheel Controls Switch - Right.

   - **If Next Preset**
7. Remove the jumper wire. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the ground circuit terminal 1.
8. Verify the scan tool Steering Wheel Control Switches parameter is Previous Preset.
   - **If not Previous Preset**

     Test or replace the S70R Steering Wheel Controls Switch - Right.

   - **If Previous Preset**
9. Test or replace the S70E Steering Wheel Controls Switch - Radio Presets.

S70R Steering Wheel Controls Switch-Right

1. Ignition OFF, disconnect the harness connector X1 at the P16 Instument Cluster.
2. Disconnect the harness connector at the S70R Steering Wheel Controls Switch - Right. Ignition ON.
3. Test for less than 1 V between the S70R Steering Wheel Controls Switch - Right serial data circuit terminal 2 and ground.
   - **If greater than 1 V**

     Repair the short to voltage on the circuit.

   - **If less than 1 V**
4. Ignition OFF.
5. Test for infinite resistance between the serial data circuit terminal 2 and ground.
   - **If less than infinite resistance**

     Repair the short to ground on the circuit.

   - **If infinite resistance**
6. Replace the S70R Steering Wheel Controls Switch - Right.

Component Testing

1. Ignition OFF, disconnect the harness connector at the S70F Steering Wheel Controls Switch - Radio Volume.
2. Test for infinite resistance between the following signal terminals and the ground terminal 3 with the switch in the open position.
   - Terminal 1
   - Terminal 2
   - **If less than infinite resistance on either circuit**

     Replace the S70F Steering Wheel Controls Switch - Radio Volume.

- **If infinite resistance**

3. Test for less than 10 Ω between the following signal terminals and the ground terminal 3 with the S70F Steering Wheel Controls Switch - Radio Volume in the Up position or Down position.
    - Terminal 1
    - Terminal 2
    - **If 10 Ω or greater**

      Replace the S70F Steering Wheel Controls Switch - Radio Volume.

    - **If less than 10 Ω**
4. Ignition OFF, disconnect the harness connector at the S70E Steering Wheel Controls Switch - Radio Presets.
5. Test for infinite resistance between the following signal terminals and the ground terminal 1 with the switch in the open position.
    - Terminal 2
    - Terminal 3
    - **If less than infinite resistance on either circuit**

      Replace the S70E Steering Wheel Controls Switch - Radio Presets.

    - **If infinite resistance**
6. Test for less than 10 Ω between the following signal terminals and the ground terminal 1 with the S70E Steering Wheel Controls Switch - Radio Presets in the Up position or Down position.
    - Terminal 2
    - Terminal 3
    - **If 10 Ω or greater**

      Replace the S70E Steering Wheel Controls Switch - Radio Presets.

    - **If less than 10 Ω**
7. All OK

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Steering Wheel Spoke Cover Replacement

REPAIR INSTRUCTIONS

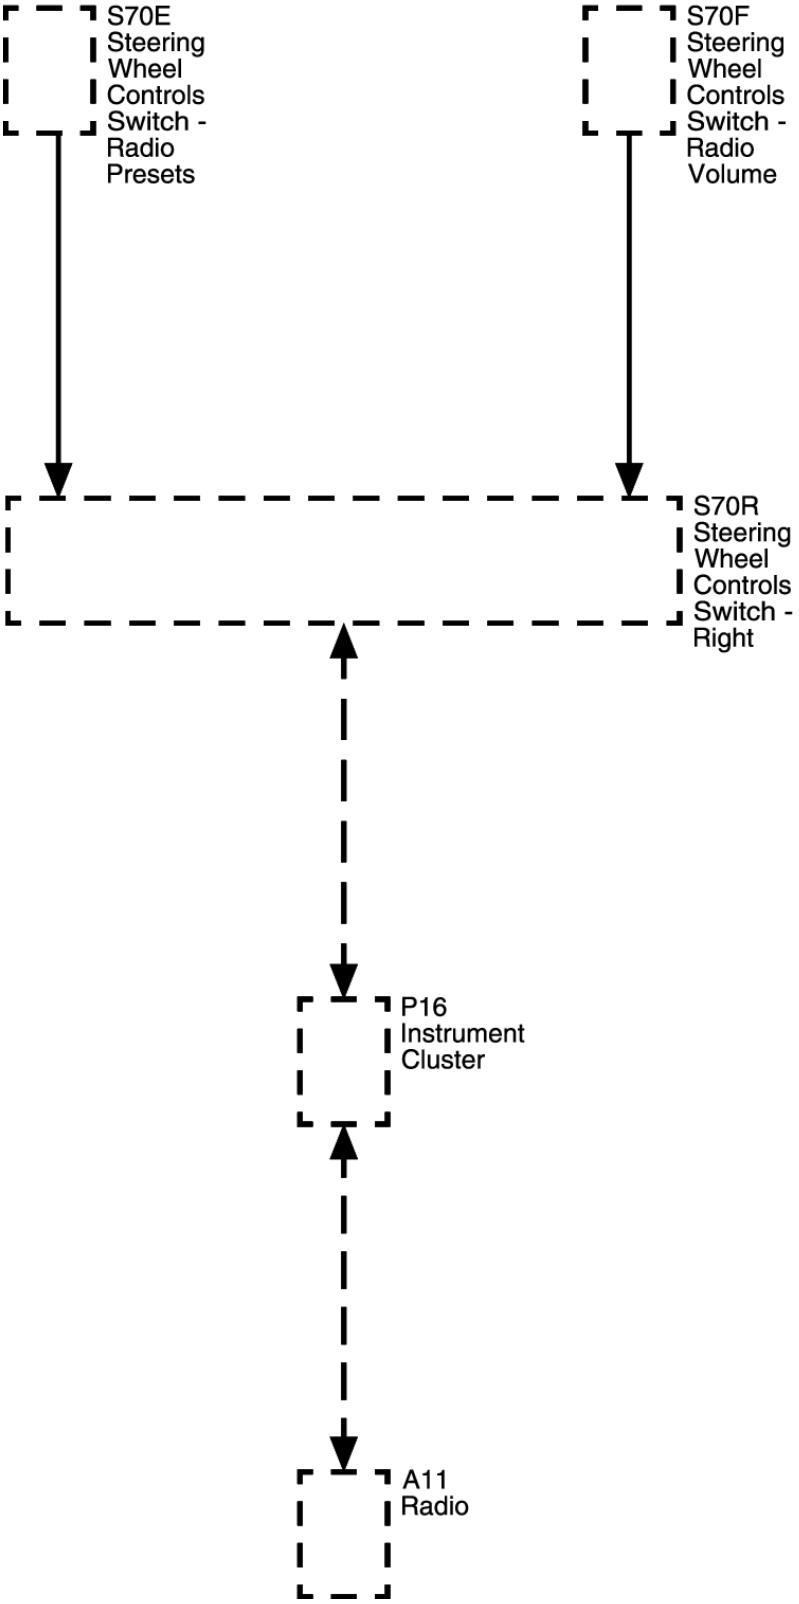
RESET TEEN DRIVER KEY PIN

If the PIN has been lost the only way to clear a Teen Key is to follow the Body Control Module (BCM) Configuration/Reset Functions Reset Teen Driver Key PIN procedure in the scan tool. This procedure will clear all Teen Keys

1. Connect a scan tool to the vehicle.
2. Select the Reset Teen Driver Key PIN.
3. After resetting the PIN, all teen keys will be cleared.
4. Verify teen keys are cleared.

DESCRIPTION AND OPERATION

STEERING WHEEL CONTROLS DESCRIPTION AND OPERATION



S70E Steering Wheel Controls Switch - Radio Presets
S70F Steering Wheel Controls Switch - Radio Volume
S70R Steering Wheel Controls Switch - Right
P16 Instrument Cluster
A11 Radio

Fig. 2: Secondary Controls Block Diagram
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
S70E	Steering Wheel Controls Switch - Radio Presets
S70F	Steering Wheel Controls Switch - Radio Volume
S70R	S70R Steering Wheel Controls Switch - Right
P16	P16 Instrument Cluster
A11	A11 Radio

The steering wheel control switches duplicate the function of the primary controls of the associated component, through a network of momentary contact switches.

The Steering Wheel Controls are divided into a right-hand set and left-hand set. The right-hand switch is connected to the IPC LIN serial data and provides input from the left-hand, left-hand rear, and right-hand rear switches

The right-hand switch controller consists of UP/DOWN/LEFT/RIGHT directional, center "select", Push-to-Talk, and Mute buttons. The LEFT/RIGHT buttons navigate the display regions of the cluster. The UP/DOWN buttons navigate the menus. The right-hand rear switch consists of volume up and volume down buttons. The left-hand rear switch consists of favorite up and favorite down buttons.

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - THEFT DETERRENT

NOTE: The following steps must be completed before using the symptom tables.

1. Perform **Diagnostic System Check - Vehicle** in order to verify that all of the following are true:
    - There are no DTCs set.
    - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to the following **Theft Systems Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Theft Deterrent System. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Content Theft Deterrent Malfunction**
- **Security Indicator Malfunction**

CONTENT THEFT DETERRENT MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The content theft deterrent system is a software based system in which the Body Control Module (BCM) actively monitors certain inputs to determine if unauthorized vehicle access is being attempted. Based on inputs such as the door ajar switches, the rear compartment ajar switch, and the hood ajar switch, the BCM determines whether a content theft deterrent alarm is warranted. If unauthorized access is being detected, the BCM will pulse the vehicle horn and flash the exterior lamps as a means of theft deterrence.

Diagnostic Aids

The scan tool BCM Content Theft Deterrent Trigger History 1, 2, and 3 parameters can be used to help isolate an intermittent unwanted content theft deterrent alarm. These parameters are a rolling history of the previous three causes of a theft deterrent alarm. If all three parameters are indicating the same alarm trigger, the indicated input should be the starting point when diagnosing an intermittent concern.

Circuit/System Verification

1. Ignition ON.
2. Verify each indicator/message transition between the ajar and closed state while opening and closing each vehicle door, hood, and rear compartment.
    - **If the indicator/message does not change**

      Refer to Door Ajar Indicator Malfunction , or Hood Ajar Indicator/Message Malfunction .

    - **If each indicator/message changes**
3. Completely lower the driver door window and close all vehicle doors, ignition OFF.
4. Arm the content theft deterrent system by locking the door with the keyless entry transmitter.
5. Verify the scan tool BCM Content Theft Deterrent Alarm Status parameter is Armed.
    - **If not Armed**

      Refer to Keyless Entry System Malfunction .

    - **If Armed**
6. Without disarming the system, reach in through the open driver window and open the driver door.
7. Verify the scan tool BCM Content Theft Deterrent Alarm Status parameter is Alarm.
    - **If not Alarm**

      Replace the K9 Body Control Module.

    - **If Alarm**
8. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Control Module References for Body Control Module replacement, programming, and setup

SECURITY INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	2	2	1	-
1. Security Indicator Always On 2. Security Indicator Inoperative				

Circuit/System Description

The security indicator is controlled by the Body Control Module (BCM) based on commands from the content theft deterrent system. The security indicator is located in the driver information center. When the content theft deterrent system requests the indicator be illuminated, the BCM applies voltage to the control circuit, illuminating the indicator.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Arm the content theft deterrent system.
2. Verify the security indicator illuminates and/or flash during the arming sequence.
    - **If the indicator does not illuminate and/or flash**

      Refer to Circuit/System Testing

    - **If the indicator illuminates and/or flashes**
3. All OK

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the A5 Driver Information Center.
2. Connect a test lamp between the control circuit terminal 2 and ground, ignition ON.
3. Verify the test lamp turns ON and OFF when commanding the Security Indicator Active and Inactive with a scan tool.
    - **If the test lamp is always OFF**
    1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp is always ON**

    1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module, ignition ON.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**
4. Test or replace the A5 Driver Information Center.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Preliminary Procedures 1. **Rear Floor Console Replacement** 2. Rear Console Side Panel-Right - Remove - **Front Floor Console Cup Holder Replacement**	

Callout	Component Name
1	Theft Deterrent Module screw **CAUTION:** Fastener Caution **Tighten** 1 N.m (9 lb in)
2	Theft Deterrent Module **Procedure** Disconnect the electrical connector.

DESCRIPTION AND OPERATION

THEFT SYSTEMS DESCRIPTION AND OPERATION

When armed, the content theft deterrent system is designed to deter vehicle content theft by pulsing the horns and exterior lamps for approximately 30 seconds when an unauthorized vehicle entry is detected. However, the content theft deterrent system does not affect engine starting.

An unauthorized entry can be any of the following with the content theft deterrent system armed:

- Unauthorized entry into the underhood area
- Unauthorized entry into the rear compartment
- When any door is opened without using the UNLOCK command from a keyless entry transmitter
- After a battery reconnect, if the battery was disconnected with the content theft deterrent system armed

The components of the content theft deterrent system are:

- Body Control Module (BCM)
- Remote control door lock receiver
- Door ajar switches
- Rear compartment ajar switch
- Hood ajar switch

Arming the Content Theft Deterrent System

Use the following procedure in order to arm the system:

1. Place the shift lever in P (park).
2. Turn OFF the ignition.
3. Open any door.

NOTE: **The system is not armed if the doors are locked manually; the remote keyless entry transmitter must be used to arm the content theft deterrent system.**

4. Lock the doors by pressing the LOCK button on the transmitter. The system is in standby mode and will not start the arming timer until all doors are closed.
5. The system will begin the arm sequence immediately after the last door is closed. If the keyless entry transmitter is used to arm the system after the vehicle doors are closed, the arm sequence will begin as soon as the LOCK command is received from the transmitter.
6. Pressing the LOCK button on the keyless entry transmitter a second time will bypass the delayed arming function and force the system to arm.

Locking the Vehicle Without Arming the Content Theft Deterrent System

Locking the vehicle may be accomplished without arming the content theft deterrent system. Use of the manual door locks will lock the vehicle, but will not arm the content theft deterrent system.

Disarming an Armed System/Silencing an Alarm

If system arming has been requested by the keyless entry transmitter, it must be disarmed.

NOTE: **Disconnecting the battery or removing fuses does not disable the arm or alarm modes, since the BCM stores the content theft deterrent mode status in memory.**

- To disarm the content theft deterrent system in standby mode, perform one of the following:
  - Press the UNLOCK button on the keyless entry transmitter.
  - Insert a valid key into the ignition and switch to the ON position.
- To disarm the content theft deterrent system in the armed mode (non-event) or when activated (during an alarm event):
  - Press the UNLOCK button on the keyless entry transmitter.
  - Insert a valid key into the ignition and switch to the ON position

Content Theft Deterrent Circuit Description

The following is a description of each component used in the content theft deterrent system:

Body Control Module

The content theft deterrent system is an internal function of the BCM which utilizes serial data and various switch inputs information to perform content theft deterrent functions. When the BCM detects an unauthorized entry, it activates the horns and exterior lamps. The BCM has 4 basic modes (disarmed, standby, armed, and alarm) for operating the content theft deterrent system. The different modes are described below.

1. The BCM has the content theft deterrent system in a disarmed mode until the following conditions are detected:
   - Ignition key turned to the OFF position.
   - Doors locked by the LOCK button on the transmitter.
2. The BCM enters the standby mode when the above conditions are detected. If a door was already opened when the arm mode was requested, the standby mode does not start the timer until the last door is closed.
3. When the last door is closed, a 15 second timer is activated. Once the timer has expired, the BCM enters the armed mode. After this delay, any unauthorized entry will activate the alarm mode.
4. When the BCM detects an unauthorized entry, the BCM enters the alarm mode. The BCM activates the horns and exterior lamps for 30 seconds. This is followed by a three minute time-out with the horn no longer active. If no new intrusions are detected after the time-out, the horn is not active. The system must be disarmed or the intrusion condition removed after the time-out for the system to exit alarm mode.

Remote Control Door Lock Receiver

The keyless entry system can arm and disarm the content theft deterrent system. When the remote control door lock receiver receives a door lock or unlock signal from the transmitter, the remote control door lock receiver sends a message to the BCM via serial data to perform the appropriate arm/disarm functions.

Door Ajar Switches

The content theft deterrent system uses the door ajar switches as a status indicator to activate the alarm. The door ajar switches are monitored by the body control module via a discrete input from each door ajar switch. If the BCM receives a signal indicating a door is opened when the content theft deterrent system is armed, the BCM activates the alarm.

Hood Ajar Switch

The content theft deterrent system uses the hood ajar switch as a status indicator to activate the alarm. The BCM monitors the hood ajar switch via a discrete input from the switch. If the BCM receives a signal indicating the hood has been opened when the content theft deterrent system is armed, the BCM activates the alarm.

Rear Compartment Ajar Switch

The content theft deterrent system uses the rear compartment ajar switch as a status indicator to activate the alarm. The BCM monitors the rear compartment ajar switch via a discrete input from the switch. If the BCM receives a signal indicating the rear compartment has been opened when content theft deterrent system is armed, the BCM activates the alarm.

Inputs

The BCM monitors the following inputs for content theft deterrent:

- Door ajar switches
- Keyless entry transmitter LOCK/UNLOCK buttons; a message from the remote control door lock receiver
- Immobilizer status - The BCM uses the immobilizer status for disarming the system or silencing an alarm when the correct vehicle key is used to start the vehicle
- Rear compartment ajar switch
- Hood ajar switch

Outputs

The BCM controls the following for content theft deterrent:

- Horn relay
- Exterior lamps

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B1474 OR B3849: PASSENGER/DRIVER EXTERIOR DOOR HANDLE SWITCH CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: Diagnostic System Check - Vehicle
- Review the description of Strategy Based Diagnosis: Strategy Based Diagnosis
- An overview of each diagnostic category can be found here: Diagnostic Procedure Instructions

DTC Descriptor

DTC B1474

Passenger Exterior Door Handle Switch Circuit

DTC B3849

Driver Exterior Door Handle Switch Circuit

Symptom Byte Information: Symptom Byte List

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal - Exterior Driver Door Handle Switch	B3849 02	1	1	-
Signal - Exterior Passenger Door Handle Switch	B1474 02	2	2	-
Ground - A24D Door Handle Assembly - Driver Exterior	-	1	-	-
Ground - A24P Door Handle Assembly - Passenger Exterior	-	2	-	-
1. B27D Door Handle Switch - Driver Exterior = Disabled 2. B27P Door Handle Switch - Passenger Exterior = Disabled				

Circuit/System Description

For an overview of the component/system, refer to: Power Door Locks Description and Operation

Circuit	Description
Signal	The control module input circuit has an internal resistance connected to 12 V.
Ground	Chassis Ground

Component	Description
B27D Door Handle Switch - Driver Exterior	The switch has a normally open contact.When the switch is activated, the signal circuit to the control module is grounded.
B27P Door Handle Switch - Passenger Exterior	The switch has a normally open contact.When the switch is activated, the signal circuit to the control module is grounded.

Component	Description
K84 Keyless Entry Control Module	The control module also reads various switches and sensors and makes their values available via serial data.

Conditions for Running the DTC

Ignition - On / Vehicle - In Service Mode

Conditions for Setting the DTC

B1474 02

Signal at B27P Door Handle Switch - Passenger Exterior = Short to Ground - For greater than 60 s

B3849 02

Signal t B27D Door Handle Switch - Driver Exterior = Short to Ground - For greater than 60 s

Actions Taken When the DTC Sets

B1474 02

B27P Door Handle Switch - Passenger Exterior = Disabled

B3849 02

B27D Door Handle Switch - Driver Exterior = Disabled

Conditions for Clearing the DTC

- A current DTC will clear when the diagnostic runs and passes.
- A history DTC will clear after 50 consecutive malfunction-free ignition cycles.

Circuit/System Verification

1. Ignition - On / Vehicle - In Service Mode
2. B27D Door Handle Switch - Driver Exterior - Not Pressed

   Verify the scan tool parameter: Exterior Driver Door Handle Switch = Inactive

   - **If not the specified state**

     Refer to: Circuit/System Testing

   - **If the specified state**
3. B27P Door Handle Switch - Passenger Exterior - Not Pressed

   Verify the scan tool parameter: Exterior Passenger Door Handle Switch = Inactive

   - **If not the specified state**

     Refer to: Circuit/System Testing

   - **If the specified state**
4. Operate the component: B27D Door Handle Switch - Driver Exterior - Pressed

   Verify the scan tool parameter: Exterior Driver Door Handle Switch = Active

   - **If not the specified state**

     Refer to: Circuit/System Testing

   - **If the specified state**
5. Operate the component: B27P Door Handle Switch - Passenger Exterior - Pressed

   Verify the scan tool parameter: Exterior Passenger Door Handle Switch = Active

   - **If not the specified state**

     Refer to: Circuit/System Testing

   - **If the specified state**
6. All OK.

Circuit/System Testing

NOTE: **It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.**

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the appropriate electrical connector: A24D Door Handle Assembly - Driver Exterior or A24P Door Handle Assembly - Passenger Exterior
3. Test for less than 10 Ω between the test points: Ground circuit terminal 5 & Ground
   - **If 10 Ω or greater**
     1. Ground Connection - Disconnect
     2. Test for less than 2 Ω between the test points: Ground circuit terminal 5 at Component harness & Ground Connection
        - If 2 Ω or greater - Repair the open/high resistance in the circuit.
        - If less than 2 Ω - Repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
4. Ignition - On / Vehicle - In Service Mode
5. Verify the scan tool parameter: Exterior Door Handle Switch Circuit = Inactive
   - **If not the specified state**
     1. Ignition/Vehicle - Off
     2. Disconnect the electrical connector: K84 Keyless Entry Control Module

        3. Test for infinite resistance between the test points: Signal circuit terminal 1 at Component harness & Ground
            - If less than infinite resistance - Repair the short to ground on the circuit.
            - If infinite resistance - Replace the component: K84 Keyless Entry Control Module
    - **If the specified state**
6. Connect a 3 A fused jumper wire between the test points: Signal circuit terminal 1 & Ground circuit terminal 5
7. Verify the scan tool parameter: Exterior Door Handle Switch Circuit = Active
    - **If not the specified state**
    1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
    2. Disconnect the electrical connector: K84 Keyless Entry Control Module
    3. Ignition - On / Vehicle - In Service Mode
    4. Test for less than 1 V between the test points: Signal circuit terminal 1 at Component harness & Ground
        - If 1 V or greater - Repair the short to voltage on the circuit.
        - If less than 1 V
    5. Ignition/Vehicle - Off
    6. Test for less than 2 Ω between the test points:
        - Signal circuit terminal 1 at A24D Door Handle Assembly - Driver Exterior & Terminal 12 X2 at Control module harness
        - Signal circuit terminal 1 at A24P Door Handle Assembly - Passenger Exterior & Terminal 11 X2 at Control module harness
        - If 2 Ω or greater - Repair the open/high resistance in the circuit.
        - If less than 2 Ω - Replace the component: K84 Keyless Entry Control Module
    - **If the specified state**
8. Test or replace the component: A24 Door Handle Assembly

Component Testing

1. Ignition/Vehicle - Off
2. Disconnect the appropriate electrical connector: A24D Door Handle Assembly - Driver Exterior or A24P Door Handle Assembly - Passenger Exterior
3. Test for infinite resistance between the test points: Signal terminal 1 & Ground terminal 5 - Not Pressed
    - **If less than infinite resistance**

      Replace the component: A24 Door Handle Assembly

    - **If infinite resistance**
4. Test for less than 3 Ω between the test points: Signal terminal 1 & Ground terminal 5 - Pressed
    - **If 3 Ω or greater**

      Replace the component: A24 Door Handle Assembly

    - **If less than 3 Ω**
5. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: **Diagnostic Repair Verification**

- **Front Side Door Outside Handle Replacement**
- For control module replacement, programming, and setup refer to: **Control Module References**

DTC B1534 OR B1535: LEFT/RIGHT REAR DOOR HANDLE SWITCH CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC B1534

Left Rear Door Handle Switch Circuit

DTC B1535

Right Rear Door Handle Switch Circuit

Symptom Byte Information: Symptom Byte List

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal - Exterior Left Rear Door Handle Switch	B1534 02	1	1	-
Signal - Exterior Right Rear Door Handle Switch	B1535 02	2	2	-
Ground - A24LR Door Handle Assembly - Left Rear Exterior	-	1	-	-
Ground - A24RR Door Handle Assembly - Right Rear Exterior	-	2	-	-

1. B27LR Door Handle Switch - Left Rear Exterior = Disabled
2. B27RR Door Handle Switch - Right Rear Exterior = Disabled

Circuit/System Description

For an overview of the component/system, refer to: **Power Door Locks Description and Operation**

Circuit	Description
Signal	The control module input circuit has an internal resistance connected to 12 V.
Ground	Chassis Ground

Component	Description
B27LR Door Handle Switch - Left Rear Exterior	The switch has a normally open contact.When the switch is activated, the signal circuit to the control module is grounded.
B27RR Door Handle Switch - Right Rear Exterior	The switch has a normally open contact.When the switch is activated, the signal circuit to the control module is grounded.
K84 Keyless Entry Control Module	The control module also reads various switches and sensors and makes their values available via serial data.

Conditions for Running the DTC

Ignition - On / Vehicle - In Service Mode

Conditions for Setting the DTC

B1534 02

Left Rear Door Handle Switch Signal = Short to Ground - For greater than 60 s

B1535 02

Right Rear Door Handle Switch Signal = Short to Ground - For greater than 60 s

Actions Taken When the DTC Sets

B1534 02

B27LR Door Handle Switch - Left Rear Exterior = Disabled

B1535 02

B27RR Door Handle Switch - Right Rear Exterior = Disabled

Conditions for Clearing the DTC

- A current DTC will clear when the diagnostic runs and passes.
- A history DTC will clear after 50 consecutive malfunction-free ignition cycles.

Scan Tool Reference

Control Module References

Circuit/System Verification

1. Ignition - On / Vehicle - In Service Mode
2. Verify the scan tool parameter: Exterior Left Rear Door Handle Switch = Inactive
    - **If not the specified state**

      Refer to: Circuit/System Testing

    - **If the specified state**
3. Verify the scan tool parameter: Exterior Right Rear Door Handle Switch = Inactive
    - **If not the specified state**

      Refer to: Circuit/System Testing

    - **If the specified state**

4. Operate the component: B27LR Door Handle Switch - Left Rear Exterior - Pressed

   Verify the scan tool parameter: Exterior Left Rear Door Handle Switch = Active

   - **If not the specified state**

     Refer to: Circuit/System Testing

   - **If the specified state**
5. Operate the component: B27RR Door Handle Switch - Right Rear Exterior - Pressed

   Verify the scan tool parameter: Exterior Right Rear Door Handle Switch = Active

   - **If not the specified state**

     Refer to: Circuit/System Testing

   - **If the specified state**
6. All OK.

Circuit/System Testing

NOTE: **It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.**

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the appropriate electrical connector: A24LR Door Handle Assembly - Left Rear Exterior or A24RR Door Handle Assembly - Right Rear Exterior
3. Test for less than 10 Ω between the test points: Ground circuit terminal 5 & Ground
   - **If 10 Ω or greater**
   1. Ground Connection - Disconnect
   2. Test for less than 2 Ω between the test points: Ground circuit terminal 5 at Component harness & Ground Connection
      - If 2 Ω or greater - Repair the open/high resistance in the circuit.
      - If less than 2 Ω - Repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
4. Ignition - On / Vehicle - In Service Mode
5. Verify the scan tool parameter: Exterior Door Handle Switch Circuit = Inactive
   - **If not the specified state**
   1. Ignition/Vehicle - Off
   2. Disconnect the electrical connector: X2 at K84 Keyless Entry Control Module
   3. Test for infinite resistance between the test points: Signal circuit terminal 1 at Component harness & Ground
      - If less than infinite resistance - Repair the short to ground on the circuit.
      - If infinite resistance - Replace the component: K84 Keyless Entry Control Module
   - **If the specified state**
6. Connect a 3 A fused jumper wire between the test points: Signal circuit terminal 1 & Ground circuit terminal 5
7. Verify the scan tool parameter: Exterior Door Handle Switch Circuit = Active
   - **If not the specified state**
   1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
   2. Disconnect the electrical connector: X2 at K84 Keyless Entry Control Module
   3. Ignition On/Vehicle in Service Mode.
   4. Test for less than 1 V between the test points: Signal circuit terminal 1 at Component harness & Ground

            - If 1 V or greater - Repair the short to voltage on the circuit.
            - If less than 1 V
        5. Ignition/Vehicle - Off
        6. Test for less than 2 Ω between the test points:
            - Signal circuit terminal 1 AT A24LR Door Handle Assembly - Left Rear Exterior & Terminal 2 X2 at Control module harness
            - Signal circuit terminal 1 at A24RR Door Handle Assembly - Right Rear Exterior & Terminal 1 X2 at Control module harness
            - If 2 Ω or greater - Repair the open/high resistance in the circuit.
            - If less than 2 Ω - Replace the component: K84 Keyless Entry Control Module
    - **If the specified state**

8. Test or replace the component: A24 Door Handle Assembly

Component Testing

1. Ignition/Vehicle - Off
2. Disconnect the appropriate electrical connector: A24LR Door Handle Assembly - Left Rear Exterior or A24RR Door Handle Assembly - Right Rear Exterior
3. Test for infinite resistance between the test points: Signal terminal 1 & Ground terminal 5 - Not Pressed
    - **If less than infinite resistance**

      Replace the component: A24 Door Handle Assembly

    - **If infinite resistance**
4. Test for less than 3 Ω between the test points: Signal terminal 1 & Ground terminal 5 - Pressed
    - **If 3 Ω or greater**

      Replace the component: A24 Door Handle Assembly

    - **If less than 3 Ω**
5. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: Diagnostic Repair Verification

- Rear Side Door Outside Handle Replacement
- For control module replacement, programming, and setup refer to: Control Module References

DTC B297B OR B297C: DRIVER DOOR OPEN SWITCH CIRCUIT NOT PLAUSIBLE

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC B297B 5A

Driver Door Open Switch Circuit Not Plausible

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	B2A00 00, B297B 5A	B2A00 00, B297B 5A	B2A00 00, B297B 5A	-
Ground	-	1	-	-
1. Ajar Indicator Inoperative				

Circuit/System Description

The keyless entry control module provides a 12 V signal to the driver door open switch signal circuit. The driver window motor provides a 12 V signal to the driver door ajar switch signal circuit. The door open switches and the door ajar switches are integral to the driver door latch assembly.

The door open switch and the door ajar switch contacts will be open with the door is fully closed, the door switches within the door latch are designed so that the when the door is ajar, the contact in the door ajar switch closes, the voltage is pulled low and the window motor will then send a serial data message to the body control module indicating that the door is ajar. When the door is opened further, the contact in the door open switch will then close providing a ground for the door open signal circuit, the keyless entry control module will then detect that the door is open.

Conditions for Running the DTC

Battery voltage is between 9 - 16 V.

Conditions for Setting the DTC

B2A00 00

- The chassis control module detects the driver door open switch is Active while receiving a serial data message from the body control module that the driver door ajar switch is Inactive.
- The condition must be present for greater than 30 seconds

B297B 5A

- The keyless entry control module detects the driver door open switch is Active while receiving a serial data message from the body control module that the driver door ajar switch is Inactive.
- The condition must be present for greater than 30 seconds

Action Taken When the DTC Sets

B2A00 00, B297B 5A

The driver information center will display the Service Driver Door Switch message

Conditions for Clearing the DTC

- The DTC will be current for as long as the fault is present.
- When the keyless entry control module receives a serial data message from the body control module that the door is ajar before the keyless entry control module detects the door open switch is active, then the DTC will be a history DTC.
- A history DTC will clear after 50 ignition cycles.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Body Control Module Driver Door Ajar Switch parameter changes between Inactive and Active when opening and closing the driver door.
    - **If the parameter does not change**

      Refer to **Door Ajar Indicator Malfunction**

    - **If the parameter changes**
3. Verify the scan tool Keyless Entry Control Module Driver Door Ajar Switch parameter changes between Inactive and Active when opening and closing the driver door.
    - **If the parameter does not change**

      Refer to Circuit/System Testing

    - **If the parameter changes**
4. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the A23D Door Latch Assembly-Driver. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 3 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify the scan tool Driver Door Ajar Switch parameter is Inactive.
    - **If not Inactive**
    1. Vehicle OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
    2. Test for infinite resistance between the signal circuit terminal 2 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K84 Keyless Entry Control Module.
    - **If Inactive**
5. Install a 3 A fused jumper wire between the circuit terminals 2 and ground.
6. Verify the scan tool Driver Door Ajar Switch parameter is Active.
    - **If not Active**

    1. Vehicle OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K84 Keyless Entry Control Module.
  - **If Active**

7. Test or replace the A23D Door Latch Assembly-Driver

Component Testing

1. Vehicle OFF, disconnect the harness connector at the A23D Door Latch Assembly-Driver.
2. Test for infinite resistance between the signal terminal 2 and the ground terminal 3 with the switch in the open position.
    - **If less than infinite resistance**

      Replace the A23D Door Latch Assembly-Driver.

    - **If infinite resistance**
3. Test for less than 3 Ω between the signal terminal 2 and the ground terminal 3 with the switch in the closed position.
    - **If 3 Ω or greater**

      Replace the A23D Door Latch Assembly-Driver.

    - **If less than 3 Ω**
4. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Front Side Door Latch Replacement**
- **Control Module References** for keyless entry control module replacement, programming and setup

DTC B3125, B3130, OR B3135: DRIVER DOOR ONLY/ALL DOORS UNLOCK/LOCK CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

1. A23D Door Latch Assembly - Driver = Inoperative
2. A23P Door Latch Assembly - Passenger = Inoperative
3. A23LR Door Latch Assembly - Left Rear = Inoperative
4. A23RR Door Latch Assembly - Right Rear = Inoperative

Circuit/System Description

For an overview of the component/system, refer to: **Power Door Locks Description and Operation**

Circuit	Description
B+ - Body Control Module	Supplied from a fuse.
Ground - Body Control Module	Chassis Ground
Control - Driver Door Unlock	The output circuit is switched from ground to 12 V to activate the component.
Control - All Doors Lock	The output circuit is switched from ground to 12 V to activate the component.
Control - Passenger Door Unlock	The output circuit is switched from ground to 12 V to activate the component.

Component	Description
A23 Door Latch Assembly	The door locks are actuated by a bidirectional DC motor that locks/unlocks the door so that it can not be opened from outside the vehicle (but still from inside).
K9 Body Control Module	The module controls various vehicle functions like lighting, central door locking, power windows, etc. The control module also reads various switches and sensors and makes their values available via serial data.

Conditions for Running the DTC

Ignition - On / Vehicle - In Service Mode

Conditions for Setting the DTC

- B3125 01, B3130 01, B3135 01 Condition 1 - Control Circuit = Short to Voltage
- B3125 02, B3130 02, B3135 02 Condition 2 - Control Circuit = Short to Ground
- B3125 02, B3130 02, B3135 02 Condition 3 - B+ circuit at K9 Body Control Module = Short to Ground/Open/High Resistance

Actions Taken When the DTC Sets

All Doors Lock Command & All Doors Unlock Command = Inoperative

Conditions for Clearing the DTC

- A current DTC will clear when the diagnostic runs and passes.
- A history DTC will clear after 50 consecutive malfunction-free ignition cycles.

Control Module References

Circuit/System Verification

1. Ignition - On / Vehicle - In Service Mode
2. Operate the component: S13D Door Lock Switch - Driver - Lock & Unlock

   Verify the scan tool parameter: Driver Door Lock Switch = Inactive & Lock & Unlock

   - **If not the specified state**

     Refer to: Refer to **Power Door Locks Malfunction**

   - **If the specified state**
3. Operate the component: S13D Door Lock Switch - Driver - Lock & Unlock

   Verify the component works as specified:

   - A23D Door Latch Assembly - Driver = Lock & Unlock
   - A23LR Door Latch Assembly - Left Rear = Lock & Unlock

- A23P Door Latch Assembly - Passenger = Lock & Unlock
- A23RR Door Latch Assembly - Right Rear = Lock & Unlock
- **If the component does not activate - A23D Door Latch Assembly - Driver**

  Refer to: Circuit/System Testing - Test 1

- **If the component does not activate - A23LR Door Latch Assembly - Left Rear**

  Refer to: Circuit/System Testing - Test 2

- **If the component does not activate - A23P Door Latch Assembly - Passenger**

  Refer to: Circuit/System Testing - Test 2

- **If the component does not activate - A23RR Door Latch Assembly - Right Rear**

  Refer to: Circuit/System Testing - Test 2

- **If none of the components operate**

  Refer to: Circuit/System Testing - Test 3

- **If all functions work properly**

4. All OK.

Circuit/System Testing

Test 1

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the electrical connector: A23D Door Latch Assembly - Driver
3. Connect a test lamp between the test points: Control terminal 7 & Control terminal 8
4. Ignition - On / Vehicle - In Service Mode
5. Operate the component: S13D Door Lock Switch - Driver - Lock & Unlock
6. Verify the test lamp does not turn On and Off.
   - **If the test lamp turns On and Off**

     Test or replace the component: A23D Door Latch Assembly - Driver

   - **If the test lamp does not turn On and Off**
7. Ignition/Vehicle - Off
8. Disconnect the electrical connector: X6 at K9 Body Control Module
9. Test for less than 2 Ω between the test points:
   - Control circuit terminal 7 at A23D Door Latch Assembly - Driver & Terminal 1 X6 at Control module harness
   - Control circuit terminal 8 at A23D Door Latch Assembly - Driver & Terminal 4 X6 at Control module harness
   - If 2 Ω or greater - Repair the open/high resistance in the circuit.
   - **If less than 2 Ω**
10. Test or replace the component: K9 Body Control Module

Test 2

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the appropriate electrical connector:
   - A23LR Door Latch Assembly - Left Rear
   - A23P Door Latch Assembly - Passenger
   - A23RR Door Latch Assembly - Right Rear

3. Connect a test lamp between the test points:
    - A23P Door Latch Assembly - PassengerControl terminal 8 & Control terminal 9
    - A23LR Door Latch Assembly - Left RearControl terminal 7 & Control terminal 8
    - A23RR Door Latch Assembly - Right RearControl terminal 8 & Control terminal 9
4. Ignition - On / Vehicle - In Service Mode
5. Operate the component: S13D Door Lock Switch - Driver - Lock & Unlock
6. Verify the test lamp does not turn On and Off.
    - **If the test lamp turns On and Off**

      Test or replace the component: A23 Door Latch Assembly

    - **If the test lamp does not turn On and Off**
7. Ignition/Vehicle - Off
8. Disconnect the electrical connector: X6 at K9 Body Control Module
9. Ignition - On / Vehicle - In Service Mode
10. Test for less than 2 Ω between the test points:
    - Control circuit terminal 7 at A23LR Door Latch Assembly - Left Rear & Terminal 2 X6 at Control module harness
    - Control circuit terminal 8 at A23LR Door Latch Assembly - Left Rear & Terminal 4 X6 at Control module harness
    - Control circuit terminal 8 at A23P Door Latch Assembly - Passenger & Terminal 4 X6 at Control module harness
    - Control circuit terminal 9 at A23P Door Latch Assembly - Passenger & Terminal 2 X6 at Control module harness
    - Control circuit terminal 8 at A23RR Door Latch Assembly - Right Rear & Terminal 4 X6 at Control module harness
    - Control circuit terminal 9 at A23RR Door Latch Assembly - Right Rear & Terminal 2 X6 at Control module harness
    - If 2 Ω or greater - Repair the open/high resistance in the circuit.
    - **If less than 2 Ω**
11. Test or replace the component: K9 Body Control Module

Test 3

NOTE: **It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.**

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the electrical connector: X2 & X6 at K9 Body Control Module
3. Test for less than 10 Ω between the test points: Ground circuit terminal 3 X6 & Ground
    - **If 10 Ω or greater**
    1. Ground Connection - Disconnect
    2. Test for less than 2 Ω between the test points: Ground circuit terminal 3 X6 & Ground Connection
        - If 2 Ω or greater - Repair the open/high resistance in the circuit.
        - If less than 2 Ω - Repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
4. Ignition - On / Vehicle - In Service Mode
5. Verify a test lamp turns On between the test points: B+ circuit terminal 4 X2 & Ground
    - **If the test lamp does not turn On and the circuit fuse is OK**
    1. Ignition/Vehicle - Off & Remove - Test lamp

    2. Test for less than 2 Ω between the test points: B+ circuit terminal 4 X2 & Output terminal at Fuse
        - If 2 Ω or greater - Repair the open/high resistance in the circuit.
        - If less than 2 Ω - Verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not turn On and the circuit fuse is open**
    1. Ignition/Vehicle - Off & Remove - Test lamp
    2. Disconnect the electrical connector:
        - A23D Door Latch Assembly - Driver
        - A23LR Door Latch Assembly - Left Rear
        - A23P Door Latch Assembly - Passenger
        - A23RR Door Latch Assembly - Right Rear
    3. Test for infinite resistance between the test points:
        - Control circuit terminal 1 X6 at K9 Body Control Module & Ground
        - Control circuit terminal 2 X6 at K9 Body Control Module & Ground
        - Control circuit terminal 4 X6 at K9 Body Control Module & Ground
        - If less than infinite resistance - Repair the short to ground on the circuit.
        - If infinite resistance - Replace the component: A23 Door Latch Assembly
    - **If the test lamp turns On**

6. Ignition/Vehicle - Off
7. Connect the electrical connector: X2 at K9 Body Control Module
8. Ignition - On / Vehicle - In Service Mode
9. Test for less than 1 V between the test points:
    - Control circuit terminal 1 X6 at K9 Body Control Module & Ground
    - Control circuit terminal 2 X6 at K9 Body Control Module & Ground
    - Control circuit terminal 4 X6 at K9 Body Control Module & Ground
    - **If greater than 1 V**

      Repair the short to voltage on the circuit.

    - **If 1 V or less**
10. Ignition/Vehicle - Off
11. Test for infinite resistance between the test points:
    - Control circuit terminal 1 X6 at K9 Body Control Module & Ground
    - Control circuit terminal 2 X6 at K9 Body Control Module & Ground
    - Control circuit terminal 4 X6 at K9 Body Control Module & Ground
    - **If less than infinite resistance**

      Repair the short to ground on the circuit.

    - **If infinite resistance**
12. Replace the component: K9 Body Control Module

Component Testing

1. Ignition/Vehicle - Off
2. Disconnect the appropriate electrical connector:
    - A23D Door Latch Assembly - Driver
    - A23P Door Latch Assembly - Passenger
    - A23LR Door Latch Assembly - Left Rear
    - A23RR Door Latch Assembly - Right Rear
3. Connect a 25 A fused jumper wire between the test points:
    - A23D Door Latch Assembly - DriverControl terminal 7 & B+

  - A23P Door Latch Assembly - PassengerControl terminal 8 & B+
  - A23LR Door Latch Assembly - Left RearControl terminal 7 & B+
  - A23RR Door Latch Assembly - Right RearControl terminal 8 & B+

CAUTION: Complete the testing as quickly as possible in order to prevent overheating and damaging the component.

4. Momentarily connect a jumper wire between the test points:
   - A23D Door Latch Assembly - DriverControl terminal 8 & Ground
   - A23P Door Latch Assembly - PassengerControl terminal 9 & Ground
   - A23LR Door Latch Assembly - Left RearControl terminal 8 & Ground
   - A23RR Door Latch Assembly - Right RearControl terminal 9 & Ground
5. Reverse the jumper wires 2 times between the terminals.

   Verify the component works as specified: A23 Door Latch Assembly = Lock & Unlock

   - **If not the specified state**

     Replace the component: A23 Door Latch Assembly

   - **If the specified state**
6. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: **Diagnostic Repair Verification**

- **Front Side Door Latch Replacement**
- **Rear Side Door Latch Replacement**
- For control module replacement, programming, and setup refer to: **Control Module References**

DTC B3140, B3145, B3150, OR B3155: DOOR UNLOCK/LOCK SWITCH CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

1. Driver Door Lock Switch Inoperative
2. Driver Door Lock Switch Lock Inoperative
3. Driver Door Lock Switch Unlock Inoperative
4. Passenger Door Lock Switch Lock Inoperative
5. Passenger Door Lock Switch Unlock Inoperative
6. Passenger Door Lock Switch Inoperative

Circuit/System Description

The body control module (BCM) monitors the voltage level of the door lock and door unlock signal circuits. When the driver door lock switch is in the open position, the voltage level in the signal circuit will be near 12 V. When the driver door lock switch is pressed to the lock or unlock position, the voltage level in the appropriate signal circuit will drop to 0 V and the BCM will detect the voltage drop and command the door latches to perform the requested lock or unlock command.

Conditions for Running the DTC

The system voltage is 9 - 16 V.

Conditions for Setting the DTC

B3140 00

The BCM detects short to ground in the driver lock signal circuit for greater than 60 seconds.

B3145 00

The BCM detects short to ground in the passenger unlock signal circuit for greater than 60 seconds.

B3150 00

The BCM detects a short to ground in the driver lock signal circuit for greater than 60 seconds.

B3155 00

The BCM detects a short to ground in the passenger lock signal circuit for greater than 60 seconds.

Action Taken When the DTC Sets

B3140 00

The BCM will ignore the unlock signal and the doors will not unlock when using the driver door unlock switch.

B3145 00

The BCM will ignore the unlock signal and the doors will not unlock when using the passenger door unlock switch.

B3150 00

The BCM will ignore the lock signal and the doors will not lock when using the driver door lock switch.

B3155 00

The BCM will ignore the lock signal and the doors will not lock when using the passenger door lock switch.

Conditions for Clearing the DTC

- The DTC will be current for as long as the fault is present.
- When the fault is no longer present, the DTC will be a history DTC.
- A history DTC will clear after 50 ignition cycles.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Driver Door Lock Switch parameter changes from Inactive to Lock and Unlock when pressing the S13D Door Lock Switch-Driver.
   - **If the parameter does not change**

     Refer to Circuit/System Testing.

   - **If the parameter changes**
3. Verify the scan tool Passenger Door Lock Switch parameter changes from Inactive to Lock and Unlock when pressing the S13P Door Lock Switch-Passenger.
   - **If the parameter does not change**

     Refer to Circuit/System Testing.

   - **If the parameter changes**
4. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the appropriate S13 Door Lock Switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 4 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify the scan tool Door Lock Switch parameter is Inactive.
    - **If not Inactive**
    1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the signal circuit terminal 3 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
    3. Test for infinite resistance between the signal circuit terminal 2 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module.
    - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the ground circuit terminal 4.
6. Verify the scan tool Door Lock Switch parameter is Unlock.
    - **If not Unlock**
    1. Vehicle OFF, remove the fused jumper wire, disconnect the harness connector at the K9 Body Control Module, Vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If Unlock**
7. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the ground circuit terminal 4.
8. Verify the scan tool Door Lock Switch parameter is Lock.
    - **If not Lock**
    1. Vehicle OFF, remove the fused jumper wire, disconnect the harness connector at the K9 Body Control Module, Vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If Lock**
9. Test or replace the S13 Door Lock Switch.

Component Testing

Door Lock Switch

1. Vehicle OFF, disconnect the harness connector at the appropriate S13 Door Lock Switch.
2. Test for infinite resistance between the signal terminal 2 and the ground terminal 4 with the switch in the open position.
    - **If less than infinite resistance**

      Replace the S13 Door Lock Switch.

    - **If infinite resistance**
3. Test for infinite resistance between the signal terminal 3 and the ground terminal 4 with the switch in the open position.
    - **If less than infinite resistance**

      Replace the S13 Door Lock Switch

    - **If infinite resistance**
4. Test for less than 2 Ω between the signal terminal 2 and the ground terminal 4 with the switch in the Lock position.
    - **If 2 Ω or greater**

      Replace the S13 Door Lock Switch.

    - **If less than 2 Ω**
5. Test for less than 2 Ω between the signal terminal 3 and the ground terminal 4 with the switch in the Unlock position.
    - **If 2 Ω or greater**

      Replace the S13 Door Lock Switch.

    - **If less than 2 Ω**
6. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Door Lock Switch Replacement**
- **Control Module References** for BCM replacement, programming and setup

DTC B324A OR B3245: REAR CARGO DOOR UNLOCK MOTOR CIRCUIT/LOCK ACTUATOR CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B324A

Rear Cargo Door Unlock Motor Circuit

DTC B3245

Rear Cargo Door Lock Actuator Circuit

For symptom byte information refer to: **Symptom Byte List**

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Liftgate Unlatch Relay Control Terminal 85	B3245 02	1	1	-
Liftgate Unlatch Relay Control Terminal 86	-	1	B324A 01	-
1. Liftgate Release Malfunction				

Circuit/System Description

When the body control module (BCM) receives a liftgate release command, it will provide voltage to one side of the relay and ground to the other side of the relay. This will energize the relay causing the switch side of the relay to close and will then provide B+ voltage to the liftgate or rear closure latch.

Conditions for Running the DTC

- The system voltage is 9 - 16 V.
- When the relay is actively commanded by the BCM.

Conditions for Setting the DTC

B324A 01

The BCM detects a short to voltage in the liftgate release relay control circuit.

B3245 02

The BCM detects a short to ground in the liftgate release relay control circuit.

Action Taken When the DTC Sets

The liftgate latch will be inoperative.

Conditions for Clearing the DTC

- The DTC will be current for as long as the fault is present.
- When the fault is no longer present, the DTC will be a history DTC.
- A history DTC will clear after 50 ignition cycles.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the A23C Liftgate Latch Assembly activates by pressing the S46B Liftgate Unlatch Switch.
    - **If the A23C Liftgate Latch Assembly does not UNLATCH**

      Refer to Circuit/System Testing.

    - **If the A23C Liftgate Latch Assembly does UNLATCH**
3. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the KR95A Liftgate Unlatch Relay. Vehicle in Service Mode.
2. Connect a test lamp between the control circuit terminal 85 and ground.
3. Verify the test lamp illuminates when pressing the S46B Liftgate Unlatch Switch.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module, Vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**
4. Connect a test lamp between the control circuit terminal 86 and B+.
5. Verify the test lamp illuminates when pressing the S46B Liftgate Unlatch Switch.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module, Vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Vehicle OFF.
    4. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**
6. Test or replace the KR95A Liftgate Unlatch Relay.

Component Testing

Relay Test

1. Vehicle OFF, disconnect the KR95A Liftgate Unlatch Relay.
2. Test for 60 - 200 Ω between terminals 85 and 86.
   - **If less than 60 Ω or greater than 200 Ω**

     Replace the KR95A Liftgate Unlatch Relay.

   - **If between 60 - 200 Ω**
3. Test for infinite resistance between the terminals listed below:
   - 30 and 85
   - 30 and 86
   - 30 and 87
   - 87 and 86
   - **If less than infinite resistance**

     Replace the KR95A Liftgate Unlatch Relay.

   - **If infinite resistance**
4. Install a 3 A fused jumper wire between relay terminal 85 and 12 V. Install a jumper wire between relay terminal 86 and ground.
5. Test for less than 2 Ω between terminals 30 and 87.
   - **If 2 Ω or greater**

     Replace the KR95A Liftgate Unlatch Relay.

   - **If less than 2 Ω**
6. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Relay Replacement (Attached to Wire Harness)** **Relay Replacement (Within an Electrical Center)**
- **Control Module References** for BCM replacement, programming and setup

DTC P0CCC, P0CCE, OR P0CCF: CHARGE PORT DOOR POSITION SENSOR CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC P0CCC 00

Charge Port Door Position Sensor Circuit

DTC P0CCE 00

Charge Port Door Position Sensor Circuit Low Voltage

DTC P0CCF 00

Charge Port Door Position Sensor Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	P0CCE 00	P0CCC 00, P0CCE 00	P0CCF 00	-
Ground	-	P0CCC 00, P0CCE 00	-	-

Circuit/System Description

For an overview of the component/system, refer to: **Charge Port Door Description and Operation**

Circuit	Description
Signal	The control module input circuit has an internal resistance connected to 5 V.
Ground	Chassis Ground

Component	Description
B197 Charge Port Door Position Switch	The switch B197 has an internal resistor ladder network. A specific resistance is generated dependent on the position of the switch.
K114B Hybrid/EV Powertrain Control Module 2	The control module also reads various switches and sensors and makes their values available via serial data.

Conditions for Running the DTC

Ignition - On / Vehicle - In Service Mode

Conditions for Setting the DTC

- P0CCC 00 - Charge Port Door Position Sensor Circuit = Voltage Out of Range
- P0CCE 00 - Charge Port Door Position Sensor Circuit = Short to Ground
- P0CCF 00 - Charge Port Door Position Sensor Circuit = Short to Voltage/Open/High Resistance

Actions Taken When the DTC Sets

Driver Information Display - Charge Port Door: Open = Not Displayed

Conditions for Clearing the DTC

DTC P0CCC 00, P0CCE 00, P0CCF 00 = Type C DTC

Scan Tool Reference

Control Module References

Circuit/System Verification

1. Ignition - On / Vehicle - In Service Mode
2. Operate the component: Charge Port Door - Close

   Verify the scan tool parameter: Charge Port Door = Closed

   - **If not the specified state**

     Refer to: Circuit/System Testing

   - **If the specified state**
3. Operate the component: Charge Port Door - Open

   Verify the scan tool parameter: Charge Port Door = open

   - **If not the specified state**

     Refer to: Circuit/System Testing

   - **If the specified state**
4. All OK.

Circuit/System Testing

NOTE: **It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.**

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the electrical connector: B197 Charge Port Door Position Switch
3. Test for less than 10 Ω between the test points: Ground circuit terminal 3 & Ground
   - **If 10 Ω or greater**
   1. Ground Connection - Disconnect
   2. Test for less than 2 Ω between the test points: Ground circuit terminal 3 at Component harness & Ground Connection
      - If 2 Ω or greater - Repair the open/high resistance in the circuit.
      - If less than 2 Ω - Repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
4. Ignition - On / Vehicle - In Service Mode
5. Test for 4.8 to 5.2 V between the test points: 5 V Reference circuit terminal 1 & Ground
   - **If less than 4.8 V**
   1. Ignition/Vehicle - Off
   2. Disconnect the electrical connector: X2 at K114B Hybrid/EV Powertrain Control Module 2
   3. Test for infinite resistance between the test points: 5 V Reference circuit terminal 1 at Component harness & Ground
      - If less than infinite resistance - Repair the short to ground on the circuit.
      - If infinite resistance
   4. Test for less than 2 Ω between the test points: 5 V Reference circuit terminal 1 at Component harness & Terminal 25 at Control module harness
      - If 2 Ω or greater - Repair the open/high resistance in the circuit.

        - If less than 2 Ω - Replace the component: K114B Hybrid/EV Powertrain Control Module 2
    - **If greater than 5.2 V**
    1. Ignition/Vehicle - Off
    2. Disconnect the electrical connector: X2 at K114B Hybrid/EV Powertrain Control Module 2
    3. Ignition - On / Vehicle - In Service Mode
    4. Test for less than 1 V between the test points: 5 V Reference circuit terminal 1 at Component harness & Ground
        - If 1 V or greater - Repair the short to voltage on the circuit.
        - If less than 1 V - Replace the component: K114B Hybrid/EV Powertrain Control Module 2
    - **If between 4.8 and 5.2 V**
6. Test or replace the component: B197 Charge Port Door Position Switch

Component Testing

1. Ignition/Vehicle - Off
2. Disconnect the electrical connector: B197 Charge Port Door Position Switch
3. Test for 185 to 190 Ω between the test points: Signal terminal 1 & Ground terminal 3 - The switch is in the open position.
    - **If not in the specified range**

      Replace the component: B197 Charge Port Door Position Switch

    - **If in the specified range**
4. Test for 1865 to 1875 Ω between the test points: Signal terminal 1 & Ground terminal 3 - The switch is in the closed position.
    - **If not in the specified range**

      Replace the component: B197 Charge Port Door Position Switch

    - **If in the specified range**
5. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: **Diagnostic Repair Verification**

- **Charge Port Door Ajar Indicator Switch Replacement (Except Dubai)** **Charge Port Door Ajar Indicator Switch Replacement (Dubai)**
- For control module replacement, programming, and setup refer to: **Control Module References**

SYMPTOMS - VEHICLE ACCESS

NOTE: **The following steps must be completed before using the symptom tables.**

1. Perform the **Diagnostic System Check - Vehicle** .
    - There are no DTCs set
    - The control modules can communicate via the serial data link
2. Review the system operation in order to familiarize yourself with the system functions. Refer to the following systems description:
    - **Door Ajar Indicator Description and Operation**
    - **Charge Port Door Description and Operation**
    - **Power Door Locks Description and Operation**
    - **Rear Hatch/Gate Description and Operation**

Visual/Physical Inspection

Several of the symptom procedures ask for a careful visual/physical check. This step is extremely important, it could lead to correcting a problem without further checks and can save valuable time. These checks include the following:

- Inspect for aftermarket devices which could affect the operation of the power door systems. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components and harness connectors for obvious damage or conditions which could cause the symptom.

Intermittents

NOTE: **Inspect for proper installation of electrical components if an intermittent condition exists. Inspect for aftermarket theft deterrent devices, lights, and cellular phones. Ensure that no aftermarket equipment is connected to the class 2 circuit. If you can not locate an intermittent condition, a cellular phone signal may cause the condition. Faulty electrical connections or wiring may also be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections .**

NOTE: **The problem may or may not turn ON the SERVICE VEHICLE SOON indicator or store a DTC. Do not use the symptom tables to diagnose intermittent conditions. The malfunction must be present in order to locate the problem.**

Poor electrical connections or wiring cause most intermittent conditions. Perform a careful visual/physical check for the following conditions:

- Poor mating of the connector halves or a terminal not fully seated in the connector body
- An improperly formed or damaged terminal
- Reform or replace connector terminals in the problem circuit in order to ensure proper contact tension.
- Poor terminal to wire connection requires removing the terminal from the connector body in order to perform the check.

Use a scan tool in order to help detect intermittent conditions. The scan tool has several features that can be used to locate an intermittent condition. The snapshot feature can capture and store data parameters within the scan tool when the malfunction occurs. This information can then be reviewed in order to see what caused the malfunction.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Charger Door Ajar Indicator Malfunction**
- **Exterior Door Handle Switch Malfunction**
- **Liftgate Release Malfunction**
- **Door Ajar Indicator Malfunction**
- **Power Door Lock Key Cylinder Switches Malfunction**
- **Power Door Locks Malfunction**

CHARGER DOOR AJAR INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

Circuit/System Verification

1. Ignition - On / Vehicle - In Service Mode
2. Operate the component: Charge Port Door - Close

   Verify the scan tool parameter: Charge Port Door = Closed

   - **If not the specified state**

     Refer to: Circuit/System Testing

   - **If the specified state**
3. Operate the component: Charge Port Door - Open

   Verify the scan tool parameter: Charge Port Door = open

   - **If not the specified state**

     Refer to: Circuit/System Testing

   - **If the specified state**
4. All OK.

Circuit/System Testing

NOTE: **It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.**

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the electrical connector: B197 Charge Port Door Position Switch
3. Test for less than 10 Ω between the test points: Ground circuit terminal 3 & Ground
   - **If 10 Ω or greater**
   1. Ground Connection - Disconnect
   2. Test for less than 2 Ω between the test points: Ground circuit terminal 3 at Component harness & Ground Connection
      - If 2 Ω or greater - Repair the open/high resistance in the circuit.
      - If less than 2 Ω - Repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
4. Ignition - On / Vehicle - In Service Mode
5. Test for 4.8 to 5.2 V between the test points: 5 V Reference circuit terminal 1 & Ground
   - **If less than 4.8 V**

   1. Ignition/Vehicle - Off
   2. Disconnect the electrical connector: X2 at K114B Hybrid/EV Powertrain Control Module 2
   3. Test for infinite resistance between the test points: 5 V Reference circuit terminal 1 at Component harness & Ground
      - If less than infinite resistance - Repair the short to ground on the circuit.
      - If infinite resistance
   4. Test for less than 2 Ω between the test points: 5 V Reference circuit terminal 1 at Component harness & Terminal 25 at Control module harness
      - If 2 Ω or greater - Repair the open/high resistance in the circuit.
      - If less than 2 Ω - Replace the component: K114B Hybrid/EV Powertrain Control Module 2
   - **If greater than 5.2 V**
   1. Ignition/Vehicle - Off
   2. Disconnect the electrical connector: X2 at K114B Hybrid/EV Powertrain Control Module 2
   3. Ignition - On / Vehicle - In Service Mode
   4. Test for less than 1 V between the test points: 5 V Reference circuit terminal 1 at Component harness & Ground
      - If 1 V or greater - Repair the short to voltage on the circuit.
      - If less than 1 V - Replace the component: K114B Hybrid/EV Powertrain Control Module 2
   - **If between 4.8 and 5.2 V**

6. Test or replace the component: B197 Charge Port Door Position Switch

Component Testing

1. Ignition/Vehicle - Off
2. Disconnect the electrical connector: B197 Charge Port Door Position Switch
3. Test for 185 to 190 Ω between the test points: Signal terminal 1 & Ground terminal 3 - The switch is in the open position.
   - **If not in the specified range**

     Replace the component: B197 Charge Port Door Position Switch

   - **If in the specified range**
4. Test for 1865 to 1875 Ω between the test points: Signal terminal 1 & Ground terminal 3 - The switch is in the closed position.
   - **If not in the specified range**

     Replace the component: B197 Charge Port Door Position Switch

   - **If in the specified range**
5. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: **Diagnostic Repair Verification**

- **Charge Port Door Ajar Indicator Switch Replacement (Except Dubai)** **Charge Port Door Ajar Indicator Switch Replacement (Dubai)**
- For control module replacement, programming, and setup refer to: **Control Module References**

EXTERIOR DOOR HANDLE SWITCH MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**

- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal - Exterior Driver Door Handle Switch	B3849 02	1	1	-
Signal - Exterior Passenger Door Handle Switch	B1474 02	2	2	-
Signal - Exterior Left Rear Door Handle Switch	B1534 02	3	3	-
Signal - Exterior Right Rear Door Handle Switch	B1535 02	4	4	-
Ground - A24D Door Handle Assembly - Driver Exterior	-	1	-	-
Ground - A24P Door Handle Assembly - Passenger Exterior	-	2	-	-
Ground - A24LR Door Handle Assembly - Left Rear Exterior	-	3	-	-
Ground - A24RR Door Handle Assembly - Right Rear Exterior	-	4	-	-

1. B27D Door Handle Switch - Driver Exterior = Disabled
2. B27P Door Handle Switch - Passenger Exterior = Disabled
3. B27LR Door Handle Switch - Left Rear Exterior = Disabled
4. B27RR Door Handle Switch - Right Rear Exterior = Disabled

Circuit/System Description

For an overview of the component/system, refer to: **Power Door Locks Description and Operation**

Circuit	Description
Signal	The control module input circuit has an internal resistance connected to 12 V.
Ground	Chassis Ground

Component	Description
B27D Door Handle Switch - Driver Exterior	The switch has a normally open contact.When the switch is activated, the signal circuit to the control module is grounded.
B27P Door Handle Switch - Passenger Exterior	The switch has a normally open contact.When the switch is activated, the signal circuit to the control module is grounded.
B27LR Door Handle Switch - Left Rear Exterior	The switch has a normally open contact.When the switch is activated, the signal circuit to the control module is grounded.
B27RR Door Handle Switch - Right Rear Exterior	The switch has a normally open contact.When the switch is activated, the signal circuit to the control module is grounded.
K84 Keyless Entry Control Module	The control module also reads various switches and sensors and makes their values available via serial data.

Circuit/System Verification

1. Ignition - On / Vehicle - In Service Mode
2. B27D Door Handle Switch - Driver Exterior - Not Pressed

   Verify the scan tool parameter: Exterior Driver Door Handle Switch = Inactive

   - **If not the specified state**

     Refer to: Circuit/System Testing

   - **If the specified state**
3. B27P Door Handle Switch - Passenger Exterior - Not Pressed

   Verify the scan tool parameter: Exterior Passenger Door Handle Switch = Inactive

   - **If not the specified state**

     Refer to: Circuit/System Testing

   - **If the specified state**
4. B27LR Door Handle Switch - Left Rear Exterior - Not Pressed

   Verify the scan tool parameter: Exterior Left Rear Door Handle Switch = Inactive

   - **If not the specified state**

     Refer to: Circuit/System Testing

   - **If the specified state**
5. B27RR Door Handle Switch - Right Rear Exterior - Not Pressed

   Verify the scan tool parameter: Exterior Right Rear Door Handle Switch = Inactive

   - **If not the specified state**

     Refer to: Circuit/System Testing

   - **If the specified state**
6. Operate the component: B27D Door Handle Switch - Driver Exterior - Pressed

   Verify the scan tool parameter: Exterior Driver Door Handle Switch = Active

- **If not the specified state**

  Refer to: Circuit/System Testing

- **If the specified state**

7. Operate the component: B27P Door Handle Switch - Passenger Exterior - Pressed

   Verify the scan tool parameter: Exterior Passenger Door Handle Switch = Active

   - **If not the specified state**

     Refer to: Circuit/System Testing

   - **If the specified state**

8. Operate the component: B27LR Door Handle Switch - Left Rear Exterior - Pressed

   Verify the scan tool parameter: Exterior Left Rear Door Handle Switch = Active

   - **If not the specified state**

     Refer to: Circuit/System Testing

   - **If the specified state**

9. Operate the component: B27RR Door Handle Switch - Right Rear Exterior - Pressed

   Verify the scan tool parameter: Exterior Right Rear Door Handle Switch = Active

   - **If not the specified state**

     Refer to: Circuit/System Testing

   - **If the specified state**

10. All OK.

Circuit/System Testing

NOTE: **It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.**

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the appropriate electrical connector: A24 Door Handle Assembly
3. Test for less than 10 Ω between the test points: Ground circuit terminal 5 & Ground
   - **If 10 Ω or greater**
   1. Ground Connection - Disconnect
   2. Test for less than 2 Ω between the test points: Ground circuit terminal 5 at Component harness & Ground Connection
      - If 2 Ω or greater - Repair the open/high resistance in the circuit.
      - If less than 2 Ω - Repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
4. Ignition - On / Vehicle - In Service Mode
5. Verify the scan tool parameter: Exterior Door Handle Switch Circuit = Inactive
   - **If not the specified state**
   1. Ignition/Vehicle - Off
   2. Disconnect the electrical connector: X2 at K84 Keyless Entry Control Module
   3. Test for infinite resistance between the test points: Signal circuit terminal 1 at Component harness & Ground
      - If less than infinite resistance - Repair the short to ground on the circuit.

        - If infinite resistance - Replace the component: K84 Keyless Entry Control Module
    - **If the specified state**

6. Connect a 3 A fused jumper wire between the test points: Signal circuit terminal 1 & Ground circuit terminal 5
7. Verify the scan tool parameter: Exterior Door Handle Switch Circuit = Active
    - **If not the specified state**
    1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
    2. Disconnect the electrical connector: X2 at K84 Keyless Entry Control Module
    3. Ignition - On / Vehicle - In Service Mode
    4. Test for less than 1 V between the test points: Signal circuit terminal 1 at Component harness & Ground
        - If 1 V or greater - Repair the short to voltage on the circuit.
        - If less than 1 V
    5. Ignition/Vehicle - Off
    6. Test for less than 2 Ω between the test points:
        - Signal circuit terminal 1 at A24D Door Handle Assembly - Driver Exterior & Terminal 12 X2 at Control module harness
        - Signal circuit terminal 1 at A24P Door Handle Assembly - Passenger Exterior & Terminal 11 X2 at Control module harness
        - Signal circuit terminal 1 at A24LR Door Handle Assembly - Left Rear Exterior & Terminal 2 X2 at Control module harness
        - Signal circuit terminal 1 at A24RR Door Handle Assembly - Right Rear Exterior & Terminal 1 X2 at Control module harness
        - If 2 Ω or greater - Repair the open/high resistance in the circuit.
        - If less than 2 Ω - Replace the component: K84 Keyless Entry Control Module
    - **If the specified state**
8. Test or replace the component: A24 Door Handle Assembly

Component Testing

1. Ignition/Vehicle - Off
2. Disconnect the appropriate electrical connector: A24 Door Handle Assembly
3. Test for infinite resistance between the test points: Signal terminal 1 & Ground terminal 5 - Not Pressed
    - **If less than infinite resistance**

      Replace the component: A24 Door Handle Assembly

    - **If infinite resistance**
4. Test for less than 3 Ω between the test points: Signal terminal 1 & Ground terminal 5 - Pressed
    - **If 3 Ω or greater**

      Replace the component: A24 Door Handle Assembly

    - **If less than 3 Ω**
5. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: **Diagnostic Repair Verification**

- **Front Side Door Outside Handle Replacement**
- **Rear Side Door Outside Handle Replacement**
- For control module replacement, programming, and setup refer to: **Control Module References**

LIFTGATE RELEASE MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Liftgate Unlatch Relay B+	2	2	-	-
Liftgate Unlatch Switch Signal	1	1	1	-
Liftgate Unlatch Relay Control Terminal 86	-	2	B324A 01	-
Liftgate Unlatch Relay Control Terminal 85	B3245 02	2	2	-
Liftgate Latch Assembly Ground	-	2	-	-
Liftgate Unlatch Switch Ground	-	1	-	-
1. Liftgate Release Switch Malfunction 2. Liftgate Release Malfunction				

Circuit/System Description

The liftgate unlatch switch is an input to the body control module (BCM). The BCM supplies a 12 V signal to the liftgate unlatch switch and when the switch is pressed, signal circuit voltage goes low. When the BCM receives a liftgate release signal it will monitor the status to the door latches. If the vehicle doors are locked, the BCM will ignore the request, if the doors are unlocked, the BCM will supply voltage and ground to the liftgate release relay coil, energizing the relay. When the relay is energized, battery voltage flows through the closed contacts of the relay to the Liftgate Latch Assembly assembly which activates allowing for the liftgate to be raised to the open position.

Diagnostic Aids

An intermittent short to ground in the liftgate unlatch switch signal circuit may cause the BCM to command the liftgate to open if the vehicle is in park and the doors are unlocked. If the vehicle has a history of the liftgate opening unexpectedly, inspect the point where the wires enter the liftgate unlatch switch for corrosion or evidence of water intrusion.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Trunk Lid/Liftgate Window Exterior Unlatch Switch parameter changes between Active and Inactive when pressing and releasing the S46B Liftgate Unlatch Switch.
    - **If the parameter does not change**

      Refer to Circuit/System Testing - Liftgate Release Switch Inoperative

    - **If the parameter changes**

NOTE: **Verify all doors have been commanded UNLOCK with a scan tool prior to commanding the liftgate**

3. Verify the A23C Liftgate Latch Assembly releases when commanding the Liftgate Unlatch with a scan tool
    - **If the A23C Liftgate Latch Assembly does not release**

      Refer to Circuit/System Testing - Liftgate Release Actuator Inoperative

    - **If the A23C Liftgate Latch Assembly does release**
4. All OK.

Circuit/System Testing

Liftgate Release Switch Inoperative

1. Vehicle OFF and all vehicle systems OFF, disconnect the X907 inline harness connector at the S46B Liftgate Unlatch Switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 2 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify the scan tool Trunk Lid/Liftgate Window Exterior Unlatch Switch parameter is Inactive.
    - **If not Inactive**
    1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the signal circuit terminal 1 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module.
    - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the ground circuit terminal 2.
6. Verify the scan tool Trunk Lid/Liftgate Window Exterior Unlatch Switch parameter is Active.
    - **If not Active**
    1. Vehicle OFF, remove the 3 A fused jumper wire, disconnect the harness connector at the K9 Body Control Module, Vehicle in Service Mode.

   2. Test for less than 1 V between the signal circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If Active**
7. Test or replace the S46B Liftgate Unlatch Switch.

Release Actuator Inoperative

1. Vehicle OFF, disconnect the KR95A Liftgate Unlatch Relay. Vehicle in Service Mode
2. Verify a test lamp illuminates between the B+ circuit terminal 30 and ground.
   - **If the test lamp does not illuminate**
   - Replace the X50A Fuse Block-Underhood
   - **If the test lamp illuminates**
3. Connect a test lamp between the control circuit terminal 85 and ground.
4. Vehicle in Service Mode, verify the test lamp turns ON and OFF when commanding the Liftgate Unlatch with a scan tool.
   - **If the test lamp is always OFF**
   1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If the test lamp is always ON**
   1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module, Vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K9 Body Control Module.
   - **If the test lamp turns ON and OFF**
5. Connect a test lamp between the control circuit terminal 86 and B+.
6. Verify the test lamp turns ON and OFF when commanding the Liftgate Unlatch with a scan tool.
   - **If the test lamp is always OFF**
   1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module, Vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V
   3. Vehicle OFF.
   4. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If the test lamp is always ON**
   1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the control circuit and ground.

    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance, replace the K9 Body Control Module.
  - **If the test lamp turns ON and OFF**

7. Verify that a test lamp does not illuminate between the control circuit terminal 5 and ground.
  - **If the test lamp illuminates**

    Repair the short to voltage on the control circuit

  - **If the test lamp does not illuminate**

8. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the A23C Liftgate Latch Assembly. It may take up to 2 minutes for all vehicle systems to power down.
9. Test for less than 10 Ω between the ground circuit terminal 1 and ground.
  - **If 10 Ω or greater**
  1. Vehicle OFF.
  2. Test for less than 2 Ω in the ground circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, repair the open/high resistance in the ground connection.
  - **If less than 10 Ω**

10. Connect the harness connector at the A23C Liftgate Latch Assembly
11. Vehicle in Service Mode, connect a 10 A fused jumper wire between the B+ circuit terminal 30 and the control circuit terminal 87.
12. Verify the A23C Liftgate Latch Assembly is activated.
  - **If the A23C Liftgate Latch Assembly does not activate**
  1. Vehicle OFF, disconnect the harness connector at the A23C Liftgate Latch Assembly.
  2. Test for less than 2 Ω in the control circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the A23C Liftgate Latch Assembly.
  - **If the A23C Liftgate Latch Assembly activates**

13. Test or replace the KR95A Liftgate Unlatch Relay.

Component Testing

Liftgate Latch Assembly

1. Vehicle OFF, disconnect the harness connector at the A23C Liftgate Latch Assembly.
2. Install a 10 A fused jumper wire between the control terminal 3 and 12 V. Install a jumper wire between the ground terminal 1 and ground.
3. Verify the A23C Liftgate Latch Assembly activates
  - **If the A23C Liftgate Latch Assembly does not activate.**

    Replace the A23C Liftgate Latch Assembly.

  - **If the A23C Liftgate Latch Assembly does activate.**

4. All OK

Liftgate Release Switch

1. Vehicle OFF, disconnect the X907 inline harness connector at the S46B Liftgate Unlatch Switch.
2. Test for infinite resistance between the signal circuit terminal 1 and the ground circuit terminal 2 with the switch in the open position.
  - **If less than infinite resistance**

    Replace the S46B Liftgate Unlatch Switch.

  - **If infinite resistance**

3. Test for less than 3 Ω between the signal circuit terminal 1 and the ground circuit terminal 2 with the switch in the closed position.
    - **If 3 Ω or greater**

      Replace the S46B Liftgate Unlatch Switch.

    - **If less than 3 Ω**
4. All OK

Relay Test

1. Vehicle OFF, disconnect the KR95A Liftgate Unlatch Relay.
2. Test for 60 - 200 Ω between terminals 85 and 86.
    - **If less than 60 Ω or greater than 200 Ω**

      Replace the KR95A Liftgate Unlatch Relay.

    - **If between 60 - 200 Ω**
3. Test for infinite resistance between the terminals listed below:
    - 30 and 85
    - 30 and 86
    - 30 and 87
    - 87 and 86
    - **If less than infinite resistance**

      Replace the KR95A Liftgate Unlatch Relay.

    - **If infinite resistance**
4. Install a 3 A fused jumper wire between relay terminal 85 and 12 V. Install a jumper wire between relay terminal 86 and ground.
5. Test for less than 2 Ω between terminals 30 and 87.
    - **If 2 Ω or greater**

      Replace the KR95A Liftgate Unlatch Relay.

    - **If less than 2 Ω**
6. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair procedure.

- **Relay Replacement (Attached to Wire Harness)** **Relay Replacement (Within an Electrical Center)**
- **Liftgate Release Switch Replacement**
- **Liftgate Latch Replacement**
- **Control Module References** for BCM replacement, programming and setup

LIFTGATE AJAR INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	1	2	2	-
Ground	-	3	-	-

1. Trunk Open Display Message = Always On
2. Trunk Open Display Message = Disabled
3. A23C Liftgate Latch Assembly = Disabled

Circuit/System Description

For an overview of the component/system, refer to: **Liftgate Ajar Indicator Description and Operation**

Circuit	Description
Signal	The control module input circuit has an internal resistance connected to 12 V.
Ground	Chassis Ground

Component	Description
A23C Liftgate Latch Assembly	The DC motor unlatches the liftgate. Once the liftgate is unlatched, a switch in the latch will close, grounding the signal circuit to the control module K9.
K9 Body Control Module	The module controls various vehicle functions like lighting, central door locking, power windows, etc.

Circuit/System Verification

1. Ignition - On / Vehicle - In Service Mode
2. Operate the component: Liftgate - Closed

   Verify the scan tool parameter: Rear Closure Ajar Switch = Inactive

   - **If not the specified state**

Refer to: Circuit/System Testing

- **If the specified state**

3. Operate the component: Liftgate - Ajar

   Verify the scan tool parameter: Rear Closure Ajar Switch = Active

   - **If not the specified state**

     Refer to: Circuit/System Testing

   - **If the specified state**

4. All OK.

Circuit/System Testing

1. Ignition/Vehicle - Off
2. Disconnect the electrical connector: A23C Liftgate Latch Assembly
3. Ignition - On / Vehicle - In Service Mode
4. Verify the scan tool parameter: Rear Closure Ajar Switch = Inactive
   - **If not the specified state**
   1. Ignition/Vehicle - Off
   2. Disconnect the electrical connector: K9 Body Control Module
   3. Test for infinite resistance between the test points: Signal circuit terminal 2 at Component harness & Ground
      - If less than infinite resistance - Repair the short to ground on the circuit.
      - If infinite resistance - Replace the component: K9 Body Control Module
   - **If the specified state**
5. Connect a 3 A fused jumper wire between the test points: Signal circuit terminal 2 & Ground circuit terminal 1
6. Verify the scan tool parameter: Rear Closure Ajar Switch = Active
   - **If not the specified state**
   1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
   2. Disconnect the electrical connector: K9 Body Control Module
   3. Ignition - On / Vehicle - In Service Mode
   4. Test for less than 1 V between the test points: Signal circuit terminal 2 at Component harness & Ground
      - If 1 V or greater - Repair the short to voltage on the circuit.
      - If less than 1 V
   5. Ignition/Vehicle - Off
   6. Test for less than 2 Ω between the test points: Signal circuit terminal 2 at Component harness & Terminal 5 X6 at Control module harness
      - If 2 Ω or greater - Repair the open/high resistance in the circuit.
      - If less than 2 Ω - Replace the component: K9 Body Control Module
   - **If the specified state**
7. Test or replace the component: A23C Liftgate Latch Assembly

Component Testing

1. Ignition/Vehicle - Off
2. Disconnect the electrical connector: A23C Liftgate Latch Assembly
3. Test for infinite resistance between the test points: Signal terminal 2 & Ground terminal 1 - The switch is in the open position.
   - **If less than infinite resistance**

    Replace the component: A23C Liftgate Latch Assembly

  - **If infinite resistance**

4. Test for less than 3 Ω between the test points: Signal terminal 2 & Ground terminal 1 - The switch is in the closed position.
    - **If 3 Ω or greater**

      Replace the component: A23C Liftgate Latch Assembly

    - **If less than 3 Ω**
5. All OK.

Control Module References

Circuit/System Verification

1. Ignition - On / Vehicle - In Service Mode
2. Verify the appropriate scan tool door ajar switch parameter changes when opening and closing the vehicle doors.
   - **If the parameter state does not change**

     Refer to: Circuit/System Testing

   - **If the parameter state changes**
3. All OK.

Circuit/System Testing

NOTE: **It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.**

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the appropriate electrical connector: A23 Door Latch Assembly
3. Test for less than 10 Ω between the test points: Ground circuit terminal 3 & Ground
    - **If 10 Ω or greater**
    1. Ground Connection - Disconnect
    2. Test for less than 2 Ω between the test points: Ground circuit terminal 3 at Component harness & Ground Connection
        - If 2 Ω or greater - Repair the open/high resistance in the circuit.
        - If less than 2 Ω - Repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
4. Ignition - On / Vehicle - In Service Mode
5. Verify the scan tool parameter: Door Ajar Switch = Inactive
    - **If not the specified state**
    1. Ignition/Vehicle - Off
    2. Disconnect the appropriate electrical connector:
        - M74 Window Motor
        - S79 Window Switch
    3. Test for infinite resistance between the test points:
        - A23D Door Latch Assembly - Driver Signal circuit terminal 1 at Component harness & Ground
        - A23P Door Latch Assembly - Passenger Signal circuit terminal 1 at Component harness & Ground
        - A23LR Door Latch Assembly - Left Rear Signal circuit terminal 1 at Component harness & Ground
        - A23RR Door Latch Assembly - Right Rear Signal circuit terminal 1 at Component harness & Ground
        - If less than infinite resistance - Repair the short to ground on the circuit.
        - If infinite resistance - Replace the component:
    - M74 Window Motor
    - S79 Window Switch
    - **If the specified state**
6. Connect a 3 A fused jumper wire between the test points:
    - A23D Door Latch Assembly - Driver Signal circuit terminal 1 & Ground circuit terminal 3
    - A23P Door Latch Assembly - Passenger Signal circuit terminal 1 & Ground circuit terminal 3
    - A23LR Door Latch Assembly - Left Rear Signal circuit terminal 1 & Ground circuit terminal 3
    - A23RR Door Latch Assembly - Right Rear Signal circuit terminal 1 & Ground circuit terminal 3
7. Verify the scan tool parameter: Door Ajar Switch = Active
    - **If not the specified state**
    1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
    2. Disconnect the electrical connector:
        - M74 Window Motor
        - S79 Window Switch
    3. Ignition - On / Vehicle - In Service Mode
    4. Test for less than 1 V between the test points:

        - A23D Door Latch Assembly - Driver Signal circuit terminal 1 at Component harness & Ground
        - A23P Door Latch Assembly - Passenger Signal circuit terminal 1 at Component harness & Ground
        - A23LR Door Latch Assembly - Left Rear Signal circuit terminal 1 at Component harness & Ground
        - A23RR Door Latch Assembly - Right Rear Signal circuit terminal 1 at Component harness & Ground
        - If 1 V or greater - Repair the short to voltage on the circuit.
        - If less than 1 V
    5. Ignition/Vehicle - Off
    6. Test for less than 2 Ω between the test points:
        - Signal circuit terminal 1 at A23D Door Latch Assembly - Driver & Signal circuit terminal 6 at M74D Window Motor - Driver
        - Signal circuit terminal 1 at A23P Door Latch Assembly - Passenger & Signal circuit terminal 6 at S79P Window Switch - Passenger
        - Signal circuit terminal 1 at A23LR Door Latch Assembly - Left Rear & Signal circuit terminal 6 at S79LR Window Switch - Left Rear
        - Signal circuit terminal 1 at A23RR Door Latch Assembly - Right Rear & Signal circuit terminal 6 at S79RR Window Switch - Right Rear
        - If 2 Ω or greater - Repair the open/high resistance in the circuit.
        - If less than 2 Ω - Replace the component:
        - M74 Window Motor
        - S79 Window Switch
    - **If the specified state**

8. Test or replace the component: A23 Door Latch Assembly

Component Testing

1. Ignition/Vehicle - Off
2. Disconnect the appropriate electrical connector: A23 Door Latch Assembly
3. Test for infinite resistance between the test points:
    - A23D Door Latch Assembly - Driver: Signal terminal 1 & Ground terminal 3 - The switch is in the open position.
    - A23P Door Latch Assembly - Passenger: Signal terminal 5 & Ground terminal 3 - The switch is in the open position.
    - A23LR Door Latch Assembly - Left Rear: Signal terminal 1 & Ground terminal 3 - The switch is in the open position.
    - A23RR Door Latch Assembly - Right Rear: Signal terminal 5 & Ground terminal 3 - The switch is in the open position.
    - **If less than infinite resistance**

      Replace the component: A23 Door Latch Assembly

    - **If infinite resistance**
4. Test for less than 3 Ω between the test points:
    - A23D Door Latch Assembly - Driver: Signal terminal 1 & Ground terminal 3 - The switch is in the closed position.
    - A23P Door Latch Assembly - Passenger: Signal terminal 5 & Ground terminal 3 - The switch is in the closed position.
    - A23LR Door Latch Assembly - Left Rear: Signal terminal 1 & Ground terminal 3 - The switch is in the closed position.
    - A23RR Door Latch Assembly - Right Rear: Signal terminal 5 & Ground terminal 3 - The switch is in the closed position.

- **If 3 Ω or greater**

  Replace the component: A23 Door Latch Assembly

- **If less than 3 Ω**

5. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: **Diagnostic Repair Verification**

- **Front Side Door Latch Replacement**
- **Rear Side Door Latch Replacement**
- **Front Side Door Window Switch Replacement**
- **Rear Side Door Window Switch Replacement**
- **Front Side Door Window Regulator Replacement**

POWER DOOR LOCK KEY CYLINDER SWITCHES MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	1	1	1	-
Ground	-	1	-	-

1. B29D Door Lock Key Cylinder Switch - Driver = Disabled

Circuit/System Description

For an overview of the component/system, refer to: **Power Door Locks Description and Operation**

Circuit	Description
Signal	The control module input circuit has an internal resistance connected to 12 V.
Ground	Chassis Ground

Component	Description
A23 Door Latch Assembly	The door locks are actuated by a bidirectional DC motor that locks/unlocks the door so that it can not be opened from outside the vehicle (but still from inside).The assembly also contains a normally open door ajar switch that closes as soon as the door is not fully closed.
S146 Window/Outside Rearview Mirror Switch - Driver	The switch assembly has a 4-way switch to control the mirror movement (up, down, left, right) and a 2-position switch to select the left and right mirror.

Circuit/System Verification

1. Operate the component: S13D Door Lock Switch - Driver - Unlock
2. Operate the component: B29D Door Lock Key Cylinder Switch - Driver - Lock
3. Verify the component activates: A23LR Door Latch Assembly - Left Rear/A23P Door Latch Assembly - Passenger/A23RR Door Latch Assembly - Right Rear
    - **If the component does not work as specified**

      Refer to: Circuit/System Testing

    - **If all functions work properly**
4. All OK.

Circuit/System Testing

NOTE: **It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.**

1.
2. Ignition/Vehicle & All vehicle systems - Off
3. Disconnect the electrical connector: A23D Door Latch Assembly - Driver
4. Test for less than 10 Ω between the test points: Ground circuit terminal 3 & Ground
    - **If 10 Ω or greater**
    1. Ground Connection - Disconnect
    2. Test for less than 2 Ω between the test points: Ground circuit terminal 3 at Component harness & Ground Connection
        - If 2 Ω or greater - Repair the open/high resistance in the circuit.
        - If less than 2 Ω - Repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
5. Ignition - On / Vehicle - In Service Mode
6. Test for greater than 10 V between the test points: Signal circuit terminal 4 & Ground circuit terminal 3
    - **If 10 V or less**
    1. Ignition/Vehicle - Off

    2. Disconnect the electrical connector: S146 Window/Outside Rearview Mirror Switch - Driver
    3. Test for infinite resistance between the test points: Signal circuit terminal 4 at Component harness & Ground
        - If less than infinite resistance - Repair the short to ground on the circuit.
        - If infinite resistance
    4. Test for less than 2 Ω between the test points: Signal circuit terminal 4 at Component harness & Signal circuit terminal 14 at S146 Window/Outside Rearview Mirror Switch - Driver
        - If 2 Ω or greater - Repair the open/high resistance in the circuit.
        - If less than 2 Ω - Replace the component: S146 Window/Outside Rearview Mirror Switch - Driver
    - **If greater than 10 V**

7. Test or replace the component: A23D Door Latch Assembly - Driver

Component Testing

1. Ignition/Vehicle - Off
2. Disconnect the electrical connector.A23D Door Latch Assembly - Driver
3. Test for infinite resistance between the test points: Signal terminal 4 & Ground terminal 3 - The switch is in the open position.
    - **If less than infinite resistance**

      Replace the component: A23D Door Latch Assembly - Driver

    - **If infinite resistance**
4. Test for less than 3 Ω between the test points: Signal terminal 4 & Ground terminal 3 - The switch is in the closed position.
    - **If 3 Ω or greater**

      Replace the component: A23D Door Latch Assembly - Driver

    - **If less than 3 Ω**
5. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: **Diagnostic Repair Verification**

- **Front Side Door Window Control Switch Replacement**
- **Front Side Door Latch Replacement**

POWER DOOR LOCKS MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**

Circuit/System Description

For an overview of the component/system, refer to: **Power Door Locks Description and Operation**

Circuit	Description
B+ - Body Control Module	Supplied from a fuse.
Signal	The control module input circuit has an internal resistance connected to 12 V.
Control - Driver Door Unlock	The output circuit is switched from ground to 12 V to activate the component.
Control - All Doors Lock	The output circuit is switched from ground to 12 V to activate the component.
Control - Passenger Door Unlock	The output circuit is switched from ground to 12 V to activate the component.
Ground - S13D Door Lock Switch - Driver	Chassis Ground

Circuit	Description
Ground - S13P Door Lock Switch - Passenger	Chassis Ground
Ground - Body Control Module	Chassis Ground

Component	Description
A23 Door Latch Assembly	The door locks are actuated by a bidirectional DC motor that locks/unlocks the door so that it can not be opened from outside the vehicle (but still from inside).
K9 Body Control Module	The module controls various vehicle functions like lighting, central door locking, power windows, etc.
S13P Door Lock Switch - Passenger	• The switch has a normally open contact. • When the switch is activated, the signal circuit to the control module is grounded.
S13D Door Lock Switch - Driver	• The switch has a normally open contact. • When the switch is activated, the signal circuit to the control module is grounded.

Control Module References

Circuit/System Verification

1. Ignition - On / Vehicle - In Service Mode
2. Verify the scan tool parameter: Driver Door Lock Switch = Inactive
    - **If not the specified state**

      Refer to: Circuit/System Testing - Test 1

    - **If the specified state**
3. Operate the component: S13D Door Lock Switch - Driver - Lock & Unlock

Verify the scan tool parameter: Driver Door Lock Switch = Lock & Unlock

- **If not the specified state**

  Refer to: Circuit/System Testing - Test 1

- **If the specified state**

4. Verify the scan tool parameter: Passenger Door Lock Switch = Inactive
   - **If not the specified state**

     Refer to: Circuit/System Testing - Test 1

   - **If the specified state**
5. Operate the component: S13P Door Lock Switch - Passenger - Lock & Unlock

   Verify the scan tool parameter: Passenger Door Lock Switch = Lock & Unlock

   - **If not the specified state**

     Refer to: Circuit/System Testing - Test 1

   - **If the specified state**
6. Operate the component: S13D Door Lock Switch - Driver - Lock & Unlock

   Verify the component works as specified:

   - A23D Door Latch Assembly - Driver = Lock & Unlock
   - A23LR Door Latch Assembly - Left Rear = Lock & Unlock
   - A23P Door Latch Assembly - Passenger = Lock & Unlock
   - A23RR Door Latch Assembly - Right Rear = Lock & Unlock
   - **If the component does not activate - A23D Door Latch Assembly - Driver**

     Refer to: Circuit/System Testing - Test 2

   - **If the component does not activate - A23LR Door Latch Assembly - Left Rear**

     Refer to: Circuit/System Testing - Test 3

   - **If the component does not activate - A23P Door Latch Assembly - Passenger**

     Refer to: Circuit/System Testing - Test 3

   - **If the component does not activate - A23RR Door Latch Assembly - Right Rear**

     Refer to: Circuit/System Testing - Test 3

   - **If none of the components operate**

     Refer to: Circuit/System Testing - Test 4

   - **If all functions work properly**
7. All OK.

Circuit/System Testing

Test 1

NOTE: **It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.**

1. Ignition/Vehicle & All vehicle systems - Off

2. Disconnect the appropriate electrical connector: S13D Door Lock Switch - Driver/S13P Door Lock Switch - Passenger
3. Test for less than 10 Ω between the test points: Ground circuit terminal 4 & Ground
    - **If 10 Ω or greater**
    1. Ground Connection - Disconnect
    2. Test for less than 2 Ω between the test points: Ground circuit terminal 4 at Component harness & Ground Connection
        - If 2 Ω or greater - Repair the open/high resistance in the circuit.
        - If less than 2 Ω - Repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
4. Ignition - On / Vehicle - In Service Mode
5. Verify the scan tool parameter: Driver Door Lock Switch or Passenger Door Lock Switch = Inactive
    - **If not the specified state**
    1. Ignition/Vehicle - Off
    2. Disconnect the electrical connector: X1/X2/X7 at K9 Body Control Module
    3. Test for infinite resistance between the test points:
        - Signal circuit terminal 2 at Component harness & Ground
        - Signal circuit terminal 3 at Component harness & Ground
        - If less than infinite resistance - Repair the short to ground on the circuit.
        - If infinite resistance - Replace the component: K9 Body Control Module
    - **If the specified state**
6. Connect a 3 A fused jumper wire between the test points: Signal circuit terminal 3 & Ground circuit terminal 4
7. Verify the scan tool parameter: Driver Door Lock Switch or Passenger Door Lock Switch = Unlock
    - **If not the specified state**
    1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
    2. Disconnect the electrical connector: X1 or X2 at K9 Body Control Module
    3. Ignition - On / Vehicle - In Service Mode
    4. Test for less than 1 V between the test points: Signal circuit terminal 3 at Component harness & Ground
        - If 1 V or greater - Repair the short to voltage on the circuit.
        - If less than 1 V
    5. Ignition/Vehicle - Off
    6. Test for less than 2 Ω between the test points:
        - Signal circuit terminal 3 at S13D Door Lock Switch - Driver & Terminal 15 X2 at Control module harness
        - Signal circuit terminal 3 at S13P Door Lock Switch - Passenger & Terminal 14 X1 at Control module harness
        - If 2 Ω or greater - Repair the open/high resistance in the circuit.
        - If less than 2 Ω - Replace the component: K9 Body Control Module
    - **If the specified state**
8. Connect a 3 A fused jumper wire between the test points: Signal circuit terminal 2 & Ground circuit terminal 4
9. Verify the scan tool parameter: Driver Door Lock Switch or Passenger Door Lock Switch = Lock
    - **If not the specified state**
    1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
    2. Disconnect the electrical connector: X2 or X7 at K9 Body Control Module
    3. Ignition - On / Vehicle - In Service Mode

        4. Test for less than 1 V between the test points: Signal circuit terminal 2 at Component harness & Ground
            - If 1 V or greater - Repair the short to voltage on the circuit.
            - If less than 1 V
        5. Ignition/Vehicle - Off
        6. Test for less than 2 Ω between the test points:
            - Signal circuit terminal 2 at S13D Door Lock Switch - Driver & Terminal 19 X2 at Control module harness
            - Signal circuit terminal 2 at S13P Door Lock Switch - Passenger & Terminal 14 X7 at Control module harness
            - If 2 Ω or greater - Repair the open/high resistance in the circuit.
            - If less than 2 Ω - Replace the component: K9 Body Control Module
    - **If the specified state**

10. Test or replace the component: S13D Door Lock Switch - Driver/S13P Door Lock Switch - Passenger

Test 2

1. Ignition/Vehicle - Off
2. Disconnect the electrical connector: A23D Door Latch Assembly - Driver
3. Connect a test lamp between the test points: Control circuit terminal 7 & Control circuit terminal 8
4. Ignition - On / Vehicle - In Service Mode
5. Operate the component: S13D Door Lock Switch - Driver - Lock & Unlock
6. Verify the test lamp does not turn On and Off.
    - **If the test lamp turns On and Off**

      Test or replace the component: A23D Door Latch Assembly - Driver

    - **If the test lamp does not turn On and Off**
7. Ignition/Vehicle - Off
8. Disconnect the electrical connector: X6 at K9 Body Control Module
9. Test for less than 2 Ω between the test points:
    - Control circuit terminal 7 at A23D Door Latch Assembly - Driver & Terminal 1 X6 at Control module harness
    - Control circuit terminal 8 at A23D Door Latch Assembly - Driver & Terminal 4 X6 at Control module harness
    - If 2 Ω or greater - Repair the open/high resistance in the circuit.
    - **If less than 2 Ω**
10. Test or replace the component: K9 Body Control Module

Test 3

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the appropriate electrical connector:
    - A23LR Door Latch Assembly - Left Rear
    - A23P Door Latch Assembly - Passenger
    - A23RR Door Latch Assembly - Right Rear
3. Connect a test lamp between the test points:
    - A23P Door Latch Assembly - Passenger Control circuit terminal 9 & Control circuit terminal 8
    - A23LR Door Latch Assembly - Left Rear Control circuit terminal 7 & Control circuit terminal 8
    - A23RR Door Latch Assembly - Right Rear Control circuit terminal 9 & Control circuit terminal 8

4. Ignition - On / Vehicle - In Service Mode
5. Operate the component: S13D Door Lock Switch - Driver - Lock & Unlock
6. Verify the test lamp does not turn On and Off.
    - **If the test lamp turns On and Off**

      Test or replace the component: A23 Door Latch Assembly

    - **If the test lamp does not turn On and Off**
7. Ignition/Vehicle - Off
8. Disconnect the electrical connector: X6 at K9 Body Control Module
9. Ignition - On / Vehicle - In Service Mode
10. Test for less than 2 Ω between the test points:
    - Control circuit terminal 7 at A23LR Door Latch Assembly - Left Rear & Terminal 2 X6 at Control module harness
    - Control circuit terminal 8 at A23LR Door Latch Assembly - Left Rear & Terminal 4 X6 at Control module harness
    - Control circuit terminal 8 at A23P Door Latch Assembly - Passenger & Terminal 4 X6 at Control module harness
    - Control circuit terminal 9 at A23P Door Latch Assembly - Passenger & Terminal 2 X6 at Control module harness
    - Control circuit terminal 8 at A23RR Door Latch Assembly - Right Rear & Terminal 4 X6 at Control module harness
    - Control circuit terminal 9 at A23RR Door Latch Assembly - Right Rear & Terminal 2 X6 at Control module harness
    - If 2 Ω or greater - Repair the open/high resistance in the circuit.
    - **If less than 2 Ω**
11. Test or replace the component: K9 Body Control Module

Test 4

NOTE: **It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.**

1. Ignition/Vehicle - Off
2. Disconnect the electrical connector: X2 & X6 at K9 Body Control Module
3. Test for less than 10 Ω between the test points: Ground circuit terminal 3 X6 & Ground
    - **If 10 Ω or greater**
    1. Ground Connection - Disconnect
    2. Test for less than 2 Ω between the test points: Ground circuit terminal 3 X6 & Ground Connection
        - If 2 Ω or greater - Repair the open/high resistance in the circuit.
        - If less than 2 Ω - Repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
4. Ignition - On / Vehicle - In Service Mode
5. Verify a test lamp turns On between the test points: B+ circuit terminal 4 X2 & Ground
    - **If the test lamp does not turn On and the circuit fuse is OK**
    1. Ignition/Vehicle - Off & Remove - Test lamp
    2. Test for less than 2 Ω between the test points: B+ circuit terminal 4 X2 & Output terminal at Fuse
        - If 2 Ω or greater - Repair the open/high resistance in the circuit.
        - If less than 2 Ω - Verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not turn On and the circuit fuse is open**

    1. Ignition/Vehicle - Off & Remove - Test lamp
    2. Disconnect the electrical connector:
        - A23D Door Latch Assembly - Driver
        - A23LR Door Latch Assembly - Left Rear
        - A23P Door Latch Assembly - Passenger
        - A23RR Door Latch Assembly - Right Rear
    3. Test for infinite resistance between the test points:
        - Control circuit terminal 1 X6 at K9 Body Control Module & Ground
        - Control circuit terminal 2 X6 at K9 Body Control Module & Ground
        - Control circuit terminal 4 X6 at K9 Body Control Module & Ground
        - If less than infinite resistance - Repair the short to ground on the circuit.
        - If infinite resistance - Replace the component: A23 Door Latch Assembly
    - **If the test lamp turns On**

6. Ignition/Vehicle - Off
7. Connect the electrical connector: X2 at K9 Body Control Module
8. Ignition - On / Vehicle - In Service Mode
9. Test for less than 1 V between the test points:
    - Control circuit terminal 1 X6 at K9 Body Control Module & Ground
    - Control circuit terminal 2 X6 at K9 Body Control Module & Ground
    - Control circuit terminal 4 X6 at K9 Body Control Module & Ground
    - **If greater than 1 V**

      Repair the short to voltage on the circuit.

    - **If 1 V or less**
10. Ignition/Vehicle - Off
11. Test for infinite resistance between the test points:
    - Control circuit terminal 1 X6 at K9 Body Control Module & Ground
    - Control circuit terminal 2 X6 at K9 Body Control Module & Ground
    - Control circuit terminal 4 X6 at K9 Body Control Module & Ground
    - **If less than infinite resistance**

      Repair the short to ground on the circuit.

    - **If infinite resistance**
12. Replace the component: K9 Body Control Module

Component Testing

S13 Door Lock Switch - Test

1. Ignition/Vehicle - Off
2. Disconnect the appropriate electrical connector: S13 Door Lock Switch
3. Test for infinite resistance between the test points:
    - Signal terminal 2 & Ground terminal 4 - Switch - Not Pressed
    - Signal terminal 3 & Ground terminal 4 - Switch - Not Pressed
    - **If less than infinite resistance**

      Replace the component: S13 Door Lock Switch

    - **If infinite resistance**
4. Test for less than 3 Ω between the test points: Signal terminal 2& Ground terminal 4 - LockSwitch - Pressed
    - **If 3 Ω or greater**

Replace the component: S13 Door Lock Switch

- **If less than 3 Ω**

5. Test for less than 3 Ω between the test points: Signal terminal 3 & Ground terminal 4 - Unlock Switch - Pressed
   - **If 3 Ω or greater**

     Replace the component: S13 Door Lock Switch

   - **If less than 3 Ω**
6. All OK.

A23 Door Latch Assembly

1. Ignition/Vehicle - Off
2. Disconnect the appropriate electrical connector:
   - A23D Door Latch Assembly - Driver
   - A23P Door Latch Assembly - Passenger
   - A23LR Door Latch Assembly - Left Rear
   - A23RR Door Latch Assembly - Right Rear
3. Connect a 25 A fused jumper wire between the test points: Control terminal 8 & B+

CAUTION: **Complete the testing as quickly as possible in order to prevent overheating and damaging the component.**

4. Momentarily connect a jumper wire between the test points:
   - A23D Door Latch Assembly - Driver: Control terminal 7 & Ground
   - A23P Door Latch Assembly - Passenger: Control terminal 9 & Ground
   - A23LR Door Latch Assembly - Left Rear: Control terminal 7 & Ground
   - A23RR Door Latch Assembly - Right Rear: Control terminal 9 & Ground
5. Reverse the jumper wires 2 times between the terminals.

   Verify the component works as specified: A23 Door Latch Assembly = Lock & Unlock

   - **If not the specified state**

     Replace the component: A23 Door Latch Assembly

   - **If the specified state**
6. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: **Diagnostic Repair Verification**

- **Front Side Door Latch Replacement**
- **Rear Side Door Latch Replacement**
- **Door Lock Switch Replacement**
- For control module replacement, programming, and setup refer to: **Control Module References**

DOOR WILL NOT OPEN/CLOSE, DOOR BINDING, OR LOCKS, HANDLES, OR CYLINDERS DO NOT FUNCTION

Step	Action	Yes	No
DEFINITION: This diagnostic table is designed to address the mechanical diagnosis of the door latching system, which could include the inside and outside handles, latch rods/cables, latches, or latch cylinders.			

Step	Action	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	Go to **Step 2**	Go to **Diagnostic System Check - Vehicle**
2	Were you sent here from a Vehicle Access Symptom Table?	Go to **Step 3**	Go to **Symptoms - Vehicle Access**
3	Does the door open with the outside handle?	Go to **Step 4**	Go to **Step 10**
4	Does the door open with the inside handle?	Go to **Step 5**	Go to **Step 11**
5	Does the manual latch knob latch and unlatch the latch smoothly without binding?	Go to **Step 6**	Go to **Step 12**
6	Does the door latch switch and/or the keyless entry transmitter latch and unlatch the door latch or door latches?	Go to **Step 7**	Go to **Step 14**
7	Is the outside key cylinder loose or does it rattle or fall out? (if equipped)	Go to **Step 15**	Go to **Step 8**
8	Does the outside key cylinder latch and unlatch the latch and function smoothly without binding? (if equipped)	Go to **Step 9**	Go to **Step 16**
9	Does the door bind, does it take excessive effort to open, or is it misaligned?	Go to **Step 17**	Go to **Step 18**
10	If the door will not open with the outside handle, or the handle is obstructed or loose, check the following: • For cold weather freezing, thaw as necessary. • Check the handle for foreign material. Remove material as necessary. • Check the handle grab bar for looseness or damage. Repair as necessary. • Check the handle for full travel. If the issue is not resolved, remove the trim panel as necessary to gain access to door hardware and check the following: • Check the handle chassis for loose fasteners, broken chassis inserts, loose or missing spring, or a loose, missing or bent rod lever. • Check for bent rod to the outside handle. • Check that the handle grab bar engages the rod lever properly. • Check for interference of rod and handle to other components in the door. • Check that handle rod is securely attached at both latch and handle. • Check if rod is positioned properly in the clip on the latch. At rest position, the handle should be fully against the down stop and the latch lever should be at the bottom of its travel. Correct by opening clip, repositioning rod in clip and closing clip till it snaps, as necessary. Did you find and correct the condition?	Go to **Step 18**	Go to **Step 11**

Step	Action	Yes	No
11	Door will not open with the inside handle: • Check the inside handle for foreign material. Remove material as necessary. • Check that the handle is secure. Correct as necessary. • If rear door, verify child security is not engaged. • Remove the trim panel as necessary to and check the inside handle rod/cable attachments at both the latch and handle. If the cable is kinked or pinched, correct as necessary. Did you find and correct the condition?	Go to **Step 18**	Go to **Step 12**
12	The door will not or is difficult to unlatch with the inside manual latch knob: • For cold weather freezing, thaw as necessary • Check the latch knob for a loose condition. Repair or replace as necessary. Check the latch knob for binding or dragging using the following procedure: 1. Remove the latch knob. 2. If condition goes away, check for drag/interference of the latch knob against the inner belt seal, or the trim panel. Correct as required. If further action is required, remove the trim panel and check the latch rod and latch knob for interference with the following: • Water deflector/paper • Side impact foam • Rod grommet in sheet metal • Glass run channel • Other rods or cables • Trim panel Did you find and correct the condition?	Go to **Step 18**	Go to **Step 13**

Step	Action	Yes	No
13	With a manual lock, if the latch will not function properly do the following: 1. Function the lock/unlatch lever on the latch to unlatch the latch. Check for high internal resistance. 2. With the door open, manually close the latch with a screwdriver. 3. Check the latch for internal binding by actuating the latch with the inside door handle lever. 4. Manually close the latch with a screwdriver again. 5. Check the latch for internal binding by actuating the latch with the outside door handle lever. Did you find and correct the condition?	Go to **Step 18**	Go to **Step 14**
14	If power locks are included in vehicle options and do not function with either the keyless entry transmitter or switch: 1. For cold weather freezing, thaw as necessary. 2. Remove trim pad as required and check the following: • Verify door harness has appropriate power connectors for switches and latch. • Check harness connector pins for corrosion. • Assure wire harness connectors are seated and locked properly at latch and switch. Remove and re-seat if required. • Check door harness for cuts/chafing/corrosion. Correct/replace as required. • Check for 12V at latch and door switch. Correct/proceed accordingly. • Check BCM for trouble codes. Correct/proceed accordingly. 3. If power locks still do not function do the following: 1. Remove latch from door cavity. 2. Connect latch to electrical connector outside the door. 3. Function power lock/unlatch switch in both latch and unlatch directions. Watch for lock/unlatch lever on latch to move completely from one position to the other. 4. If lever does not move, remove connector from old latch and attach to new latch outside of door cavity. 5. Verify new latch is functional, if so, attach rods and install new latch in door. Did you find and correct the condition?	Go to **Step 18**	Go to **Step 15**

Step	Action	Yes	No
15	If the key cylinder is loose do the following: • Remove the trim if necessary. • Check that the retaining clip is properly seated. (if equipped) • Check that the fastener is properly torqued. (if equipped) Did you find and correct the condition?	Go to **Step 18**	Go to **Step 16**
16	The outside key cylinder will not latch and unlatch the latch and function smoothly without binding: 1. For cold weather freezing, thaw as necessary 2. Remove trim if required. 3. Check that the key cylinder rod is securely attached both to the key cylinder pawl and the latch. 4. Check that key cylinder lever, rod and latch lever are free of interferences. Remove interferences as required. 5. Check that latch cylinder rod is routed properly. Re-route as required. 6. Remove rod from latch cylinder and actuate cylinder. Check for internal resistance. Lubricate latch cylinder as required 7. Verify Cylinder rotates with vehicle key. If not, code and replace cylinder to match vehicle key. See latch cylinder coding and replacing. Did you find and correct the condition?	Go to **Step 18**	Go to **Step 17**
17	The door is difficult to open: • Check for interference with the fender, adjacent door, body opening or door striker and adjust as necessary. • Check for binding door hinges. Lubricate or align/adjust as necessary. • Check the door check link for binding. Lubricate as necessary. • Adjust the door as necessary. Did you find and correct the condition?	Go to **Step 18**	Go to appropriate Door Lock Striker Adjustment procedure.

Step	Action	Yes	No

18	Verify proper operation of the door closing system.
	• Outside handle
	• Inside handle
	• Manual lock/unlatch
	  ◦ Outside key cylinder
	  ◦ Inside latch knob
	  ◦ Double pull handle
	• Power lock/unlatch
	  ◦ Key fob
	  ◦ Door switches
	• Door opening/closing effort
	Is the condition still present?
		Go to **Step 1**	System OK

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Rear Side Door Trim Replacement	
1	Rear Side Door Locking Rod Knob **NOTE:** **Ensure that the door lock system operates properly before installing the trim.**

FRONT SIDE DOOR LOCK STRIKER ADJUSTMENT

To determine if striker adjustment is required, proceed as follows:

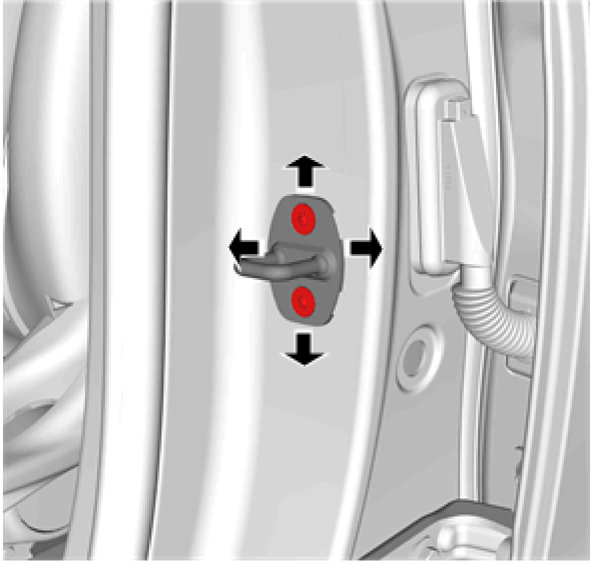

Fig. 89: Adjusting Front Side Door Lock Striker
Courtesy of GENERAL MOTORS COMPANY

1. Ensure the door is properly aligned within the door opening before proceeding with the striker adjustment.
2. Close the door onto the striker and note if the door drags on the striker causing the door to move upward or downward upon contact with the striker. Also note the closing effort to fully engage the lock.
3. Using a grease pencil, mark around the striker for reference of the original position. Loosen the striker.
4. Move the striker to eliminate drag on the striker and door lock and to achieve the proper door position within the door opening. Start with the up/down position, then position the striker to achieve proper alignment to the door opening. Set the in/out adjustment for the proper door seal engagement making sure the door closing efforts are correct.

CAUTION: **Refer to Fastener Caution .**

5. Tighten the striker screws. Tighten the front side door striker screws to 22 N.m (16 lb ft).

FRONT SIDE DOOR LOCK STRIKER REPLACEMENT

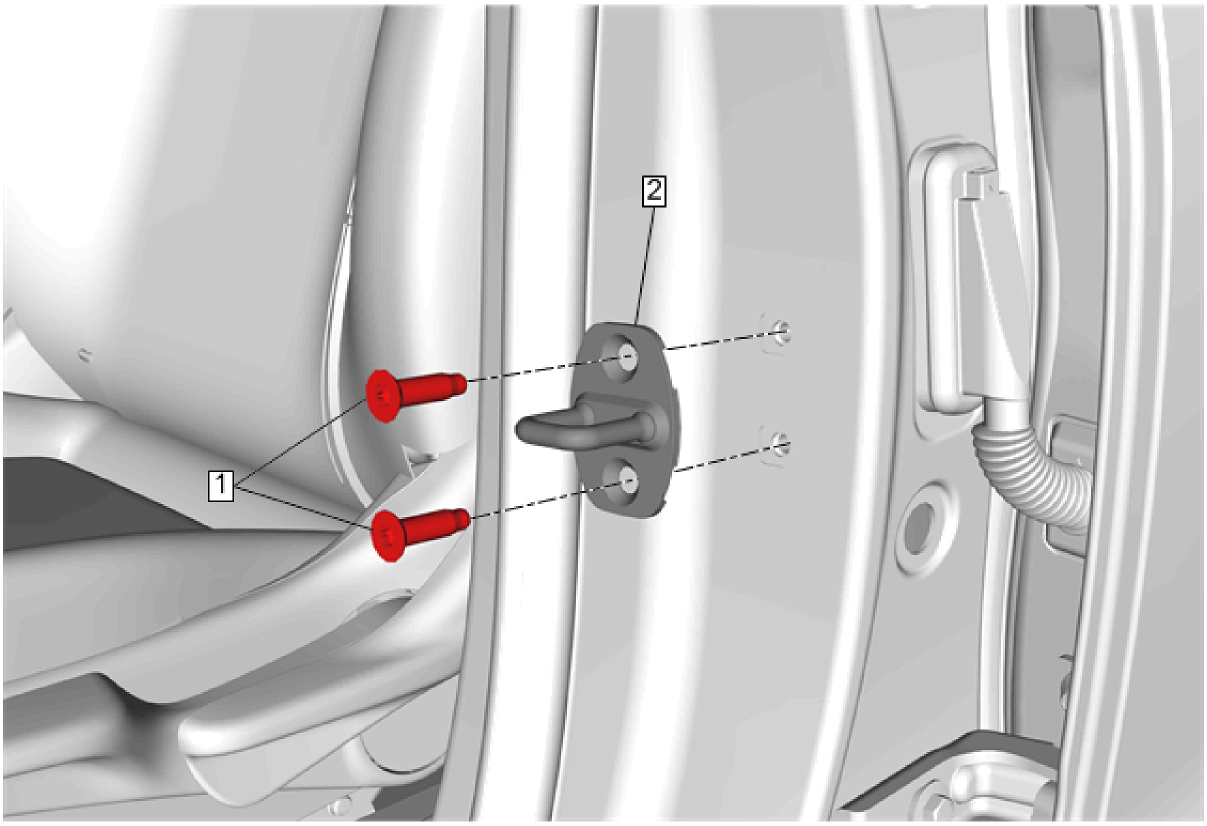

Fig. 90: Front Side Door Lock Striker
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Side Door Lock Striker Screw **CAUTION:** **Refer to Fastener Caution .** **Tighten** 22 N.m (16 lb ft)
2	Front Side Door Lock Striker **Procedure** Ensure proper alignment after installation. Front Side Door Lock Striker Adjustment

LIFTGATE LATCH STRIKER REPLACEMENT

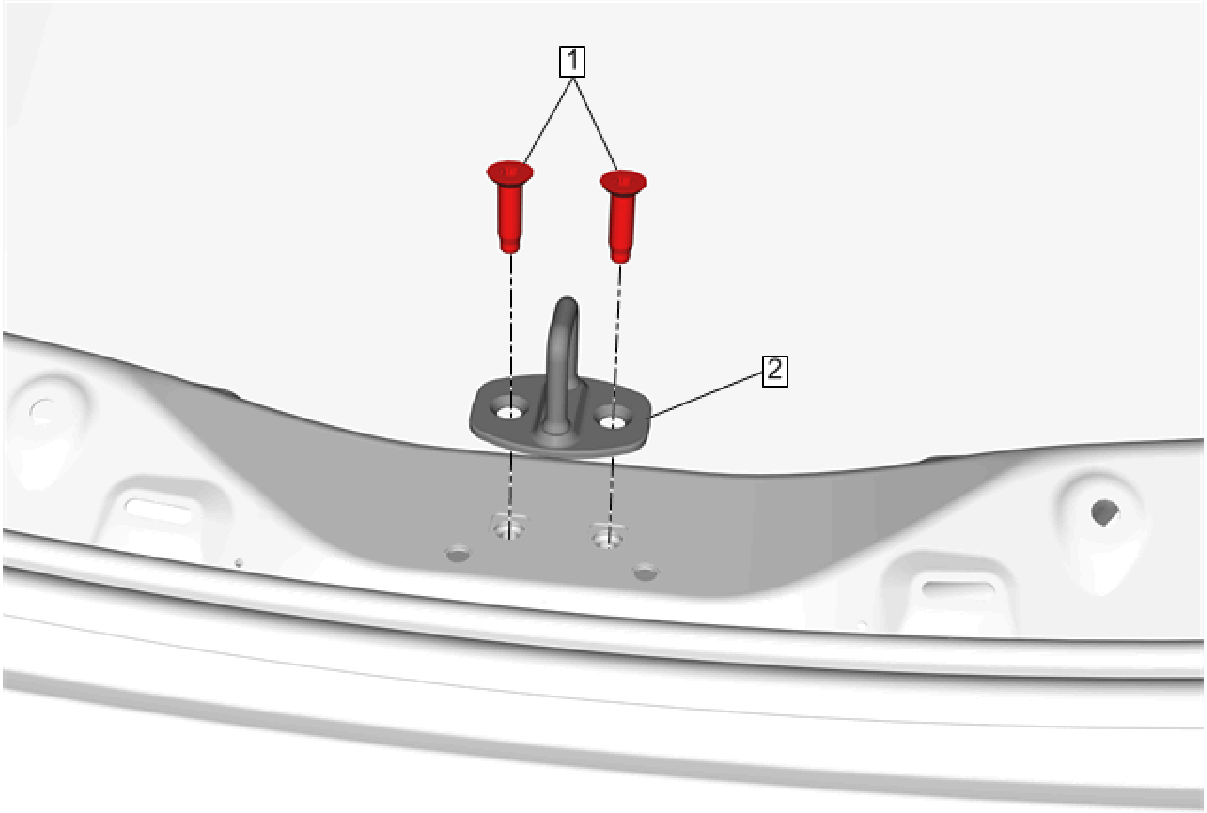

Fig. 91: Liftgate Latch Striker

Preliminary Procedure Liftgate Sill Garnish Molding Replacement	
1	Liftgate Latch Striker Bolt **CAUTION:** **Fastener Caution** **Tighten** 22 N.m (16 lb ft) **Procedure** Use a grease pencil to outline the striker before removing the bolts.

Callout	Component Name
2	Liftgate Latch Striker **Procedure** Adjust the liftgate latch striker after replacing, if needed.

REAR SIDE DOOR LOCK STRIKER ADJUSTMENT

To determine if striker adjustment is required, proceed as follows:

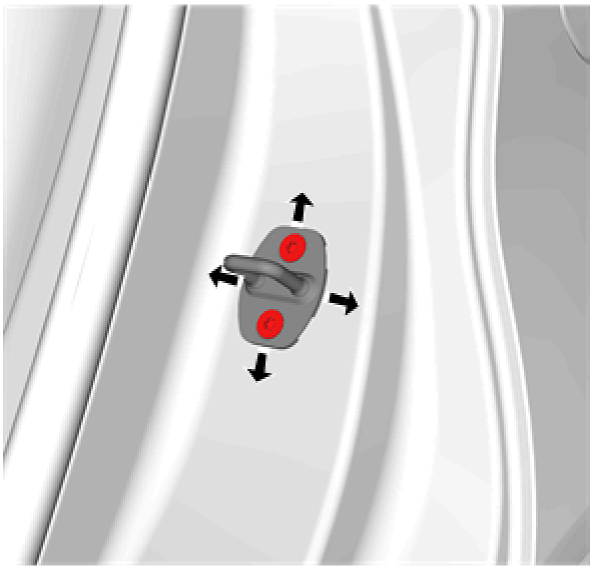

Fig. 92: Adjusting Rear Side Door Lock Striker
Courtesy of GENERAL MOTORS COMPANY

1. Ensure the door is properly aligned within the door opening before proceeding with the striker adjustment.
2. Close the door onto the striker and note if the door drags on the striker causing the door to move upward or downward upon contact with the striker. Also note the closing effort to fully engage the lock.
3. Using a grease pencil, mark around the striker for reference of the original position. Loosen the striker.
4. Move the striker to eliminate drag on the striker and door lock and to achieve the proper door position within the door opening. Start with the up/down position, then position the striker to achieve proper alignment to the door opening. Set the in/out adjustment for the proper door seal engagement making sure the door closing efforts are correct.

CAUTION: **Refer to Fastener Caution .**

5. Tighten the striker screws. Tighten the rear side door striker screws to 22 N.m (16 lb ft).

REAR SIDE DOOR LOCK STRIKER REPLACEMENT

DESCRIPTION AND OPERATION

CHARGE PORT DOOR DESCRIPTION AND OPERATION

Charge Port System Components

The charge port system consists of the following components:

- Charge port door position sensor
- Hybrid/EV powertrain control module 2

Charge Port Ajar Message

When the vehicle is in the Service Mode or ON, the hybrid/EV powertrain control module 2 supplies a 5V signal to the charge port door position switch through the charge port door sensor signal circuit. The charge port door position switch contains a resistor ladder interface for switch position between two resistors for sensing used by the hybrid/EV powertrain control module 2 to determine if the charge port door is in the open position or the closed position. The hybrid/EV powertrain control module 2 sends a serial data message to the driver information center in the instrument panel cluster to display the Charge Door Open message.

DOOR AJAR INDICATOR DESCRIPTION AND OPERATION

Door Ajar Indicator System Components

The door ajar indicator system consists of the following components:

- Body control module (BCM)
- Instrument cluster
- Driver door latch
- Passenger door latch
- Left rear door latch
- Right rear door latch
- Driver window motor
- Passenger window switch
- Left rear window switch
- Right rear window switch

Driver Door Ajar

The driver window motor provides a 12V signal to the driver door ajar switch signal circuit. The driver door ajar switch is integral to the driver door latch assembly. When the driver door is opened, the normally open door ajar switch closes. With the door ajar switch closed, ground is provided to the door ajar switch signal circuit and the voltage within the signal circuit drops. The driver window motor will detect the voltage drop and will send a serial data message to the body control module which will then send a message to the instrument panel cluster to command the door ajar message

Passenger Door Ajar

The passenger window switches each provide a 12 V signal to their respective door ajar switch signal circuits. The door ajar switches are integral to each door latch assembly. When a door is opened, the normally open door ajar switch closes. With the door ajar switch closed, ground is provided to the door ajar switch signal circuit and the voltage within the signal circuit drops. The window switches will detect the voltage drop and will send a serial data message to the body control module which will then send a message to the instrument panel cluster to command the door ajar message.

LIFTGATE AJAR INDICATOR DESCRIPTION AND OPERATION

Hatch Open Indicator

The body control module (BCM) monitors the voltage level of the rear hatch ajar signal circuit which is normally at the system voltage when the hatch is closed. When the hatch is ajar or open, a switch within the rear hatch latch closes providing a path to ground for the hatch ajar signal circuit. The voltage within the signal circuit will then drop to 0 volts, the BCM will then detect the voltage drop and will send a serial data message to the instrument panel cluster (IPC). The IPC will then display an icon of the vehicle with the hatch open.

POWER DOOR LOCKS DESCRIPTION AND OPERATION

Door Lock System Components

The power door lock system consists of the following components:

- Driver door lock switch
- Passenger door lock switch
- Key cylinder switch
- Body control module (BCM)
- Driver door latch
- Passenger door latch
- Left rear door latch
- Right rear door latch
- Exterior door handle switches
- Keyless entry control module

Door Lock and Unlock Operation

When the driver or passenger door lock switch is activated in the lock or unlock position, the BCM will receive a ground signal on either the door lock switch lock or unlock signal circuits.

The BCM, upon receipt of a lock switch lock or unlock signal, will supply battery voltage to the door lock actuator lock or unlock control circuits. Since the opposite side of the lock actuator is connected to ground through the other lock actuator control circuit, the doors will then lock or unlock as commanded.

The following three circuits are used to operate the lock:

- Driver door unlock
- Passenger door unlock
- All door lock

The driver door lock actuator is isolated so it can be unlocked by itself using the keyless entry transmitter.

Key Cylinder Switch

The driver window switch monitors the voltage level of the driver door lock motor status signal circuit. When the key is inserted into the driver door key cylinder and turned to the Lock position, a switch within the driver door latch closes causing the voltage to drop within the driver door lock motor status signal circuit. The driver window switch will detect the drop in voltage and will send a serial data message to the BCM commanding all the doors to Lock.

The driver key cylinder switch is used by the customer for programming the keyless entry transmitters, The driver window/outside rearview mirror switch monitors the voltage level of the key switch unlock signal circuit and when it detects a reprogramming request, it will send a serial data message to the body control module.

Passive Door Lock/Unlock Operation

The exterior door handle switch signal circuits provide inputs to the keyless entry control module when the exterior door handle switches are activated. These inputs allow the keyless entry control module to detect a door lock or a door unlock request. The keyless entry control module provides a 12 V signal to each exterior door handle switch via the door handle switch signal circuits. When a door handle switch is pressed, the switch closes and the voltage signal within the signal circuit is pulled to ground. The keyless entry control module will detect the voltage drop and a low frequency antenna will transmit a challenge to the keyless entry transmitter. If the challenge is met, the keyless entry transmitter will respond and the keyless entry control module will send a serial data message to the body control module to command the door(s) to be locked or unlocked

REAR HATCH/GATE DESCRIPTION AND OPERATION

Liftgate Release System Components

- Body control module (BCM)
- Liftgate unlatch switch
- Liftgate latch assembly
- Liftgate unlatch relay

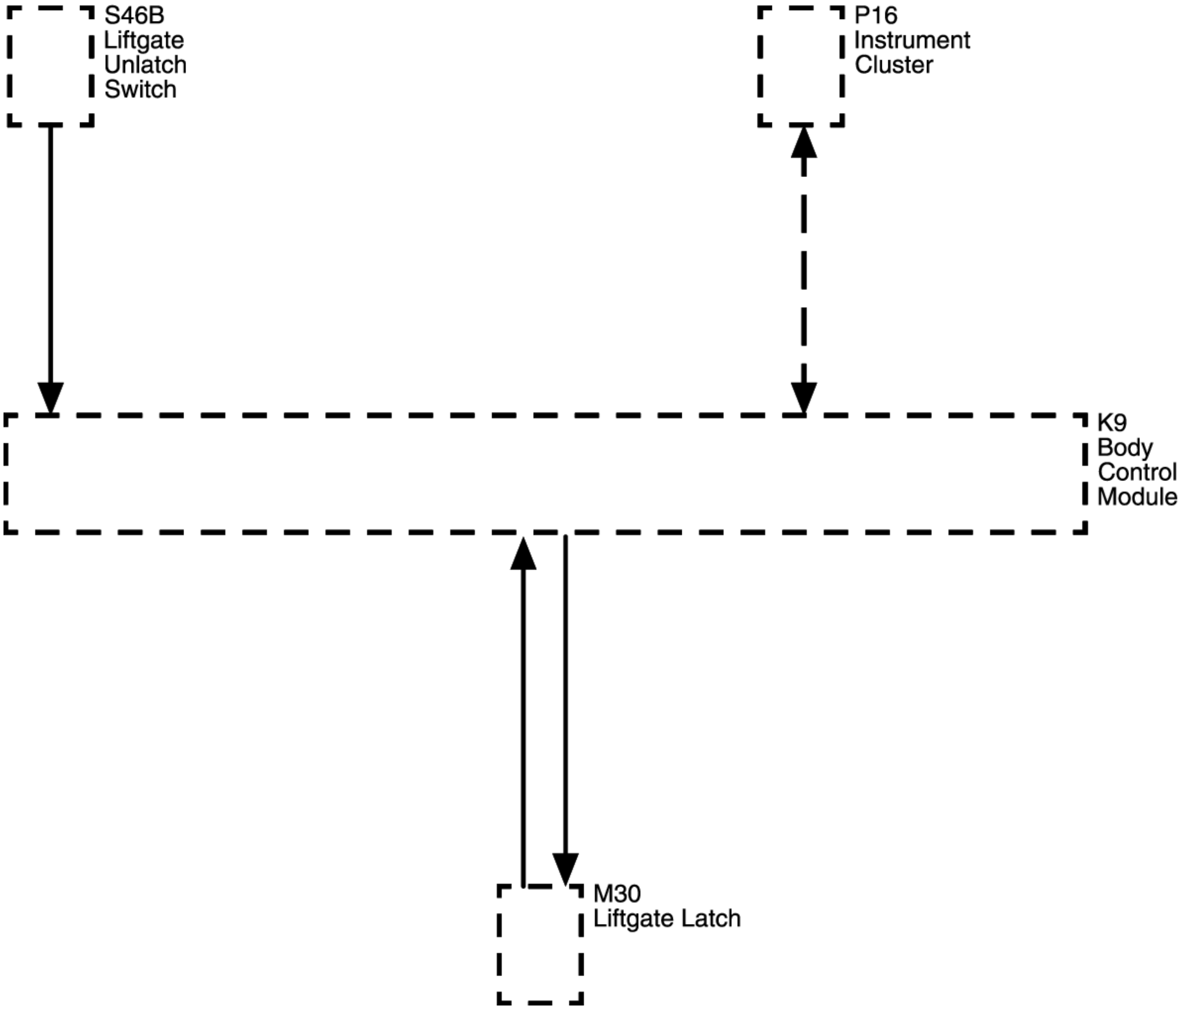

Fig. 98: Liftgate Release Block Diagram
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
P16	P16 Instrument Cluster
K9	K9 Body Control Module
M30	M30 Liftgate Latch
S46B	S46B Liftgate Unlatch Switch

Liftgate Release Operation

Liftgate Unlatch Switch

The BCM monitors supplies a 12 V signal to the liftgate unlatch switch so that when the switch is pressed, the voltage within the signal circuit is pulled low and in response, the BCM will detect the voltage drop and check the status of the door lock system. If the doors are locked, the BCM will ignore the request, if the All Doors Unlock has been commanded, the BCM will recognize the request and will provide voltage to the release relay.

Liftgate Latch Assembly

When BCM receives a liftgate release command from the liftgate unlatch switch, the BCM applies brief pulse of voltage to the liftgate unlatch relay control circuit, which energizes the coil side of the relay. The switch side of the liftgate unlatch relay then momentarily closes, supplying a brief pulse of battery positive voltage to the liftgate latch assembly. The liftgate latch assembly is continuously grounded and when it receives the voltage pulse, it will become energized and the latch will activate releasing the liftgate so that it may be manually raised to an open position.

Keyless Entry Transmitter

All doors of the vehicle must first be commanded to UNLOCK prior to pressing the liftgate unlatch switch. The BCM monitors the status of the vehicle door latches. If the passenger doors are locked, the BCM will ignore the signal from the liftgate unlatch switch. Pressing the appropriate button on the keyless entry transmitter will send a request to the remote control door lock receiver which will in turn send a serial data message to unlock all doors.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B370A: RAIN SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B370A

Rain Sensor

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	U151A	U151A	-	-
Serial Data	U151A	U151A	U151A	-
Ground	-	U151A	-	-

Circuit/System Description

B+ and ground is supplied at all times to the rain sensor. The rain sensor communicates with the body control module (BCM) via serial data. When the ignition is in the ON or ACCESSORY position and the windshield wiper/washer switch is in the intermittent delay position, the BCM monitors the rain sensor data to determine the rain build up on the windshield. As rain builds up on the windshield, the BCM will command the wipers to activate. The sensitivity of the wiper frequency is controlled by the intermittent delay of the windshield wiper/washer switch. As the sensitivity is increased, the BCM will command more frequent wiper activation based on rain build up on the windshield.

Conditions for Running the DTC

- Vehicle ON or in Service Mode
- The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

Communication between the BCM and the rain sensor is interrupted.

Action Taken When the DTC Sets

- If the BCM loses communication with the rain sensor while operating under manual 1X control, the windshield wiper operation will default to intermittent operation with a fixed dwell time of 4 s.
- If the BCM loses communication with the rain sensor while operating at low speed, the windshield wiper operation will default to low speed.
- If the BCM loses communication with the rain sensor while operating at high speed, the windshield wiper operation will default to high speed.

Conditions for Clearing the DTC

The DTC will clear when communication is established between the BCM and rain sensor.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify DTC U151A is not set.
    - **If the DTC is set**

      Please Refer to **DTC U1500-U15FF**

    - **If the DTC is not set**
3. Place the S82 Windshield Wiper/Washer Switch in the intermittent delay setting and spray the outside of the windshield in the area of the B177 Rain/Ambient Light Sensor Module with a water bottle. It may be necessary to increase the sensitivity of the intermittent delay to achieve windshield wiper operation.
4. Verify the windshield wipers operate at low speed.
    - **If the windshield wipers are not operating at low speed**

      Refer to Circuit/System Testing.

   - **If the windshield wipers are operating at low speed**

5. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B117 Rain Sensor. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 3 and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Vehicle OFF, remove the test lamp.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF, remove the test lamp.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the B117 Rain Sensor.
   - **If the test lamp illuminates**
5. Test for 5.0 - 10.0 V between the serial data circuit terminal 2 and ground.
   - **If less than 5.0 V**
   1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module and the harness connector at the M75L Windshield Wiper Motor Module-Left.
   2. Test for infinite resistance between the serial data circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the serial data circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If greater than 10.0 V**
   1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module, Vehicle in Service Mode.
   2. Test for less than 1 V between the serial data circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K9 Body Control Module.
   - **If between 5.0 - 10.0 V**
6. Test or replace the B117 Rain Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Inside Air Moisture and Windshield Temperature Sensor Replacement (With Front View Camera)** **Inside Air Moisture and Windshield Temperature Sensor Replacement (Without Front View Camera)**
- **Control Module References** for body control module replacement, programming and setup.

DTC B370B: REAR WIPER FUNCTION CONTROL CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B370B

Rear Wiper Function Control Circuit

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	B370B 02	1	2	-
Ground	-	1	1	-
1. Rear Wiper Inoperative. 2. Rear Wiper Always ON.				

Circuit/System Description

The rear wiper motor is controlled by the body control module (BCM) via a printed circuit board (PCB) relay. The BCM will respond by commanding the specific rear wiper function based on an input from the rear wiper switch, which is part of the windshield wiper/washer switch. The rear wiper switch uses a resistor ladder to determine low speed, intermittent, and rear washer operation. A constant B+ and ground are supplied to the rear wiper motor. When the rear wiper switch is placed in the low speed, intermittent, or rear washer position, the voltage is pulled down through a different resistor in the resistor ladder, reducing the voltage seen at the BCM.

The BCM monitors the liftgate ajar signal circuit, and the BCM will disable the function of the rear wiper motor if the liftgate of liftglass is ajar or open

Conditions for Running the DTC

- Ignition ON
- The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

The BCM detects a short to ground in the rear window wiper control circuit.

Action Taken When the DTC Sets

Rear wiper operation is suspended.

Conditions for Clearing the DTC

A current DTC clears when the diagnostic runs and passes.

Diagnostic Aids

The rear liftgate must be closed in order for the rear wiper to work. The liftgate ajar switch signal circuit provides information to the rear window wiper module about the status of the liftgate. If the liftgate or liftglass is open the rear wiper operation is not performed.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Rear Closure Ajar Switch parameter changes between Inactive and Active when opening and closing the liftgate.
    - **If the parameter does not change**

      Refer to **Liftgate Ajar Indicator Malfunction**
    - **If the parameter changes**
3. Verify the rear wiper turns ON and OFF when commanding the Rear Wiper Active and Inactive with a scan tool.
    - **If the rear wiper does not turn ON and OFF**

      Refer to Circuit/System Testing
    - **If the rear wiper turns ON and OFF**
4. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the X4 harness connector at the K9 Body Control Module, ignition ON.
2. Verify the M45 Rear Wiper Motor is not activated.
    - **If the M45 Rear Wiper Motor is activated**
    1. Ignition OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood, ignition ON.
    2. Test for less than 1 V between the control circuit terminal 22 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the X50A Fuse Block - Underhood.
    - **If the M45 Rear Wiper Motor is not activated**
3. Connect a 10 A fused jumper wire between the control circuit terminal 10 and B+.
4. Verify the M45 Rear Wiper Motor activates.
    - **If the M45 Rear Wiper Motor does not activate**
    1. Ignition OFF, remove the jumper wire, disconnect the X2 harness connector at the X50A Fuse Block - Underhood.
    2. Test for infinite resistance between the control circuit terminal 22 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.

        - If less than 2 Ω, test or replace the X50A Fuse Block - Underhood.
    - **If the M45 Rear Wiper Motor activates**

5. Test or replace the K9 Body Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Engine Wiring Harness Junction Block Replacement**
- **Control Module References** or BCM replacement, programming and setup

DTC B371A: WINDSHIELD WIPER MOTOR INTERNAL MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B371A 39

Windshield Wiper Motor Internal Malfunction

Circuit/System Description

B+ voltage and ground are supplied to the windshield wiper motor. Whenever the vehice is ON or in Service Mode, the body control module (BCM) sends the wiper/washer switch status through the LIN communication bus. If a fault occurs at any time in the windshield wiper motor, the BCM will set the DTC.

Conditions for Running the DTC

The BCM runs the diagnostic to detect an internal fault when power up is commanded. The only requirements are voltage and ground. This diagnostic runs even if the voltage is out of the valid operating range.

Conditions for Setting the DTC

The BCM receives an invalid signal from the windshield wiper motor.

Action Taken When the DTC Sets

The BCM ignores all additional inputs.

Conditions for Clearing the DTC

A current DTC clears when the diagnostic runs and passes.

DTC Descriptor

DTC B371C

Front Wiper Motor 2

For symptom byte information, refer to Symptom Byte List .

Circuit/System Description

B+ voltage and ground are supplied to the windshield wiper motor. Whenever the vehice is ON or in Service Mode, the body control module (BCM) sends the wiper/washer switch status through the LIN communication bus. If a fault occurs at any time in the windshield wiper motor, the BCM will set the DTC.

Conditions for Running the DTC

The BCM runs the diagnostic to detect an internal fault when power up is commanded. The only requirements are voltage and ground. This diagnostic runs even if the voltage is out of the valid operating range.

Conditions for Setting the DTC

The BCM receives an invalid signal from the windshield wiper motor.

Action Taken When the DTC Sets

The BCM ignores all additional inputs.

Conditions for Clearing the DTC

A current DTC clears when the diagnostic runs and passes.

Circuit/System Verification

1. Vehicle ON.
2. Verify that there is no communications DTC set.
    - **If there is a communications DTC set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If there is no communications DTC set**
3. Verify that DTC B371C is not set.
    - **If DTC B371C is set**

      Replace the M75R Windshield Wiper Motor Module - Right..

    - **If DTC B371C is not set**
4. All OK.

DTC B3811: REAR WASHER RELAY CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3811

Rear Washer Relay Circuit

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	B3811 02	B3811 04	2	-
Ground	-	B3811 04	-	-
1. Rear Washer Inoperative 2. Rear Washer Always ON				

Circuit/System Description

The rear windshield washer pump is controlled by the body control module (BCM) via a printed circuit board (PCB) relay. The BCM monitors the rear windshield wiper/washer switch signal circuit and when rear washer activation is requested, the BCM applies voltage through the rear window washer pump relay control circuit. With the relay energized, fused battery voltage is applied through the switch contacts of the relay and the windshield washer pump control circuit to activate the windshield washer pump.

Conditions for Running the DTC

- Ignition ON.
- The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

B3811 01

The body control module detects a short to B+ in the rear windshield washer pump relay control circuit

B3811 02

The body control module detects a short to ground in the rear windshield washer pump relay control circuit

B3811 04

The body control module detects an open or high resistance in the rear windshield washer pump relay control circuit or the ground circuit

Action Taken When the DTC Sets

Washer operation is suspended.

Conditions for Clearing the DTC

- A current DTC clears when the diagnostic runs and passes.
- A history DTC will clear after 50 consecutive ignition cycles without a fault present.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the rear window washer turns ON and OFF when commanding the Rear Washer Relay Active and Inactive with a scan tool.
    - **If the rear window washer does not turn ON and OFF**

      Refer to Circuit/System Testing

    - **If the rear window washer turns ON and OFF**
3. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the X1 harness connector at the X50A Fuse Block - Underhood. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the X50A Fuse Block - Underhood ground circuit terminal 12 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Connect the X1 harness connector at the X50A Fuse Block - Underhood and disconnect the X1 harness connector at the K9 Body Control Module, ignition ON.
4. Verify the G19 Rear Window Washer Pump is not activated.
    - **If the G19 Rear Window Washer Pump is activated**
    1. Ignition OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood, ignition ON.
    2. Test for less than 1 V between the X50A Fuse Block - Underhood control circuit terminal 15 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, test or replace the X50A Fuse Block - Underhood.
    - **If the G19 Rear Window Washer Pump is not activated**
5. Connect a 10 A fused jumper wire between the control circuit terminal 6 X1 and B+.
6. Verify the G19 Rear Window Washer Pump activates.
    - **If the G19 Rear Window Washer Pump does not activate**
    1. Ignition OFF, remove the jumper wire, disconnect the X2 harness connector at the X50A Fuse Block - Underhood.
    2. Test for infinite resistance between the X50A Fuse Block - Underhood control circuit terminal 15 X2 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the X50A Fuse Block - Underhood.
    - **If the G19 Rear Window Washer Pump activates**

7. Replace the K9 Body Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Engine Wiring Harness Junction Block Replacement**
- **Control Module References** for BCM replacement, programming and setup

DTC B3873: FRONT WASHER RELAY CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B3873

Front Washer Relay Circuit

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	B3873 02	B3873 04	B3873 01	-

Circuit/System Description

The windshield washer pump is controlled by the body control module (BCM) via a printed circuit board (PCB) relay. When the washer switch is depressed, the BCM's internally pulled high resistor is pulled low by the washer request circuit. The BCM then applies voltage through a control circuit to the PCB windshield washer pump relay. With the relay energized, fused battery voltage is applied through the switch contacts of the relay and the control circuit to activate the windshield washer fluid pump.

Conditions for Running the DTC

- Vehicle ON or in Service Mode
- The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

B3873 01

The body control module detects a short to B+ in the windshield washer pump relay control circuit

B3873 02

The body control module detects a short to ground in the windshield washer pump relay control circuit

B3873 04

The body control module detects an open or high resistance in the windshield washer pump relay control circuit

Action Taken When the DTC Sets

Washer operation is suspended.

Conditions for Clearing the DTC

A current DTC clears when the diagnostic runs and passes.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the G24 Windshield Washer Pump activates when commanding the Windshield Washer Relay On and Off with a scan tool.
    - **If the G24 Windshield Washer Pump does not activate**

      Refer to Circuit/System Testing

    - **If the G24 Windshield Washer Pump activates**
3. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify the G24 Windshield Washer Pump is not activated.
    - **If the G24 Windshield Washer Pump is activated**
    1. Vehicle OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood, vehicle in Service Mode.
    2. Test for less than 1 V between the K9 Body Control Module control circuit terminal 14 X4 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the X50A Fuse Block - Underhood.
    - **If the G24 Windshield Washer Pump is not activated**
3. Connect a 10 A fused jumper wire between the control circuit terminal 14 and B+.
4. Verify the G24 Windshield Washer Pump activates.
    - **If the G24 Windshield Washer Pump does not activate**
    1. Vehicle OFF, remove the jumper wire, disconnect the X2 harness connector at the X50A Fuse Block - Underhood.
    2. Test for infinite resistance between the control circuit terminal 23 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If less than infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, test or replace the X50A Fuse Block - Underhood.

    - **If the G24 Windshield Washer Pump activates**

5. Replace the K9 Body Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Engine Wiring Harness Junction Block Replacement**
- **Control Module References** for body control module replacement, programming and setup.

SYMPTOMS - WIPER/WASHER SYSTEMS

NOTE: **The following steps must be completed before using the symptom tables:**

1. Perform **Diagnostic System Check - Vehicle** , in order to verify that all of the following conditions are true:
    - No DTCs are set.
    - The control modules can communicate via the serial data link.
2. Refer to **Wiper/Washer System Description and Operation** in order to familiarize yourself with the system functions.

Visual/Physical Inspection

- Inspect for aftermarket devices which may affect the operation of the windshield wiper/washer system. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which may cause the symptom.
- Inspect the washer fluid reservoir for the proper fluid level.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Windshield Wiper System Malfunction**
- **Washer Malfunction**
- **Rain Sensor Malfunction**

WINDSHIELD WIPER SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

1. Windshield Wipers Inoperative 2. Windshield Wipers High Speed Inoperative 3. Windshield Wipers Intermediate Speeds Inoperative 4. Windshield Wipers Always ON 5. Windshield Wiper Motor - Right, Always Inoperative 6. Windshield Wiper Motor - Left, Always Inoperative				

Circuit/System Description

The body control module (BCM) controls the windshield wiper motor based on inputs from the windshield wiper/washer switch, and when intermittent mode is selected, the rain/ambient light sensor module. The BCM monitors the windshield wiper/washer switch through two separate signal circuits and a low reference circuit. The windshield wiper/washer switch utilizes resistive multiplexing to signal a low speed and intermittent operation request to the BCM while a separate discrete signal circuit is used to indicate a high speed wiper request. When the wiper switch is placed in the low speed or intermittent position, the BCM monitors the voltage drop, which changes dependent upon switch position, over an internal pulled high resistor. The BCM will respond by commanding on the low speed or intermittent wipers. With the windshield wiper/washer switch in the high speed position, the BCM's high speed signal circuit is pulled low. The BCM will respond by commanding the windshield wiper motor to operate at high speed via serial data.

Diagnostic Aids

M75L Windshield Wiper Motor Module - Left, and M75R Windshield Wiper Motor Module - Right are identical, however, they should NOT be swapped from one side to another. Swapping Wiper motors will causes both wipers to be inoperative.

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC U151A is not set.
   - **If DTC U151A is set**

     Please Refer to DTC U1500-U15FF

   - **If DTC U151A is not set**
3. Verify the scan tool Windshield Wiper High Speed Switch parameter changes between Active and Inactive when cycling the S82 Windshield Wiper/Washer Switch between Off and High.
   - **If the parameter does not change**

     Refer to Circuit/System Testing - Windshield Wiper/Washer Switch Malfunction.

   - **If the parameter changes**
4. Verify the scan tool Windshield Wiper Switch parameter changes between Off and Low when cycling the S82 Windshield Wiper/Washer Switch between Off and Low.
   - **If the parameter does not change**

     Refer to Circuit/System Testing - Windshield Wiper/Washer Switch Malfunction.

   - **If the parameter changes**
5. Verify the scan tool Windshield Wiper Switch parameter changes between Delay 1 and Delay 5 when cycling the S82 Windshield Wiper/Washer Switch intermittent speed positions.
   - **If the parameter does not change**

     Test or replace the S82 Windsheild Wiper/Washer Switch.

   - **If the parameter changes**
6. Verify the M75L Windshield Wiper Motor Module - Left and M75R Windshield Wiper Motor Module-Right change between Off, Low, and High when commanding the Windshield Wiper Motor Relay from Off to Low to High.
   - **If the M75L Windshield Wiper Motor Module - Left and M75R Windshield Wiper Motor Module-Right does not cycle between Off, Low, and High**

     Refer to Circuit/System Testing - Windshield Wiper Motor Malfunction

   - **If the M75L Windshield Wiper Motor Module - Left and M75R Windshield Wiper Motor Module-Right cycle between Off, Low, and High**
7. All OK.

Circuit/System Testing

Windshield Wiper/Washer Switch Malfunction

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S82 Windshield Wiper/Washer Switch. It may take up to 11 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 1 and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module.
   2. Test for less than 2 Ω in the low reference circuit end to end.

        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If less than 10 Ω**
3. Vehicle ON.
4. Verify the scan tool Windshield Wiper High Speed Switch parameter is Inactive.
    - **If not Inactive**
    1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the signal circuit terminal 2 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module.
    - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the low reference circuit terminal 1.
6. Verify the scan tool Windshield Wiper High Speed Switch parameter is Active.
    - **If not Active**
    1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the K9 Body Control Module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If Active**
7. Test for greater than 8 V between the signal circuit terminal 3 and ground.
    - **If less than 8 V**
    1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the signal circuit and ground
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If 8 V or greater**
8. Vehicle OFF, disconnect the X3 harness connector at the K9 Body Control Module, vehicle ON.
9. Test for less than 1 V between the S82 Windshield Wiper/Washer Switch signal circuit terminal 3 and ground.
    - **If 1 V or greater**

      Repair the short to voltage on the circuit.

    - **If less than 1 V**
10. Test or replace the S82 Windshield Wiper/Washer Switch.
11. Verify the symptom does not occur while operating the wipers.
    - **If the symptom is not corrected**

      replace the K9 Body Control Module.

    - **If the symptom is corrected**
12. All OK.

Windshield Wiper Motor Malfunction

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the M75L Windshield Wiper Motor Module-Left. It may take up to 2 min for all vehicle systems to power down.

2. Test for less than 10 Ω between the ground circuit terminal B and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle ON.
4. Verify a test lamp illuminates between the B+ circuit terminal A and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF, remove the test lamp.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the M75L Windshield Wiper Motor Module-Left.
    - **If the test lamp illuminates**
5. Test for 5 - 10 V between the serial data circuit terminal D and ground:
    - **If less than 5 V**
    1. Vehicle OFF, disconnect the X6 harness connector at the K9 Body Control Module and the B177 Rain Sensor.
    2. Test for infinite resistance between the serial data circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the serial data circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If greater than 10 V**
    1. Ignition OFF, disconnect the X6 harness connector at the K9 Body Control Module, vehicle ON.
    2. Test for less than 1 V between the serial data circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V or greater, replace the K9 Body Control Module.
    - **If 5 - 10 V**
6. Vehicle OFF, disconnect the harness connector at the M75R Windshield Wiper Motor Module-Right, vehicle ON.
7. Test for less than 4 V between the M75L Windshield Wiper Motor Module-Left data communications circuit terminal C and ground.
    - **If 4 V or greater**

      Repair the short to voltage in the circuit.

    - **If less than 4 V**
8. Vehicle OFF.
9. Test for infinite resistance between the M75L Windshield Wiper Motor Module-Left data communications circuit terminal C and ground.
    - **If less than infinite resistance**

      Repair the short to ground on the circuit.

    - **If infinite resistance**

10. Test for less than 2 Ω in the M75L Windshield Wiper Motor Module-Left data communications circuit end to end.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 2 Ω**
11. Vehicle OFF, connect the harness connector at the M75L Windshield Wiper Motor Module-Left, vehicle ON.
12. Test for less than 10 Ω between the ground circuit terminal 3 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
13. Vehicle ON.
14. Verify a test lamp illuminates between the B+ circuit terminal 4 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF, remove the test lamp.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the M75R Windshield Wiper Motor Module-Right.
    - **If the test lamp illuminates**
15. Connect a test lamp between the B+ circuit terminal 4 and ground.
16. Verify the test lamp turns ON and OFF when commanding the high speed wipers ON and OFF with the wiper high speed switch.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, remove the test lamp, disconnect the X4 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, remove the test lamp, disconnect the X4 harness connector at the K9 Body Control Module, vehicle ON.
    2. Test for less than 1 V between the control circuit terminal 2 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**
17. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module. Connect harness connector at the M75R Windshield Wiper Motor Module-Right, vehicle ON.
18. Verify the M75R Windshield Wiper Motor Module-Right is NOT activated.
    - **If the M75R Windshield Wiper Motor Module-Right is activated**

    1. Vehicle OFF, disconnect the harness connector at the M75R Windshield Wiper Motor Module-Right, vehicle ON.
    2. Test for less than 1 V between the control circuit terminal 2 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the M75R Windshield Wiper Motor Module-Right.
    - **If the M75R Windshield Wiper Motor Module-Right is not activated**

19. Connect a 20 A fused jumper wire between the control circuit terminal 16 and B+.
20. Verify the M75R Windshield Wiper Motor Module-Right activates.
    - **If the M75R Windshield Wiper Motor Module-Right does not activate**
    1. Vehicle OFF, remove the jumper wire, disconnect the harness connector at the M75R Windshield Wiper Motor Module-Right, vehicle ON.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than Infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, test or replace the M75R Windshield Wiper Motor Module-Right.
    - **If the M75R Windshield Wiper Motor Module-Right activates**
21. Test or replace the M75L Windshield Wiper Motor Module-Left.

Component Testing

Windshield Wiper/Washer Switch

1. Ignition OFF, disconnect the harness connector at the S82 Windshield Wiper/Washer Switch.
2. Test for infinite resistance between the signal terminal 2 and the low reference terminal 1 with the high speed switch in the open position.
    - **If less than infinite resistance**

      Replace the S82 Windshield Wiper/Washer Switch.

    - **If infinite resistance**
3. Test for less than 2 Ω between the signal circuit terminal 2 and the low reference circuit terminal 1 with the high speed switch in the closed position.
    - **If 2 Ω or greater**

      Replace the S82 Windshield Wiper/Washer Switch.

    - **If less than 2 Ω**
4. Test for infinite resistance between the signal terminal 3 and the low reference terminal 1 with the low speed switch in the open position.
    - **If less than infinite resistance**

      Replace the S82 Windshield Wiper/Washer Switch.

    - **If infinite resistance**
5. Position the S82 Windshield Wiper/Washer Switch to INT.
6. Verify the resistance readings are within the specified range listed below between the signal circuit terminal 3 and the low reference circuit terminal 1 by pushing the switch in the listed positions below.
    - Delay 1 : 3.74-4.00kΩ
    - Delay 2 : 2.75-2.85kΩ
    - Delay 3 : 1.95-2.05kΩ
    - Delay 4 : 1.25-1.35kΩ
    - Delay 5 : 765-775Ω
    - **If not within the specified range**

Replace the S82 Windshield Wiper/Washer Switch.

- **If within the specified range**

7. All OK

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Windshield Wiper and Washer Switch Replacement
- Windshield Wiper System Module Replacement
- Control Module References for Body Control Module replacement, programming and setup

WASHER MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	-	3	-	-
Windshield Washer Switch Signal	1, 2	1	1	-
Windshield Washer Pump Control	3	3	2	-
Windshield Washer Pump Relay Control	B3873 02	B3873 04	B3873 01	-
Underhood Fuse Block Ground	-	3	-	-
Windshield Washer Pump Ground	-	3	-	-
1. Windshield Washer Switch Malfunction 2. Windshield Washer Pump Always ON 3. Windshield Washer Pump Inoperative				

Circuit/System Description

The windshield washer pump is controlled by the body control module (BCM) via a printed circuit board (PCB) relay. When the washer switch is depressed, the BCM's internally pulled high resistor is pulled low by the washer request circuit. The BCM then applies voltage through a control circuit to the PCB windshield washer pump relay. With the relay energized, fused battery voltage is applied through the switch contacts of the relay and the control circuit to activate the windshield washer fluid pump.

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Windshield Washer Switch parameter changes between Active and Inactive when pressing the windshield washer switch.
   - **If the parameter does not change**

     Refer to Circuit/System Testing - Windshield Wiper/Washer Switch Malfunction.

   - **If the parameter changes**
3. Verify the G24 Windshield Washer Pump activates and deactivates when commanding the Windshield Washer Relay Active and Inactive with a scan tool.
   - **If the G24 Windshield Washer Pump does not activate or does not deactivate**

     Refer to Circuit/System Testing - Windshield Washer Pump Malfunction

   - **If the G24 Windshield Washer Pump activates and deactivates**
4. All OK.

Circuit/System Testing

Windshield Wiper/Washer Switch Malfunction

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S82 Windshield Wiper/Washer Switch. It may take up to 11 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 1 and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify the scan tool Windshield Washer Switch parameter is Inactive.
   - **If not Inactive**
   1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the signal circuit terminal 7 and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K9 Body Control Module.
   - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 7 and the low reference circuit terminal 1.
6. Verify the scan tool Windshield Washer Switch parameter is Active.
   - **If not Active**
   1. Vehicle OFF, remove the jumper wire, disconnect the harness connector at the K9 Body Control Module, vehicle in Service Mode.
   2. Test for less than 1 V between the signal circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.

        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If Active**
7. Test or replace the S82 Windshield Wiper/Washer Switch.

Windshield Washer Pump Malfunction

1. Vehicle OFF, and all vehicle systems OFF. Disconnect the harness connector at the G24 Windshield Washer Pump. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 2 and ground.
    - **If 10 Ω or greater**
    1. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Connect a test lamp between the control circuit terminal 1 and the ground circuit terminal 2, vehicle in Service Mode.
4. Verify the test lamp turn ON and OFF when commanding the Windshield Washer Relay Active and Inactive with a scan tool.
    - **If the test lamp turns ON and OFF**

      Test or replace the G24 Windshield Washer Pump.

    - **If the test lamp does not turn ON and OFF**
5. Vehicle OFF, connect the harness connector at the G24 Windshield Washer Pump. Disconnect the X1 harness connector at the X50A Fuse Block - Underhood. It may take up to 2 min for all vehicle systems to power down.
6. Test for less than 10 Ω between the ground circuit terminal 12 and ground.
    - **If 10 Ω or greater**
    1. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
7. Vehicle in Service Mode.
8. Verify the G24 Windshield Washer Pump is not activated.
    - **If the G24 Windshield Washer Pump is activated**
    1. Vehicle OFF, disconnect the harness connector at the G24 Windshield Washer Pump, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal 1 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the G24 Windshield Washer Pump.
    - **If the G24 Windshield Washer Pump is not activated**
9. Connect a 20 A fused jumper wire between the control circuit terminal 14 and B+.
10. Verify the G24 Windshield Washer Pump activates.
    - **If the G24 Windshield Washer Pump does not activate**
    1. Vehicle OFF, remove the jumper wire, disconnect the harness connector at the G24 Windshield Washer Pump.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than Infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the G24 Windshield Washer Pump.
    - **If the G24 Windshield Washer Pump activates**

11. Vehicle OFF, connect the X1 harness connector at the X50A Fuse Block - Underhood. Disconnect the X4 harness connector at the K9 Body Control Module, vehicle in Service Mode.
12. Verify the G24 Windshield Washer Pump is not activated.
    - **If the G24 Windshield Washer Pump is activated**
    1. Vehicle OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood, vehicle in Service Mode.
    2. Test for less than 1 V between the K9 Body Control Module control circuit terminal 14 X4 and ground, vehicle in Service Mode.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the X50A Fuse Block - Underhood.
    - **If the G24 Windshield Washer Pump is not activated**
13. Connect a 10 A fused jumper wire between the control circuit terminal 14 and B+.
14. Verify the G24 Windshield Washer Pump activates.
    - **If the G24 Windshield Washer Pump does not activate**
    1. Vehicle OFF, remove the jumper wire, disconnect the X2 harness connector at the X50A Fuse Block - Underhood.
    2. Test for infinite resistance between the control circuit terminal 23 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If less than infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, test or replace the X50A Fuse Block - Underhood.
    - **If the G24 Windshield Washer Pump activates**
15. Replace the K9 Body Control Module.

Component Testing

Windshield Wiper/Washer Switch

1. Vehicle OFF, disconnect the harness connector at the S82 Windshield Wiper/Washer Switch.
2. Test for infinite resistance between the signal terminal 7 and the low reference terminal 1 with the switch in the open position.
    - **If less than infinite resistance**

      Replace the S82 Windshield Wiper/Washer Switch.

    - **If infinite resistance**
3. Test for less than 2 Ω between the signal circuit terminal 7 and the low reference circuit terminal 1 with the switch in the closed position.
    - **If 2 Ω or greater**

      Replace the S82 Windshield Wiper/Washer Switch.

    - **If less than 2 Ω**
4. All OK

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Windshield Washer Pump Replacement
- Windshield Wiper and Washer Switch Replacement
- Engine Wiring Harness Junction Block Replacement
- Control Module References for body control module replacement, programming and setup.

RAIN SENSOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B370A

Rain Sensor

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	U151A	U151A	-	-
Serial Data	U151A	U151A	U151A	-
Ground	-	U151A	-	-

Circuit/System Description

B+ and ground is supplied at all times to the rain sensor. The rain sensor communicates with the body control module (BCM) via serial data. When the ignition is in the ON or ACCESSORY position and the windshield wiper/washer switch is in the intermittent delay position, the BCM monitors the rain sensor data to determine the rain build up on the windshield. As rain builds up on the windshield, the BCM will command the wipers to activate. The sensitivity of the wiper frequency is controlled by the intermittent delay of the windshield wiper/washer switch. As the sensitivity is increased, the BCM will command more frequent wiper activation based on rain build up on the windshield.

Conditions for Running the DTC

- Vehicle ON or in Service Mode
- The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

Communication between the BCM and the rain sensor is interrupted.

Action Taken When the DTC Sets

- If the BCM loses communication with the rain sensor while operating under manual 1X control, the windshield wiper operation will default to intermittent operation with a fixed dwell time of 4 s.
- If the BCM loses communication with the rain sensor while operating at low speed, the windshield wiper operation will default to low speed.
- If the BCM loses communication with the rain sensor while operating at high speed, the windshield wiper operation will default to high speed.

Conditions for Clearing the DTC

The DTC will clear when communication is established between the BCM and rain sensor.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify DTC U151A is not set.
    - **If the DTC is set**

      Please Refer to **DTC U1500-U15FF**

    - **If the DTC is not set**
3. Place the S82 Windshield Wiper/Washer Switch in the intermittent delay setting and spray the outside of the windshield in the area of the B177 Rain/Ambient Light Sensor Module with a water bottle. It may be necessary to increase the sensitivity of the intermittent delay to achieve windshield wiper operation.
4. Verify the windshield wipers operate at low speed.
    - **If the windshield wipers are not operating at low speed**

      Refer to Circuit/System Testing.

    - **If the windshield wipers are operating at low speed**
5. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B117 Rain Sensor. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 3 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF, remove the test lamp.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF, remove the test lamp.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the B117 Rain Sensor.
    - **If the test lamp illuminates**

5. Test for 5.0 - 10.0 V between the serial data circuit terminal 2 and ground.
   - **If less than 5.0 V**
   1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module and the harness connector at the M75L Windshield Wiper Motor Module-Left.
   2. Test for infinite resistance between the serial data circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the serial data circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If greater than 10.0 V**
   1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module, Vehicle in Service Mode.
   2. Test for less than 1 V between the serial data circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K9 Body Control Module.
   - **If between 5.0 - 10.0 V**
6. Test or replace the B117 Rain Sensor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Inside Air Moisture and Windshield Temperature Sensor Replacement (With Front View Camera)
  Inside Air Moisture and Windshield Temperature Sensor Replacement (Without Front View Camera)
- Control Module References for body control module replacement, programming and setup.

REAR WIPER SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	1	1	-	-
B+ Ignition Relay	1	1	-	-
Rear Window Wiper Switch Signal	1	1	2	-
Rear Window Wiper Motor Control	1	1	2	-
Rear Window Wiper Relay Control	B370B 02	B370B 04	B370B 01	-
Windshield Wiper/Washer Switch Low Reference	-	1	-	-
Rear Window Wiper Motor Ground	-	1	-	-
Underhood Fuse Block Ground Terminal 18 X1	-	1	-	-
1. Rear Wiper Inoperative. 2. Rear Wiper Always ON.				

Circuit/System Description

The rear wiper motor is controlled by the body control module (BCM) via a printed circuit board (PCB) relay. The BCM will respond by commanding the specific rear wiper function based on an input from the rear wiper switch, which is part of the windshield wiper/washer switch. The rear wiper switch uses a resistor ladder to determine low speed, intermittent, and rear washer operation. A constant B+ and ground are supplied to the rear wiper motor. When the rear wiper switch is placed in the low speed, intermittent, or rear washer position, the voltage is pulled down through a different resistor in the resistor ladder, reducing the voltage seen at the BCM.

The BCM monitors the liftgate ajar signal circuit, and the BCM will disable the function of the rear wiper motor if the liftgate of liftglass is ajar or open

Diagnostic Aids

The rear liftgate must be closed in order for the rear wiper to work. The liftgate ajar switch signal circuit provides information to the rear window wiper module about the status of the liftgate. If the liftgate or liftglass is open the rear wiper operation is not performed.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Rear Closure Ajar Switch parameter changes between Inactive and Active when opening and closing the liftgate.
    - **If the parameter does not change**

      Refer to **Liftgate Ajar Indicator Malfunction**

    - **If the parameter changes**
3. Verify the scan tool Rear Wiper Switch parameter changes between Off and On when turning the rear wipers ON and OFF.
    - **If the parameter does not change**

      Refer to Circuit/System Testing - Rear Wiper/Washer Switch Malfunction.

    - **If the parameter changes**
4. Verify the M45 Rear Wiper Motor turns On when commanding the Rear Wiper Active and Inactive with a scan tool.
    - **If the Rear Wiper Motor does not turn ON**

      Refer to Circuit/System Testing - Rear Wiper Motor Malfunction

    - **If the Rear Wiper Motor turns ON**
5. Verify the Rear Wiper finishes the wiping cycle and will park at the end of the rear window when cycling the S82 Rear Wiper/Washer Switch Malfunction from Rear Wiper to Off.

- **If the Rear Wiper does not park at the end of the rear window**

  Refer to Circuit/System Testing - Wiper Park Feature Malfunction

- **If the Rear Wiper park at the end of the rear window**

6. All OK.

Circuit/System Testing

Rear Wiper/Washer Switch Malfunction

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S82 Windshield Wiper/Washer Switch. It may take up to 11 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 1 and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If less than 10 Ω**
3. Ignition ON.
4. Test for greater than 8 V between the signal circuit terminal 5 and ground.
   - **If less than 8 V**
   1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the signal circuit and ground
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If 8 V or greater**
5. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module, ignition ON.
6. Test for less than 1 V between the S82 Windshield Wiper/Washer Switch signal circuit terminal 5 and ground.
   - **If 1 V or greater**

     Repair the short to voltage on the circuit.

   - **If less than 1 V**
7. Test or replace the S82 Windshield Wiper/Washer Switch.

Rear Wiper Motor Malfunction

1. Ignition OFF, and all vehicle systems OFF. Disconnect the harness connector at the M45 Rear Wiper Motor. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 2 and ground.
   - **If 10 Ω or greater**
   1. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Ignition ON.
4. Verify a test lamp illuminates between the B+ circuit terminal 1 and the ground circuit terminal 2.
   - **If the test lamp does not illuminate**
   1. Ignition OFF, remove the test lamp. Disconnect the X2 harness connector at the X50A Fuse Block - Underhood.

   2. Test for less than 2 Ω in the control circuit terminal 30 X2 end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the X50A Fuse Block - Underhood.
   - **If the test lamp illuminates**
5. Connect a test lamp between the ignition circuit terminal 3 and the ground circuit terminal 2.
6. Verify the test lamp turn ON and OFF when commanding the Rear Wiper On and Off with a scan tool.
   - **If the test lamp does not turn On and the circuit fuse is OK**
   1. Ignition/Vehicle OFF.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not turn On and the circuit fuse is open**
7. Ignition/Vehicle OFF.
8. Test for infinite resistance between the ignition circuit and ground.
   - If less than infinite resistance, repair the short to ground on the circuit.
   - If infinite resistance, test or replace the M45 Rear Wiper Motor
   - **the test lamp turns On and OFF**
9. Ignition OFF, connect the harness connector at the M45 Rear Wiper Motor. Connect the X2 harness connector at the X50A Fuse Block - Underhood, disconnect the X1 harness connector at the X50A Fuse Block - Underhood, It may take up to 2 min for all vehicle systems to power down.
10. Test for less than 10 Ω between the ground circuit terminal 12 and ground.
    - **If 10 Ω or greater**
    1. Test for less than 2 Ω in the ground circuit end to end.
       - If 2 Ω or greater, repair the open/high resistance in the circuit.
       - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
11. Ignition ON.
12. Verify the M45 Rear Wiper Motor is NOT activated.
    - **If the M45 Rear Wiper Motor is activated**
    1. Ignition OFF, disconnect the harness connector at the M45 Rear Wiper Motor, ignition ON.
    2. Test for less than 1 V between the control circuit terminal 3 and ground.
       - If 1 V or greater, repair the short to voltage on the circuit.
       - If less than 1 V, replace the M45 Rear Wiper Motor.
    - **If the M45 Rear Wiper Motor is not activated**
13. Connect a 20 A fused jumper wire between the control circuit listed below and B+:
    - Terminal 30
    - Terminal 44
14. Verify the M45 Rear Wiper Motor activates.
    - **If the M45 Rear Wiper Motor does not activate**
    1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the M45 Rear Wiper Motor, ignition ON.
    2. Test for infinite resistance between the control circuit and ground.
       - If less than Infinite resistance, repair the short to ground on the circuit.
       - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
       - If 2 Ω or greater, repair the open/high resistance in the circuit.
       - If less than 2 Ω, replace the M45 Rear Wiper Motor.
    - **If the M45 Rear Wiper Motor activates**
15. Ignition OFF, connect the X1 harness connectors at the X50A Fuse Block - Underhood. Disconnect the X4 harness connector at the K9 Body Control Module, ignition ON.

16. Verify the M45 Rear Wiper Motor is not activated.
    - **If the M45 Rear Wiper Motor is activated**
    1. Ignition OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood, ignition ON.
    2. Test for less than 1 V between the control circuit terminal 22 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the X50A Fuse Block - Underhood.
    - **If the M45 Rear Wiper Motor is not activated**
17. Connect a 10 A fused jumper wire between the control circuit terminal 10 and B+.
18. Verify the M45 Rear Wiper Motor activates.
    - **If the M45 Rear Wiper Motor does not activate**
    1. Ignition OFF, remove the jumper wire, disconnect the X2 harness connector at the X50A Fuse Block - Underhood.
    2. Test for infinite resistance between the control circuit terminal 22 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If less than infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, test or replace the X50A Fuse Block - Underhood.
    - **If the M45 Rear Wiper Motor activates**
19. Test or replace the M45 Rear Wiper Motor.

Wiper Park Feature Malfunction

1. Ignition OFF, disconnect the harness connector at the M45 Rear Wiper Motor. Ignition ON
2. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.
    - **If the test lamp does not illuminate**
    1. Ignition OFF, remove the test lamp.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - **If the test lamp illuminates**
3. Test or replace the M45 Rear Wiper Motor.

Component Testing

Windshield Wiper/Washer Switch

1. Ignition OFF, disconnect the harness connector at the S82 Windshield Wiper/Washer Switch.
2. Test for infinite resistance between the signal terminal 5 and the low reference terminal 1 with the rear window washer switch in the open position.
    - **If less than infinite resistance**

      Replace the S82 Windshield Wiper/Washer Switch.

    - **If infinite resistance**
3. Verify the resistance reading is within the range specified below between the signal circuit terminal 5 and the low reference circuit terminal 1 by cycling the switch between Rear Wiper position and Rear Washers position.
    - Rear Wiper : 624-644Ω
    - Rear Wiper Sweep : 1.99-2.01kΩ
    - Rear Washer : 6.11-6.13kΩ
    - **If not within range specified**

      Replace the S82 Windshield Wiper/Washer Switch.

    - **If within range specified**

4. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Engine Wiring Harness Junction Block Replacement**
- **Rear Window Wiper Motor Replacement**
- **Windshield Wiper and Washer Switch Replacement**
- **Control Module References** or BCM replacement, programming and setup

REAR WASHER SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance

1. Rear Washer Inoperative 2. Rear Washer Always ON				

Circuit/System Description

The rear windshield washer pump is controlled by the body control module (BCM) via a printed circuit board (PCB) relay. The BCM monitors the rear windshield wiper/washer switch signal circuit and when rear washer activation is requested, the BCM applies voltage through the rear window washer pump relay control circuit. With the relay energized, fused battery voltage is applied through the switch contacts of the relay and the rear windshield washer pump control circuit to activate the rear windshield washer pump.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Rear Washer Relay Command parameter changes between Active and Inactive when cycling the rear washer switch ON and OFF.
    - **If the parameter does not change**

      Refer to Circuit/System Testing - Rear Wiper/Washer Switch Malfunction

    - **If the parameter changes**
3. Verify the G19 Rear Window Washer Pump turns on and off when commanding the Rear Washer Relay Inactive and Active with the scan tool
    - **If the G19 Rear Window Washer Pump does not turn ON and OFF**

      Refer to Circuit/System Testing - Rear Washer Pump Malfunction

    - **If the G19 Rear Window Washer Pump turns ON and OFF**
4. All OK.

Circuit/System Testing

Rear Wiper/Washer Switch Malfunction

1. Ignition OFF and all vehicle systems OFF, disconnect the X3 harness connector at the S82 Windshield Wiper/Washer Switch. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 1 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If less than 10 Ω**
3. Ignition ON.
4. Test for greater than 8 V between the signal circuit terminal 5 and ground.
    - **If less than 8 V**
    1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the signal circuit and ground
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If 8 V or greater**
5. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module, ignition ON.
6. Test for less than 1 V between the S82 Windshield Wiper/Washer Switch signal circuit terminal 5 and ground.
    - **If 1 V or greater**

      Repair the short to voltage on the circuit.

    - **If less than 1 V**
7. Test or replace the S82 Windshield Wiper/Washer Switch.

Rear Washer Pump Malfunction

1. Ignition OFF and all vehicle systems OFF, disconnect the X1 harness connector at the X50A Fuse Block - Underhood. It may take up to 10 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 12 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Connect the X1 harness connector at the X50A Fuse Block - Underhood, disconnect the harness connector at the G19 Rear Window Washer Pump. It may take up to 2 min for all vehicle systems to power down.
4. Test for less than 10 Ω between the ground circuit terminal 2 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
5. Connect a test lamp between the control circuit terminal 1 and ground, ignition ON.
6. Verify the test lamp does not turn ON and OFF when commanding the Rear Washer Relay Active and Inactive with a scan tool.
    - **If the test lamp turns ON and OFF**

      Test or replace the G19 Rear Window Washer Pump.

    - **If the test lamp does not turn ON and OFF**
7. Ignition OFF, connect the harness connector at the G19 Rear Window Washer Pump. Disconnect the X1 harness connector at the X50A Fuse Block-Underhood, ignition ON.
8. Verify the G19 Rear Window Washer Pump is not activated.
    - **If the G19 Rear Window Washer Pump is activated**
    1. Ignition OFF, disconnect the harness connector at the G19 Rear Window Washer Pump, ignition ON.
    2. Test for less than 1 V between the control circuit terminal 24 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, test or replace the G19 Rear Window Washer Pump.
    - **If the G19 Rear Window Washer Pump is not activated**
9. Connect a 15 A fused jumper wire between the control circuit terminal 24 and B+.
10. Verify the G19 Rear Window Washer Pump activates.
    - **If the G19 Rear Window Washer Pump does not activate**
    1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the G19 Rear Window Washer Pump, ignition ON.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than Infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, test or replace the G19 Rear Window Washer Pump.
    - **If the G19 Rear Window Washer Pump activates**
11. Ignition OFF, connect the X1 harness connector at the X50A Fuse Block-Underhood, disconnect X1 harness connector at the K9 Body Control Module, ignition ON.
12. Verify the G19 Rear Window Washer Pump is not activated.

- **If the G19 Rear Window Washer Pump is activated**
  1. Ignition OFF, disconnect the X2 harness connector at the X50A Fuse Block-Underhood.
  2. Test for less than 1 volt between the K9 Body Control Module control circuit terminal 6 X1 and ground.
     - If 1 V or greater, repair the short to voltage on the circuit.
     - If less than 1 V, test or replace the X50A Fuse Block-Underhood.

13. Connect a 3 A fused jumper wire between the control circuit terminal 6 and B+.
14. Verify the G19 Rear Window Washer Pump activates.
    - **If the G19 Rear Window Washer Pump does not activate**
      1. Ignition OFF, remove the jumper wire, disconnect the X2 harness connector at the X50A Fuse Block-Underhood, ignition ON.
      2. Test for infinite resistance between the control circuit terminal 15 and ground.
         - If less than Infinite resistance, repair the short to ground on the circuit.
         - If infinite resistance
      3. Test for less than 2 Ω in the control circuit end to end.
         - If 2 Ω or greater, repair the open/high resistance in the circuit.
         - If less than 2 Ω, test or replace the X50A Fuse Block-Underhood.
    - **If the G19 Rear Window Washer Pump activates**
15. Replace the K9 Body Control Module.

Component Testing

Rear Windshield Washer Pump

1. Install a 15 A fused jumper wire between the B+ terminal 1 and 12 V. Install a jumper wire between the ground terminal 2 and ground.
2. Verify the G19 Rear Window Washer Pump activates.
   - **If the G19 Rear Window Washer Pump does not activate.**

     Replace the G19 Rear Window Washer Pump.

   - **If the G19 Rear Window Washer Pump does activate.**
3. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Engine Wiring Harness Junction Block Replacement**
- **Windshield Washer Pump Replacement**
- **Windshield Wiper and Washer Switch Replacement**
- **Control Module References** for body control module replacement, programming and setup.

REPAIR INSTRUCTIONS

WINDSHIELD WIPER AND WASHER SWITCH REPLACEMENT

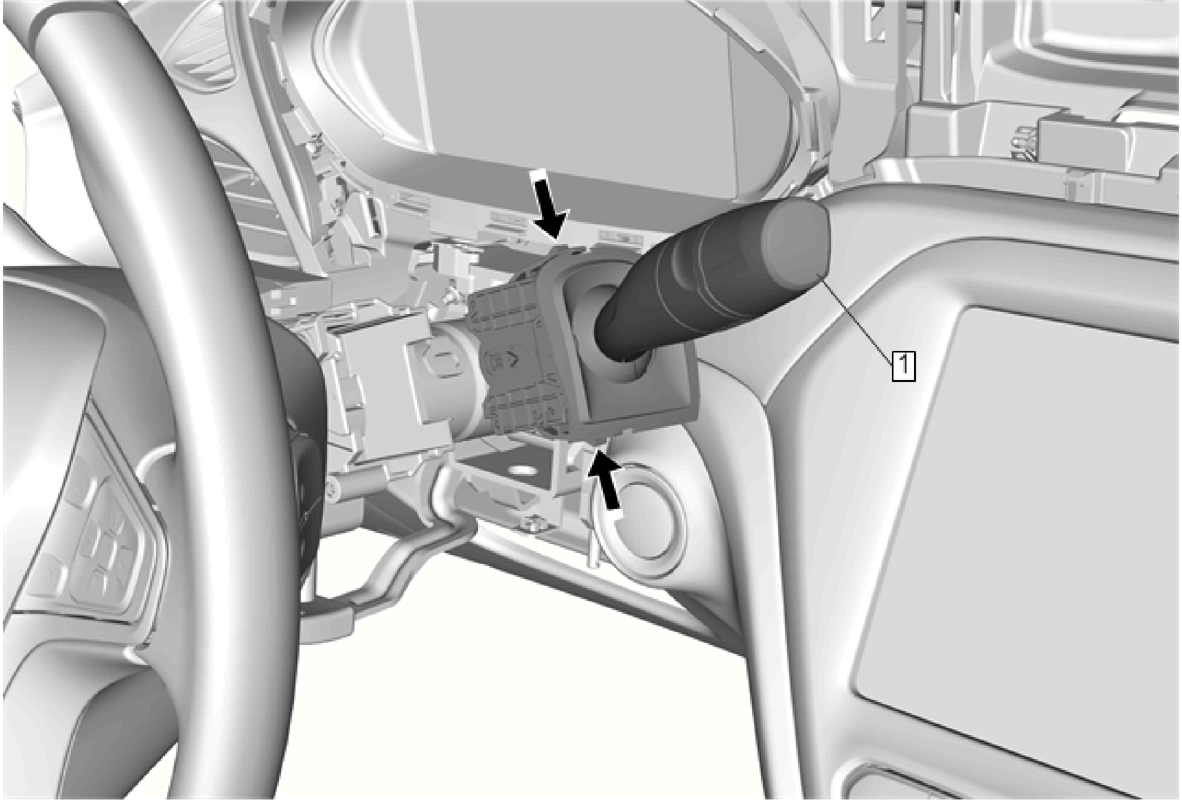

Fig. 4: Windshield Wiper and Washer Switch
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Steering Column Lower Trim Cover Replacement	
1	Windshield Wiper and Washer Switch **Procedure** 1. Release the retaining tabs and remove the windshield wiper and washer switch from the switch bracket. 2. Disconnect the electrical connector.

WINDSHIELD WASHER NOZZLE HOSE REPLACEMENT

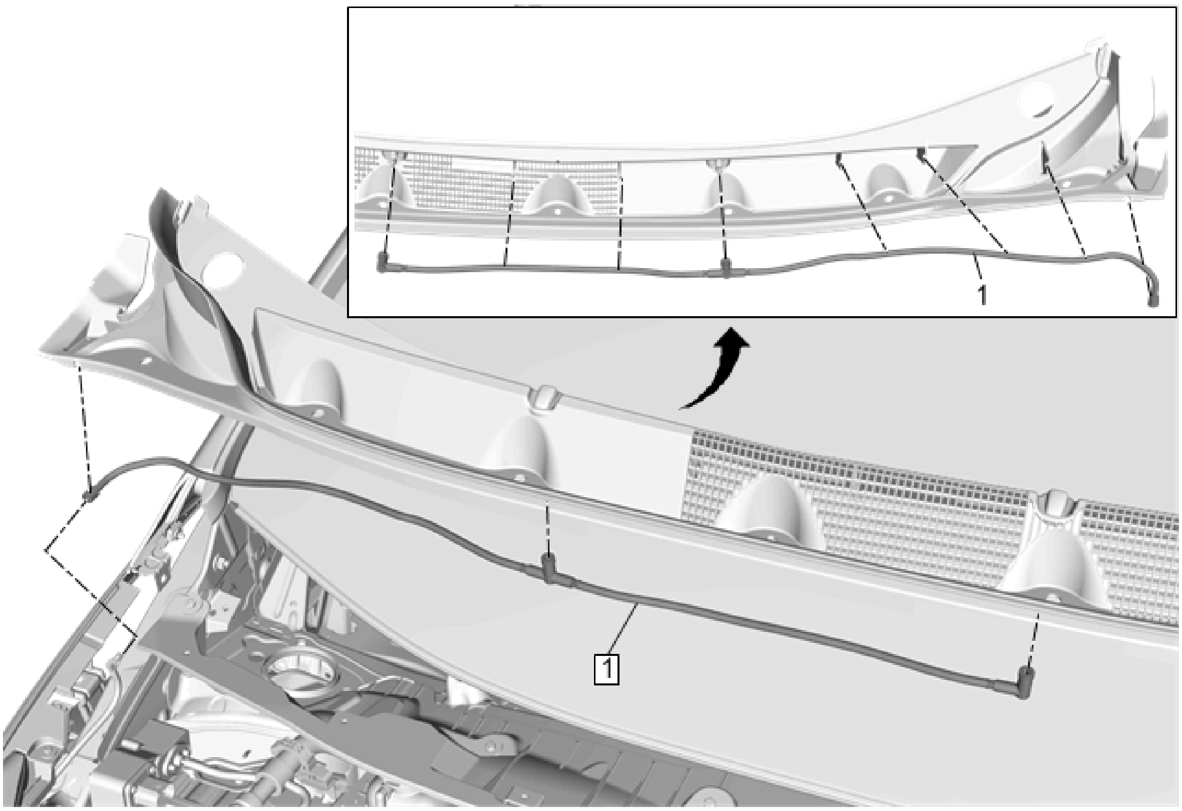

Fig. 5: Windshield Washer Nozzle Hose
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Air Inlet Grille Panel Replacement 2. Reposition air inlet grille foam seal.	
1	Windshield Washer Nozzle Hose **Procedure** 1. Disconnect Windshield Washer Nozzle Hose@Air Inlet Grille Panel 2. Disconnect Windshield Washer Nozzle Hose@Windshield Washer Nozzle 3. Remove Windshield Washer Nozzle Hose

WINDSHIELD WASHER NOZZLE REPLACEMENT

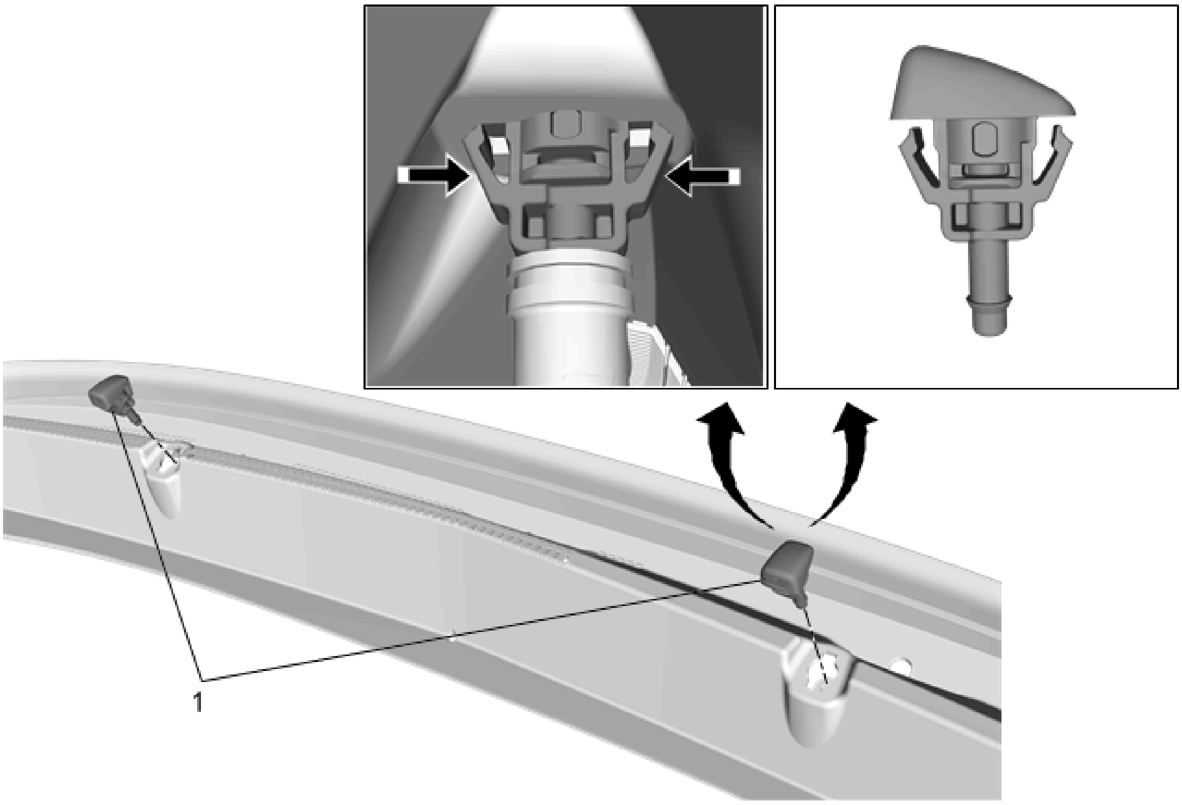

Fig. 6: Windshield Washer Nozzle
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Air Inlet Grille Panel Replacement	
1	Windshield Washer Nozzle **Procedure** 1. Press the retainer to unlock. 2. DisconnectWindshield Washer Nozzle@Windshield Washer Nozzle Hose

REAR WINDOW WASHER NOZZLE REPLACEMENT

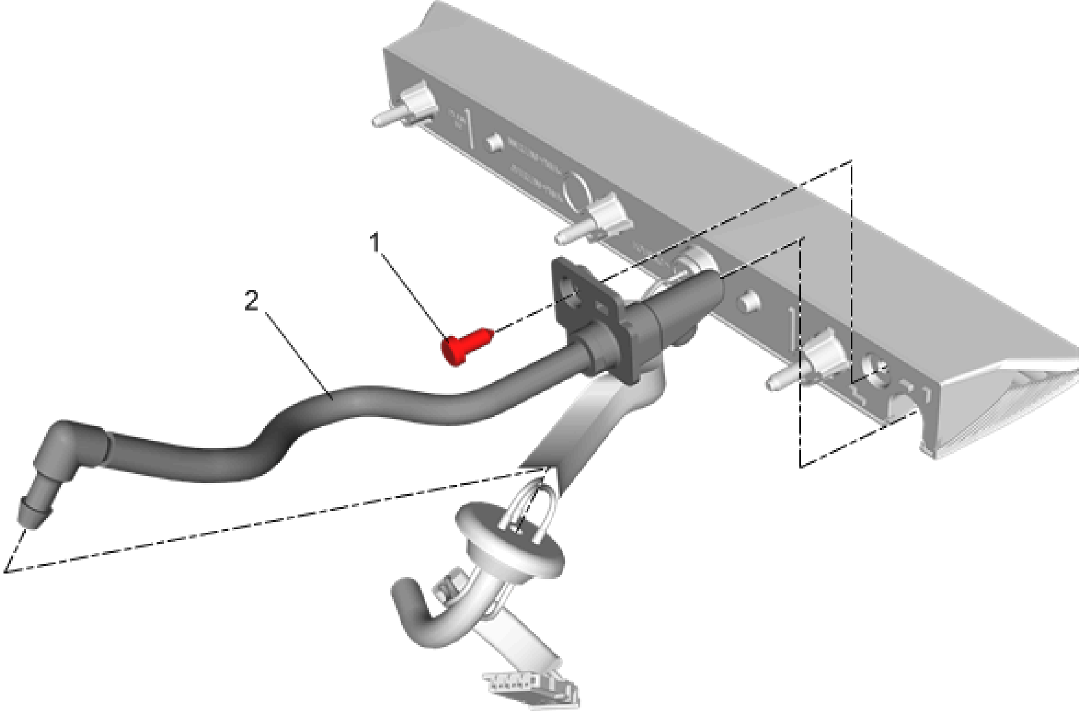

Fig. 7: Rear Window Washer Nozzle
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure **High Mount Stop Lamp Replacement**	
1	Rear Window Washer Nozzle Retainer
2	Rear Window Washer Nozzle

WINDSHIELD WASHER SOLVENT CONTAINER FILLER TUBE REPLACEMENT

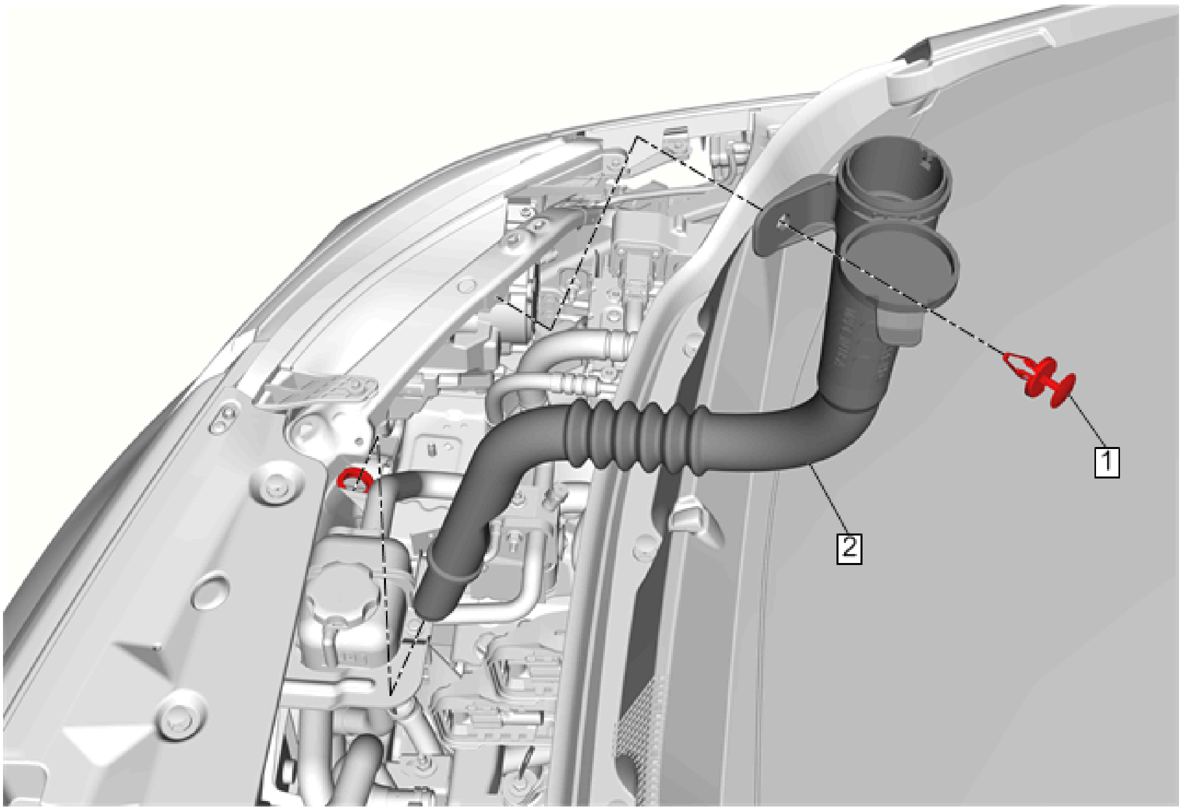

Fig. 8: Windshield Washer Solvent Container Filler Tube
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name

Callout	Component Name
1	Windshield Washer Solvent Container Filler Tube Retainer
2	Windshield Washer Solvent Container Filler Tube **NOTE:** **Depending on the fluid level, fluid loss may occur when replacing the windshield washer solvent container filler tube.**

WINDSHIELD WASHER SOLVENT CONTAINER REPLACEMENT

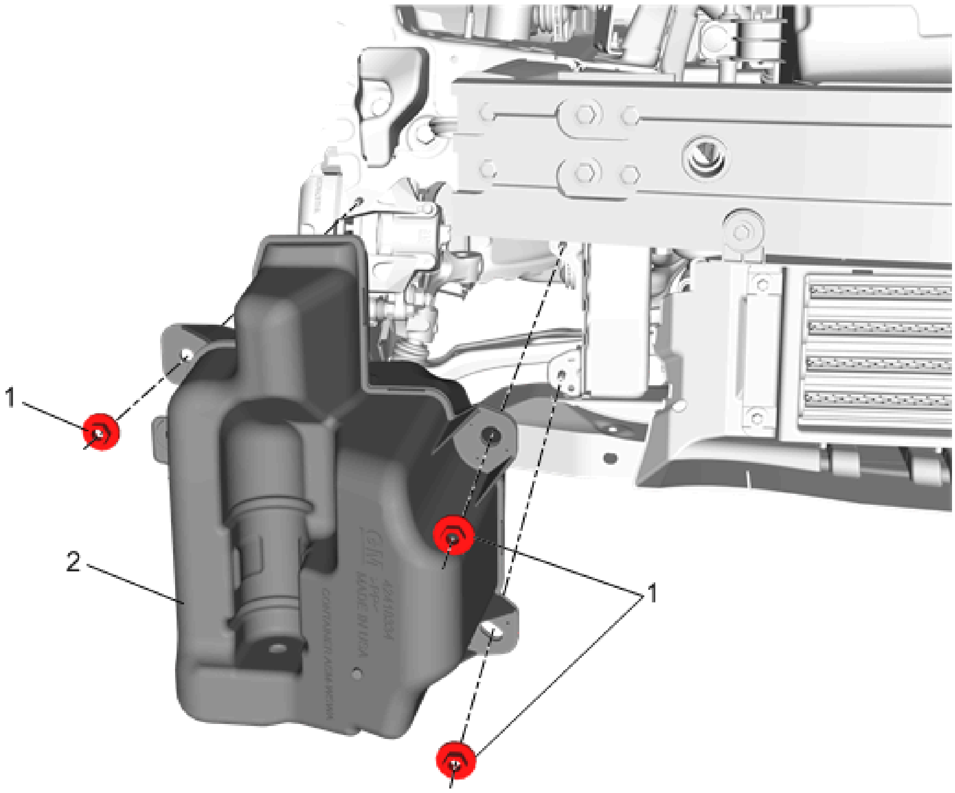

Fig. 9: Windshield Washer Solvent Container
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Front Bumper Fascia Replacement (North America) Front Bumper Fascia Replacement (Europe, Korea) 2. Windshield Washer Solvent Container Filler Tube Replacement	
1	Windshield Washer Solvent Container Nut (Qty: 3) **CAUTION:** Fastener Caution **Tighten** 5 N.m (44 lb in)

Callout	Component Name
2	Windshield Washer Solvent Container **Procedure** 1. Unclip the harness and hose from the container. 2. Drain the windshield washer solvent into a suitable clean container. 3. Transfer components as necessary. 4. Fill the windshield washer solvent container after installation. **NOTE:** **Inspect windshield washer pump seal and replace it, if damaged.**

WINDSHIELD WASHER PUMP REPLACEMENT

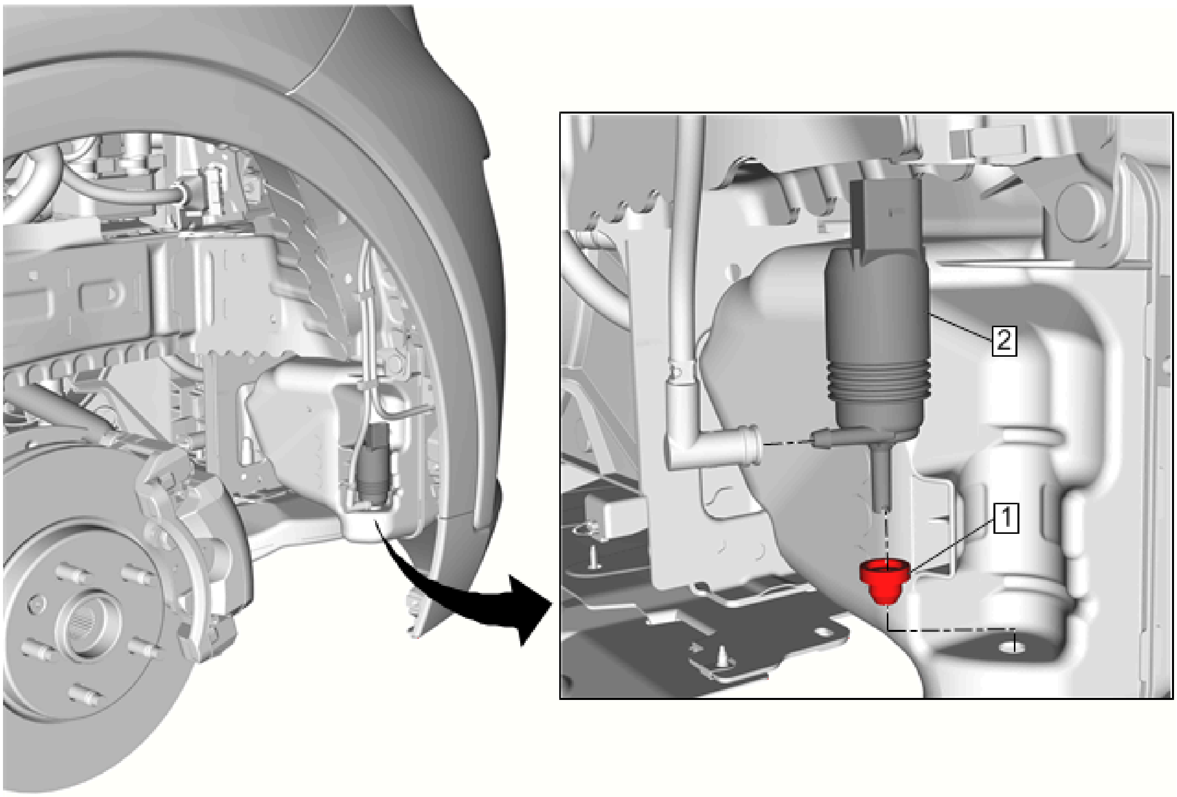

Fig. 10: Windshield Washer Pump

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Front Wheelhouse Liner - Right Side Front Wheelhouse Liner Replacement	
1	Windshield Washer Pump Grommet **Procedure** Using a small flat-bladed tool, remove the windshield washer pump grommet from the windshield washer solvent container and inspect the grommet. Replace if damaged.
2	Windshield Washer Pump **Procedure** 1. Disconnect the electrical connector. 2. Drain the windshield washer solvent container into a clean suitable container. 3. Disconnect Windshield Washer Pump Hose@Windshield Washer Pump 4. Using a small flat-bladed tool, remove the windshield washer pump from the windshield washer solvent container.

REAR WINDOW WASHER PUMP REPLACEMENT

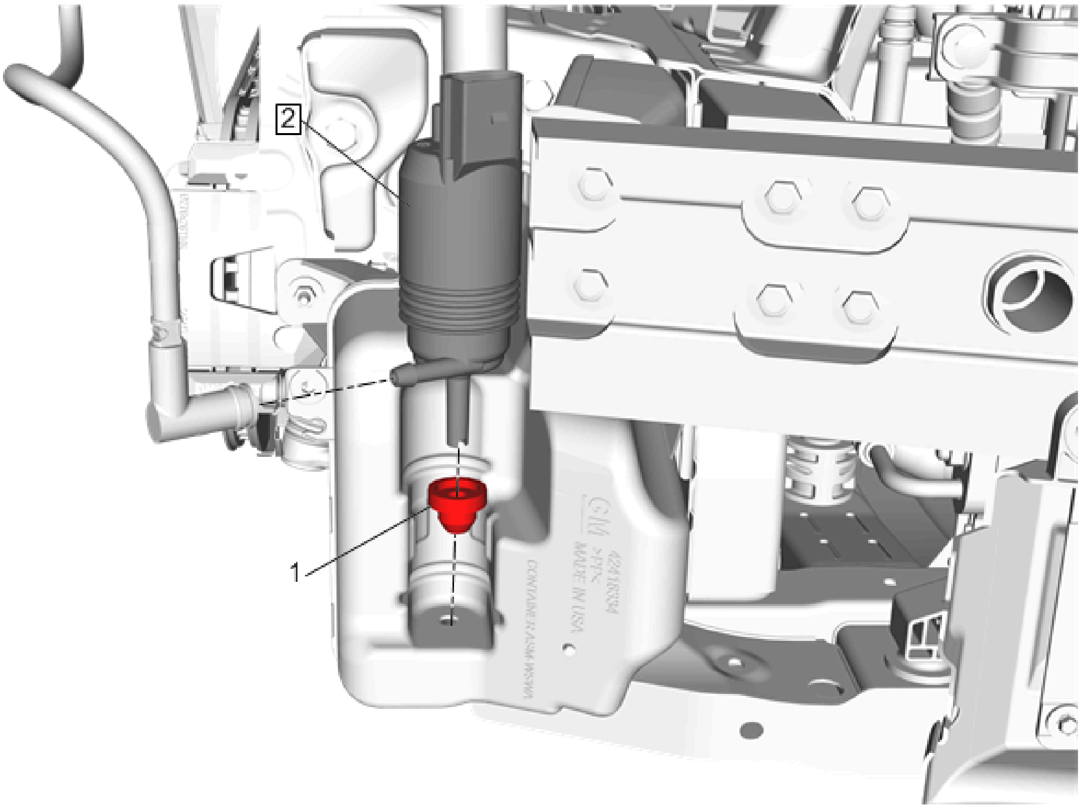

Fig. 11: Rear Window Washer Pump
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Front Bumper Fascia Replacement (North America) Front Bumper Fascia Replacement (Europe, Korea)	
1	Rear Window Washer Pump Grommet **Procedure** Using a small flat-bladed tool, remove the rear window washer pump grommet from the windshield washer solvent container and inspect the grommet. Replace if damaged.
2	Rear Window Washer Pump **Procedure** 1. Disconnect the electrical connector. 2. Drain the windshield washer solvent container into a clean suitable container. 3. Disconnect Windshield Washer Pump Hose@Windshield Washer Pump 4. Using a small flat-bladed tool, remove the rear window washer pump from the windshield washer solvent container.

DASH PANEL UPPER EXTENSION PANEL EXTENSION REPLACEMENT

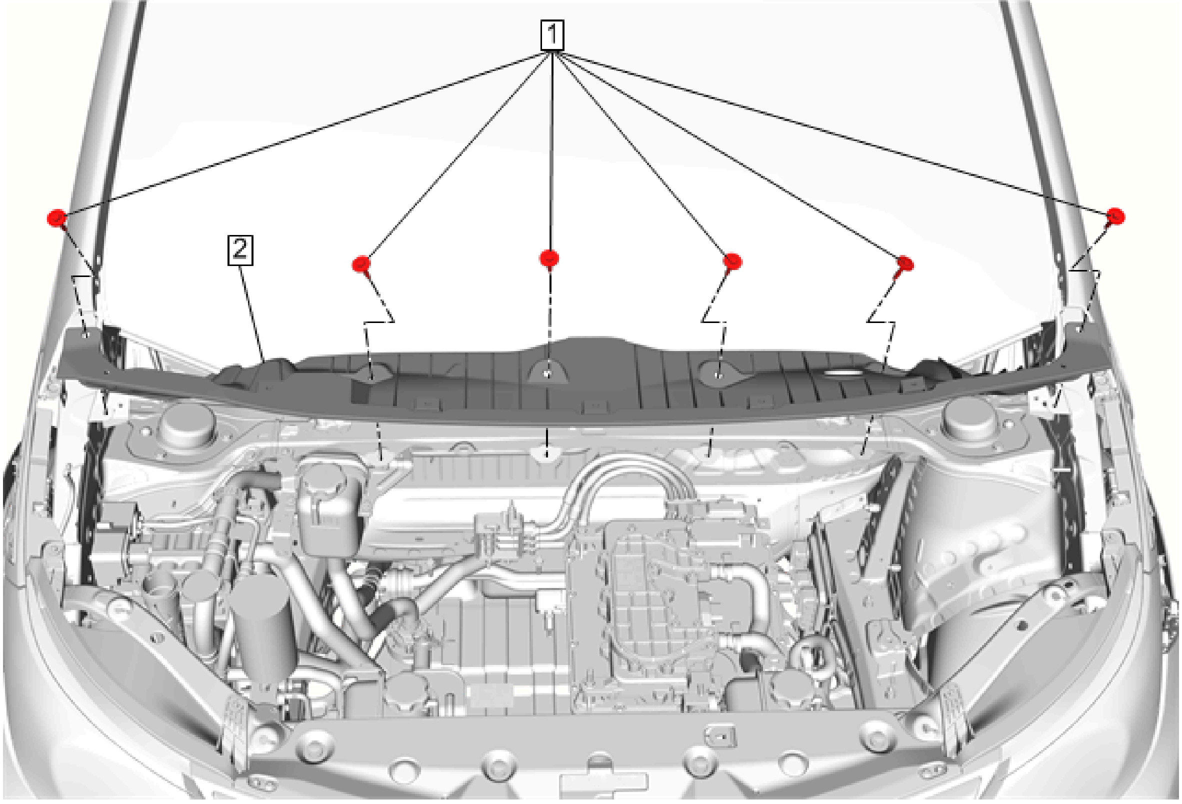

Fig. 12: Dash Panel Upper Extension Panel Extension
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Air Inlet Grille Panel Replacement 2. Windshield Wiper System Module Replacement	
1	Air Inlet Grille Panel Bolt (Qty: 6) **CAUTION:** Fastener Caution **Tighten** 4.5 N.m (40 lb in)
2	Dash Panel Upper Extension Panel Extension **Procedure** Route the electrical harness passthroughs through the extension panel.

AIR INLET GRILLE PANEL REPLACEMENT

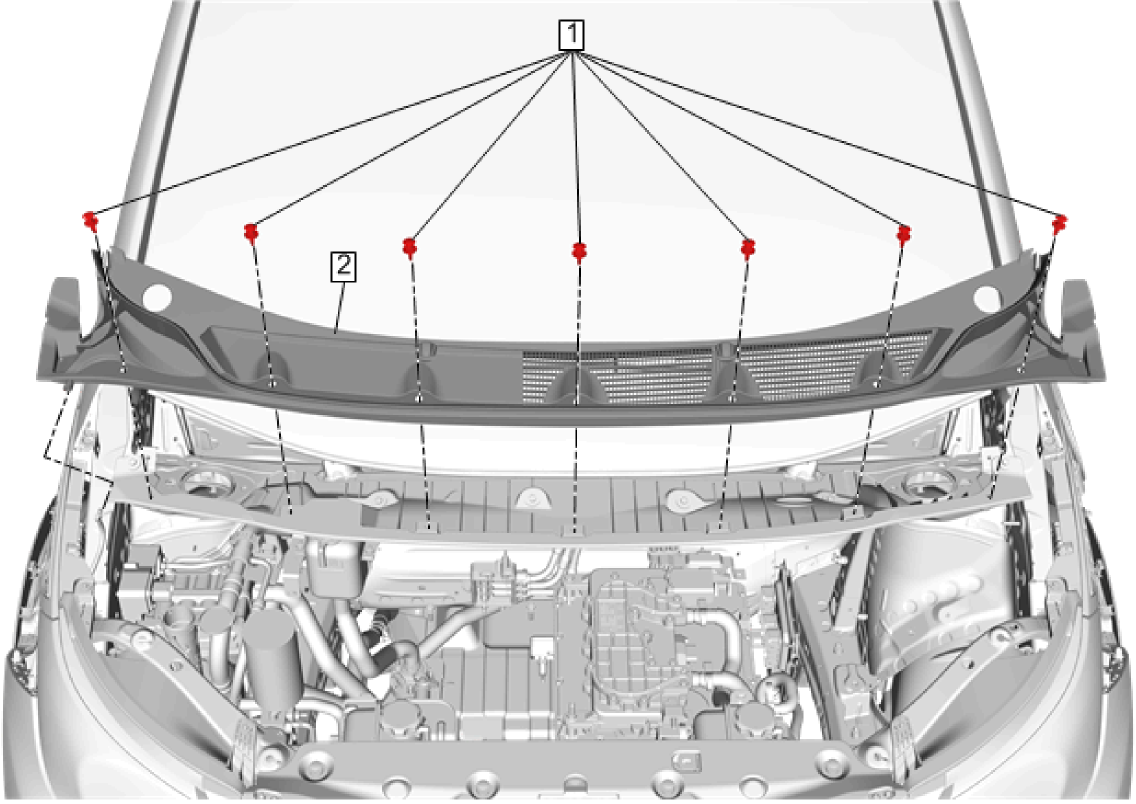

Fig. 13: Air Inlet Grille Panel
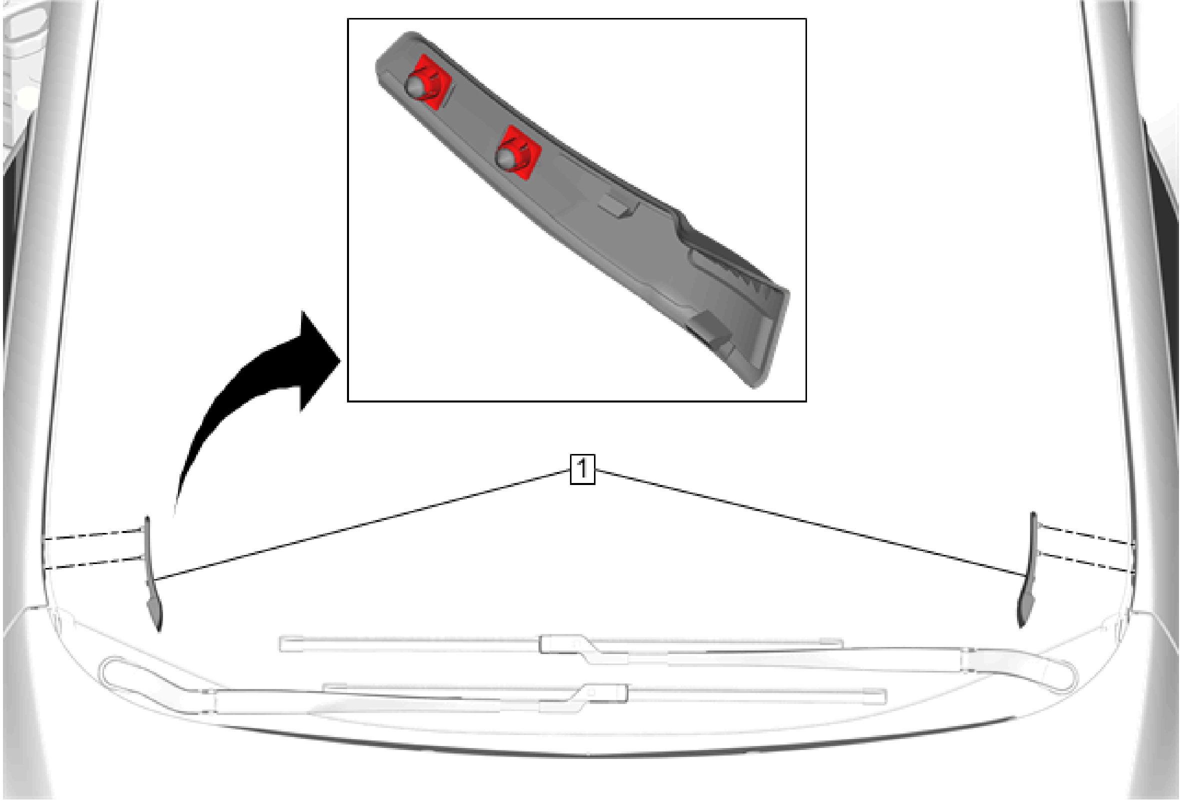
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Windshield Wiper Arm Replacement 2. Air Inlet Grille Panel Extension Replacement	
1	Air Inlet Grille Panel Retainer **Procedure** Remove Air Inlet Grille Panel Retainer@Air Inlet Grille Panel
2	Air Inlet Grille Panel **Procedure** Disconnect Windshield Washer Nozzle Hose@Windshield Washer Pump Hose Windshield Washer Nozzle Hose Replacement

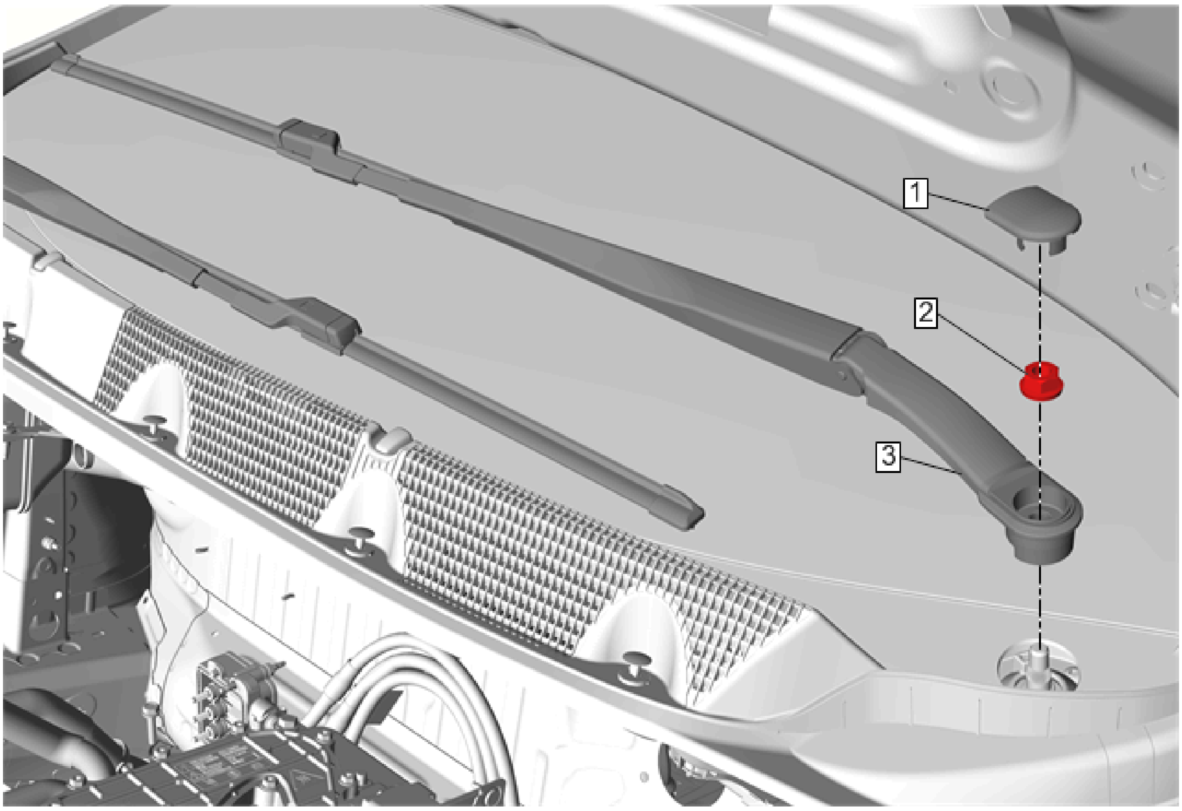
AIR INLET GRILLE PANEL EXTENSION REPLACEMENT



[Fig. 14: Air Inlet Grille Panel Extension](#)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Air Inlet Grille Panel Extension **Procedure** Grasp the air inlet grille panel extension and disengage the retainers from the body side outer.

WINDSHIELD WIPER ARM REPLACEMENT



[Fig. 15: Windshield Wiper Arm](#)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name

Callout	Component Name
1	Windshield Wiper Arm Finish Cap **Procedure** Use a flat bladed plastic tool to remove.
2	Windshield Wiper Arm Nut **CAUTION:** **Fastener Caution** **Tighten** 30 N.m (22 lb ft)
3	Windshield Wiper Arm **Procedure** 1. Gently rock the windshield wiper arm to remove it from the windshield wiper transmission pivot shaft. 2. Clean the pivot shaft knurls with a soft wire brush before installing a NEW windshield wiper arm. 3. Windshield Wiper Arm - Adjust - **Windshield Wiper Arm Adjustment** **NOTE:** **Turn the ignition switch ON. The powering on of the motor before arm installation is required to prevent module pivot shaft rotation when fastening the nut.**

REAR WINDOW WIPER ARM REPLACEMENT

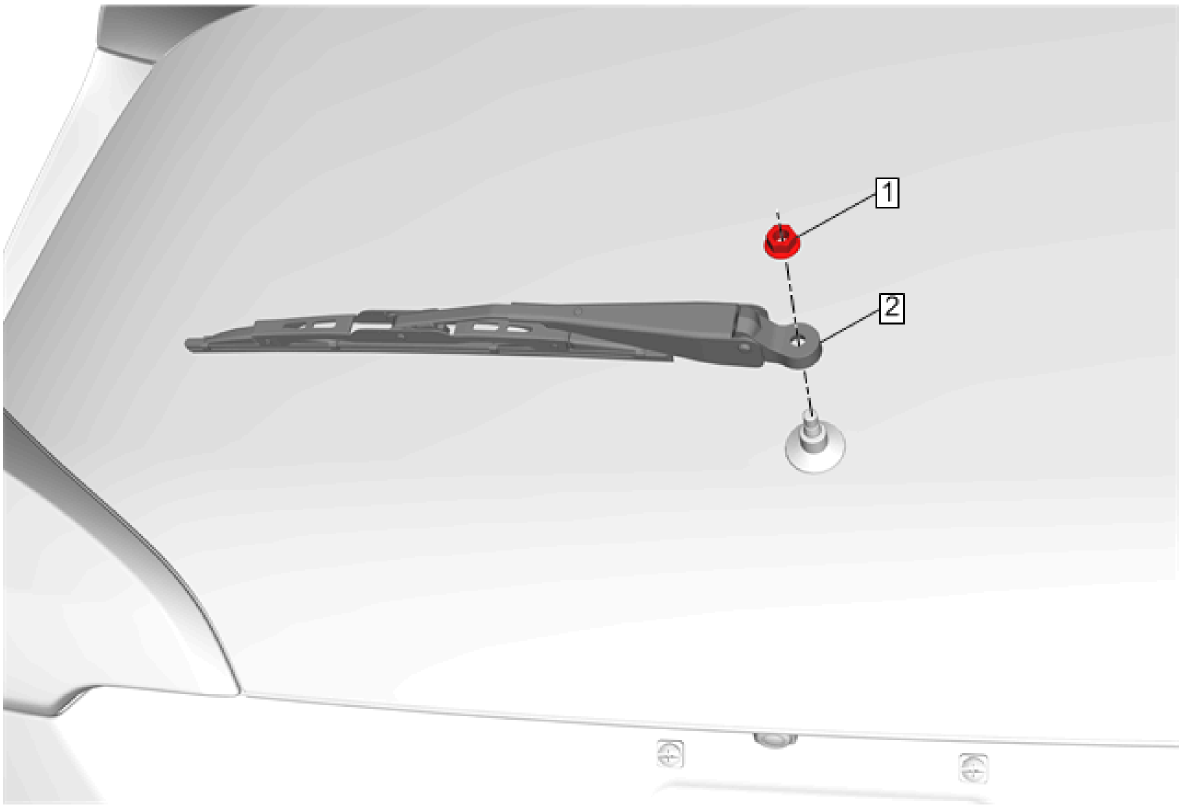


Fig. 16: Rear Window Wiper Arm
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Rear Window Wiper Cover Replacement	

Callout	Component Name
1	Rear Window Wiper Arm Nut **CAUTION:** **Fastener Caution** **Tighten** 10 N.m (89 lb in)
2	Rear Window Wiper Arm **Procedure** 1. Note the location of the arm and mark it with tape. 2. Gently rock the arm to release it. 3. Use the **J-39822** Wiper Arm Puller or equivalent, if difficulty is encountered. **Special Tools** **J-39822** Wiper Arm Puller For equivalent regional tools, refer to **Special Tools**.

WINDSHIELD WIPER BLADE REPLACEMENT

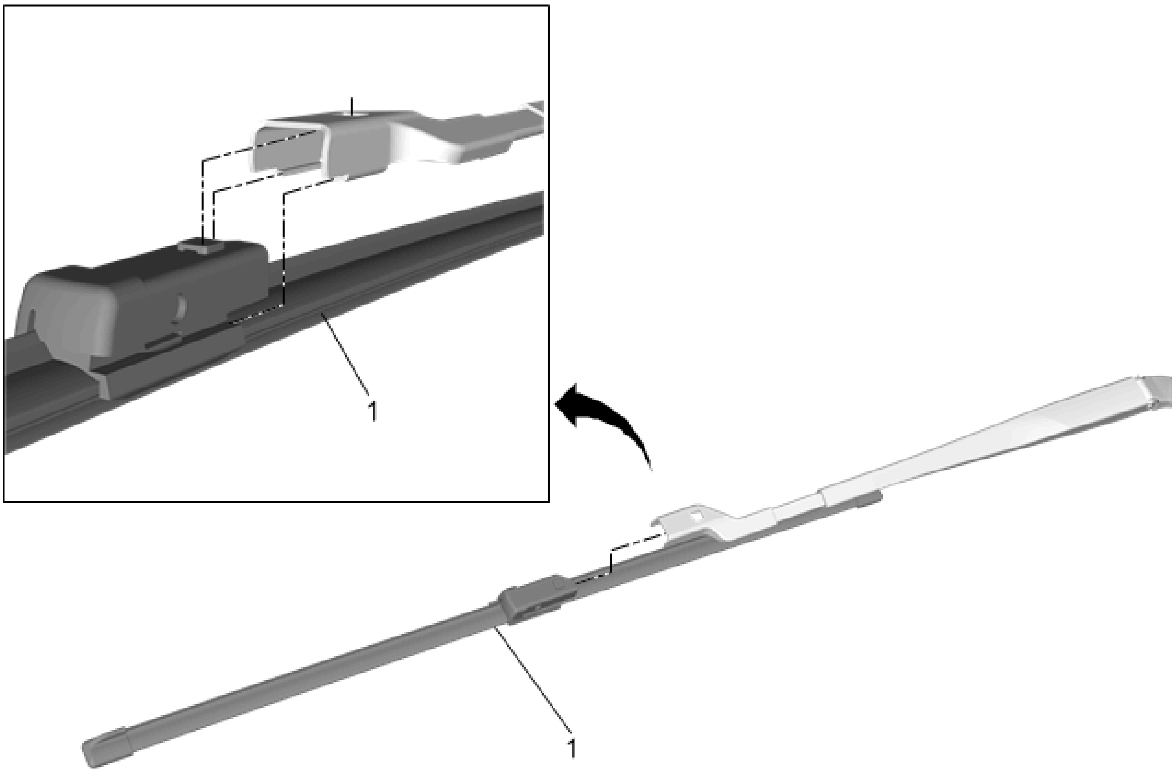

Fig. 17: Windshield Wiper Blade
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name

Callout	Component Name
1	Windshield Wiper Blade **Procedure** 1. Lift the windshield wiper arm off the windshield to the service up position. 2. Depress the windshield wiper arm tab at the small square hole in the windshield wiper arm. 3. Slide the windshield wiper blade forward and remove it from the windshield wiper arm. 4. Gently return the windshield wiper arm to the windshield.

REAR WINDOW WIPER BLADE REPLACEMENT

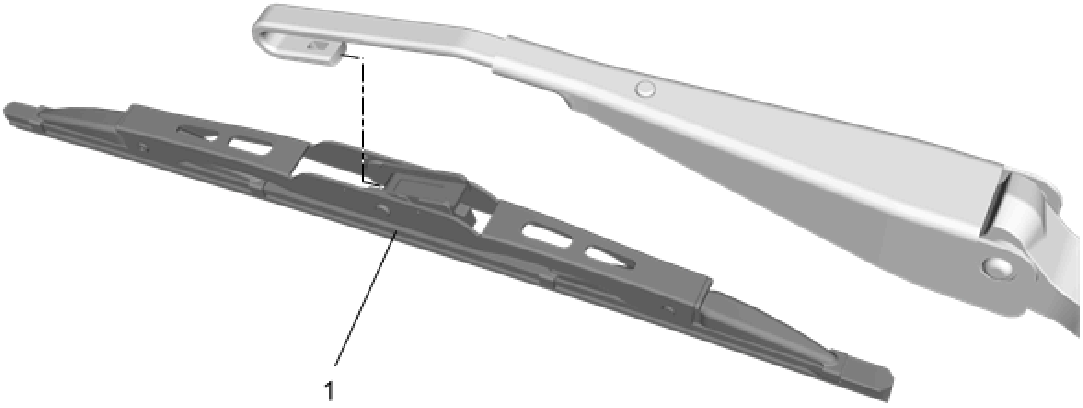

Fig. 18: Rear Window Wiper Blade
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure **Rear Window Wiper Cover Replacement**	
1	Rear Window Wiper Blade **Procedure** 1. Lift the rear window wiper arm off the liftgate glass. 2. Depress the rear window wiper arm tab at the small square hole in the rear window wiper arm. 3. Rotate the rear window wiper blade slightly and slide the rear window wiper blade downward from the rear window wiper arm. 4. Gently return the rear window wiper arm to the liftgate glass.

REAR WINDOW WIPER MOTOR REPLACEMENT

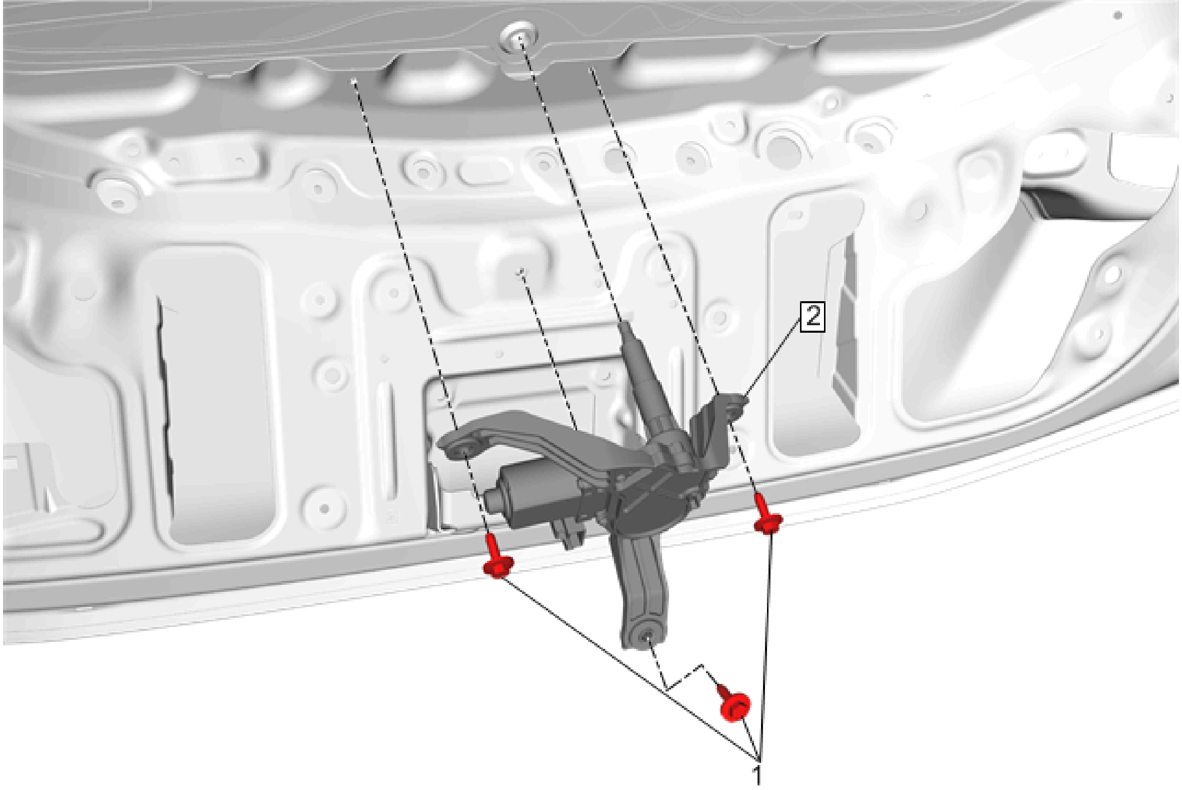

Fig. 19: Rear Window Wiper Motor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Liftgate Lower Trim Finish Panel Replacement 2. Rear Window Wiper Arm Replacement	
1	Rear Window Wiper Motor Bolt (Qty: 3) **CAUTION:** Fastener Caution **Tighten** 9 N.m (80 lb in)
2	Rear Window Wiper Motor **Procedure** 1. Pull the rear window wiper motor inward from the rear liftgate. 2. Disconnect the electrical connector. 3. Inspect the rear window wiper motor grommet for damage. Replace if needed.

REAR WINDOW WIPER COVER REPLACEMENT

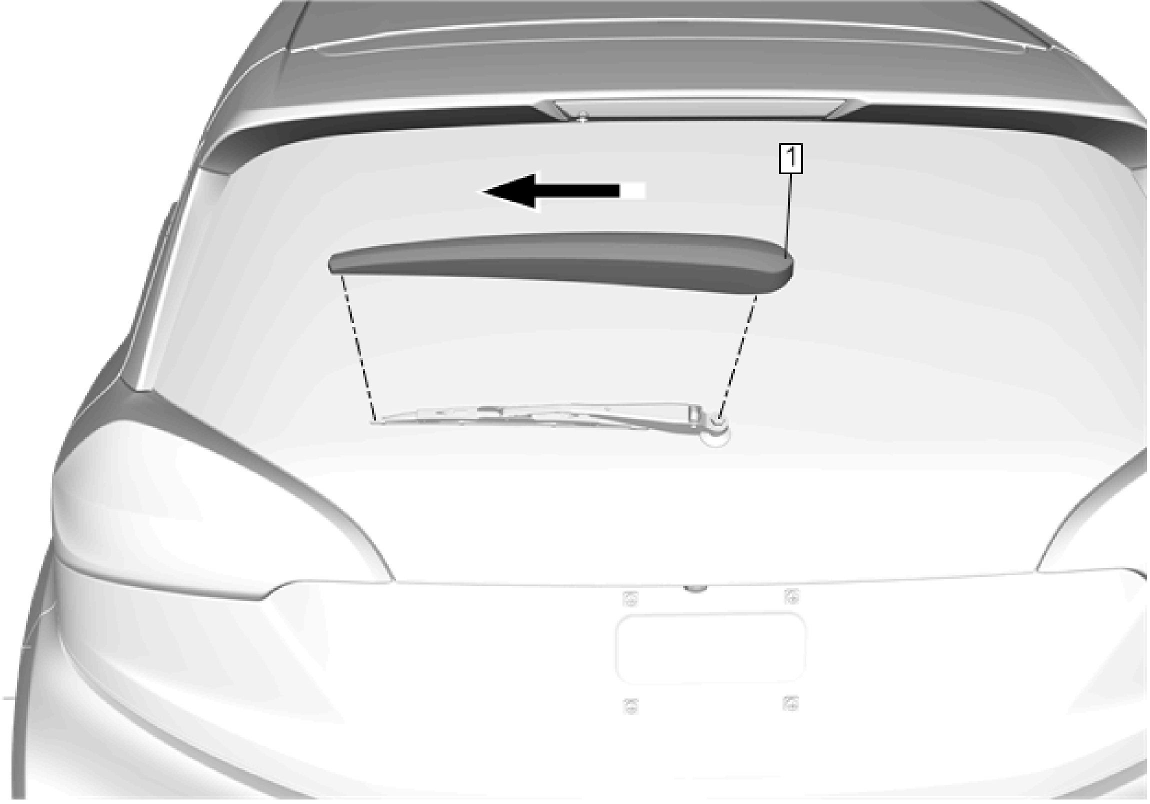

Fig. 20: Rear Window Wiper Cover
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear Window Wiper Cover **Procedure** 1. Release the integral retainers at the pivot side. 2. Slide the cover toward the arm side to release the hook feature (towards the arrow).

WINDSHIELD WIPER SYSTEM MODULE REPLACEMENT

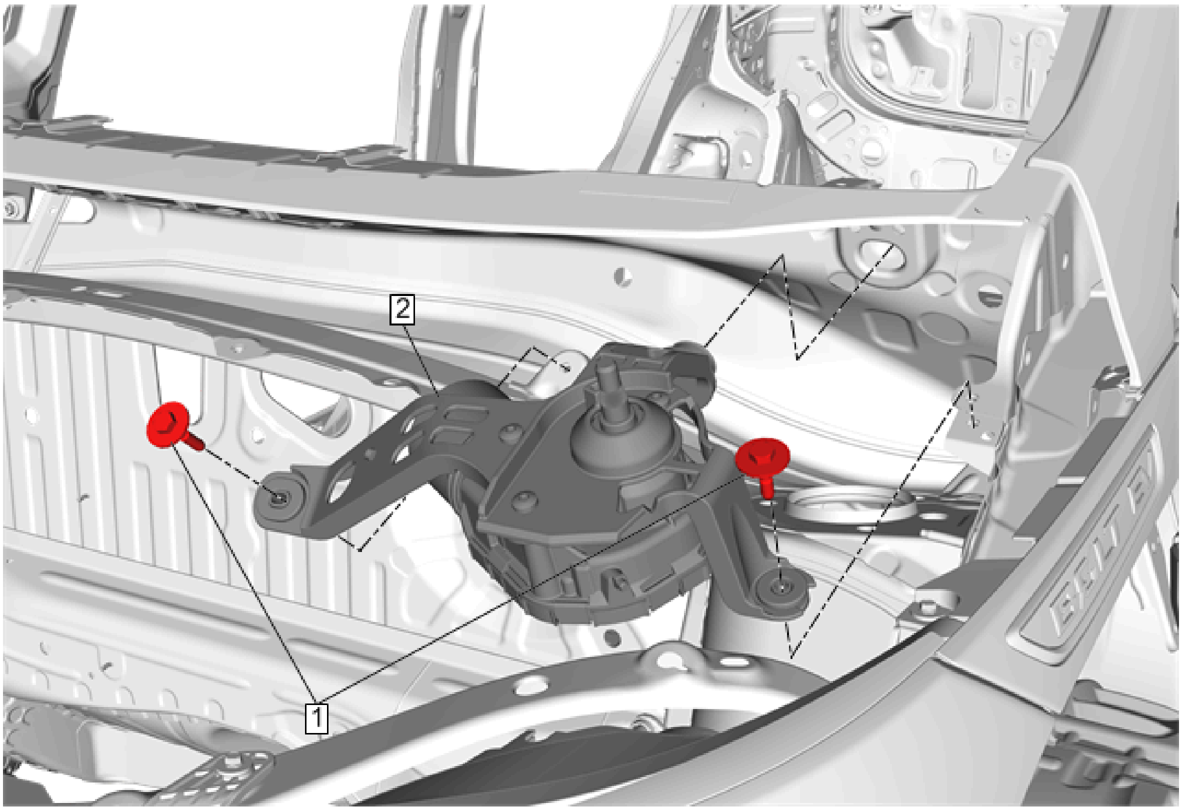

Fig. 21: Windshield Wiper System Module
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Air Inlet Grille Panel Replacement	
1	Windshield Wiper System Module Bolt (Qty: 2) **CAUTION:** **Fastener Caution** **Tighten** 9 N.m (80 lb in)
2	Windshield Wiper System Module **Procedure** Disconnect the electrical connector.

WINDSHIELD MULTIFUNCTION SENSOR MOUNT BRACKET COVER REPLACEMENT (WITH FRONT VIEW CAMERA)

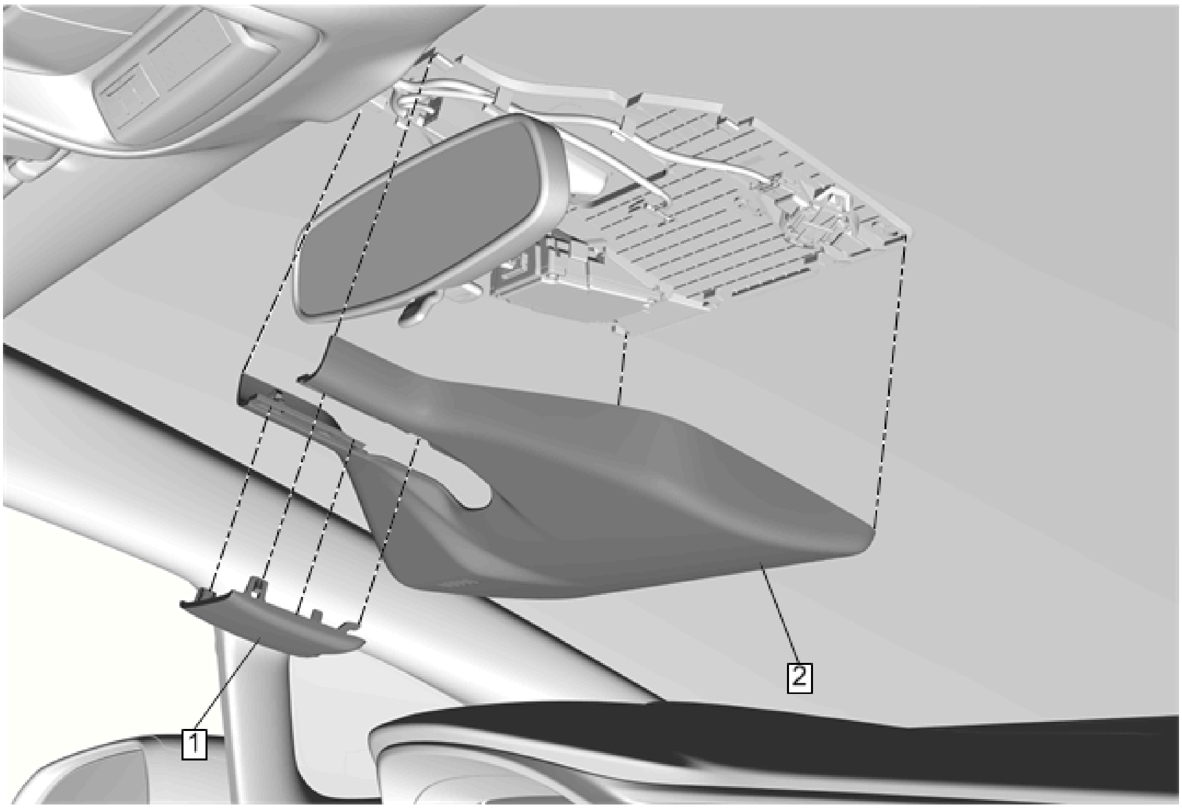

Fig. 22: Windshield Multifunction Sensor Mount Bracket Cover
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Windshield Multifunction Sensor Mount Bracket Cover Insert
2	Windshield Multifunction Sensor Mount Bracket Cover **Procedure** 1. Using a plastic trim tool, release the cover from the windshield bracket. 2. Remove Windshield Multifunction Sensor Mount Bracket Cover Insert@Windshield Multifunction Sensor Mount Bracket Cover

WINDSHIELD MULTIFUNCTION SENSOR MOUNT BRACKET COVER REPLACEMENT (WITHOUT FRONT VIEW CAMERA)

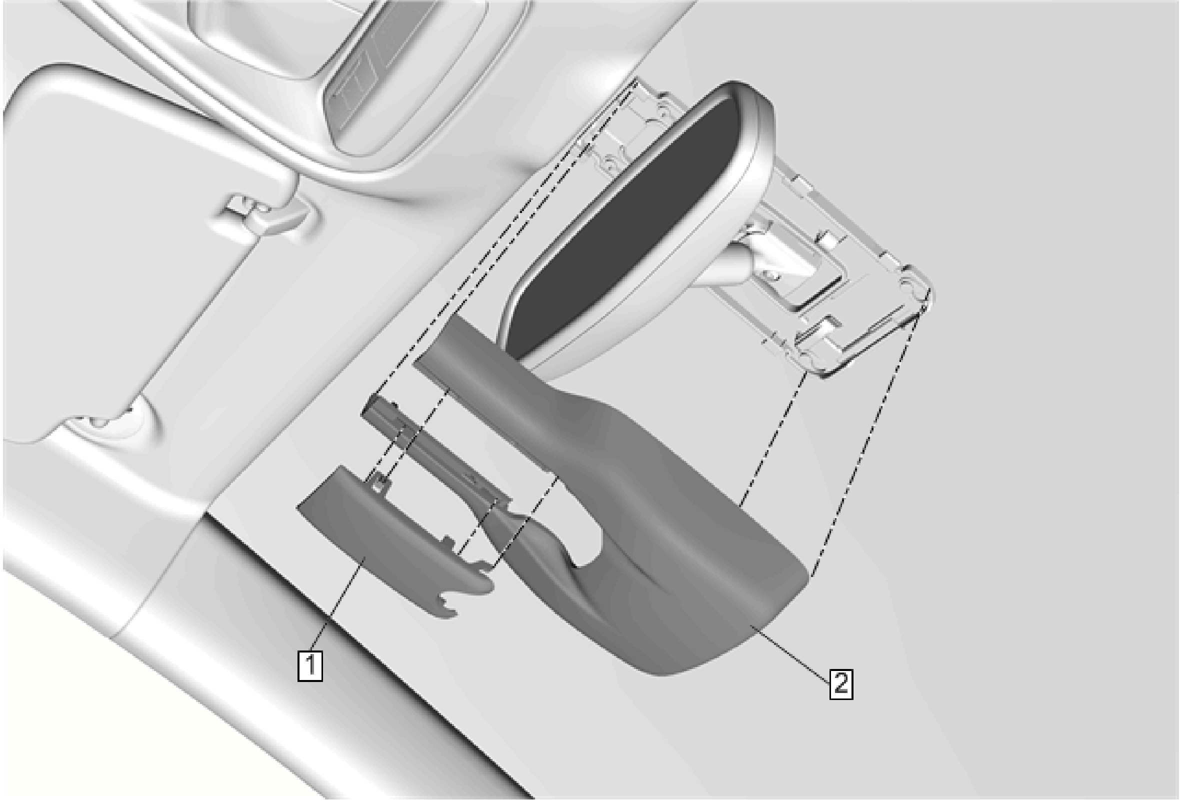

Fig. 23: Windshield Multifunction Sensor Mount Bracket Cover
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Windshield Multifunction Sensor Mount Bracket Cover Insert
2	Windshield Multifunction Sensor Mount Bracket Cover **Procedure** 1. Using a plastic trim tool, release the cover from the windshield bracket. 2. Remove Windshield Multifunction Sensor Mount Bracket Cover Insert@Windshield Multifunction Sensor Mount Bracket Cover

WINDSHIELD WIPER ARM ADJUSTMENT

Adjustment Procedure

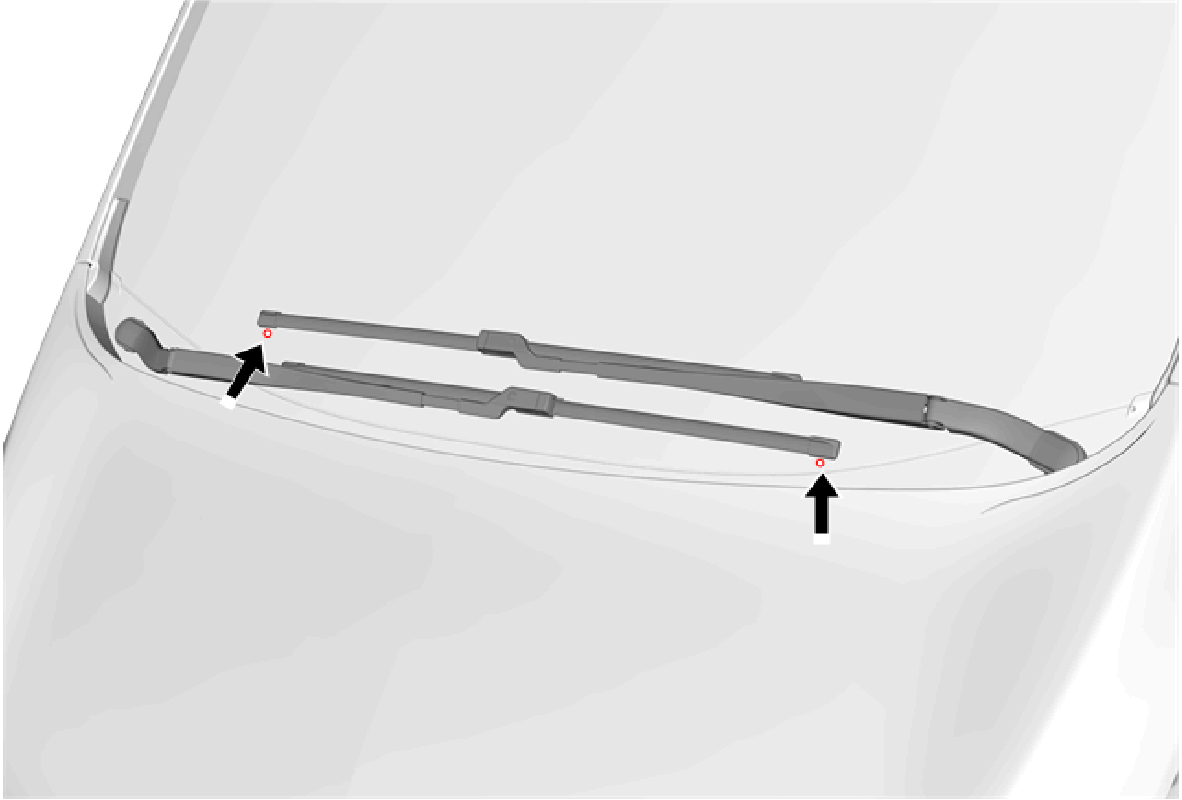

Fig. 24: Windshield Wiper Arms
Courtesy of GENERAL MOTORS COMPANY

1. Check the mark to install the wiper arm at the lower blackout of the windshield.
2. Position the wiper arm blade to this mark.

NOTE: **When installing the windshield wiper arm, perform this procedure for wiper arm to be in original position.**

DESCRIPTION AND OPERATION

WIPER/WASHER SYSTEM DESCRIPTION AND OPERATION

Wiper/Washer System Components

The wiper/washer system consists of the following electrical components:

- Windshield Washer Pump Relay
- Windshield Washer Pump
- Windshield Wiper Motor Module Right
- Windshield Wiper Motor Module Left
- Windshield Wiper/Washer Switch
- Body Control Module (BCM)
- Windshield Washer Fluid Level Switch
- Underhood Fuse Block (Contains Windshield Washer Pump PCB Relay)
- Rain Sensor
- Instrument Cluster
- Instrument Panel Right

Windshield Wiper System

The body control module (BCM) controls the wiper motor based on an input from the wiper switch, and when wiper operation is requested, the BCM will send serial data messages to the windshield wiper motor module. The front wiper systems consists of the driver's side (Windshield Wiper Motor Module Left), and the passenger's side Wiper Arm (Windshield Wiper Motor Module Right) which are connected by a mechanical linkage driven by both windshield wiper motor modules. The windshield wiper motor module contains the necessary electronics, motor, and position sensors to execute front wiper commands from the BCM. These internal electronics are integrated into the cover of the wiper motor gear housing and are not considered a serviceable item. The windshield wiper motor module wipes the front windshield by controlling the up and down wiper arm movement by the use of a reversing motor and an internal position sensor. The sensor keeps track of the gear wheel position and when the Controller determines that the wiper arms are at a position to reverse direction, it reverses the motor supply voltage by use of its internal motor control circuitry. The BCM also provides a hardwired redundant output that switches Battery power to the Wiper Motor upon activation of its low assertion High Speed Wiper Switch input.

The BCM utilizes resistive multiplexing through the wiper switch to discern the requested action from the driver. The BCM will respond by commanding the specific wiper function to operate as follows:

1. Using intermittent wipes, the wipers pause briefly on the windshield. If the wiper level is moved to OFF or if additional wipes are not required, the wipers may move to the base of the windshield.
2. If the ignition is put in OFF while the wipers are on LO, HI, or INT, they will immediately stop.
3. If the ignition is put in OFF while the wipers are performing wipes due to windshield washing, the wipers continue to run until they reach the base of the windshield.
4. Perform one immediate wipe by issuing a serial data signal set to low wipes. The windshield wiper motor shall initiate low speed wiper operation and send a serial data signal back set to low wiping.
5. Upon the wipers leaving their PARKED position, the windshield wiper motor shall send a serial data signal indicating the wipers are no longer in park.
6. Upon receipt of the Wiper out of Park serial data signal, the BCM shall transition the windshield wiper motor command serial data signal to Park. While the wiper system smart is in the process of moving the wipers to their parked position, it shall set the value of its wiper front status serial data signal to Parking.

The wipe delay interval is a function of the INTERMITTENT Delay Interval Switch setting. When enabled, the Intermittent with Speed feature affects each of the 5 normal Intermittent Delay Intervals as a function of vehicle Speed. The Delay Intervals shall be biased to a shorter delay period with faster vehicle speeds and to a longer delay period with a slower vehicle speed.

The windshield wiper system MIST operation is identical to LOW speed operation, except that the MIST switch is a press and release type switch. When the wiper switch is moved to the MIST position (1X) and released, low speed wiper motor operation is started and will continue until 1 cycle is complete. If the wiper switch is moved to the MIST position and held, the wiper motor will operate in the LOW speed mode until the switch is released.

To initiate high speed wiping operation, the BCM provides continuous high speed wiper operation through setting the serial data signal to high speed Wipe. When the wiper switch lever is moved to the high position (HI) and released, high speed wiper motor operation is started and high speed wiping operation is performed.

M75L	Windshield Wiper Motor Module - Left

Windshield Washer System

The windshield washer pump is controlled by the body control module (BCM) via a printed circuit board (PCB) relay. When the washer switch is depressed, the BCM's internally pulled high resistor is pulled low by the washer request circuit. The BCM then applies voltage through a control circuit to the PCB windshield washer pump relay. With the relay energized, fused battery voltage is applied through the switch contacts of the relay and the control circuit to activate the windshield washer fluid pump.

K9	K9 Body Control Module
G24	G24 Windshield Washer Pump

Washer Fluid Level Indicator

The check washer fluid message is controlled by the instrument cluster using an input from the washer fluid level switch. The washer fluid level signal circuit is supplied ignition voltage through a resistor then monitored within the instrument cluster. The washer fluid level switch is normally open so the instrument cluster detects ignition voltage on the washer fluid level signal circuit whenever the washer fluid level is not low. When the washer fluid reaches the point where the driver should be informed that the washer fluid is low, the washer fluid level switch closes. When the washer fluid level switch is closed the washer fluid level signal circuit voltage is pulled low, and the instrument cluster displays the Check Washer Fluid message on the driver information center. In order to prevent the check washer fluid message from being displayed while sloshing is occurring in the washer fluid container, the instrument cluster is programed with a 1 min delay before changing states of the check washer fluid message during an ignition cycle.

Callout	Component Name
P16	P16 Instrument Cluster
B118B	B118B Windshield Washer Fluid Level Switch

Rain Sense Mode and Rain Sense Indicator

B+ voltage is supplied to the rain sensor. Whenever the ignition switch is in the on, or accessory positions, the body control module (BCM), sends the windshield wiper/washer switch status by using serial data. When a wipe cycle is needed, the rain sensor sends a data communication message to the BCM, requesting the wiper operation. The BCM commands the Windshield Wiper Motor wipe cycles. If at anytime a fault occurs between the rain sensor and BCM, the BCM will use the inputs from the windshield wiper/washer switch in the delay positions to operate the windshield wiper motor at continuous variable delay intervals.

* DTC set in keyless entry control module				

Circuit/System Description

The vehicle ON/OFF switch has a single LED that indicate the vehicle power mode. When the vehicle is in the off mode, the LED is not illuminated. Pressing and holding the vehicle ON/OFF switch up to 10 s, without the brake pedal applied will enter the Ignition ON/Vehicle Service Mode and the LED will illuminate. With the Ignition OFF/Vehicle OFF and the brake pedal applied, pressing the vehicle ON/OFF switch once will enter Ignition ON/Vehicle ON mode and the LED will illuminate.

The vehicle ON/OFF switch contains two individual switches that provide redundant inputs to both the body control module (BCM) and the keyless entry control module. The BCM supplies the vehicle ON/OFF switch a constant B+ signal. The BCM monitors this signal to determine if the switch is released or pressed. When the vehicle ON/OFF switch is not pressed, voltage on the signal circuit is pulled down through two resistors in the switch. When the vehicle ON/OFF switch is pressed, voltage on the signal circuit is pulled down through only one resistor, changing the voltage seen at the BCM and indicating that the vehicle ON/OFF switch is pressed.

The keyless entry control module monitors voltage on the switch in the same manner as the BCM. The keyless entry control module also controls the backup power for the ignition main relay 1 through the control circuit by applying voltage to the ignition voltage circuit. This circuit is a pass-thru in the BCM and will energize the ignition circuit when the vehicle is in Service Mode, the vehicle is ON, or when a remote start is requested.

Conditions for Running the DTC

Control module voltage is 9 - 16 V.

Conditions for Setting the DTC

B097B 00

- The voltage seen at the BCM monitored switch does not match the voltage seen at the keyless entry control module monitored switch.
- The above condition exists for more than 1 s

B097B 02

- The control module detects a short to ground in the vehicle ON/OFF switch signal circuit
- The above condition exists for more than 1 s

B097B 04

- The control module detects an open in the vehicle ON/OFF switch signal circuit
- The above condition exists for more than 1 s

B097B 05

- The control module detects an open in the vehicle ON/OFF switch signal circuit
- The above condition exists for more than 1 s

B097B 08

- The control module detects a change in the ignition mode without observing a switch press
- The above condition occurs 4 consecutive times

B097B 61

- The control module detects a continuously closed vehicle ON/OFF switch
- The above condition exists for more than 1 min

Action Taken When the DTC Sets

No action is taken.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears after 40 consecutive module ignition cycles without a repeat of the malfunction.

Circuit/System Verification

1. Verify DTC B097B 08 or B097B 61 is not set.
   - **If either DTC is set**

     Test or replace the S83 Vehicle On/Off Switch.

   - **If the DTCs are not set**
2. Refer to Circuit/System Testing.

Circuit/System Testing

1. Ignition OFF/Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S83 Vehicle On/Off Switch. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 4 and ground.
   - **If 10 Ω or greater**
   1. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Test for less than 10 Ω between the low reference circuit terminal 7 and ground.
   - **If 10 Ω or greater**
   1. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K84 Keyless Entry Control Module.
   - **If less than 10 Ω**
4. Connect the S83 Vehicle On/Off Switch, Ignition ON/Vehicle in Service Mode.
5. Disconnect the S83 Vehicle On/Off Switch.
6. Verify the scan tool K9 Body Control Module Push Button Ignition Switch Voltage parameter is greater than 11 V.
   - **If 11 V or less**
   1. Connect the S83 Vehicle On/Off Switch.
   2. Ignition OFF/Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module.
   3. Test for infinite resistance between the signal circuit terminal 6 and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K9 Body Control Module.
   - **If greater than 11 V**
7. Install a 3 A fused jumper wire between the signal circuit terminal 6 and ground.
8. Verify the scan tool K9 Body Control Module Push Button Ignition Switch Voltage parameter is less than 1 V.
   - **If 1 V or greater**
   1. Disconnect the harness connector at the K9 Body Control Module.
   2. Test for less than 1 V between the signal circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V

        3. Test for less than 2 Ω in signal circuit end to end.
            - If 2 Ω or greater, repair the open/high resistance in the circuit.
            - If less than 2 Ω, replace the K9 Body Control Module.
    - **If less than 1 V**
9. Connect the harness connector at the S83 Vehicle On/Off Switch.
10. Verify the scan tool K9 Body Control Module Push Button Ignition Switch Voltage parameter is 8 - 10 V, with the S83 Vehicle On/Off Switch released.
    - **If not between 8 - 10 V**

      Test or replace the S83 Vehicle On/Off Switch.

    - **If between 8 - 10 V**
11. Verify the scan tool K9 Body Control Module Push Button Ignition Switch Voltage parameter is 4 - 7 V, with the S83 Vehicle On/Off Switch pressed.
    - **If not between 4 - 7 V**

      Test or replace the S83 Vehicle On/Off Switch.

    - **If between 4 - 7 V**
12. Disconnect the X1 harness connector at the K84 Keyless Entry Control Module.
13. Test for infinite resistance between the signal circuit terminal 11 and ground.
    - **If less than infinite resistance**

      Repair the short to ground on the circuit.

    - **If infinite resistance**
14. Ignition ON/Vehicle in Service Mode.
15. Test for less than 1 V between the signal circuit terminal 11 and ground.
    - **If 1 V or greater**

      Repair the short to voltage on the circuit.

    - **If less than 1 V**
16. Test for 4.5 - 5.5 k Ω between the signal circuit terminal 11 and the low reference circuit terminal 12, with the S83 Vehicle On/Off Switch released.
    - **If not between 4.5 - 5.5 k Ω**
    1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the S83 Vehicle On/Off Switch.
    2. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, test or replace the S83 Vehicle On/Off Switch.
    - **If between 4.5 - 5.5 k Ω**
17. Test for 1 - 1.5 k Ω between the signal circuit terminal 11 and the low reference circuit terminal 12, with the S83 Vehicle On/Off Switch pressed.
    - **If not between 1 - 1.5 k Ω**

      Test or replace the S83 Vehicle On/Off Switch.

    - **If between 1 - 1.5 k Ω**
18. Replace the K84 Keyless Entry Control Module.

Component Testing

vehicle ON/OFF Switch

1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the S83 Vehicle ON/OFF Switch.

2. Test for 4.5 - 5.5 k Ω between the terminal listed below with the S83 Vehicle ON/OFF Switch released:
    - Signal terminal 6 and ground terminal 4
    - Signal terminal 3 and low reference terminal 7
    - **If not between 4.5 - 5.5 k Ω**

      Replace the S83 Vehicle On/Off Switch.

    - **If between 4.5 - 5.5 k Ω**
3. Test for 1 - 1.5k Ω between the terminals listed below with the S83 Vehicle On/Off Switch pressed, :
    - Signal terminal 6 and ground terminal 4
    - Signal terminal 3 and low reference terminal 7
    - **If not between 1 - 1.5 k Ω**

      Replace the S83 Vehicle On/Off Switch.

    - **If between 1 - 1.5 k Ω**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Control Module References** for control module replacement, programming and setup.

DTC B1370: CONTROL MODULE IGNITION ON AND START CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B1370

Control Module Ignition On and Start Circuit

For symptom byte information refer to **Symptom Byte List**

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Instrument Cluster Ignition (Instrument Cluster terminal 8)	B1370 06	B1370 06	B1370 01	-

Circuit/System Description

The vehicle power mode master is the body control module (BCM). The BCM monitors switch inputs and will activate relays and other direct outputs of the power mode master as needed according to the calculated power mode.

The instrument cluster has a switched voltage input and may operate in a default mode if the power mode master serial data message does not match what the individual module can see from its own connections.

Conditions for Running the DTC

B1370 01

Ignition is in Accessory mode.

B1370 06

Ignition is in Accessory/Ignition ON/Vehicle in Service Mode..

Conditions for Setting the DTC

B1370 01

Ignition circuit is shorted to voltage.

B1370 06

- Ignition circuit is open.
- Ignition circuit is shorted to ground.

Action Taken When the DTC Sets

The instrument cluster still functions except check engine light is always off.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 50 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Verification

1. Verify that DTC B144B or B1380 is not set.
    - **If DTC B144B or B1380 is set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If DTC B144B or B1380 is not set**
2. Refer to Circuit/System Testing.

Circuit/System Testing

1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the P16 Instrument Cluster.
2. Verify that a test lamp does not illuminate between the ignition circuit terminal 8 and ground.
    - **If the test lamp illuminates**

      Repair the short to voltage on the ignition circuit.

    - **If the test lamp does not illuminate**
3. Ignition ON/Vehicle in Service Mode.
4. Verify that a test lamp illuminates between the ignition terminal 8 and ground.
    - **If the test lamp does not illuminate and the Ignition fuse is good**
    1. Ignition OFF/Vehicle OFF, remove the test lamp.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, refer to **Power Mode Mismatch**.
    - **If the test lamp does not illuminate and the Ignition fuse is open**
    1. Ignition OFF/Vehicle OFF, remove the test lamp.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the P16 Instrument Cluster.
    - **If the test lamp illuminates**
5. Replace the P16 Instrument Cluster.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Control Module References** for control module replacement, programming and setup.

DTC B1445: CONTROL MODULE VOLTAGE OUTPUT CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B1445

Control Module Voltage Output Circuit

For symptom byte information refer to **Symptom Byte List**

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Relay Coil Control	B1445 02	-	-	-

Circuit/System Description

The body control module (BCM) controls the ignition circuit by applying voltage to the retained accessory power relay coil control circuit. The ignition circuit is energized during all power modes except OFF - awake. The ignition circuit is also energized for approximately 10 min after shutting the vehicle OFF, providing no door is opened.

Conditions for Running the DTC

- The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

The DTC will set only when the module requests the output and there is a short to ground in the ignition voltage circuit.

Action Taken When the DTC Sets

The module output driver will be shut down and not supply voltage to the circuit.

Conditions for Clearing the DTC

- The current DTC will clear when the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Circuit/System Testing

1. Ignition OFF/Vehicle OFF and all vehicle systems OFF, disconnect the X80 Accessory Power Receptacle.
2. Connect a test lamp between the ignition circuit terminal A and ground, Ignition ON/Vehicle in Service Mode.
3. Verify the test lamp turns ON and OFF when commanding the Accessory/Retained Accessory Power Relay On and Off with a scan tool.
    - **If the test lamp is always OFF**
    1. Ignition OFF/Vehicle OFF, remove test lamp, disconnect the harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance.
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.

- **If the test lamp is always ON**
  1. Ignition OFF/Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module, ignition ON/Vehicle in Service Mode.
  2. Test for less than 1 V between the control circuit and ground.
     - If 1 V or greater, repair the short to voltage on the circuit.
     - If less than 1 V, replace the K9 Body Control Module.
- **If the test lamp turns ON and OFF**

4. Test or replace the X80 Accessory Power Receptacle.

DTC B144A: RUN POWER RELAY CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B144A

Run Power Relay Circuit

For symptom byte information refer to **Symptom Byte List**

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Run Ignition 3 Voltage	B144A 02	-	-	-

Circuit/System Description

The body control module (BCM) feeds the ignition circuit by applying voltage when the vehicle is in Ignition ON/Vehicle in Service Mode or Ignition ON/Vehicle ON mode.

Conditions for Running the DTC

- The system voltage is between 9 - 16 V.
- The DTC can only run when the output is activated.

Conditions for Setting the DTC

The BCM detects a short to ground in the ignition circuit.

Action Taken When the DTC Sets

The module output driver will be shut down and not supply voltage to the ignition circuit.

Conditions for Clearing the DTC

- The current DTC will clear when the module request for the output is removed or the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

DTC B144B: RUN/CRANK POWER RELAY CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B144B

Run/Crank Power Relay Circuit

For symptom byte information refer to **Symptom Byte List**

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	B144B 02*	B144B 05*	B144B 01*	-
Control	B144B 02**	-	-	-
* DTC set in keyless entry control module ** DTC Set in BCM				

Circuit/System Description

The body control module (BCM) controls the ignition main relay 1 and the ignition main relay 2 through their control circuits by applying voltage to the ignition run/crank relay coil control circuit. The ignition main relay 1 and ignition main relay 2 are energized when the ignition is ON, or when a remote start is requested.

The keyless entry control module controls the backup power for the ignition main relays through the control circuit by applying voltage to the ignition circuit. This circuit is a pass-thru in the BCM and will energize the ignition circuit when the ignition is ON, or when a remote start is requested.

Conditions for Running the DTC

System voltage greater than 9 V.

Conditions for Setting the DTC

B144B 01

The ignition output is not active and a short to battery is detected 3 consecutive times on the ignition voltage circuit.

B144B 02

A short to ground is detected on the ignition run/crank relay coil control circuit.

B144B 05

The ignition output is not active and an open is detected 20 consecutive times on the ignition voltage circuit.

Action Taken When the DTC Sets

B144B 01, B144B 05

No action is taken.

B144B 02

The ignition main relay 1 and the ignition main relay 2 are deactivated when the fault is set. After 100 ms, the ignition main relay 1 and the ignition main relay 2 will be activated. If the fault is still set, the relays will be deactivated. The ignition main relay 1 and the ignition main relay 2 will again be activated after 100 ms. If this also results in a fault, the ignition main relay 1 and the ignition main relay 2 will be deactivated until a new ignition request is received.

Conditions for Clearing the DTC

- The current DTC will clear when the malfunction is no longer present and an ignition request is received.
- A history DTC will clear after 50 malfunction-free ignition cycles.

Diagnostic Aids

A short to voltage on the ignition run/crank relay coil control will cause the engine to remain running after the ignition mode is changed to OFF.

Circuit/System Verification

1. Ignition ON/Vehicle in Service Mode.
2. Verify the KR73A Ignition Main Relay 1 and the KR73B Ignition Main Relay 2 click ON and OFF when commanding the Run/Crank relay On and Off with a scan tool.
   - **If the KR73A Ignition Main Relay 1 or the KR73B Ignition Main Relay 2 do not click ON and OFF**

     Refer to Circuit/System Testing.

   - **If the KR73A Ignition Main Relay 1 and the KR73B Ignition Main Relay 2 click ON and OFF**
3. All OK.

Circuit/System Testing

1. Ignition ON/Vehicle in Service Mode, disconnect the X1 harness connector at the K84 Keyless Entry Control Module.
2. Verify a test lamp illuminates between the B+ circuit terminal 2 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition OFF/Vehicle OFF, remove the test lamp.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω, verify the fuse is good and there is voltage at the fuse.

   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition OFF/Vehicle OFF, remove the test lamp.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K84 Keyless Entry Control Module.
   - **If the test lamp illuminates**

3. Ignition OFF/Vehicle OFF, connect the X2 harness connector at the K84 Keyless Entry Control Module and disconnect the X3 harness connector at the K9 Body Control Module.
4. Test for less than 1 V between the ignition circuit terminal 6 and ground.
   - **If 1 V or greater**

     Repair the short to voltage on the circuit.

   - **If less than 1 V**
5. Ignition ON/Vehicle in Service Mode.
6. Verify a test lamp illuminates between the ignition circuit terminal 6 and ground.
   - **If the test lamp does not illuminate**
   1. Ignition OFF/Vehicle OFF, remove the test lamp.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance.
   3. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K84 Keyless Entry Control Module.
   - **If the test lamp illuminates**
7. Ignition OFF/Vehicle OFF, connect the X3 harness connector at the K9 Body Control Module.
8. Disconnect the KR73A Ignition Main Relay 1 and the KR73B Ignition Main Relay 2. It may take up to 2 min for all vehicle systems to power down.
9. Test for less than 10 Ω between the ground circuits listed below and ground.
   - KR73A Ignition Main Relay 1 - Ground circuit terminal 86
   - KR73B Ignition Main Relay 2 - Ground circuit terminal 86
   - **If 10 Ω or greater**
   1. Ignition OFF/Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
10. Ignition ON/Vehicle in Service Mode, connect a test lamp between the control circuits listed below and ground.
    - KR73A Ignition Main Relay 1 - Control circuit terminal 85
    - KR73B Ignition Main Relay 2 - Control circuit terminal 85
11. Verify the test lamp turns ON and OFF when commanding the Run/Crank relay On and Off with a scan tool.
    - **If the test lamp is always OFF**
    1. Ignition OFF/Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the control circuit and ground.
       - If less than infinite resistance, repair the short to ground on the circuit.
       - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.

        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp is always ON**
    1. Ignition OFF/Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module, ignition ON.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**

12. Test or replace the KR73A Ignition Main Relay 1 or the KR73B Ignition Main Relay 2.

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Control Module References** for control module replacement, programming and setup.

DTC B1451: ACCESSORY POWER CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B1451

Accessory Power Circuit

For symptom byte information refer to **Symptom Byte List**

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	B1451 02	B1451 04	B1451 01	-

Circuit/System Description

The keyless entry control module provides as a backup control for the ignition power circuit, by applying voltage to the ignition power circuit. The ignition power circuit is energized when the vehicle power mode is in ACCESSORY mode or Ignition ON mode.

Conditions for Running the DTC

B1451 01, B1451 04

- Vehicle power mode is Ignition OFF
- Module is awake
- DTC B1451 not already set
- System voltage between 6 and 16 V

B1451 02

- Vehicle power mode is ACCESSORY or Ignition ON mode
- Module is awake
- The DTC is only run when the output is active
- DTC B1451 is not already set

- System voltage between 6 and 16 V

Conditions for Setting the DTC

B1451 01

Ignition output is not active and a short to battery is detected 3 consecutive times.

B1451 02

Ignition output is active and a short to ground is detected 3 consecutive times.

B1451 04

Ignition output is not active and an open circuit is detected 20 consecutive times.

Action Taken When the DTC Sets

B1451 02

The ignition output is deactivated when a short to ground is detected. After 100 ms the output is activated again. This happens 3 times and then the output is deactivated until a new ACCESSORY or Ignition ON mode request is received.

B1451 01, B1451 04

No action is taken.

Conditions for Clearing the DTC

- The current DTC will clear when the malfunction is no longer present during a DTC check.
- A history DTC clears when the module power mode cycle counter reaches the reset threshold of 40, without a repeat of the malfunction.

Diagnostic Aids

- A short to voltage in the ignition control circuit will keep the vehicle modules awake, which can drain the vehicle's battery.
- A short to ground in the extension of this circuit through the body control module can back feed to the keyless entry control module. Check for a short to ground on the ignition circuit on the other side of the ignition pass thru, in the body control module, before replacing the body control module.

Circuit/System Verification

1. Verify DTC U1814 is not set.
   - **If DTC U1814 is set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If DTC U1814 is not set**
2. Refer to Circuit/System Testing.

Circuit/System Testing

1. Ignition ON/Vehicle in Service Mode, disconnect the X2 harness connector at the K84 Keyless Entry Control Module.
2. Verify a test lamp illuminates between the B+ circuit terminal 5 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition OFF/Vehicle OFF, remove the test lamp.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is good and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition OFF/Vehicle OFF, remove the test lamp.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K84 Keyless Entry Control Module.
   - **If the test lamp illuminates**
3. Ignition OFF/Vehicle OFF, connect the X2 harness connector at the K84 Keyless Entry Control Module and disconnect the X3 harness connector at the K9 Body Control Module.
4. Test for less than 1 V between the ignition circuit terminal 5 and ground.
   - **If 1 V or greater**

     Repair the short to voltage on the circuit.

   - **If less than 1 V**
5. Ignition ON/Vehicle in Service Mode.
6. Verify a test lamp illuminates between the ignition circuit terminal 5 and ground.
   - **If the test lamp does not illuminate**
   1. Ignition OFF/Vehicle OFF, remove the test lamp.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance.
   3. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K84 Keyless Entry Control Module.
   - **If the test lamp illuminates**
7. Replace the K9 Body Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for control module replacement, programming and setup.

DTC B147E OR B147F: BATTERY SAVER RELAY SET/RESET SECONDARY CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B147E

Battery Saver Relay Set Secondary Circuit

DTC B147F

Battery Saver Relay Reset Secondary Circuit

For symptom byte information refer to **Symptom Byte List**

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Set Relay Coil Control	B147E 02	B147E 04	B147E 01	-
Reset Relay Coil Control	B147F 02	B147F 04	B147F 01	-

Circuit/System Description

Battery saver mode (transport mode) reduces the parasitic load of some modules during overseas shipment or during vehicle storage conditions. This improves the drain time on the battery (up to 70 days without the battery going dead). When a vehicle is in transport/storage, some features may have reduced functionality while in the battery saver mode, such as disabling keyless entry or content theft features. Battery saver mode is initiated by turning on the hazard flashers, applying the brake pedal, and then turning the ignition key to the start position or pushing the ignition mode switch with the foot on the brake for greater than 15 s. The mode is disengaged by repeating the previous process. The DIC (if equipped) will display transport mode is ON when battery saver mode is enabled and transport mode is OFF when battery saver mode is disabled. For vehicles not equipped with a DIC, the battery indicator light will constantly flash on the instrument cluster when battery saver mode is enabled. This feature can be used as many times as necessary if the vehicle is to be stored for an extended period of time.

Battery saver mode incorporates a latching relay that when enabled disconnects some modules from their ignition power or memory power sources. When battery saver mode is enabled and the vehicle is switched OFF, the BCM sends a momentary command to unlatch the relay disconnecting power up to 1 min after RAP is inactive. Every time the vehicle is switched ON the BCM will send a momentary command to latch the battery saver relay. This allows the use of all features when the ignition is ON. The BCM will send another command to unlatch the relay once the vehicle is switched OFF and RAP is inactive.

Conditions for Running the DTC

- The system voltage is between 9 - 16 V.
- The DTC can only run when the output is activated.

Conditions for Setting the DTC

B147E 01 or B147F 01

The BCM detects short to battery in the battery saver relay set/reset circuits.

B147E 02 or B147F 02

The BCM detects a short to ground in the battery saver relay set/reset circuits.

B147E 04 or B147F 04

The BCM detects an open/high resistance in the battery saver relay set/reset circuits.

Action Taken When the DTC Sets

B147E 01, B147E 04, B147F 01, and B147F 04

No action is taken.

B147E 02 and B147F 02

The module output driver will be shut down and not supply voltage to the battery saver relay set/reset circuits.

Conditions for Clearing the DTC

- The current DTC will clear when the module request for the output is removed or the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Control Module References for scan tool information

Circuit/System Verification

1. Enable battery saver mode (transport mode) in the vehicle.
2. Verify that the appropriate devices controlled by the KR104A Battery Saver Relay 1 turn ON and OFF after enabling battery saver mode (transport mode).
    - **If the devices do not turn ON and OFF**

      Refer to Circuit/System Testing.

- **If the devices turn ON and OFF**

3. All OK.

Circuit/System Testing

1. Ignition OFF/Vehicle OFF and all vehicle systems OFF, disconnect the KR104A Battery Saver Relay 1. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 6 and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF/Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Ignition ON/Vehicle in Service Mode.
4. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
   - **If the test lamp does not illuminate and the fuse is not open**
   1. Ignition OFF/Vehicle OFF, remove the test lamp.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the circuit breaker is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the fuse is open**
   1. Ignition OFF/Vehicle OFF, remove the test lamp.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, test or replace the KR104A Battery Saver Relay 1.
   - **If the test lamp illuminates**
5. Enable battery saver mode (transport mode).
6. Ignition OFF/Vehicle OFF.
7. Connect a test lamp between the control circuit terminal 1 and ground.
8. Verify the test lamp momentarily flashes ON and OFF when turning the Ignition ON/Vehicle in Service Mode.
   - **If the test lamp is always OFF**
   1. Ignition OFF/Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If the test lamp is always ON**
   1. Ignition OFF/Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module, Ignition ON/Vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K9 Body Control Module.
   - **If the test lamp turns ON and OFF**
9. Connect a test lamp between the control circuit terminal 2 and ground.
10. Verify the test lamp momentarily flashes ON and OFF after turning the Ignition OFF/Vehicle OFF.

NOTE: **It may take up to 1 min after the ignition is switched OFF and retained accessory power is disabled before the K9 Body Control Module sends a command to unlatch the relay.**

- **If the test lamp is always OFF**

1. Ignition OFF/Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module.
2. Test for infinite resistance between the control circuit and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance
3. Test for less than 2 Ω in the control circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K9 Body Control Module.

- **If the test lamp is always ON**

1. Ignition OFF/Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module, Ignition ON/Vehicle in Service Mode.
2. Test for less than 1 V between the control circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, replace the K9 Body Control Module.

- **If the test lamp turns ON and OFF**

11. Verify that a test lamp does not illuminate between the ignition circuit terminal 5 and ground.
    - **If the test lamp illuminates**

      Repair the short to voltage on the ignition circuit

    - **If the test lamp does not illuminate**
12. Ignition ON/Vehicle in Service Mode, connect a 40 A fused jumper wire between the B+ circuit terminal 3 and the ignition circuit terminal 5.
13. Verify device is activated.
    - **If the device does not activate**

    1. Ignition OFF/Vehicle OFF, remove the test lamp, disconnect the harness connector at the device.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the device.

    - **If the device activates**
14. Test or replace the KR104A Battery Saver Relay 1.

Component Testing

Relay Test

1. Ignition OFF/Vehicle OFF, disconnect the KR104A Battery Saver Relay 1.
2. Test for 70 - 150 Ω between terminals the following terminals.
    - 1 and 6
    - 2 and 6
    - **If less than 70 or greater than 150 Ω**

      Replace the relay.

    - **If between 70 - 150 Ω**

3. Install a 3 A fused jumper wire between relay terminal 1 and 12 V. Install a jumper wire between relay terminal 6 and ground.
4. Test for infinite resistance between the following terminals:
    - 3 and 6
    - 3 and 5
    - 3 and 1
    - 3 and 2
    - 1 and 5
    - 2 and 5
    - **If less than infinite resistance**

      Replace the relay.

    - **If infinite resistance**
5. Install a 3 A fused jumper wire between relay terminal 1 and 12 V. Install a jumper wire between relay terminal 6 and ground.
6. Test for less than 5.0 Ω between terminals 3 and 5.
    - **If 5.0 Ω or greater**

      Replace the relay.

    - **If less than 5.0 Ω**
7. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Control Module References** for control module replacement, programming and setup.

DTC B305E: INTERRUPTIBLE RAP RELAY CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B305E

Interruptible RAP Relay Circuit

For symptom byte information refer to **Symptom Byte List**

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Relay Coil Control	B305E 02	B305E 05	B305E 01, B305E 05	-

Circuit/System Description

The keyless entry control module controls the retained accessory power relay through the control circuit by applying voltage to the interruptible retained accessory power relay coil control circuit. The retained accessory power relay is energized when the ignition is in the Vehicle In Service Mode or the Vehicle On mode. The relay is also energized for approximately 10 min after shutting the vehicle OFF, providing no door is opened

Conditions for Running the DTC

- System voltage is greater than 6 V.
- The DTC can only set when the output is actively being requested by the module.

Conditions for Setting the DTC

B305E 01

The ignition output is not active and a short to battery is detected 3 consecutive times on the ignition voltage circuit.

B305E 02

The ignition output is active and a short to ground is detected on the ignition voltage circuit.

B305E 05

The ignition output is active and an open or short to battery is detected on the ignition voltage circuit.

Action Taken When the DTC Sets

B305E 01, B305E 05

No action is taken.

B305E 02

The module output driver will be shut down and not supply voltage to the circuit.

Conditions for Clearing the DTC

- The current DTC will clear when the malfunction is no longer present and the ignition output is active.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the KR76 Retained Accessory Power Relay clicks ON and OFF when cycling the S83 vehicle ON/OFF switch between Vehicle in Service Mode and Vehicle OFF with the door open.
    - **If the KR76 Retained Accessory Power Relay does not click ON and OFF**

      Refer to Circuit/System Testing.

    - **If the KR76 Retained Accessory Power Relay clicks ON and OFF**
3. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the KR76 Retained Accessory Power Relay. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 85 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle in Service Mode, connect a test lamp between the control circuit terminal 86 and ground circuit terminal 85.
4. Verify the test lamp turns ON and OFF when cycling the S83 vehicle ON/OFF switch between Vehicle in Service Mode and Vehicle OFF with the door open.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K84 Keyless Entry Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K84 Keyless Entry Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K84 Keyless Entry Control Module, Vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K84 Keyless Entry Control Module.
    - **If the test lamp turns ON and OFF**
5. Test or replace the KR76 Retained Accessory Power Relay.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Relay Replacement (Attached to Wire Harness) Relay Replacement (Within an Electrical Center)
- Control Module References for control module replacement, programming and setup.

DTC P15B9 OR P15BA: ELECTRIC A/C COMPRESSOR CONTROL MODULE IGNITION ON/START SWITCH CIRCUIT LOW/HIGH VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P15B9

Electric A/C Compressor Control Module Ignition On/Start Switch Circuit Low Voltage

DTC P15BA

Electric A/C Compressor Control Module Ignition On/Start Switch Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Electric A/C compressor control module ignition	P15B9	P15B9	P15BA	-

Circuit/System Description

The body control module (BCM) controls the ignition main relay by applying voltage to the run/crank coil control circuit. The ignition circuit is energized when the vehicle power mode is Vehicle ON or Vehicle in Service Mode. The hybrid powertrain control module 2 receives the power mode status from the A/C compressor over serial data and compares this status to its own internal power mode status.

Conditions for Running the DTC

P15B9

- Vehicle power mode is Vehicle ON or Vehicle in Service Mode.
- Hybrid powertrain control module 2 is awake.
- DTC's P2534, P2535, or U016B is not set.
- System voltage greater than 10.2 V.

P15BA

- Vehicle power mode is Vehicle OFF.
- Hybrid powertrain control module 2 is awake.
- DTC's P2534, P2535, or U016B is not set.
- System voltage greater than 10.2 V.

Conditions for Setting the DTC

P15B9

- Vehicle power mode is Vehicle ON or Vehicle in Service Mode.
- Hybrid powertrain control module 2 ignition input is active.
- A/C compressor ignition input is not active for more than 2 s.

P15BA

- Vehicle power mode is Vehicle OFF.
- Hybrid powertrain control module 2 is awake.
- Hybrid powertrain control module 2 ignition input is not active.
- A/C compressor ignition input is active for more than 2 s

Action Taken When the DTC Sets

P15B9, P15BA

DTCs P15B9 and P15BA are type B DTCs.

Conditions for Clearing the DTC

P15B9 or P15BA

DTCs P15B9 and P15BA, are type B DTCs.

Diagnostic Aids

A short to voltage in the ignition circuit will keep the vehicle modules awake, which can drain the vehicle's battery.

Circuit/System Verification

1. Verify DTC B144B is not set.
    - **If the DTC is set**

      Refer to **DTC B144B**.

    - **If the DTC is not set**
2. Refer to Circuit/System Testing.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure will perform the following tasks:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**

- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Vehicle OFF, disconnect the X1 harness connector at the G1 A/C Compressor.
2. Verify that a test lamp does not illuminate between the ignition circuit terminal 3 and ground.
   - **If the test lamp illuminates**

     Repair the short to voltage on the ignition circuit.
   - **If the test lamp does not illuminate**
3. Vehicle in Service Mode
4. Verify a test lamp illuminates between the ignition circuit terminal 3 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, refer to **Power Mode Mismatch**.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF, disconnect the harness connector at the G1 A/C Compressor and all devices that share the same ignition circuit.
   2. Test for infinite resistance between the ignition circuit terminal 3 and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance.
   3. Connect each of the devices one at a time and test for greater than 10 Ω between the ignition circuit terminal 3 and ground.
      - If 10 Ω or less, disconnect the appropriate device and retest to verify if the short is in the circuit or the component.
      - If greater than 10 Ω replace the appropriate device.
   - **If the test lamp illuminates**
5. Replace the G1 A/C Compressor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Control Module References** for control module replacement, programming and setup.

DTC P16E8: ENGINE CONTROLS IGNITION RELAY SIGNAL MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P16E8

Engine Controls Ignition Relay Signal Message Counter Incorrect

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Engine Controls Ignition	P16E8	P16E8	-	-
Run/Crank ignition 1	P17B3	P17B3	P17B4	-

Circuit/System Description

The transmission range control module monitors and compares the voltage of the engine controls ignition voltage circuit to the run/crank ignition 1 voltage circuit.

Conditions for Running the DTC

Ignition 1 voltage is greater than 6 V for.5 s.

Conditions for Setting the DTC

The transmission range control module detects that the ignition state of the engine controls ignition circuit and the run/crank ignition 1 circuit do not match.

Action Taken When the DTC Sets

DTC P16E8 is a Type B DTC.

Conditions for Clearing the DTC

DTC P16E8 is a Type B DTC.

Circuit/System Verification

1. Verify that DTC P17B3 or P13B4 is not set.
   - **If DTC P17B3 or P13B4 is set**

     Refer to **DTC P17B3 or P17B4**.

   - **If DTC P17B3 or P13B4 is not set**

2. Refer to Circuit/System Testing.

Circuit/System Testing

1. Ignition OFF/Vehicle OFF, and all vehicle systems OFF, disconnect the harness connector at the K173 Transmission Range Control Module. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between ground circuit terminal 8 and ground.
   - **If 10 Ω or greater**
   1. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Test for less than 1 V between the ignition circuit terminal 1 and ground.
   - **If 1 V or greater**

     Repair the short to voltage on the circuit.

   - **If less than 1 V**
4. Ignition ON/Vehicle in Service Mode.
5. Verify a test lamp illuminates between terminal 1 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition OFF/Vehicle OFF.
   2. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, refer to **Power Mode Mismatch**.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition OFF/Vehicle OFF.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
   - **If the test lamp illuminates**
6. Replace the K173 Transmission Range Control Module.

Repair Instructions

- Perform the **Diagnostic Repair Verification** after completing the repair.
- Refer to **Control Module References** for control module replacement, programming, and setup.

DTC P17B3 OR P17B4: TRANSMISSION RANGE CONTROL MODULE IGNITION 1 SWITCH CIRCUIT LOW VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P17B3

Transmission Range Control Module Ignition 1 Switch Circuit Low Voltage

DTC P17B4

Transmission Range Control Module Ignition 1 Switch Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	P17B3	P17B3	P17B4	-
Ground	-	P17B3	-	-

Circuit/System Description

The transmission range control module samples the system voltage on the Ignition 1 voltage circuit every 0.25 s. Lower than normal voltage may be inadequate to operate properly.

Conditions for Running the DTC

P17B3

The ignition voltage signal is valid, with the ignition turned ON.

P17B4

The ignition voltage signal is valid, with the Ignition turned OFF.

Conditions for Setting the DTC

P17B3

The transmission range control module detects 6 V or less on the ignition voltage circuit, with the ignition turned ON.

P17B4

The transmission range control module detects greater than 6 V or greater on the ignition voltage circuit, with the ignition turned OFF.

Action Taken When the DTC Sets

DTCs P17B3 and P17B4 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P17B3 and P17B4 are Type B DTCs.

Circuit/System Testing

1. Ignition OFF/Vehicle OFF, and all vehicle systems OFF, disconnect the X1 harness connector at the K173 Transmission Range Control Module. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between ground circuit terminal 8 and ground.
   - **If 10 Ω or greater**
   1. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Ignition ON/Vehicle in Service Mode, verify a test lamp illuminates between B+ circuit terminal 16 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition OFF/Vehicle OFF.
   2. Test for less than 2 Ω in the B+ circuit end to end
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is good and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition OFF/Vehicle OFF.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
   - **If the test lamp illuminates**
4. Test for less than 1 V between the ignition circuit terminal 2 and ground.
   - **If 1 V or greater**

     Repair the short to voltage on the circuit.

   - **If less than 1 V**
5. Ignition ON/Vehicle in Service Mode.
6. Verify a test lamp illuminates between terminal 2 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition OFF/Vehicle OFF.
   2. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, refer to **Power Mode Mismatch**.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition OFF/Vehicle OFF.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
   - **If the test lamp illuminates**
7. Replace the K173 Transmission Range Control Module.

Repair Instructions

- Perform the **Diagnostic Repair Verification** after completing the repair.
- Refer to **Control Module References** for control module replacement, programming, and setup.

DTC P17B5: TRANSMISSION RANGE CONTROL MODULE IGNITION SWITCH ACCESSORY POSITION CIRCUIT LOW VOLTAGE

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P17B5

Transmission Range Control Module Ignition Switch Accessory Position Circuit Low Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	P17B5, U1814, U2099	P17B5	-	-

Circuit/System Description

The transmission range control module continuously monitors the voltage on the Ignition Accessory/Run circuit from the body control module (BCM). When the ignition is in the ACCESSORY or RUN position, the BCM sends a 12 V wake up signal to the control module. This wake up signal allows the control module to power up and start functioning before the engine is started.

Conditions for Running the DTC

The ignition is in the ACCESSORY or RUN position.

Conditions for Setting the DTC

The control module detects the Ignition Accessory/Run circuit is less than 6 V for 1 min.

Action Taken When the DTC Sets

DTC P17B5 is a Type C DTC.

Conditions for Clearing the DTC

DTC P17B5 is a Type C DTC.

Circuit/System Verification

1. Verify DTC U1814 or U2099 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If none of the DTCs are set**
2. Refer to Circuit/System Testing.

Circuit/System Testing

1. Ignition OFF/Vehicle OFF, disconnect the harness X1 connector at the K173 Transmission Range Control Module.
2. Ignition ON/Vehicle in Service Mode.
3. Verify a test lamp illuminates between the ignition circuit terminal 3 and ground.
    - **If the test lamp does not illuminate.**
    1. Ignition OFF/Vehicle OFF remove the test lamp, disconnect the X4 connector at the K9 Body Control Module.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground in the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω on the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp illuminates**
4. Replace the K173 Transmission Range Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for control module replacement, programming, and setup.

DTC P1A5E OR P1A5F: BATTERY ENERGY CONTROL MODULE IGNITION ON/START SWITCH CIRCUIT LOW/HIGH VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P1A5E

Battery Energy Control Module Ignition On/Start Switch Circuit Low Voltage

DTC P1A5F

Battery Energy Control Module Ignition On/Start Switch Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Battery Energy Control Module Ignition	P1A5E	P1A5E	P1A5F	-

Circuit/System Description

The body control module (BCM) controls the ignition main relay through the control circuit by applying voltage to the run/crank coil control circuit. The ignition circuit is energized when the vehicle power mode is Vehicle ON or Vehicle in Service Mode.

Conditions for Running the DTC

P1A5E

- Hybrid powertrain control module 2 is awake.
- Vehicle power mode is Vehicle ON or Vehicle in Service Mode.
- Battery energy control module is awake.
- System voltage greater than 9 V.

P1A5F

- Hybrid powertrain control module 2 is awake.
- Vehicle power mode is Vehicle OFF.
- Battery energy control module is awake.
- System voltage greater than 9 V.

Conditions for Setting the DTC

P1A5E

- Hybrid powertrain control module 2 is awake.
- Ignition input is active and not above 5 V.

P1A5F

- Hybrid powertrain control module 2 is awake.
- Ignition input is not active and not below 5 V.

Action Taken When the DTC Sets

P1A5E, P1A5F

DTCs P1A5E and P1A5F are type B DTCs.

Conditions for Clearing the DTC

P1A5E, P1A5F

DTCs P1A5E and P1A5F are type B DTCs.

Diagnostic Aids

A short to voltage in the ignition circuit will keep the vehicle modules awake, which can drain the vehicle's battery.

Circuit/System Verification

1. Verify DTC B144B is not set.
    - **If the DTC is set**

      Refer to **DTC B144B**.

    - **If the DTC is not set**
2. Refer to Circuit/System Testing.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure will perform the following tasks:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the A4 Hybrid/EV Battery Pack. Refer to **High Voltage Disabling**
2. Connect the 12 V battery, disconnect the X358 harness connector at the A4 Hybrid/EV Battery Pack.
3. Verify that a test lamp does not illuminate between the ignition circuit terminal 4 and ground.
    - **If the test lamp illuminates**

      Repair the short to voltage on the ignition circuit.

    - **If the test lamp does not illuminate**
4. Vehicle in Service Mode

5. Verify a test lamp illuminates between the ignition circuit terminal 4 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
     1. Vehicle OFF.
     2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, refer to **Power Mode Mismatch**.
   - **If the test lamp does not illuminate and the circuit fuse is open**
     1. Vehicle OFF, disconnect the harness connector at all devices that share the same ignition circuit.
     2. Test for infinite resistance between the ignition circuit terminal 4 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance.
     3. Vehicle OFF, remove the A4 Hybrid/EV Battery Pack cover. Refer to **Battery Upper Cover Replacement**
     4. Connect the **EL-52014** low voltage jumper harness extension.
     5. Disconnect the X8 harness connector at the K16 Battery Energy Control Module.
     6. Test for infinite resistance between the ignition circuit terminal 9 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance.
     7. Connect each of the devices that share the same ignition circuit one at a time and test for greater than 100 Ω between the ignition circuit terminal 9 and ground.
        - If 100 Ω or less, disconnect the appropriate device and retest to verify if the short is in the circuit or the component.
        - If greater than 100 Ω replace the appropriate device.
   - **If the test lamp illuminates**
6. Vehicle OFF, remove the A4 Hybrid/EV Battery Pack cover. Refer to **Battery Upper Cover Replacement**
7. Connect the **EL-52014** low voltage jumper harness extension.
8. Disconnect the X8 harness connector at the K16 Battery Energy Control Module.
9. Verify that a test lamp does not illuminate between the ignition circuit terminal 9 and ground.
   - **If the test lamp illuminates**

     Repair the short to voltage on the ignition circuit.

   - **If the test lamp does not illuminate**
10. Vehicle in Service Mode
11. Verify a test lamp illuminates between the ignition circuit terminal 9 and ground.
    - **If the test lamp does not illuminate.**
      1. Vehicle OFF.
      2. Test for less than 2 Ω in the ignition circuit end to end.
         - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - **If the test lamp illuminates**
12. Replace the K16 Battery Energy Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for control module replacement, programming and setup.

DTC P1A60: BATTERY ENERGY CONTROL MODULE IGNITION ACCESSORY SWITCH CIRCUIT LOW VOLTAGE

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC P1A60

Battery Energy Control Module Ignition Accessory Switch Circuit Low Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Serial Data Wake-Up	P1A60, P06E4, U1814, U2099	P1A60	-	-

Circuit/System Description

The hybrid powertrain control module 2 sends the serial data wake-up power mode status in a serial data message to the battery energy control module. The hybrid powertrain control module 2 also powers up the serial data wake-up circuit to the battery energy control module when the vehicle power mode is Vehicle ON or Vehicle in Service Mode.

Conditions for Running the DTC

- Vehicle power mode is Vehicle ON or Vehicle in Service Mode
- Battery energy control module is awake
- System voltage greater than 9 V

Conditions for Setting the DTC

Ignition input is active, and 500 ms after the ignition input transitions high, a voltage below 5 V is detected 3 consecutive times

Action Taken When the DTC Sets

DTC P1A60 is a type B DTC.

Conditions for Clearing the DTC

DTC P1A60 is a type B DTC.

Diagnostic Aids

A short to voltage in the serial data wake-up circuit will keep the vehicle bus awake, which can drain the vehicle's battery.

Circuit/System Verification

1. Verify DTC U1814, U2099, or P06E4 is not set.
   - **If any of the DTCs are set**

     Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

   - **If none of the DTCs are set**
2. Refer to Circuit/System Testing.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the A4 Hybrid/EV Battery Pack. Refer to High Voltage Disabling
2. Connect the 12 V battery, disconnect the X357 harness connector at the A4 Hybrid/EV Battery Pack.
3. Connect a test lamp between the serial data wake-up circuit terminal 5 and ground.
4. Verify the test lamp turns ON and OFF when cycling the S39 Ignition Mode Switch between Vehicle in Service Mode and Vehicle OFF.
   - **If the test lamp is always OFF**
   1. Vehicle OFF, disconnect the harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for less than 2 Ω in the serial data wake-up circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If the test lamp is always ON**
   1. Vehicle OFF, disconnect the harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for less than 1 V between the ignition circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.

        - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp turns ON and OFF**

5. Vehicle OFF, remove the A4 Hybrid/EV Battery Pack cover. Refer to **Battery Upper Cover Replacement**
6. Connect the **EL-52014** low voltage jumper harness extension.
7. Disconnect the X8 harness connector at the K16 Battery Energy Control Module.
8. Connect a test lamp between the serial data wake-up circuit terminal 3 and ground.
9. Verify the test lamp turns ON and OFF when cycling the S39 Ignition Mode Switch between Vehicle in Service Mode and Vehicle OFF.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the **EL-52014** low voltage jumper harness extension.
    2. Test for less than 2 Ω in the serial data wake-up circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the **EL-52014** low voltage jumper harness extension.
    2. Test for less than 1 V between the ignition circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
    - **If the test lamp turns ON and OFF**
10. Replace the K16 Battery Energy Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for control module replacement, programming and setup,

DTC P2534 OR P2535: IGNITION ON/START SWITCH CIRCUIT LOW/HIGH VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P2534

Ignition On/Start Switch Circuit Low Voltage

DTC P2535

Ignition On/Start Switch Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	P2534	P2534	P2535	-

Circuit/System Description

The body control module (BCM) controls the ignition relay through the control circuit by applying voltage to the circuit. The ignition circuit is energized when the vehicle power mode is Vehicle ON or Vehicle in Service Mode.

Conditions for Running the DTC

P2534, P2535

The control module is awake.

Conditions for Setting the DTC

P2534

The control module detects 2 V or less on the ignition voltage circuit.

P2535

The control module detects greater than 5 V or greater on the ignition voltage circuit, with the ignition turned OFF.

Action Taken When the DTC Sets

P2534, P2535

DTCs P2534 and P2535 are type A DTCs.

Conditions for Clearing the DTC

P2534, P2535

DTCs P2534 and P2535 are type A DTCs.

Diagnostic Aids

A short to voltage in the ignition circuit will keep the vehicle modules awake, which can drain the vehicle's battery.

Hybrid/EV Powertrain Control Module 2 Circuit Malfunction

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
2. Vehicle in Service Mode.
3. Verify a test lamp illuminates between the accessory wake up serial data circuit terminal 67 and ground.
    - **If the test lamp does not illuminate.**
    1. Ignition OFF remove the test lamp, disconnect the X4 connector at the K9 Body Control Module.
    2. Test for less than 2 Ω on the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp illuminates**
4. Replace the K114B Hybrid/EV Powertrain Control Module 2.

Engine Control Module Circuit Malfunction

1. Vehicle OFF and all vehicle systems off, disconnect the X1 harness connector at the K20 Engine Control Module.
2. Vehicle in Service Mode.
3. Verify a test lamp illuminates between the Accessory Wake up Serial Data 2 circuit terminal 43 and ground.
    - **If the test lamp does not illuminate**

    1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the KR114B Hybrid/EV Powertrain Control Module 2.
    2. Test for less than 2 Ω on the Accessory Wake up Serial Data 2 circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the KR114B Hybrid/EV Powertrain Control Module 2.
  - **If the test lamp illuminates**

4. Replace the control module setting the K20 Engine Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

SYMPTOMS - WIRING SYSTEMS

NOTE: The following steps must be completed before using the symptom tables.

1. Perform the **Diagnostic System Check - Vehicle** before using the symptom tables in order to verify that all of the following are true:
    - There are no DTCs set.
    - The control modules can communicate via the serial data links.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to:
    - **Power Mode Description and Operation**
    - **Retained Accessory Power Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the systems. Refer to **Checking Aftermarket Accessories**.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections**.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Power Mode Mismatch**
- **Retained Accessory Power Malfunction**
- **Vehicle ON/OFF Switch Indicator Malfunction**
- **Vehicle Will Not Change Power Mode**

POWER MODE MISMATCH

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The body control module (BCM) controls the ignition main relay by applying voltage to their individual relay control circuits. The BCM controls the ignition main relay through the control circuit by applying voltage to the run/crank relay coil control circuit. The ignition main relay is energized when the vehicle is in Service Mode, the vehicle is ON, or when a remote start is requested.

The keyless entry control module controls the retained accessory power relay by applying voltage to the interruptible retained accessory power relay coil control circuit. The retained accessory power relay is energized during all power modes, except OFF-awake. The relay is also energized for approximately 10 min after shutting the vehicle OFF providing no door is opened. and during transmitter authentication. The keyless entry control module will deactivate components that may cause radio frequency (RF) interference when the vehicle on/off switch is pressed which may result in NO REMOTE DETECTED displayed on the driver information center. The relay is also energized for approximately 10 min after shutting the vehicle OFF, providing no door is opened.

The engine control module (ECM) controls the engine controls the ignition relay by applying voltage to the engine controls relay control circuit.

Circuit/System Verification

NOTE: **Use schematics to determine which ignition relay supplies the ignition feed for the appropriate devices. Use the connector end view to identify the ignition circuit terminal for each of those devices.**

1. Vehicle in Service Mode.
2. Verify that the appropriate devices controlled by the KR73A Ignition Main Relay 1 turn ON and OFF when commanding the Run/Crank Relay On and Off with a scan tool.
   - **If the devices do not turn ON and OFF**

     Refer to Circuit/System Testing - Diagnostic A.
   - **If the devices turn ON and OFF**
3. Verify that the appropriate devices controlled by the KR73B Ignition Main Relay 2 turn ON and OFF when commanding the Run/Crank Relay On and Off with a scan tool.
   - **If the devices do not turn ON and OFF**

Refer to Circuit/System Testing - Diagnostic B.

- **If the devices turn ON and OFF**

4. Verify that the appropriate devices controlled by the KR76 Retained Accessory Power Relay turn ON and OFF when cycling the between Vehicle in Service Mode and Vehicle OFF.
   - **If the devices do not turn ON and OFF**

     Refer to Circuit/System Testing - Diagnostic C.

   - **If the devices turn ON and OFF**
5. All OK.

Circuit/System Testing

WARNING: **High voltage enabling and disabling shall be only performed by High Voltage Qualified Technicians. The procedures for high voltage enabling/disabling can be found in the service instructions and must be strictly followed at all times. The usage of the Protocol High Voltage Disabling / Enabling is mandatory. The High Voltage Qualified Technician is responsible for the adherence to the manufacturer's service instructions as well as current national legal regulations.**

Failure to follow the procedures exactly as written may result in serious injury or death.

Questions regarding training can be answered by your national training centre.

WARNING: **Any hybrid/EV battery pack replacement shall be performed by High Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior removal of the battery pack.**

Diagnostic A

1. Vehicle OFF and all vehicle systems OFF, disconnect the KR73A Ignition Main Relay 1. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 85 and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify a test lamp illuminates between the B+ circuit terminal 30 and ground.
   - **If the test lamp does not illuminate**

     Replace the X50A Fuse Block - Underhood

   - **If the test lamp illuminates**
5. Connect a test lamp between the control circuit terminal 86 and the ground circuit terminal 85.
6. Verify the test lamp turns ON and OFF when commanding the Run/Crank Relay On and Off with a scan tool.

- **If the test lamp is always OFF**
  1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module.
  2. Test for infinite resistance between the control circuit and ground.
     - If less than infinite resistance, repair the short to ground on the circuit.
     - If infinite resistance.
  3. Test for less than 2 Ω in the control circuit end to end.
     - If 2 Ω or greater, repair the open/high resistance in the circuit.
     - If less than 2 Ω, replace the K9 Body Control Module.
- **If the test lamp is always ON**
  1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module, Vehicle in Service Mode.
  2. Test for less than 1 V between the control circuit and ground.
     - If 1 V or greater, repair the short to voltage on the circuit.
     - If less than 1 V, replace the K9 Body Control Module.
- **If the test lamp turns ON and OFF**

7. Verify that a test lamp does not illuminate between the ignition circuit terminal 87 and ground.
   - **If the test lamp illuminates**

     Repair the short to voltage on the ignition circuit.

   - **If the test lamp does not illuminate**
8. Vehicle in Service Mode, connect a 40 A fused jumper wire between the B+ circuit terminal 30 and the ignition circuits listed below.
   - Ignition circuit terminal 87
   - Ignition circuit terminal 87A
9. Verify the device is activated.
   - **If the device does not activate**
     1. Vehicle OFF, disconnect the harness connector at the device.
     2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
     3. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the device.
   - **If the device activates**
10. Test or replace the KR73A Ignition Main Relay 1.

Diagnostic B

1. Vehicle OFF and all vehicle systems OFF, disconnect the KR73B Ignition Main Relay 2. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 85 and ground.
   - **If 10 Ω or greater**
     1. Vehicle OFF.
     2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify a test lamp illuminates between the B+ circuit terminal 30 and ground.

   - **If the test lamp does not illuminate**

     Replace the X50A Fuse Block - Underhood

   - **If the test lamp illuminates**

5. Connect a test lamp between the control circuit terminal 86 and the ground circuit terminal 85.
6. Verify the test lamp turns ON and OFF when commanding the Run/Crank Relay On and Off with a scan tool.
   - **If the test lamp is always OFF**
   1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance.
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If the test lamp is always ON**
   1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module, Vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K9 Body Control Module.
   - **If the test lamp turns ON and OFF**
7. Verify that a test lamp does not illuminate between the ignition circuit terminal 87 and ground.
   - **If the test lamp illuminates**

     Repair the short to voltage on the ignition circuit.

   - **If the test lamp does not illuminate**
8. Vehicle in Service Mode, connect a 40 A fused jumper wire between the B+ circuit terminal 30 and the ignition circuit terminal 87.
9. Verify the device is activated.
   - **If the device does not activate**
   1. Vehicle OFF, disconnect the harness connector at the device.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the device.
   - **If the device activates**
10. Test or replace the KR73B Ignition Main Relay 2.

Diagnostic C

1. Vehicle OFF and all vehicle systems OFF, disconnect the KR76 Retained Accessory Power Relay. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 85 and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.

        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify a test lamp illuminates between the B+ circuit terminal 30 and ground.
    - **If the test lamp does not illuminate**

      Replace the X51A Fuse Block - Instrument Panel

    - **If the test lamp illuminates**
5. Connect a test lamp between the control circuit terminal 86 and the ground circuit terminal 85.
6. Verify the test lamp turns ON and OFF when cycling the between Vehicle in Service Mode and Vehicle OFF.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K84 Keyless Entry Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance.
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K84 Keyless Entry Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K84 Keyless Entry Control Module, Vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K84 Keyless Entry Control Module.
    - **If the test lamp turns ON and OFF**
7. Verify that a test lamp does not illuminate between the ignition circuit terminal 87 and ground.
    - **If the test lamp illuminates**

      Repair the short to voltage on the ignition circuit.

    - **If the test lamp does not illuminate**
8. Vehicle in Service Mode, connect a 40 A fused jumper wire between the B+ circuit terminal 30 and the ignition circuit terminal 87.
9. Verify device is activated.
    - **If the device does not activate**
    1. Vehicle OFF, disconnect the harness connector at the device.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the device.
    - **If the device activates**
10. Test or replace the KR76 Retained Accessory Power Relay.

Component Testing

Relay Test

1. Vehicle OFF, disconnect the appropriate relay.

2. Test for 70 - 150 Ω between terminals (85 or 1) and (86 or 2).
   - **If less than 70 or greater than 150 Ω**

     Replace the relay.

   - **If between 70 - 150 Ω**
3. Test for infinite resistance between the terminals listed below:
   - (30 or 3) and (86 or 2)
   - (30 or 3) and (87 or 5)
   - (30 or 3) and (85 or 1)
   - (85 or 1) and (87 or 5)
   - (86 or 2) and (87 or 5)
   - **If less than infinite resistance**

     Replace the relay.

   - **If infinite resistance**
4. Install a 3 A fused jumper wire between relay terminal (85 or 1) and 12 V. Install a jumper wire between relay terminal (86 or 2) and ground.
5. Test for less than 5.0 Ω between terminals (30 or 3) and (87 or 5).
   - **If 5.0 Ω or greater**

     Replace the relay.

   - **If less than 5.0 Ω**
6. All OK

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Relay Switch B+	1	1	1	-
Relay Switch Ignition	1	1	1, 2	-
Relay Coil Control	B305E 02	B305E 05	B305E 01, B305E 05	-
Relay Coil Ground	-	B305E 05	-	-
Ground	-	1	-	-
1. Retained accessory power malfunction 2. Retained accessory power relay always ON				

Circuit/System Description

The keyless entry control module controls the retained accessory power relay by applying voltage to the interruptible retained accessory power relay coil control circuit. The retained accessory power relay is energized during all power modes, except OFF-awake. The relay is also energized for approximately 10 min after shutting the vehicle OFF providing no door is opened. and during transmitter authentication. The keyless entry control module will deactivate components that may cause radio frequency (RF) interference when the vehicle on/off switch is pressed which may result in NO REMOTE DETECTED displayed on the driver information center. The relay is also energized for approximately 10 min after shutting the vehicle OFF, providing no door is opened.

Circuit/System Verification

NOTE: **Use schematics to determine which devices are controlled by the KR76 Retained Accessory Power Relay. Use the connector end view to identify the ignition circuit terminal for each of those devices.**

1. Ignition ON.
2. Verify the appropriate devices controlled by the KR76 Retained Accessory Power Relay turn ON and OFF when cycling the S83 vehicle ON/OFF switch between Vehicle in Service Mode and Vehicle OFF with the door open.
    - **If the devices do not turn ON and OFF**

      Refer to Circuit/System Testing

    - **If the devices turn ON and OFF**
3. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the KR76 Retained Accessory Power Relay. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 85 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.

        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify a test lamp illuminates between the B+ circuit terminal 30 and ground.
    - **If the test lamp does not illuminate**

      Replace the X51A Fuse Block - Instrument Panel

    - **If the test lamp illuminates**
5. Connect a test lamp between the control circuit terminal 86 and the ground circuit terminal 85.
6. Verify the test lamp turns ON and OFF when cycling the S83 vehicle ON/OFF switch between Vehicle in Service Mode and Vehicle OFF with the door open.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K84 Keyless Entry Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance.
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K84 Keyless Entry Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K84 Keyless Entry Control Module, Vehicle in Service Mode.
    2. Test for less than 1 V between the ignition circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K84 Keyless Entry Control Module.
    - **If the test lamp turns ON and OFF**
7. Connect the KR76 Retained Accessory Power Relay.
8. Disconnect the appropriate X80 Accessory Power Receptacle or T22 Mobile Device Wireless Charger Module.
9. Vehicle OFF.
10. Verify that a test lamp does not illuminate between each of the ignition circuits listed below and ground.
    - X80H Accessory Power Receptacle - Center Console - Ignition circuit terminal A
    - X80L Accessory Power Receptacle - Center Console Rear - Ignition circuit terminal A
    - T22 Mobile Device Wireless Charger Module - Ignition circuit terminal 1
    - **If the test lamp illuminates**

      Repair the short to voltage on the ignition circuit.

    - **If the test lamp does not illuminate**
11. Vehicle in Service Mode.
12. Verify that a test lamp illuminates between each of the ignition circuits listed below and ground.
    - X80H Accessory Power Receptacle - Center Console - Ignition circuit terminal A
    - X80L Accessory Power Receptacle - Center Console Rear - Ignition circuit terminal A
    - T22 Mobile Device Wireless Charger Module - Ignition circuit terminal 1
    - **If the test lamp does not illuminate and the circuit breaker or fuse is good**
    1. Vehicle OFF, remove the test lamp.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, test or replace the K84 Keyless Entry Control Module.

- **If the test lamp does not illuminate and the circuit breaker or fuse is open**
  1. Vehicle OFF, remove the test lamp.
  2. Test for infinite resistance between the ignition circuit and ground.
     - If less than infinite resistance, repair the short to ground on the circuit.
     - If infinite resistance, test or replace the appropriate X80 Accessory Power Receptacle or T22 Mobile Device Wireless Charger Module.
- **If the test lamp illuminates**

13. Test or replace the appropriate X80 Accessory Power Receptacle or T22 Mobile Device Wireless Charger Module.

Component Testing

Relay Test

1. Vehicle OFF, disconnect the KR76 Retained Accessory Power Relay.
2. Test for 70 - 150 Ω between terminals 85 and 86.
   - **If less than 70 or greater than 150 Ω**

     Replace the relay.

   - **If between 70 - 150 Ω**
3. Test for infinite resistance between the following terminals:
   - 30 and 86
   - 30 and 87
   - 30 and 85
   - 85 and 87
   - **If less than infinite resistance**

     Replace the relay.

   - **If infinite resistance**
4. Test for less than 5.0 Ω between terminals 30 and 87.
   - **If 5.0 Ω or greater**

     Replace the relay.

   - **If less than 5.0 Ω**
5. Install a 3 A fused jumper wire between relay terminal 41 and 12 V. Install a jumper wire between relay terminal 40 and ground.
6. Test for less than 5.0 Ω between terminals 30 and 87.
   - **If 5.0 Ω or greater**

     Replace the relay.

   - **If less than 5.0 Ω**
7. All OK

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Accessory Power Receptacle Replacement
- Control Module References for control module replacement, programming and setup.

VEHICLE ON/OFF SWITCH INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	B097C 02	2	1	-
Ground	-	2	-	-
1. Vehicle ON/OFF switch indicator always ON 2. Vehicle ON/OFF switch indicator inoperative				

Circuit/System Description

The vehicle ON/OFF switch has a single LED that indicates the vehicle power mode. When the vehicle is in the OFF mode, the LED is not illuminated. Pressing and holding the vehicle ON/OFF switch for at least 5 s, without the brake pedal applied, will enter the Vehicle Service Mode and the blue LED will illuminate. With the vehicle OFF and the brake pedal applied, pressing the vehicle ON/OFF switch once, the vehicle will enter the Vehicle ON mode and the blue LED will illuminate.

The vehicle ON/OFF switch contains two individual switches that provides redundant switch inputs to both the body control module (BCM) and the keyless entry control module. The BCM supplies the vehicle ON/OFF switch a constant B+ signal. The BCM monitors this signal to determine if the switch is released or pressed. When the vehicle ON/OFF switch is not pressed, voltage on the signal circuit is pulled down through two resistors in the switch. When the vehicle ON/OFF switch is pressed, voltage on the signal circuit is pulled down through only one resistor, changing the voltage seen at the BCM and indicating that the vehicle ON/OFF switch is pressed.

The keyless entry control module monitors voltage on the switch is the same manner as the BCM, but monitors the second switch located in the vehicle ON/OFF switch.

Circuit/System Verification

1. Verify the blue LED illuminates when the S83 Vehicle ON/OFF Switch is pressed and held for at least 5 s, with the brake pedal released.
   - **If the blue LED does not illuminate**

   Refer to Circuit/System Testing.

   - **If the blue LED illuminates**

2. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S83 Vehicle ON/OFF Switch. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 4 and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Test for less than 1 V between the control circuit terminal 5 and ground.
   - **If 1 V of greater**
   1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module, Vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V
   3. Test for less than 2 Ω in control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If less than 1 V**
4. Vehicle OFF, connect the harness connector at the S83 Vehicle ON/OFF Switch.
5. Vehicle in Service Mode, disconnect the harness connector at the S83 Vehicle ON/OFF Switch.
6. Verify a test lamp illuminates between the control circuit terminal 5 and ground.
   - **If the test lamp does not illuminate**
   1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If the test lamp illuminates**
7. Test or replace the S83 Vehicle ON/OFF Switch.

Component Testing

1. Vehicle OFF, disconnect the harness at the S83 Vehicle ON/OFF Switch.
2. Connect a jumper wire between the S83 Vehicle ON/OFF Switch terminal 4 and ground.
3. Connect a 3 A fused jumper wire between the S83 Vehicle ON/OFF Switch terminal 5 and B+.
4. Verify the blue LED illuminates.
   - **If the LED does not illuminate**

     Replace the S83 vehicle ON/OFF switch.

   - **If the LED illuminates**

5. All OK.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal - Terminal 3	B097B 02*	B097B 05*	B097B 05*	-
Signal - Terminal 6	2	B097B 05*	2	-
Low Reference	-	B097B 05*	-	-
Ground	-	1	-	-
1. Vehicle ON/OFF Switch Indicator Always Off 2. Power Mode Mismatch * DTC set in keyless entry control module				

Circuit/System Description

The vehicle ON/OFF switch has a single LED that indicate the vehicle power mode. When the vehicle is in the off mode, the LED is not illuminated. Pressing and holding the vehicle ON/OFF switch for up to 10 s, without the brake pedal applied, will enter the Vehicle Service Mode and the blue LED will illuminate. With the vehicle OFF and the brake pedal applied, pressing the vehicle ON/OFF switch once, the vehicle will enter the Vehicle ON mode and the blue LED will illuminate.

The vehicle ON/OFF switch contains 2 individual switches that provides redundant switch inputs to both the body control module (BCM) and the keyless entry control module. The BCM supplies the vehicle ON/OFF switch a constant B+ signal. The BCM monitors this signal to determine if the switch is released or pressed. When the vehicle ON/OFF switch is not pressed, voltage on the signal circuit is pulled down through 2 resistors in the switch. When the vehicle ON/OFF switch is pressed, voltage on the signal circuit is pulled down through only one resistor, changing the voltage seen at the BCM and indicating that the vehicle ON/OFF switch is pressed.

The keyless entry control module monitors voltage on the switch is the same manner as the BCM, but monitors the second switch located in the vehicle ON/OFF switch. The keyless entry control module also controls the backup power for the ignition run relay through the control circuit by applying voltage to the ignition voltage circuit. This circuit is a pass-thru in the BCM and will energize the ignition circuit when the vehicle is in Service Mode, the vehicle is ON, or when a remote start is requested.

Circuit/System Verification

1. Verify DTC B097B 08 or B097B 61 is not set.
   - **If either DTC is set**

     Test or replace the S83 Vehicle On/Off Switch.

   - **If the DTCs are not set**
2. Verify the blue LED illuminates when the S83 Vehicle On/Off Switch is pressed and held for up to 10 s, with the brake pedal released.
   - **If the blue LED does not illuminate**

     Refer to Circuit/System Testing.

   - **If the blue LED illuminates**
3. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S83 Vehicle On/Off Switch. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 4 and ground.
   - **If 10 Ω or greater**
   1. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Test for less than 10 Ω between the low reference circuit terminal 7 and ground.
   - **If 10 Ω or greater**
   1. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K84 Keyless Entry Control Module.
   - **If less than 10 Ω**
4. Connect the S83 Vehicle On/Off Switch, Vehicle in Service Mode.
5. Disconnect the S83 Vehicle On/Off Switch.
6. Verify the scan tool K9 Body Control Module Push Button Ignition Switch Voltage parameter is greater than 11 V.
   - **If 11 V or less**
   1. Connect the S83 Vehicle On/Off Switch.
   2. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module and S83 Vehicle On/Off Switch.
   3. Test for infinite resistance between the signal circuit terminal 6 and ground.

        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module.
    - **If greater than 11 V**
7. Install a 3 A fused jumper wire between the signal circuit terminal 6 and ground.
8. Verify the scan tool K9 Body Control Module Push Button Ignition Switch Voltage parameter is less than 1 V.
    - **If 1 V or greater**
    1. Disconnect the harness connector at the K9 Body Control Module.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If less than 1 V**
9. Connect the harness connector at the S83 Vehicle On/Off Switch.
10. Verify the scan tool K9 Body Control Module Push Button Ignition Switch Voltage parameter is 8 - 10 V, with the S83 Vehicle On/Off Switch released.
    - **If not between 8 - 10 V**

      Test or replace the S83 Vehicle On/Off Switch.

    - **If between 8 - 10 V**
11. Verify the scan tool K9 Body Control Module Push Button Ignition Switch Voltage parameter is 4 - 7 V, with the S83 Vehicle On/Off Switch pressed.
    - **If not between 4 - 7 V**

      Test or replace the S83 Vehicle On/Off Switch.

    - **If between 4 - 7 V**
12. Disconnect the X1 harness connector at the K84 Keyless Entry Control Module.
13. Test for infinite resistance between the signal circuit terminal 11 and ground.
    - **If less than infinite resistance**

      Repair the short to ground on the circuit.

    - **If infinite resistance**
14. Vehicle in Service Mode.
15. Test for less than 1 V between the signal circuit terminal 11 and ground.
    - **If 1 V or greater**

      Repair the short to voltage on the circuit.

    - **If less than 1 V**
16. Test for 4.5 - 5.5 k Ω between the signal circuit terminal 11 and the low reference circuit terminal 12, with the S83 Vehicle On/Off Switch released.
    - **If not between 4.5 - 5.5 k Ω**
    1. Vehicle OFF, disconnect the harness connector at the S83 Vehicle On/Off Switch.
    2. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, test or replace the S83 Vehicle On/Off Switch.
    - **If between 4.5 - 5.5 k Ω**
17. Test for 1 - 1.5 k Ω between the signal circuit terminal 11 and the low reference circuit terminal 12, with the S83 Vehicle On/Off Switch pressed.

- **If not between 1 - 1.5 k Ω**

  Test or replace the S83 Vehicle On/Off Switch.

- **If between 1 - 1.5 k Ω**

18. Replace the K84 Keyless Entry Control Module.

Component Testing

Ignition Mode Switch Test

1. Vehicle OFF, disconnect the harness connector at the S83 vehicle ON/OFF switch.
2. With the S83 vehicle ON/OFF switch released, test for 4.5 - 5.5 kΩ between the terminal listed below:
   - Signal terminal 6 and ground terminal 4
   - Signal terminal 3 and low reference terminal 7
   - **If not between 4.5 - 5.5 kΩ**

     Replace the S83 Vehicle On/Off Switch.

   - **If between 4.5 - 5.5 kΩ**
3. With the S83 Vehicle On/Off Switch pressed, test for 1 - 1.5k Ω between the terminals listed below:
   - Signal terminal 6 and ground terminal 4
   - Signal terminal 3 and low reference terminal 7
   - **If not between 1 - 1.5 kΩ**

     Replace the S83 Vehicle On/Off Switch.

   - **If between 1 - 1.5 kΩ**
4. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Control Module References for the appropriate control module replacement, programming and setup.

GENERAL ELECTRICAL DIAGNOSIS

Basic Knowledge Required

Without a basic knowledge of electricity, it will be difficult to use the diagnostic procedures contained in the service manual. You should understand the basic theory of electricity, and know the meaning of voltage (V), current (A), and resistance (Ω). You should also be able to read and understand a wiring diagram, as well as understand what happens in a circuit with an open or a shorted wire.

CHECKING AFTERMARKET ACCESSORIES

WARNING: **Refer to SIR Warning .**

Do not connect aftermarket accessories into the SIR circuits, all such circuits are indicated on circuit diagrams with the SIR symbol.

Always check for aftermarket accessories (non-OEM) as the first step in diagnosing electrical problems. If the vehicle is so equipped, disconnect the system to verify that these add-on accessories are not the cause of the problems.

Possible causes of vehicle problems related to aftermarket accessories include:

- Power feeds connected to points other than the battery

- Antenna location
- Transceiver wiring located too close to vehicle electronic modules or wiring
- Poor shielding or poor connectors on antenna feed line
- Check for recent service bulletins detailing installation guidelines for aftermarket accessories.

CIRCUIT TESTING

The Circuit Testing section contains the following diagnostic testing information. Using this information along with the diagnostic procedures will identify the cause of the electrical malfunction.

- Using Connector Test Adapters
- Probing Electrical Connectors
- Troubleshooting with a Digital Multimeter
- Troubleshooting with a Test Lamp
- Using Fused Jumper Wires
- Measuring Voltage
- Measuring Voltage Drop
- Measuring Frequency
- Testing Ground and Low Reference Circuits
- Testing for Continuity
- Testing for Short to Ground
- Testing for a Short to Voltage
- Testing for Intermittent Conditions and Poor Connections
- Inducing Intermittent Fault Conditions
- Testing for Electrical Intermittents
- Scan Tool Snapshot Procedure

USING CONNECTOR TEST ADAPTERS

Special Tools

EL-35616 Terminal Test Probe Kit

For equivalent regional tools, refer to Special Tools .

WARNING: **This procedure should not be performed on high voltage circuits. Performing this procedure on high voltage circuits may result in serious injury or death.**

CAUTION: **Do not insert test equipment probes (DMM etc.) into any connector or fuse block terminal. The diameter of the test probes will deform most terminals. A deformed terminal will cause a poor connection, which will result in a system failure. Always use the J-35616-F GM Approved Terminal Release Tool Kit in order to front probe terminals. Do not use paper clips or other substitutes to probe terminals.**

When using the J-35616-F GM Approved Terminal Release Tool Kit, ensure the terminal test adapter choice is the correct size for the connector terminal. Do not visually choose the terminal test adapter because some connector terminal cavities may appear larger than the actual terminal in the cavity. Using a larger terminal test adapter will damage the terminal. Refer to the J-35616-F GM Approved Terminal Release Tool Kit label on the inside of the J-35616-F GM Approved

Terminal Release Tool Kit for the correct adapter along with the connector end view for terminal size.

PROBING ELECTRICAL CONNECTORS

Special Tools

EL-35616 Terminal Test Probe Kit

For equivalent regional tools, refer to **Special Tools** .

WARNING: **This procedure should not be performed on high voltage circuits. Performing this procedure on high voltage circuits may result in serious injury or death.**

NOTE: **Always be sure to reinstall the connector position assurance (CPA) and terminal position assurance (TPA) when reconnecting connectors or replacing terminals.**

Front probe

Disconnect the connector and probe the terminals from the mating side (front) of the connector.

CAUTION: **Refer to Test Probe Caution .**

NOTE: **When probing female 0.64 terminals, it is important to use the correct adapter. There have been some revisions to the test adapter for 0.64 terminals. The proper adapter for 0.64 terminals is the J-35616-64B which has a gold terminal and a black wire between the base and tip. Failure to use the proper test adapter may result in damage to the terminal being tested and improper diagnosis.**

NOTE: **The proper adapter for probing the terminals for fuses, relays, or diodes in an electrical center is J-35616-35. Using any other tool or adapter may damage the terminal being tested.**

Refer to the following table as a guide in selecting the correct test adapter for front probing connectors:

Test Adapter	Description
J-35616-2A	150 Male Probe Adapter (gray)
J-35616-3	150 Female Probe Adapter (gray)
J-35616-4A	280 Male Probe Adapter (purple)
J-35616-5	280 Female Probe Adapter (purple)
J-35616-6	100W Male (round) Probe Adapter (brown)
J-35616-7	100W Female (round) Probe Adapter (brown)
J-35616-8	Weather Pack Male Probe Adapter (orange)
J-35616-9	Weather Pack Female Probe Adapter (orange)
J-35616-10	100W Male (round) Probe Adapter (green)
J-35616-11	100W Female (round) Probe Adapter (green)
J-35616-12	130 Male Probe Adapter (blue)
J-35616-13	130 Female Probe Adapter (blue)
J-35616-14	150 Male Probe Adapter (green)
J-35616-16	100 Male Probe Adapter (lt green)
J-35616-17	100 Female Probe Adapter (lt green)
J-35616-18	220 Male Probe Adapter (black)
J-35616-19	220 Female Probe Adapter (black)
J-35616-21	950 Female Probe Adapter (red)
J-35616-22	950 Male Probe Adapter (red)

Test Adapter	Description
J-35616-31	500 Male Probe Adapter (orange)
J-35616-32	500 Female Probe Adapter (orange)
J-35616-33	160/180 Male Probe Adapter (yellow)
J-35616-34	160/180 Female Probe Adapter (yellow)
J-35616-35	280 Male Probe Adapter (violet)
J-35616-40	480 Male Probe Adapter (dk blue)
J-35616-41	480 Female Probe Adapter (dk blue)
J-35616-42	630 Male Probe Adapter (red)
J-35616-43	630 Female Probe Adapter (red)
J-35616-44	800 Male Probe Adapter (yellow)
J-35616-45	800 Female Probe Adapter (yellow)
J-35616-54	280 Male (round) Probe Adapter (tan)
J-35616-55	280 Female (round) Probe Adapter (tan)
J-35616-64B	0.64 Male Probe Adapter (lt blue)
J-35616-65B	0.64 Female Probe Adapter (lt blue)
J-35616-66	150 Male (round) Probe Adapter (yellow)
J-35616-67	150 Female (round) Probe Adapter (yellow)

Backprobe

NOTE:

- **Backprobe connector terminals only when specifically required in diagnostic procedures.**
- **Do not backprobe a sealed (Weather PackÃ,Â®) connector, less than a 280 series Metri-Pack connector, a Micro-Pack connector, or a flat wire connector.**
- **Backprobing can be a source of damage to connector terminals. Use care in order to avoid deforming the terminal, either by forcing the test probe too far into the cavity or by using too large of a test probe.**
- **After backprobing any connector, inspect for terminal damage. If terminal damage is suspected, test for proper terminal contact.**

Do not disconnect the connector and probe the terminals from the harness side (back) of the connector.

TROUBLESHOOTING WITH A DIGITAL MULTIMETER

Special Tools

EL-39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to Special Tools .

WARNING: **High voltage circuits should only be tested using a digital multimeter (DMM) and test leads with at least a CAT III rating, such as the J 39200-A Digital Multimeter. Failure to follow the procedures may result in serious injury or death.**

CAUTION: **Refer to Test Probe Caution .**

Digital Multimeter (DMM) Basic Requirements

Service information is validated using digital multimeters that meet or exceed the following requirements. Using a multimeter that does not meet these basic requirements may give inaccurate readings which could lead to an incorrect diagnosis.

Display and Settings

1. Four digits displayed
2. Voltage, current, resistance, frequency, diode test settings, and min-max function
3. Display positive and negative values

Voltage

1. Have at least 10 M Ω input impedance
2. Test a DC voltage range of 0.1 - 1000 V.
3. Test an AC voltage range of 0.1 - 1000 V.

Current

1. Test a DC current range of 0.1µA - 10 A.
2. Test an AC current range of 0.1µA - 10 A.

Resistance

Test a resistance range of 0.1 Ω - 40 MΩ and displays infinite for a value greater than 40 M Ω (O.L. (Over-load))

Frequency

Test for a frequency range of 0.5 HZ - 199 K HZ

Diode Test

1. Apply at least 2 mA when performing the diode bias test
2. Display the break over voltage drop (0 - 3 V) of a forward biased diode
3. Display infinite (O.L. (Over-load)) when a diode is reverse biased

Min-Max Readings

1. Can update at a 25 ms sample rate
2. Saves and displays minimum and maximum values

NOTE: **Circuits which include any solid state control modules, such as the engine control module (ECM), should only be tested with a 10 megohm or higher impedance digital multimeter such as the EL-39200.**

The DMM instruction manual is a good source of information and should be read thoroughly upon receipt of the DMM as well as kept on hand for future reference.

A DMM should be used instead of a test lamp in order to test for voltage in high impedance circuits. While a test lamp shows whether voltage is present if the impedance is low enough, a DMM indicates how much voltage is present. In other words, if there is not enough current, the test lamp will not illuminate even though voltage is present.

The ohmmeter function on a DMM shows how much resistance exists between 2 points along a circuit. Low resistance in a circuit means good continuity.

NOTE: **Disconnect the power feed from the suspect circuit when measuring resistance with a DMM. This prevents incorrect readings. DMMs apply such a small voltage to measure resistance that the presence of voltages can upset a resistance reading.**

Diodes and solid state components in a circuit can cause a DMM to display a false reading. To find out if a component is affecting a measurement take a reading once, then reverse the leads and take a second reading. If the readings differ the solid state component is affecting the measurement.

Following are examples of the various methods of connecting the DMM to the circuit to be tested:

- Probe both ends of the connector and either hold the leads in place while manipulating the connector or tape the leads to the harness for continuous monitoring while you perform other operations or test driving. Refer to **Probing Electrical Connectors**.
- Disconnect the harness at both ends of the suspected circuit where it connects either to a component or to other harnesses.
- If the system that is being diagnosed has a specified pinout or breakout box, it may be used in order to simplify connecting the DMM to the circuit or for testing multiple circuits quickly.

TROUBLESHOOTING WITH A TEST LAMP

Special Tools

EL-35616-200 Test Light - Probe Kit

For equivalent regional tools, refer to **Special Tools** .

WARNING: **This procedure should not be performed on high voltage circuits. Performing this procedure on high voltage circuits may result in serious injury or death.**

CAUTION: **Refer to Test Probe Caution .**

A test lamp can simply and quickly test a low impedance circuit for voltage. A digital multimeter (DMM) should be used instead of a test lamp in order to test for voltage in high impedance circuits. While a test lamp shows whether voltage is present if the impedance is low enough, a DMM indicates how much voltage is present. In other words, if there is not enough current, the test lamp will not illuminate even though voltage is present.

The **EL-35616-200** kit is Micro-Pack compatible and comprised of a 12 V light bulb with an attached pair of leads.

To properly operate this tool use the following procedures.

When testing for voltage:

1. Attach one lead to ground.
2. Touch the other lead to various points along the circuit where voltage should be present.
3. When the bulb illuminates, there is voltage at the point being tested.

When testing for ground:

1. Attach one lead to battery positive voltage.
2. Touch the other lead to various points along the circuit where ground should be present.
3. When the bulb illuminates, there is ground at the point being tested.

USING FUSED JUMPER WIRES

Special Tools

EL 35616-20F Fused Jumper Wire

For equivalent regional tools, refer to **Special Tools** .

NOTE: **A fused jumper may not protect solid state components from being damaged.**

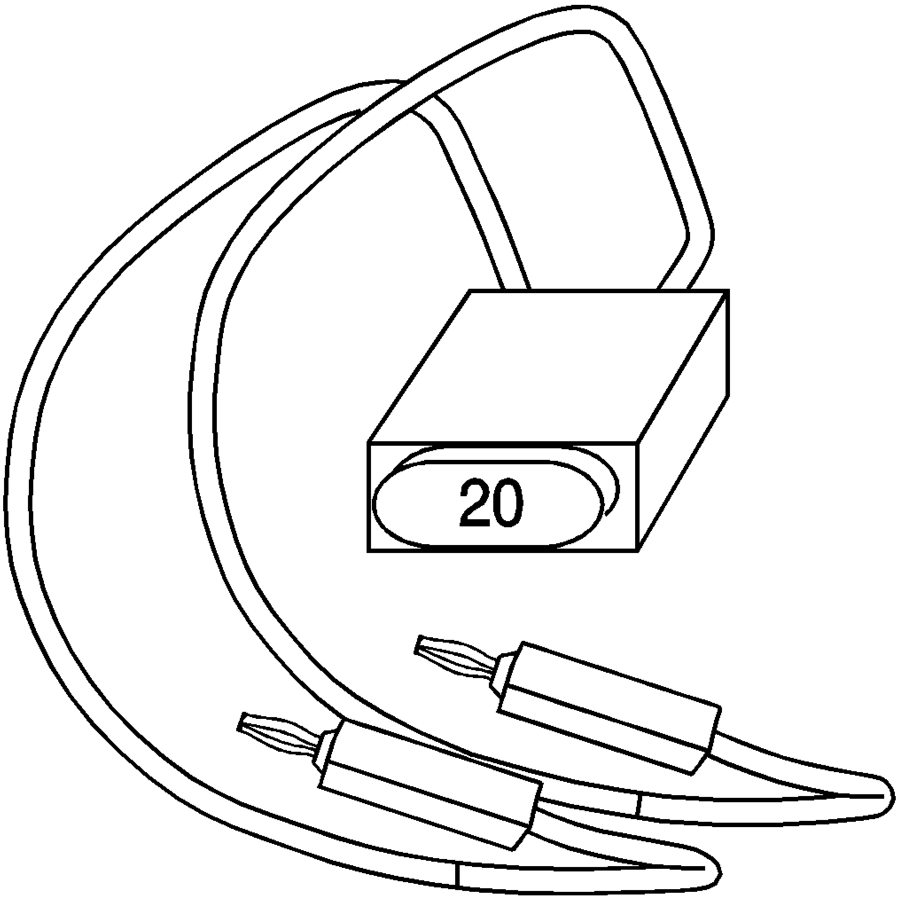

Fig. 1: Fused Jumper Wire
Courtesy of GENERAL MOTORS COMPANY

The **EL 35616-20F** Fused Jumper Wire includes banana jack connectors that provide adaptation to most connectors without damage. This fused jumper wire is supplied with a 20 A fuse which may not be suitable for some circuits. Do not use a fuse with a higher rating than the fuse that protects the circuit being tested.

MEASURING VOLTAGE

Special Tools

EL-39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to Special Tools .

WARNING: **Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:**

- **Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedure exactly as written may result in serious injury or death.

CAUTION: **Refer to Test Probe Caution .**

The following procedure measures the voltage at a selected point in a circuit.

1. Disconnect the electrical harness connector for the circuit being tested, if necessary.
2. Enable the circuit and/or system being tested. Use the following methods:
    - Vehicle power mode to Vehicle in Service Mode or Vehicle On.
    - Turn ON the circuit and/or system with a scan tool in Output Controls.
    - Turn ON the switch for the circuit and/or system being tested.
3. Select the V (AC) or V (DC) position on the digital multimeter (DMM).
4. Connect the positive lead of the DMM to the point of the circuit to be tested.
5. Connect the negative lead of the DMM to a good ground.
6. The DMM displays the voltage measured at that point.

MEASURING VOLTAGE DROP

Special Tools

EL - 39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to Special Tools .

CAUTION: **Refer to Test Probe Caution .**

The following procedure determines the difference in voltage potential between 2 points.

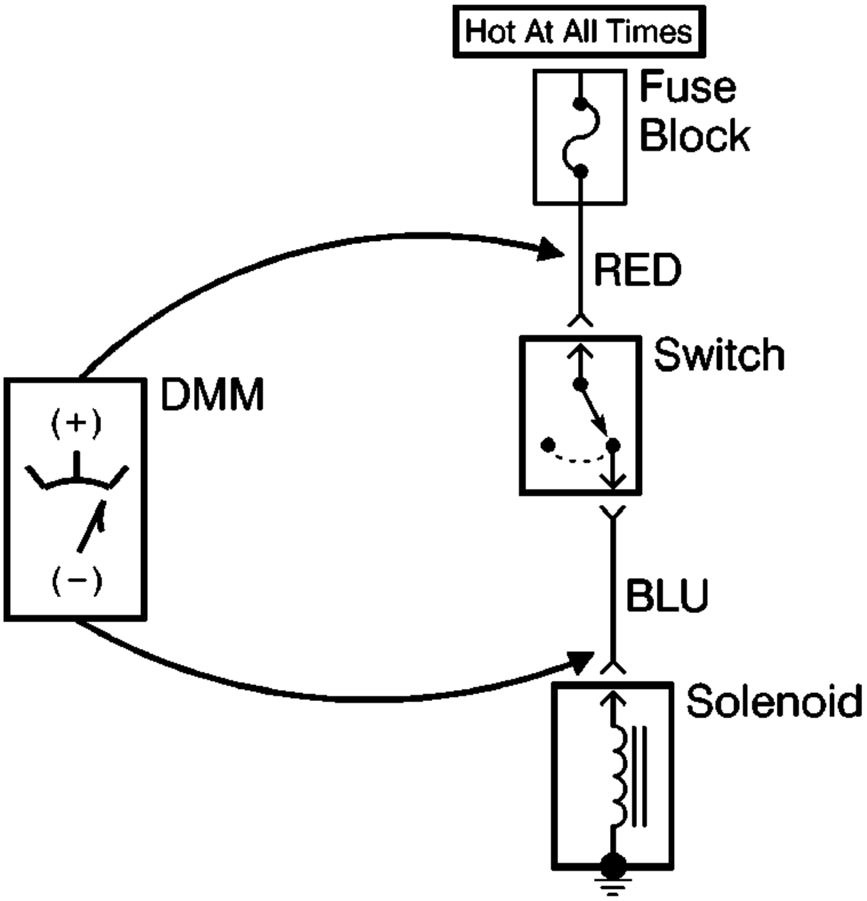

Fig. 2: Measuring Voltage Drop
Courtesy of GENERAL MOTORS COMPANY

1. Set the Digital Multimeter (DMM) to the V (DC) position.
2. Connect the positive lead of the DMM to one point of the circuit to be tested.
3. Connect the negative lead of the DMM to the other point of the circuit.
4. Operate the circuit.
5. The DMM displays the difference in voltage between the 2 points.

MEASURING FREQUENCY

Special Tools

EL - 39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to Special Tools .

CAUTION: **Refer to Test Probe Caution .**

The following procedure determines the frequency of a signal.

NOTE: **Connecting the Digital Multimeter (DMM) to the circuit before pressing the Hz button will allow the DMM to autorange to an appropriate range.**

1. Apply power to the circuit.
2. Set the DMM to the V (AC) position.
3. Connect the positive lead of the DMM to the circuit to be tested.
4. Connect the negative lead of the DMM to a good ground.
5. Set to Hz on the DMM.
6. The DMM will display the frequency measured.

TESTING GROUND AND LOW REFERENCE CIRCUITS

Because a test lamp can light with up to 200 Ω in a ground or low reference circuit they are not recommended to be used for this type of test. A low impedance test lamp can light and indicate the circuit is good when there is as much as 20 - 30 Ω present, while a high impedance test lamp can light with up to 200 Ω present in the circuit. This is why the Digital Multi-Meter (DMM) is used when validating a ground or low reference circuit continuity.

When using the DMM there are many vehicle conditions that can affect the ground and low reference continuity testing. If these conditions are not met, a ground or low reference circuit test can fail on a good circuit. This may cause longer diagnosis time and incorrect component replacement.

Any current flow through a ground or low reference circuit, while being tested, will skew the DMM continuity reading, or display a reading higher than when there is no current flowing. Performing a ground or low reference circuit continuity test, in reference to the vehicles battery negative terminal, will have the highest risk of failing a good ground or low reference circuit test than any other ground reference point. The best ground test points would be a control module housing (if the control modules housing is metal and grounded), door jamb striker (if attached to metal), under dash metal frame work, engine block, or body ground studs (other than where the negative battery cable is attached).

A typical DMM ground or low reference circuit continuity reading can be as high as 100 Ω with the vehicle power mode in Vehicle ON or Vehicle in Service Mode, and drop to 15 - 25 Ω after switching the vehicle off. The reading will drop below 10 Ω after 30 - 40 s, then below 5 Ω after 60 s. Once the vehicle completely goes to sleep (generally 3-10 min) the reading will drop below 0.3 Ω.

The following list of conditions may need to be met to ensure a valid continuity reading on a ground or low reference circuit:

- Vehicle off
- Transmitter out of range of the vehicle
- Retained Accessory Power off (open and close the driver door after vehicle off)
- Battery charger set at a 2 A or less charge rate

- Scan tool not communicating with any vehicle control module (in some cases it may need to be disconnected from the DLC)
- All entry doors closed
- Headlamps off(auto headlamps disabled)
- Any delay lighting off
- HVAC after blow off
- Any accessory that can work when the vehicle power mode is Vehicle OFF
- Wait up to 60 s (after all other listed conditions are met)

Locking the doors with a remote transmitter can greatly reduce the time to achieve a valid ground or low reference continuity test result.

There are some low reference circuits that use a driver to isolate the circuit while the ignition is off. This is done in most cases for accidental reverse battery connections or reverse polarity jump starting. When this driver is present, the ignition will need to be on to validate the circuit.

TESTING FOR CONTINUITY

Special Tools

EL-39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to Special Tools .

WARNING: **This procedure should not be performed on high voltage circuits. Performing this procedure on high voltage circuits may result in serious injury or death.**

CAUTION: **Refer to Test Probe Caution .**

The following procedures verify good continuity in a circuit.

With a Digital Multimeter (DMM)

1. Set the DMM to the Ω position.
2. Disconnect the power feed (i.e. fuse, control module) from the suspect circuit.
3. Disconnect the load.
4. Select the MIN MAX function on the DMM.
5. Connect one lead of the DMM to one end of the circuit to be tested.
6. Connect the other lead of the DMM to the other end of the circuit.
7. If the DMM displays low or no resistance, the circuit has good continuity.

With a Test Lamp

NOTE: **Only use the test lamp procedure on low impedance power and ground circuits.**

1. Remove the power feed (i.e. fuse, control module) from the suspect circuit.
2. Disconnect the load.
3. Connect one lead of the test lamp to one end of the circuit to be tested.
4. Connect the other lead of the test lamp to battery positive voltage.
5. Connect the other end of the circuit to ground.
6. If the test lamp illuminates (full intensity), then the circuit has good continuity.

TESTING FOR SHORT TO GROUND

WARNING: **This procedure should not be performed on high voltage circuits. Performing this procedure on high voltage circuits may result in serious**

injury or death.

CAUTION: **Refer to Test Probe Caution .**

The following procedures test for a short to ground in a circuit.

With a Digital Multimeter (DMM)

1. Remove the power feed (i.e. fuse, control module) from the suspect circuit.
2. Disconnect the load.
3. Set the rotary dial of the DMM to the Ω position.
4. Connect one lead of the DMM to one end of the circuit to be tested.
5. Connect the other lead of the DMM to a good ground.
6. If the DMM does NOT display infinite resistance (OL), there is a short to ground in the circuit.

With a Test Lamp

1. Remove the power feed (i.e. fuse, control module) from the suspect circuit.
2. Disconnect the load.
3. Connect one lead of the test lamp to battery positive voltage.
4. Connect the other lead of the test lamp to one end of the circuit to be tested.
5. If the test lamp illuminates, there is a short to ground in the circuit.

Fuse Powering Several Loads

1. Review the system schematic and locate the fuse that is open.
2. Open the first connector or switch leading from the fuse to each load.
3. Connect a DMM across the fuse terminals (be sure that the fuse is powered).
    - When the DMM displays voltage the short is in the wiring leading to the first connector or switch.
    - If the DMM does not display voltage refer to the next step.
4. Close each connector or switch until the DMM displays voltage in order to find which circuit is shorted.

TESTING FOR A SHORT TO VOLTAGE

Special Tools

EL-39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to **Special Tools** .

WARNING: **This procedure should not be performed on high voltage circuits. Performing this procedure on high voltage circuits may result in serious injury or death.**

CAUTION: **Refer to Test Probe Caution .**

The following procedure tests for a short to voltage in a circuit.

1. Remove the power feed (i.e. fuse, control module) from the suspect circuit.
2. Disconnect the load.
3. Set the digital multimeter (DMM) to the V (DC) position.
4. Connect the positive lead of the DMM to one end of the circuit to be tested.
5. Connect the negative lead of the DMM to a good ground.
6. Switch the vehicle power mode to Vehicle in Service Mode and operate all accessories.
7. If the voltage measured is greater than 1 V, there is a short to voltage in the circuit.

TESTING FOR INTERMITTENT CONDITIONS AND POOR CONNECTIONS

Special Tools

EL-35616 Terminal Test Probe Kit

For equivalent regional tools, refer to Special Tools .

WARNING: **This procedure should not be performed on high voltage circuits. Performing this procedure on high voltage circuits may result in serious injury or death.**

When the condition is not currently present, but is indicated in DTC history, the cause may be intermittent. An intermittent may also be the cause when there is a customer complaint, but the symptom cannot be duplicated. Refer to the Symptom Table of the system that is suspect of causing the condition before trying to locate an intermittent condition.

Most intermittent conditions are caused by faulty electrical connections or wiring. Inspect for the following items:

- Wiring broken inside the insulation
- Poor connection between the male and female terminal at a connector
- Poor terminal to wire connection - Some conditions which fall under this description are poor crimps, poor solder joints, crimping over the wire insulation rather than the wire itself, and corrosion in the wire to terminal contact area, etc.
- Pierced or damaged insulation can allow moisture to enter the wiring causing corrosion. The conductor can corrode inside the insulation, with little visible evidence. Look for swollen and stiff sections of wire in the suspect circuits.
- Wiring which has been pinched, cut, or its insulation rubbed through may cause an intermittent open or short as the bare area touches other wiring or parts of the vehicle.
- Wiring that comes in contact with hot or exhaust components
- Refer to Inducing Intermittent Fault Conditions in order to duplicate the conditions required, in order to verify the customer concern.
- Refer to Testing for Electrical Intermittents for test procedures to detect intermittent open, high resistance, short to ground, and short to voltage conditions.
- Refer to Scan Tool Snapshot Procedure for advanced intermittent diagnosis and Vehicle Data Recorder operation.

Testing for Terminal Fretting

Some intermittent conditions can be caused by wire terminal fretting corrosion. Fretting corrosion is a build-up of insulating, oxidized wear debris that can form when there is a small motion between electrical contacts. The oxidized wear debris can pile up enough at the electrical contact spots that the electrical resistance across the connection increases. Movement between the contacting surfaces as small as 10 to 100 microns can cause fretting. To put this in perspective, a sheet of paper is about 100 microns thick, so fretting motion is small and hard to see. Vibration and thermal expansion/contraction are the main sources that create fretting motion. Since vehicles vibrate and can experience large temperature swings, they are a good source for fretting motion. Tin, copper, nickel, and iron surfaces are all susceptible to fretting corrosion. Fretting corrosion can be difficult to see but it looks like small, dark smudges on the terminals contact surface.

To correct a fretting condition disconnect the suspect connector and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087) to both sides of the connector terminals. Then reconnect the connector and wipe away any excess lubricant. This will correct the additional terminal contact resistance due to the terminal fretting corrosion.

Testing for Proper Terminal Contact

It is important to test terminal contact at the component and any inline connectors before replacing a suspect component. Mating terminals must be inspected to ensure good terminal contact. A poor connection between the male and female terminal at a connector may be the result of contamination or deformation.

Contamination may be caused by the connector halves being improperly connected. A missing or damaged connector seal, damage to the connector itself, or exposing the terminals to moisture and dirt can also cause contamination. Contamination, usually in the underhood or underbody connectors, leads to terminal corrosion, causing an open circuit or intermittently open circuit.

Deformation is caused by probing the mating side of a connector terminal without the proper adapter. Always use the **EL-35616** kit when probing connectors. Other causes of terminal deformation are improperly joining the connector halves, or repeatedly separating and joining the connector halves. Deformation, usually to the female terminal contact tang, can result in poor terminal contact causing an open or intermittently open circuit.

Testing for Proper Terminal Contact in Bussed Electrical Centers (BEC)

It is very important to use the correct test adapter when testing for proper terminal contact of fuses and relays in a bussed electrical center (BEC). Use **EL-35616** kit to test for proper terminal contact. Failure to use **EL-35616** kit can result in improper diagnosis of the bussed electrical center.

Follow the procedure below in order to test terminal contact:

1. Separate the connector halves.
2. Visually inspect the connector halves for contamination. Contamination may result in a white or green build-up within the connector body or between terminals. This causes high terminal resistance, intermittent contact, or an open circuit. An underhood or underbody connector that shows signs of contamination should be replaced in its entirety: terminals, seals, and connector body.
3. Using an equivalent male terminal/terminated lead, verify that the retention force is significantly different between a known good terminal and the suspect terminal. Replace the female terminal in question.

Flat Wire Connectors

There are no serviceable parts for flat wire connectors on the harness side or the component side.

Follow the procedure below in order to test terminal contact:

1. Remove the component in question.
2. Visually inspect each side of the connector for signs of contamination. Avoid touching either side of the connector as oil from your skin may be a source of contamination as well.
3. Visually inspect the terminal bearing surfaces of the flat wire circuits for splits, cracks, or other imperfections that could cause poor terminal contact. Visually inspect the component side connector to ensure that all of the terminals are uniform and free of damage or deformation.
4. Insert the appropriate adapter from the on the flat wire harness connector in order to test the circuit in question.

Control Module/Component Voltage and Grounds

Poor voltage or ground connections can cause widely varying symptoms.

- Test all control module voltage supply circuits. Many vehicles have multiple circuits supplying voltage to a control module. Other components in the system may have separate voltage supply circuits that may also need to be tested. Inspect connections at the module/component connectors, fuses, and any intermediate connections between the voltage source and the module/component. A test lamp or a DMM may indicate that voltage is present, but neither tests the ability of the circuit to carry sufficient current. Operate the component to test the ability of the circuit to carry sufficient current. Refer to **Circuit Testing**, and **Power Distribution Schematics** .
- Test all control module ground and system ground circuits. The control module may have multiple ground circuits. Other components in the system may have separate grounds that may also need to be tested. Inspect grounds for clean and tight connections at the grounding point. Inspect the connections at the component and in splice packs, where applicable. Operate the component to

test the ability of the circuit to carry sufficient current. Refer to **Circuit Testing**, and **Ground Distribution Schematics** .

Temperature Sensitivity

- An intermittent condition may occur when a component/connection reaches normal operating temperature. The condition may occur only when the component/connection is cold, or only when the component/connection is hot.
- Freeze Frame, Failure Records, Snapshot, or Vehicle Data Recorder data may help with this type of intermittent condition, where applicable.
- If the intermittent is related to heat, review the data for a relationship with the following:
  - High ambient temperatures
  - Underhood/engine generated heat
  - Circuit generated heat due to a poor connection, or high electrical load
  - Higher than normal load conditions, towing, etc.
- If the intermittent is related to cold, review the data for the following:
  - Low ambient temperatures - In extremely low temperatures, ice may form in a connection or component. Inspect for water intrusion.
  - The condition only occurs on a cold start.
  - The condition goes away when the vehicle warms up.
- Information from the customer may help to determine if the trouble follows a pattern that is temperature related.
- If temperature is suspected of causing an intermittent fault condition, attempt to duplicate the condition. Refer to **Inducing Intermittent Fault Conditions** in order to duplicate the conditions required.

Electromagnetic Interference and Electrical Noise

Some electrical components/circuits are sensitive to electromagnetic interference (EMI) or other types of electrical noise. Inspect for the following conditions:

- A mis-routed harness that is too close to high voltage/high current devices such as secondary ignition components, motors, generator, etc. - These components may induce electrical noise on a circuit that could interfere with normal circuit operation.
- Electrical system interference caused by a malfunctioning relay, or a control module driven solenoid or switch - These conditions can cause a sharp electrical surge. Normally, the condition will occur when the malfunctioning component is operating.
- Improper installation of non-factory or aftermarket add on accessories such as lights, 2-way radios, amplifiers, electric motors, remote starters, alarm systems, cell phones, etc. - These accessories may create interference in other circuits while operating and the interference would disappear when the accessory is not operating. Refer to **Checking Aftermarket Accessories**.
- Test for an open diode across the A/C compressor clutch and for other open diodes. Some relays may contain a clamping diode.
- The generator may be allowing AC noise into the electrical system.

Incorrect Control Module

- There are only a few situations where reprogramming a control module is appropriate:
  - A new service control module is installed.
  - A control module from another vehicle is installed.
  - Revised software/calibration files have been released for this vehicle.

NOTE: **DO NOT re-program the control module with the SAME software/calibration files that are already present in the control module. This is not an effective repair for any type of concern.**

- Verify that the control module contains the correct software/calibration. If incorrect programming is found, reprogram the control module with the most current software/calibration. Refer to

Control Module References for replacement, setup, and programming.

INDUCING INTERMITTENT FAULT CONDITIONS

Special Tools

EL-25070 Heat Gun

For equivalent regional tools, refer to Special Tools .

WARNING: **Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:**

- **Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedure exactly as written may result in serious injury or death.

Many intermittent open or shorted circuits are affected by harness/connector movement that is caused by vibration, torque, bumps/rough pavement, etc. In order to duplicate the customer's concern, it may be necessary to manipulate the wiring harness if the malfunction appears to be vibration related. Manipulation of a circuit can consist of a wide variety of actions, including:

- Wiggling the harness
- Disconnecting a connector and reconnecting
- Stressing the mechanical connection of a connector
- Pulling on the harness or wire in order to identify a separation/break inside the insulation
- Relocating a harness or wires

All these actions should be performed with some goal in mind. For instance, with a scan tool connected, wiggling the wires may uncover a faulty input to the control module. The snapshot option would be appropriate here. Refer to Scan Tool Snapshot Procedure. Another option is, with the component commanded ON and OFF by the scan tool, to move related connectors and wiring and observe the component operation. With the vehicle ON, move related connectors and wiring while monitoring vehicle operation. If harness or connector movement affects the data displayed, component/system operation, or vehicle operation, inspect and repair the harness/connections as necessary.

You may need to load the vehicle in order to duplicate the concern. This may require the use of weights, floor jacks, jackstands, frame machines, etc. In these cases you are attempting to duplicate the concern by manipulating the suspension or frame. This method is useful in finding harnesses that are too short and their connectors pull apart enough to cause a poor connection. A DMM set to the Min/Max mode and connected to the suspect circuit while testing can yield desirable results. Refer to Testing for Electrical Intermittents.

Certainly, using the senses of sight, smell, and hearing while manipulating the circuit can provide good results as well.

There may be instances where circuit manipulation alone will not meet the required criteria for the fault condition to appear. In such cases it may be necessary to expose the suspect circuit to other conditions while manipulating the harness. Such conditions would include high moisture conditions, along with exceptionally high or low temperatures. The following discusses how to expose the circuit to these kinds of conditions.

High Temperature Conditions

If the complaint tends to be heat related, you can simulate the condition using the **EL-25070** heat gun.

Using the heat gun, you can heat up the suspected area or component. Manipulate the harnesses under high temperature conditions while monitoring the scan tool or DMM to locate the fault condition.

The high temperature condition may be achieved simply by test driving the vehicle at normal operating temperature. If a heat gun is unavailable, consider this option to enhance your diagnosis. This option does not allow for the same control, however.

Low Temperature Conditions

Depending on the nature of the fault condition, placing a fan in front of the vehicle while the vehicle is in the shade can have the desired effect.

If this is unsuccessful, use local cooling treatments such as ice or a venturi type nozzle (one that provides hot or cold air). This type of tool is capable of producing air stream temperatures down to -18Ã‚Â°C (0Ã‚Â°F) from one end and +71Ã‚Â°C (160Ã‚Â°F) from the other. This is ideally suited for localized cooling needs. In addition, circuit cooling spray can be used to cool down a component or circuit.

Once the vehicle, component, or harness has been sufficiently cooled, manipulate the harness or components in an effort to duplicate the concern.

Duplicating Failure Conditions

- If none of the previous tests are successful, attempt to duplicate and/or capture the failure conditions.
- Freeze Frame/Failure Records data, where applicable, contains the conditions that were present when the DTC set.
    1. Review and record Freeze Frame/Failure Records data.
    2. Clear the DTCs using the scan tool.
    3. Switch the vehicle power mode to Vehicle Off and wait 15 seconds.
    4. Operate the vehicle under the same conditions that were noted in Freeze Frame/Failure Records data, as closely as possible. The vehicle must also be operating within the Conditions for Running the DTC. Refer to Conditions for Running the DTC in the supporting text if a DTC is being diagnosed.
    5. Monitor DTC Status for the DTC being tested. The scan tool will indicate Ran, when the enabling conditions have been satisfied long enough for the DTC to run. The scan tool will also indicate whether the DTC passed or failed.
- An alternate method is to drive the vehicle with the DMM connected to a suspected circuit. An abnormal reading on the DMM when the concern occurs, may help you locate the concern.

TESTING FOR ELECTRICAL INTERMITTENTS

Special Tools

EL-39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to Special Tools .

WARNING: **This procedure should not be performed on high voltage circuits. Performing this procedure on high voltage circuits may result in serious injury or death.**

Perform the following procedures while wiggling the harness from side to side. Continue this at convenient points (about 6 inches apart) while watching the test equipment.

- Testing for Short to Ground
- Testing for Continuity
- Testing for a Short to Voltage

If the fault is not identified, perform the procedure below using the MIN MAX feature on the **EL-39200** DMM. This feature allows you to manipulate the circuit without having to watch the DMM. The DMM will generate an audible tone when a change is detected.

NOTE: **The DMM must be used in order to perform the following procedure since the DMM can monitor current, resistance or voltage while recording the minimum (MIN), and maximum (MAX) values measured.**

1. Connect the DMM to both sides of a suspected connector (still connected), or from one end of a suspected circuit to the other. Refer to **Troubleshooting with a Digital Multimeter** for information on connecting the DMM to the circuit.
2. Set the rotary dial of the DMM to the V (AC) or V (DC) position.
3. Press the range button of the DMM in order to select the desired voltage range.

   NOTE: **The 100 ms RECORD mode is the length of time an input must stay at a new value in order to record the full change.**

4. Select the MIN MAX function of the DMM. The DMM displays the 100 ms RECORD and emits an audible tone (beep).
5. Simulate the condition that is potentially causing the intermittent connection, either by wiggling the connections or the wiring, test driving, or performing other operations. Refer to **Inducing Intermittent Fault Conditions**.
6. Listen for the audible Min Max Alert which indicates that a new minimum or maximum value has been recorded.
7. Press the MIN MAX button until the MAX value is displayed and note the value.
8. Press the MIN MAX button until the MIN value is displayed and note the value.
9. Determine the difference between the MIN and MAX values.
   - If the variation between the recorded MIN and MAX voltage values is 1 V or greater an intermittent open or high resistance condition exists. Repair the condition as necessary.
   - If the variation between the recorded MIN and MAX voltage values is less than 1 V an intermittent open or high resistance condition does not exist.

SCAN TOOL SNAPSHOT PROCEDURE

Reviewing Stored Data in Global Diagnostic System (GDS)

Overview

A snapshot is a recording of what a control module on the vehicle was receiving for information while the snapshot is being made. A snapshot is used to analyze the data during the time a vehicle condition is current. In GDS 2 there is not a traditional snapshot as there has been in the past. GDS 2 saves all past VIN and diagnostic data for future viewing. GDS 2 automatically records data whenever the user views Module Diagnostics, Vehicle Diagnostics and/or Systems Diagnostics. Module Diagnostics includes DTC Data, Identification Information, Data Display, Control Functions and Configuration/Reset Functions. Vehicle Diagnostics includes Vehicle Wide DTCs. Systems Diagnostics includes Inspection/Maintenance Status and Inspection/Maintenance Information.

Reviewing Stored Data

The Review Stored Data function allows viewing and playing of previously recorded vehicle data. This information can be used in analysis of vehicle problems and detection of trigger error conditions. The graph function can be used to compare multiple parameters to see if a component is functioning properly. Recorded sessions can be selected for viewing by the following two methods:

- From the Home Page, click on Review Stored Data. In the Review Stored Data page, highlight a vehicle in the Sessions screen located in the upper pane and highlight the desired Stored Data in the lower pane, then click the Review button.
- The user can view stored data without ending a current on-vehicle diagnostic session by clicking the Vehicle Menu button (when active) or Back button until the Session Manager is displayed in the menu. This is used when a user is viewing live data and wants the quickest way to review the

data. Click on the Session Manager button. Highlight the desired Stored Data in the lower pane and click the Review button.

Stored Data Review Selections

The following information can be selected in the tabs at the top of the screen:

- Graphical Data Display - Allows a detailed review of parameter data. The buttons on the right side modify the graph data
- Diagnostic Data Display - Displays incoming information from the file. The current value of the parameters is displayed on the screen.
- Line Graph - Allows selected locked parameters to be graphed with parameters overlaid for data comparison. The current value of the parameters is displayed on the screen. Use the buttons on the right side to modify the graph data.
- Bookmarks - If bookmarks are present, this displays the Type, Description and Time of automatic and manually generated bookmarks.
- System Information - Displays the GDS 2 Software Version and MDI Serial Number used when the session was recorded.
- Selected Vehicle Configuration - Displays vehicle identifiers, such as transmission type, for the vehicle selected on the Stored Data Review screen in the Sessions field.
- RPO - Displays vehicle build information.

Graphical Data Display

On the Graphical Data Display tab there are multiple selections at the top of the page. The selections available are:

- Create Report - Opens and internet browser page where a data display report can be printed or saved for future reference.
- Unit Switch - Toggles graph units between English and metric.
- Lock - When a parameter is selected, clicking the lock button locks a selected parameter for viewing in the Line Graph tab. In the Line Graph tab, locked parameters are isolated and overlaid for data comparison.
- Up Arrow - Click the up arrow to move a highlighted parameter up a position on the list.
- Down Arrow - Click the down arrow to move a highlighted parameter down a position on the list.
- Save As - This selection is available in the Graphical Data Display and Diagnostic Data Display tabs. This allows the user to export the graph data to a worksheet for in depth analysis and to timestamp data.

Review Stored Data Functions

To review the session there are buttons at the bottom of the window to control the cursor. From left to right the buttons are:

- Insert Bookmark - This button allows the user to insert bookmarks anywhere along the timeline. This provision allows the user to record notes regarding the inserted bookmark.
- Return Bookmark - This button moves the cursor to the previous bookmark.
- Back - This button moves the cursor back 1 frame.
- Timeline Slider Control - This allows the user to slide and select any position on the Timeline required.
- Forward - This button moves the cursor forward 1 frame.
- Forward Bookmark - This button moves the cursor forward 1 bookmark.
- Bookmarks - Allows the user to toggle bookmark visibility ON and OFF.

Graphical Preference Selections

The vertical side bar on the right side of the screen in the Graphical Data Display and Line Graph tabs toggles the Graphical Selection Panel from hidden to visible. The graphical preference selections available are:

- Reset - Resets the graph display back to the initial standard GDS 2 setting.
- Grid Line Toggle - This toggle reverses the current state of showing or removing grid lines.
- Hash Mark Toggle - This toggle reverses the current state of showing or removing data acquisition points or hash marks.
- Horizontal Graph Compression - Compresses the scale of the graph horizontally.
- Horizontal Graph Expansion - Expands the scale of the graph horizontally.
- Vertical Graph Compression - Compresses the scale of the graph vertically.
- Vertical Graph Expansion - Expands the scale of the graph vertically.
- Move Centerline of Graph Up - Moves the centerline of the graph up incrementally.
- Move Centerline of Graph Down - Moves the centerline of the graph down incrementally.

CIRCUIT PROTECTION - FUSES

Special Tools

EL - 39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to **Special Tools** .

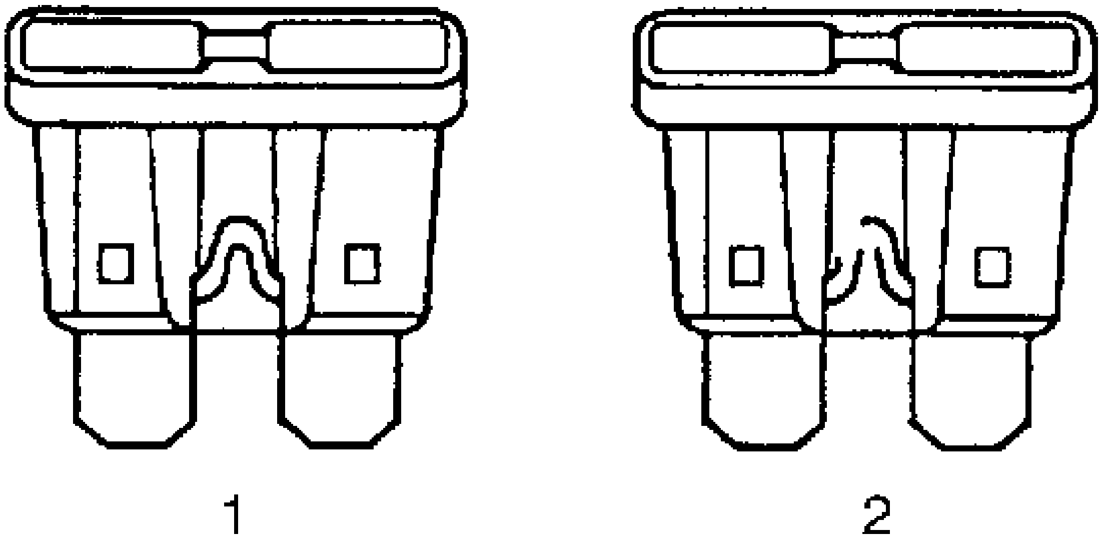

Fig. 3: Identifying Open Fuse Element
Courtesy of GENERAL MOTORS COMPANY

The fuse is the most common method of an automotive wiring circuit protection. Whenever there is an excessive amount of current flowing through a circuit the fusible element will melt and create an open or incomplete circuit. Fuses are a one time protection device and must be replaced each time the circuit is overloaded. To determine if a fuse is open, remove the suspected fuse and examine if the element in the fuse is broken (2). If not broken (1), also check for continuity using a Digital Multimeter (DMM) or a continuity tester. If the element is broken or continuity is suspect, replace the fuse with one of equal current rating.

Fuse Types

Current Rating Amperes	Color
Auto Fuses, Mini Fuses	
2	Gray
3	Violet
5	Tan
7.5	Brown
10	Red
15	Blue
20	Yellow

200	Black

CIRCUIT PROTECTION - CIRCUIT BREAKERS

A circuit breaker is a protective device that is designed to open the circuit when a current load is in excess of the rated breaker capacity. If there is a short or other type of overload condition in the circuit, the excessive current will open the circuit between the circuit breaker terminals. Two types of circuit breakers are used.

Circuit Breaker

This type opens when excessive current passes through it for a period of time. It closes again after a few seconds, and if the cause of the high current is still present, it will open again. The circuit breaker will continue to cycle open and closed until the condition causing the high current is removed.

Positive Temperature Coefficient (PTC) Circuit Breaker

This type greatly increases its resistance when excessive current passes through it. The excessive current heats the PTC device, as the device heats its resistance increases. Eventually the resistance gets so high that the circuit is effectively open. Unlike the ordinary circuit breaker the PTC unit will not reset until the circuit is opened, by removing the voltage from its terminals. Once the voltage is removed the circuit breaker will re-close within a second or 2.

CIRCUIT PROTECTION - FUSIBLE LINKS

Special Tools

EL - 39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to Special Tools .

NOTE: **When repairing a fusible link, fusible links cut longer than 225 mm (approximately 9 in) will not provide sufficient overload protection.**

Fusible link is wire designed to melt and break continuity when excessive current is applied. It is often located between or near the battery and starter or electrical center. Use a continuity tester or a Digital Multimeter (DMM) at each end of the wire containing the fusible link in order to determine if it is broken. If broken, it must be replaced with fusible link of the same gauge size.

WIRING REPAIRS

The Wiring Repairs section contains the following types of wiring repair information. Using these elements together will make wiring repair faster and easier:

- Flat Wire Repairs
- Serial Data Circuit Wiring Repairs
- High Temperature Wiring Repairs
- Heated Oxygen Sensor Wiring Repairs
- Wire to Wire Repair
- Splicing Inline Harness Diodes
- Splicing Twisted or Shielded Cable
- SIR/SRS Wiring Repairs

CONNECTOR REPAIRS

Connector Repairs contains a list of all connector repairs. The connector repairs are listed by the connector manufacturer and then by connector type. If the technician cannot identify the manufacturer of the connector, refer to Identifying Connectors below. Knowing the connector manufacturer will assist in finding the correct connector repair from the following list:

- Connector Position Assurance Locks
- Terminal Position Assurance Locks
- AFL/EPC Connectors
- Bosch Connectors (BSK) Bosch Connectors (0.64) Bosch Connectors (2.8 JPT) Bosch Connectors (ECM)
- Delphi Connectors (Weather Pack) Delphi Connectors (Push To Seat) Delphi Connectors (Pull To Seat) Delphi Connectors (Micro-Pack 100W) Delphi Connectors (Micro.64) Delphi Connectors (12-Way) Delphi Connectors (Steering Gear)
- FCI Connectors (Lever Lock) FCI Connectors (SIR)
- FEP Connectors (Steering Gear)
- JST Connectors
- Kostal Connectors (Glow Plug Control Module) Kostal Connectors (Transmission)
- Molex Connectors (Lever Lock) Molex Connectors (SIR)
- Sumitomo Connectors
- Tyco/AMP Connectors (CM 42-Way) Tyco/AMP Connectors (Sensor) Tyco/AMP Connectors (0.25 Cap) Tyco/AMP Connectors (43-Way) Tyco/AMP Connectors (Door Module) Tyco/AMP Connectors (Seat) Tyco/AMP Connectors (102-Way Inline) Tyco/AMP Connectors (SIR)
- Yazaki Connectors (2-Way) Yazaki Connectors (16-Way)

- [Repairing Connector Terminals (Terminated Lead Repair)](#) [Repairing Connector Terminals (Terminal Repair)](#)

Connector Anatomy

10	Connector Housing
11	Inner Connector

Identifying Connectors

Knowing the connector manufacturer is helpful when trying to locating the correct connector repair procedure. There are many different connector designs used on GM vehicles and it is sometimes difficult to identify the connector manufacturer. The information in this document should help with the identification of connector manufactures.

The following connector manufacturers make most of the connectors found in GM vehicles:

- AFL/EPC (Alcoa Fujikura Ltd./Engineered Plastics Components)
- Bosch
- Delphi
- FCI (Framatome Connectors International)
- JAE (Japan Aviation Electronics)
- JST (Japan Solderless Terminals)
- Kostal
- Molex
- Sumitomo
- Tyco/AMP
- Yazaki

Identifying the manufacturer of a connector is often difficult. When trying to determine the manufacturer of a connector, look for specific identifying marks that are unique to that connector supplier. Most of these identify marks are hard to find or see. Check the connector carefully and refer to the information below for pictures and descriptions of connector identification markings.

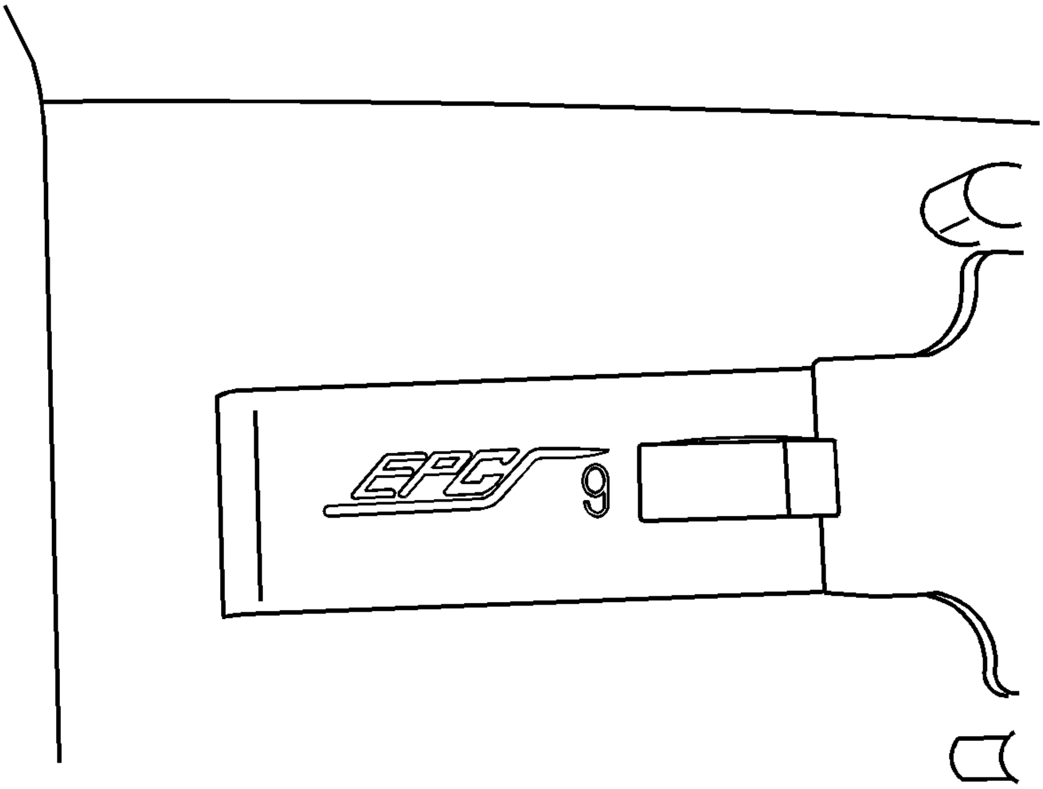

Fig. 5: View Of EPC Identification On Connector Body
Courtesy of GENERAL MOTORS COMPANY

- Most of AFL's connectors have EPC on their connector body. Some of the smaller connectors will not have any markings on them.

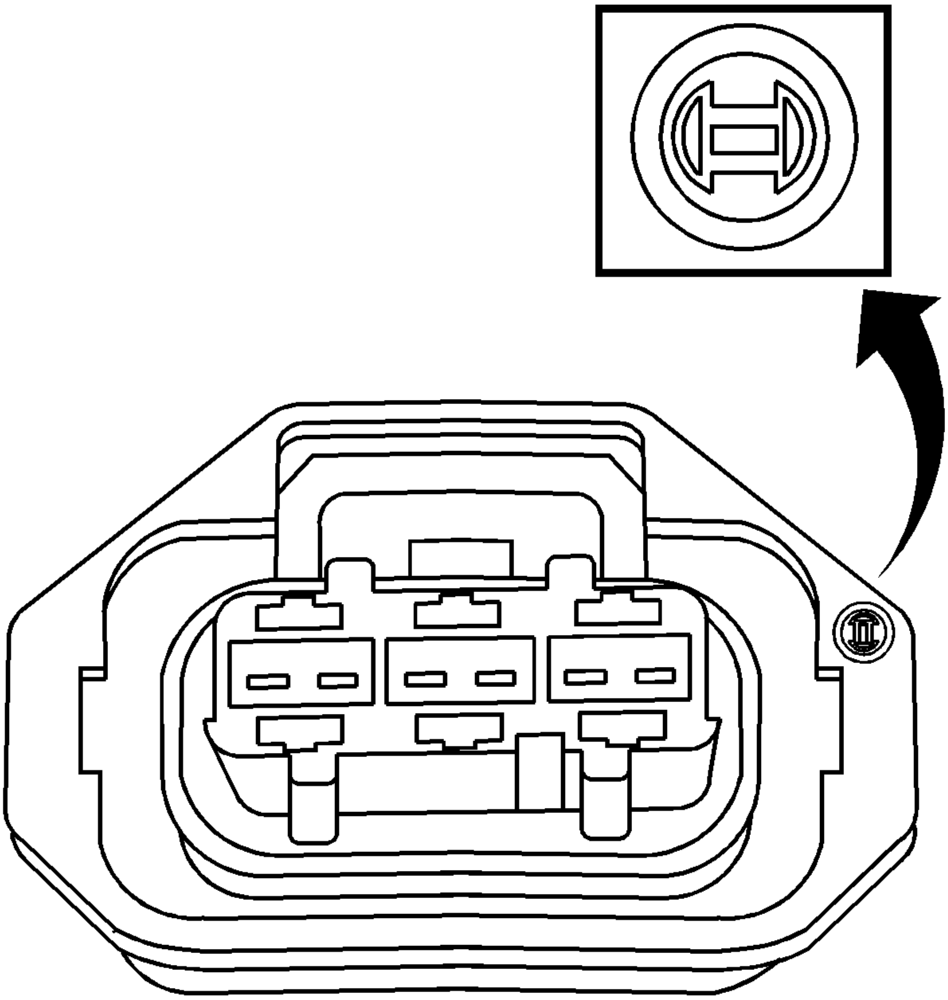

Fig. 6: View Of Bosch Identification On Connector Body
Courtesy of GENERAL MOTORS COMPANY

- In some cases Bosch will actually be printed on the connector. If Bosch does not appear on the connector, look for the Bosch logo. The Bosch logo is a circle with a blunted arrow inside. This logo can appear anywhere on the connector and is often very small.

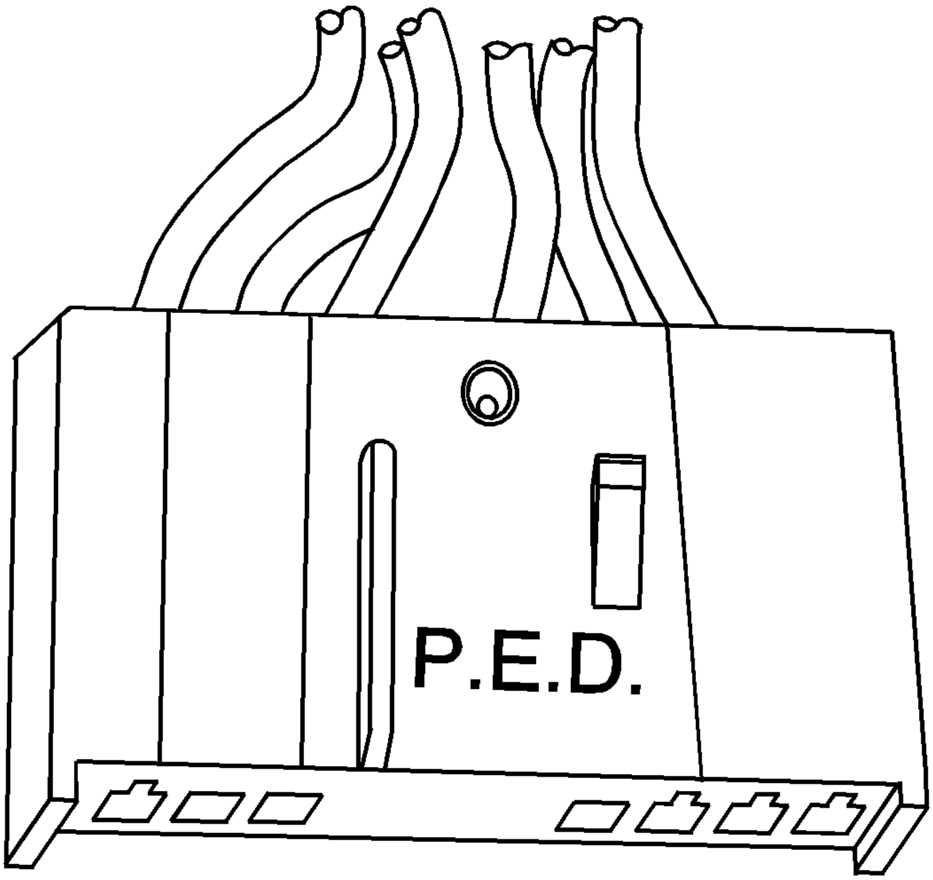

Fig. 7: View Of PED Identification On Connector Body
Courtesy of GENERAL MOTORS COMPANY

- In some cases Delphi will actually be printed on the connector. If Delphi is not printed on the connector, look for PED. In both cases there is no specific orientation for Delphi or PED and they can appear anywhere on the connector.

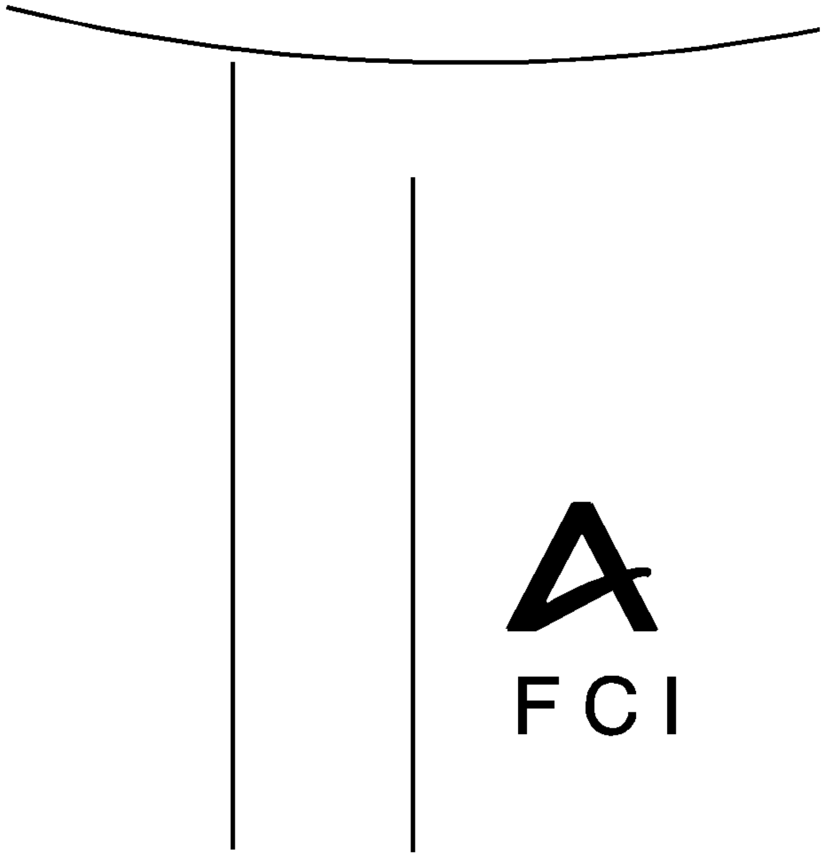

Fig. 8: View Of FCI Identification On Connector Body
Courtesy of GENERAL MOTORS COMPANY

- FCI connectors may have the FCI logo on their connectors. The logo is the letters FCI with an "A" above it.

- JAE connector have JAE in small letters on their connectors.

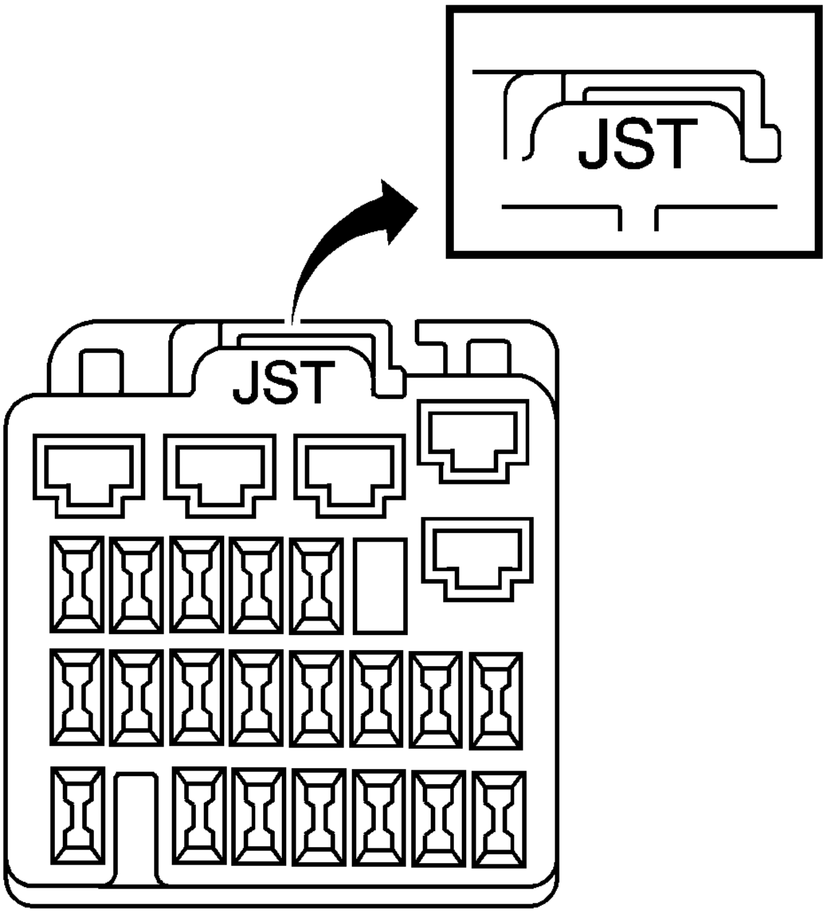

Fig. 10: View Of JST Identification On Connector Body
Courtesy of GENERAL MOTORS COMPANY

- JST connectors have JST in small letters on their connectors, similar to that above. The location of the logo will vary with the connector size and style.

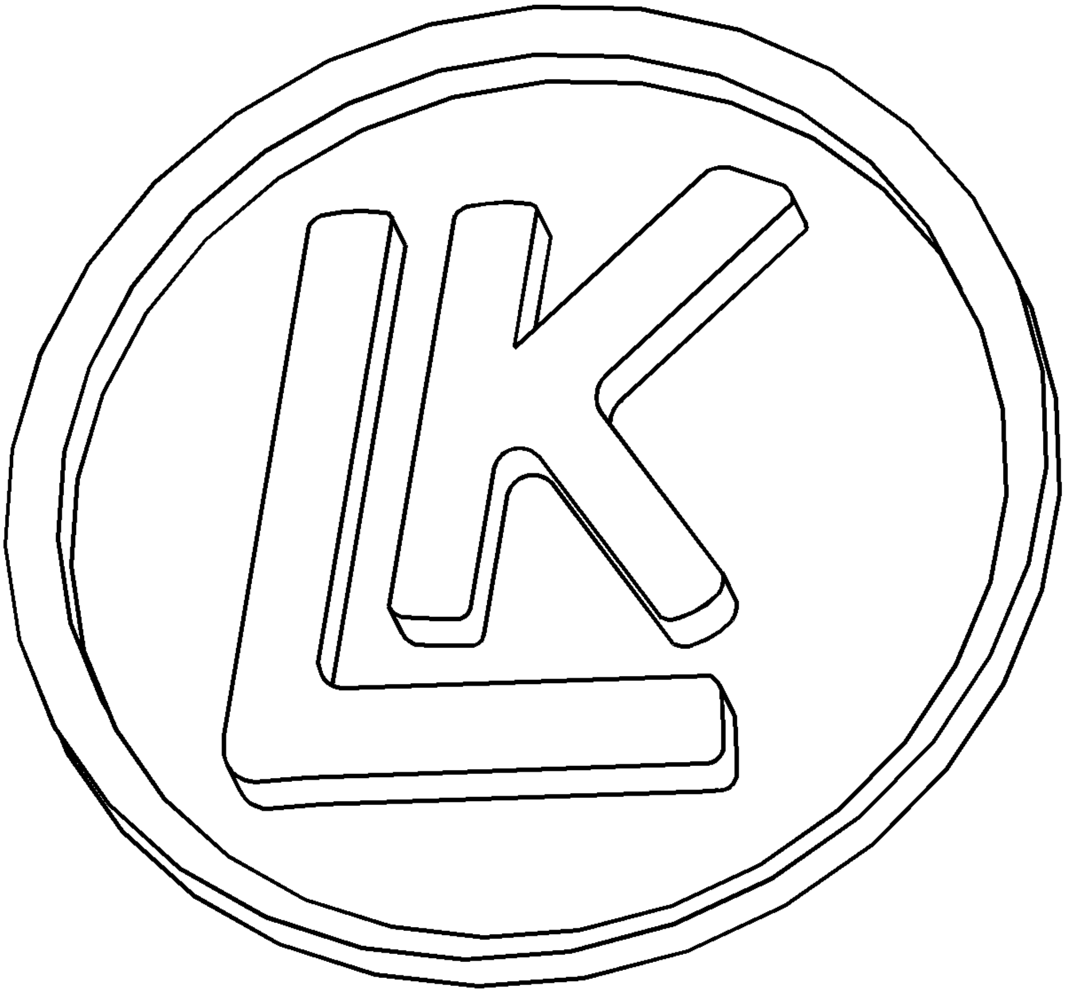

Fig. 11: View Of Kostel Connector Identifier
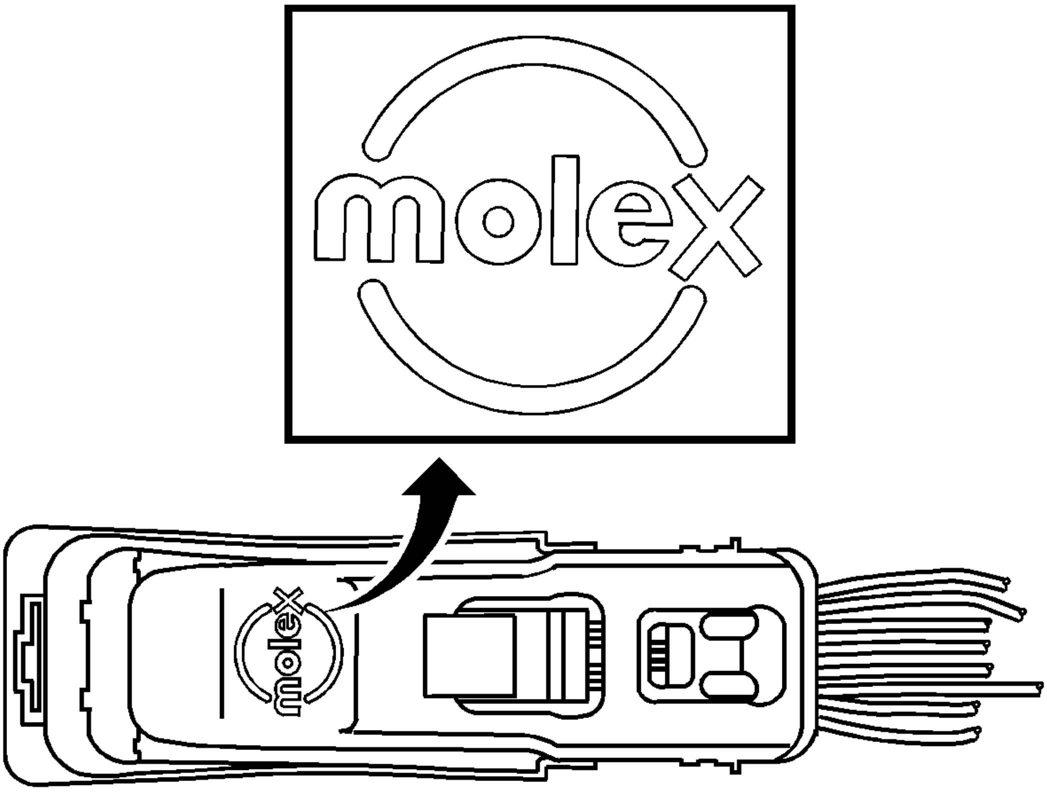
Courtesy of GENERAL MOTORS COMPANY

- Kostel has an "LK" with a circle around it. These connector are usually used as a transmissions connection.



molex
molex

Fig. 12: View Of Molex Identification On Connector Body
Courtesy of GENERAL MOTORS COMPANY

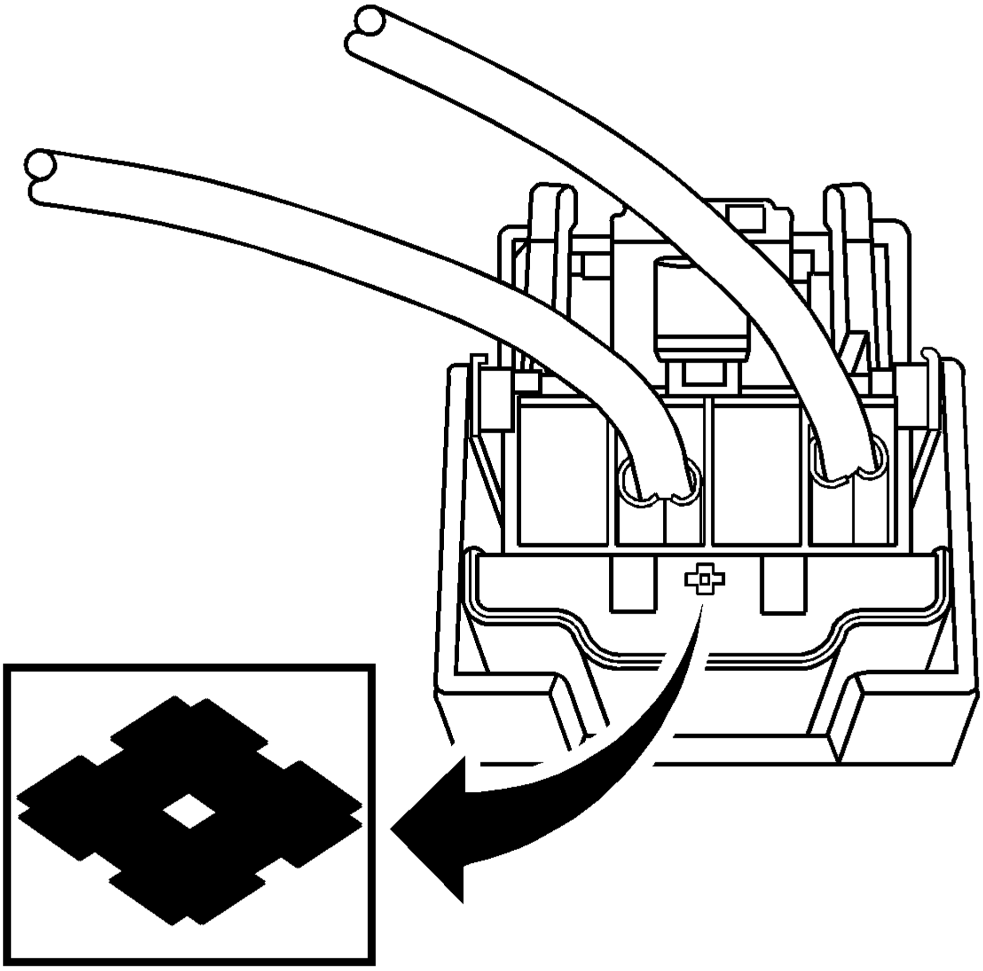


Fig. 13: Sumitomo Identification On Connector Body
Courtesy of GENERAL MOTORS COMPANY

- Most Molex connectors will have the Molex logo on the dresscover of the connector. In some cases the connectors may have MX followed by another letter. The third letter indicates where the connector was made. A connector with MXD is a Molex connector made in Detroit.

  Sumitomo has a unique symbol on their connector and possibly a part number. The symbol is similar to that of a diamond lying on its side, similar to that shown. The logo could appear anywhere but the most common place is at the wire side of the housing.

- Tyco/AMP has many different and unique connector designs. Some may or may not have identifiable marks on them.

2017 ACCESSORIES & EQUIPMENT

Wiring Systems and Power Management - Repair Instructions - Bolt EV

REPAIR INSTRUCTIONS

REPAIRING DAMAGED WIRE INSULATION

WARNING: **In order to reduce the risk of personal injury, loss of high voltage isolation to ground and higher system impedance, do not attempt to repair any HV wiring, connector, or terminal that is damaged. High voltage coaxial type cables are not repairable. Never attempt to repair a coaxial type cable. The entire cable/harness or component must be replaced. In order to maintain system integrity and personal safety, never attempt to repair any high voltage wiring, cables, or terminals. Performing this procedure on high voltage circuits may result in serious injury or death.**

If the wire insulation has been chafed, or broken, enough to show the conductive portion of the wire, and the wire is not damaged, determine the length of insulation that needs to be repaired. If the repair is less than 280 mm (11 in), cut the wire within the damaged area. Then slide the appropriate heat shrink tubing (listed below) over the wire, and repair the wire by splicing the wires together. Refer to **Wire to Wire Repair**. Once the wire is spliced together slide heat shrink tubing over the damaged area and apply heat to seal the repaired wire.

If the wire is damaged, or the damaged area is larger than 280 mm (11 in), then replace the damaged wire by splicing in a new section of wire. Refer to **Wire to Wire Repair**.

GM Part Number	Diameter		Description	Color	Length	
	Metric	English			Metric	English
12355003	9.5 mm^2	0.375 in	Tubing, Shrink 3/8	Black	305 mm^2	12 in
12355005	12.7 mm^2	0.5 in	Tubing, Shrink 1/2	Black	305 mm^2	12 in

COAXIAL CABLE REPAIRS

The GM global coaxial cable repair strategy uses coaxial cables, connectors and jumpers to repair coaxial cables. The intent is to install the new service cable in vehicle, but removal of the old cable is not necessary. There are several repair scenarios:

- New cables, jumpers, and connector housing are required.
- Only new cables are required while it is possible to reuse the existing connector housing in vehicle. A jumper may or may not be needed.
- Only new connector housing are required, while it is possible to reuse the existing cable in the vehicle.
- A new cable would need to be installed from source to destination and by-pass the inline connector in some cases when an inline connector is unrepairable (Example: a cracked male end of a 1-way connector).

Coaxial Cable Kits

Four different kits will be available to repair coaxial cables. Components of each kit cannot be ordered separately from the kit.

- **Communication Interface Module Antenna Cable Kit** (Kit # 13581174) is used to repair Cellular coaxial cables. This kit uses RG58 low loss coaxial cables that are available in four lengths. The coaxial cables can be attached together in various lengths to closely match the length of the faulty/damaged coaxial cable.
- **Digital Radio and Vehicle Locator Antenna Coaxial Cable Kit** (Kit # 13581173) is used to repair XM and GPS coaxial cables. For vehicles that have a combined GPS and Cellular/OnStar signal on one cable, use Kit # 13581174. This kit uses RG316 low loss coaxial cables that are available in three lengths. The coaxial cables can be attached together in various lengths to closely match the length of the faulty/damaged coaxial cable.
- **Digital Radio, Mobile Telephone and Vehicle Locator Antenna Coaxial Cable Kit** (Kit # 19119056) is used with OnStar, XM, and GPS cables. This kit consists of jumpers and connectors. The jumpers are used to adapt different types of connectors together (to attach 2-way and 3-way connector onto the long 7, 5, and 3 foot cables). The connectors are used to replace existing connectors. The 1-way and 2-way connectors in the kit are in water-blue color (different than what the vehicle is built with) and are non-keyed (universal fit). The 3-way connectors in the kit are in the same color as in the vehicle.
- **Communication Interface Module Antenna Cable Kit** (Kit # 22803854) is used for the OnStar module on some vehicles built before the 2011 model year.

Coaxial Cable Repair Kits

Repair Kit Name	Description
Communication Interface Module Antenna Cable Kit (Kit # 13581174)	RG58 coaxial cable with female/female connectors - 7ft/2.1m
	RG58 coaxial cable with female/male connectors - 5ft/1.5m
	RG58 coaxial cable with female/male connectors - 3.5ft/1.1m
	RG58 coaxial cable with female/male connectors - 3.5ft/1.1m
Digital Radio and Vehicle Locator Antenna Coaxial Cable Kit (Kit # 13581173)	RG316 coaxial cable with female/female connectors - 7ft/2.1m
	RG316 coaxial cable with female/male connectors - 5ft/1.5m
	RG316 coaxial cable with female/male connectors - 3.5ft/1.1m

Repair Kit Name		Description
Digital Radio, Mobile Telephone and Vehicle Locator Antenna Coaxial Cable Kit (Kit # 19119056)	3-way Gen 1 sub-kit	1-way to 3-way Gen 1 jumper for female connector - Part # 13581154 - 4in/10cm 1-way to 3-way Gen 1 jumper for male connector - Part # 19119052 - 4in/10cm
		White female connector
		White male connector
		Blue female connector
		Blue male connector
	3-way Gen 2 sub-kit	1-way to 3-way Gen 2 jumper for female connector - Part # 13581155 - 4in/10cm 1-way to 3-way Gen 2 jumper for male connector - Part # 19119058 - 4in/10cm
		Tan female connector
		Tan male connector
		Gray female connector
		Gray male connector
	2-way Gen 1 sub-kit	1-way to 2-way Gen 1 jumper for female connector - Part # 13581156 - 4in/10cm
		Water-blue female connector
	2-way Gen 2 sub-kit (wide)	1-way to 2-way Gen 2 jumper for female connector - Part # 13581157 - 4in/10cm
		1-way to 2-way Gen 2 jumper for male connector - Part # 13581158 - 4in/10cm
		Water-blue female connector
		Water-blue male connector
	2-way Gen 2 and 3 sub-kit (narrow)	1-way to 2-way Gen 2 and 3 jumper for female connector - Part # 13582468 - 4in/10cm
		Use the 1-way to 2-way Gen 2 jumper for female connector 19119058 - 4in/10cm from the 2-way Gen 2 sub-kit.
		Water-blue female connector
		Water-blue male connector
	Right-angle jumper with water-blue universal 1-way connector - 4in/10cm	
Communication Interface Module Antenna Cable Kit (Kit # 22803854)		1-way to mini UHF jumper - 4in/10cm

Connector Housing Repair Procedure

The connector housings (available in Digital Radio, Mobile Telephone and Vehicle Locator Antenna Coaxial Cable Kit) are available for 1-way housings, 2-way housings and 3-way housings. Determine the connector housing required:

1-way housing

No change to the service coaxial cable is necessary in order to install the new coaxial cable into the vehicle.

2-way housing

A 4-inch jumper is required.

1. Determine the appropriate generation (1, 2, or 3) and/or size (12.7mm or 8mm) of the 2-way housing that is in the vehicle.
2. Remove the faulty/damaged coaxial cable from the 2-way connector housing by removing the terminal position assurance (TPA) from the connector housing and then slide the cable out of the connector.

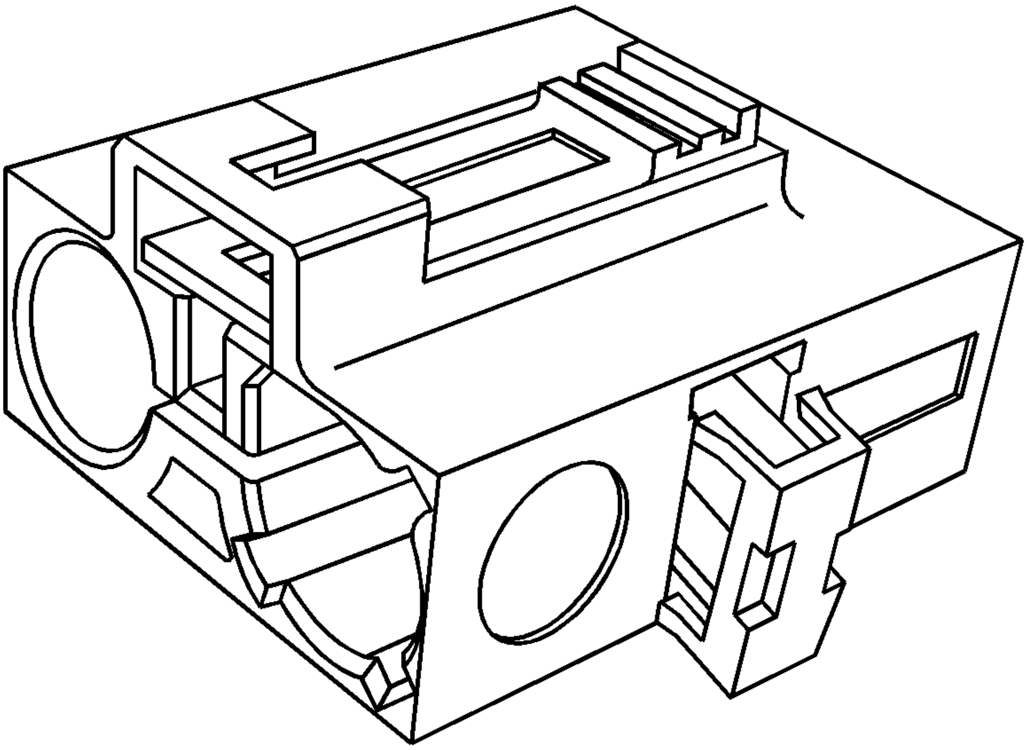

Fig. 1: Connector Housing
Courtesy of GENERAL MOTORS COMPANY

3. Install the new service coaxial cable into the vehicle. Use the 4-inch jumper for the appropriate 2-way connector housing to connect the new service coaxial cable to the connector housing.
4. If the issue is found to be the connector housing and not cable, a new connector housing may be installed while reusing all other components.

3-way housing

A 4-inch jumper is required.

1. Determine the appropriate generation (1 or 2) and keyed 3-way connector housing based on the connector housing color.
2. Note the locations of each of the cables in 3-way housing, as it is important for new cables be placed in the appropriate terminal location in the new connector. The connector housing colors are not interchangeable.
3. Remove the faulty/damaged coaxial cable from the 3-way connector housing by using a pair of side/diagonal cutters to nip and break away the housing.

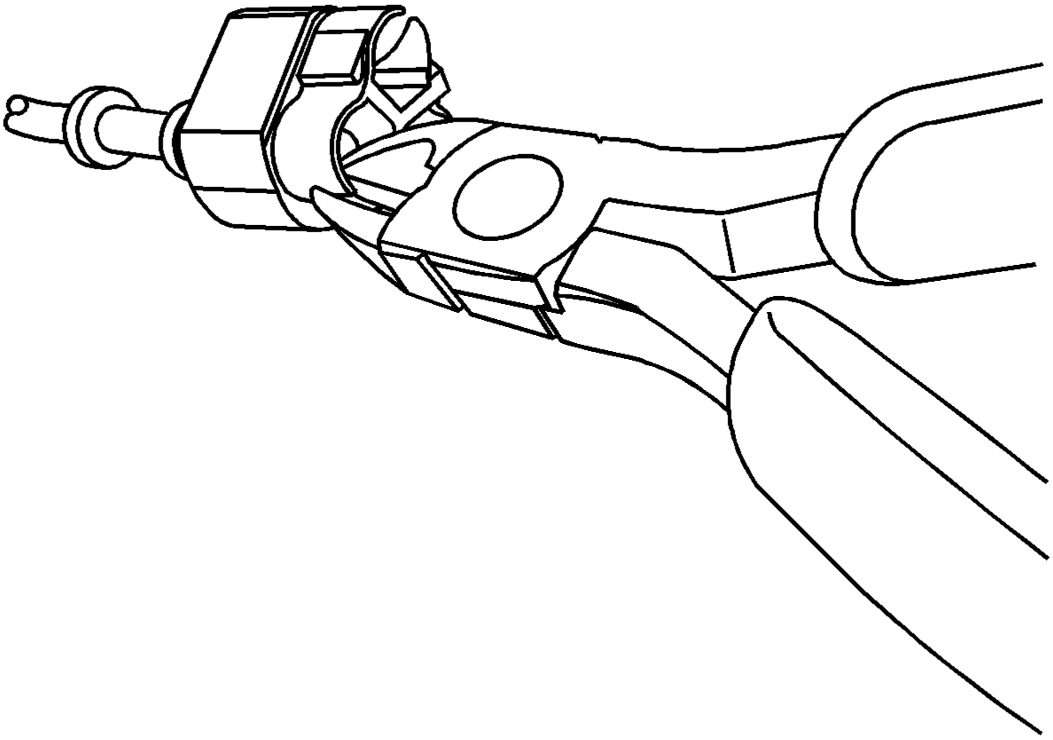

Fig. 2: Using Side/Diagonal Cutters To Nip And Break Away Connector Housing
Courtesy of GENERAL MOTORS COMPANY

4. Use caution not to damage the conductive ends of the coaxial cables inside the connector housing. Do not bend or force the terminal out or it could be damaged.

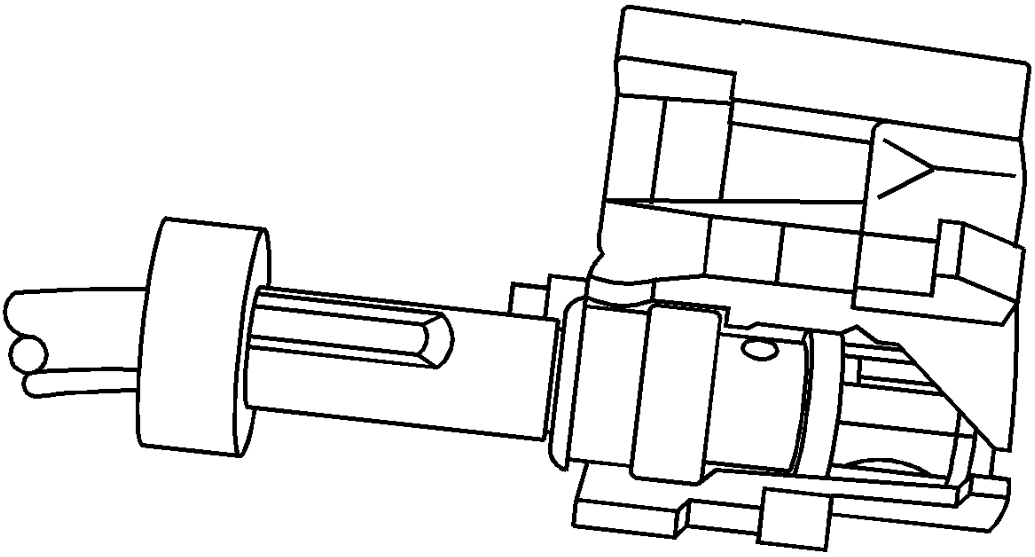

Fig. 3: Connecting New Service Coaxial Cable To New 3-Way Connector Housing
Courtesy of GENERAL MOTORS COMPANY

5. Install the new service coaxial cable into the vehicle. Use the 4-inch jumper for the appropriate color 3-way connector housing to connect the new service coaxial cable to the new 3-way connector housing.
6. If the issue is found to be the connector housing and not cable, a new connector housing may be installed while reusing all other components.

Coaxial Cable Repair Procedure

1. Identify the faulty/damaged coaxial cable.
2. Disconnect the faulty/damaged coaxial cable and leave it in the vehicle.
3. Identify the type of coaxial cable to be replaced and match up with the appropriate pieces to repair the damaged coaxial cable. Match up the type of coaxial cable, cable length and connector types. In some cases there may be extra length of cable left over.

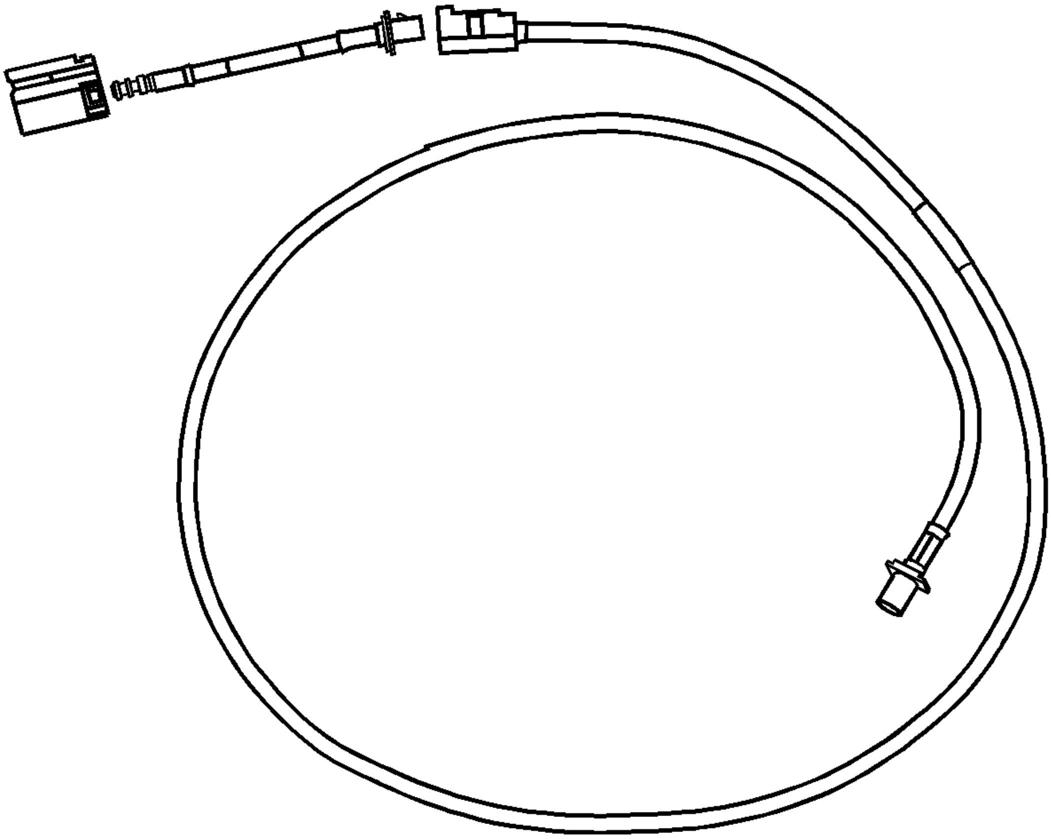

Fig. 4: Coaxial Cable
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Avoid routing the new coaxial cable near sharp edges that can damage the new coaxial cable.**

4. Install the new coaxial cable in the vehicle.

   Use tie-straps to attach the new service coaxial cable to existing harnesses or brackets. Use felt tape/foam to reduce rattles, as necessary.

   NOTE: **To avoid permanent damage, do not pinch the cable or bend it tighter than a 2 inch (5 centimeter) radius.**

5. Remove the faulty/damaged connectors, if applicable.
6. Install new connectors or jumpers, as needed. Refer to Connector Housing Repair Procedure.
7. Verify the repair by operating the system with the vehicle in Service Mode.

FLAT WIRE REPAIRS

The flat wire within the flex wiring harness is not serviceable. If an open or short exists within the flex wiring harness the complete harness must be replaced.

FOLDED-OVER WIRE REPAIR

Special Tools

- **EL-38125-10** Splice Sleeve Crimping Tool (non GMNA)
- **J-38125-5A** Ultra Torch Special Tool
- **J-38125-8** Splice Sleeve Crimping Tool (GMNA)

For equivalent regional tools, refer to **Special Tools** .

The GM global wire repair strategy uses connector assemblies (pigtails) and terminated leads to repair wiring harnesses.

To reduce and manage GM Service Parts proliferation, the service pigtails and terminated leads are designed with the largest wire gauge size that can be held by either the terminal or the connector housing.

The folded over wire repair technique, in which the copper wire strands are folded over before being installed into a splice sleeve, allows the service part to be used when repairing a smaller gauge size wire in a vehicle. This technique has passed all GM testing standards.

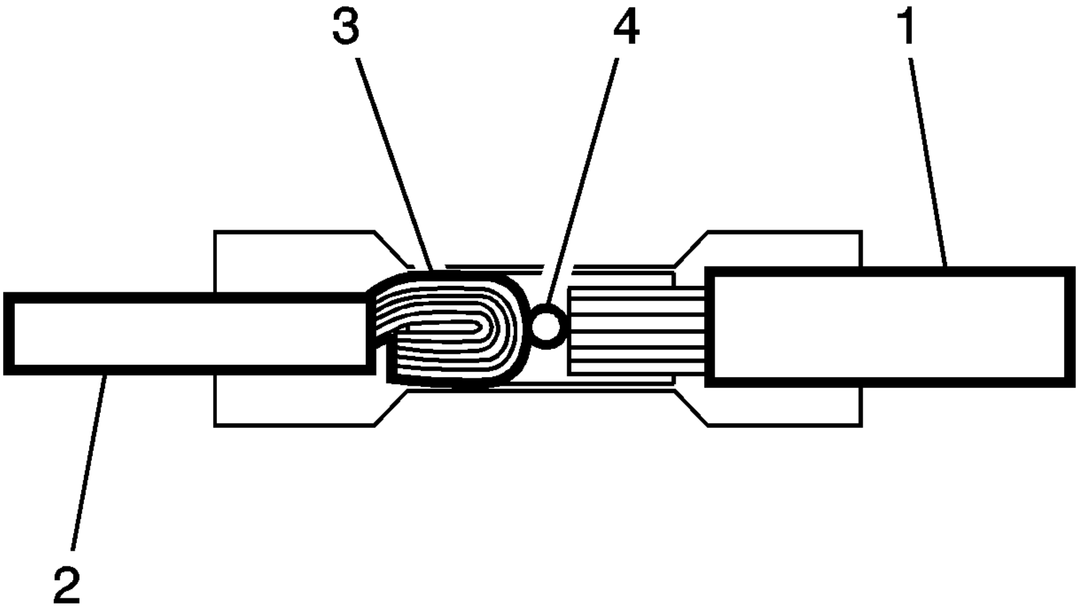

Fig. 5: View Of Stripped Wires In Splice Sleeve Connector
Courtesy of GENERAL MOTORS COMPANY

The larger harness size wires (1) will be placed in one side of the splice sleeve and match the splice sleeve closely in size. The wires are moved into the splice sleeve until they hit the stop (4) in the splice sleeve. The smaller harness size wires (2) will be placed in the other side of the splice sleeve. The smaller harness size wires will be folded over (3) to match up with the splice sleeve size.

Use the folded over wire repair for:

NOTE: **Increasing the amount of copper strands in the smaller gauge size will allow for a better crimp**

- Splicing wires of 0.35 mm or less (22, 24, 26 gauge sizes)

NOTE: **Vehicle side needs to be of same or less gauge size (not greater than the service part's gauge size)**

- Splicing wires of different gauges

Use the Service Information (SI) connector end-views to determine:

- Gauge size of wiring harness
- Recommended Repair: Terminated Lead or Pigtail

The following table lists the acceptable variance within the gauge size

Folded-Over Wire Selection Table

Harness Wire Gauge		**Connector Assembly (Pigtail) or Terminated Lead Wire Gauge Size**			
-		Salmon Color Splice Sleeve		Blue Color Splice Sleeve	Yellow Color Splice Sleeve
Metric	-	0.35 mm	0.5 - 0.8 mm	1.0 - 2.0 mm	3.0 - 6.0 mm
-	Wire Gauge (AWG)	22	20 - 18	16 - 14	12 - 10
0.13 mm	26	Fold Over Wire	Double Fold Over Wire	Not Acceptable	Not Acceptable
0.22 mm	24	Fold Over Wire	Fold Over Wire	Not Acceptable	Not Acceptable
0.35 mm	22	Wire to Wire	Fold Over Wire	Double Fold Over Wire	Not Acceptable
0.5 mm	20	Not Acceptable	Wire to Wire	Fold Over Wire	Not Acceptable
0.75 mm	-	Not Acceptable	Wire to Wire	Fold Over Wire	Double Fold Over Wire
0.8 mm	18	Not Acceptable	Wire to Wire	Fold Over Wire	Double Fold Over Wire
1.0 mm	16	Not Acceptable	Not Acceptable	Wire to Wire	Double Fold Over Wire
1.5 mm	-	Not Acceptable	Not Acceptable	Wire to Wire	Fold Over Wire
2.0 mm	14	Not Acceptable	Not Acceptable	Wire to Wire	Fold Over Wire
2.5 mm	-	Not Acceptable	Not Acceptable	Wire to Wire	Fold Over Wire
3.0-6.0 mm	12 - 10	Not Acceptable	Not Acceptable	Not Acceptable	Wire to Wire

Example

For an IP Harness of 0.22 mm (24 gauge on left side of table) wire size, the SI connector end-view recommends a pigtail with leads of 0.8 mm (18 gauge on the top of the table) with a salmon colored DuraSeal splice sleeve of 0.5 - 1.0 mm (20 - 16 gauge).

Follow these steps to use the folded over wire (1) technique on an IP Harness.

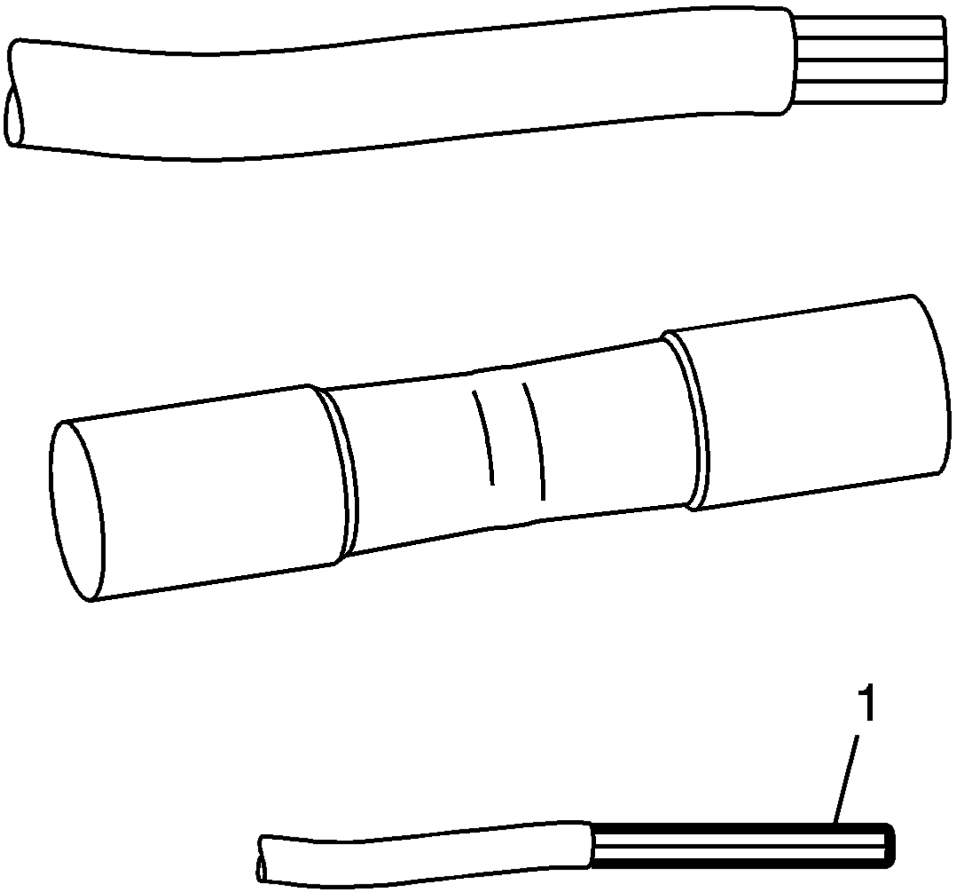

Fig. 6: View Of Stripped Wires
Courtesy of GENERAL MOTORS COMPANY

Strip twice the amount of insulation on the smaller (1) wire (IP Harness is the lower wire) than normally required. Normally, the terminated leads have 5 mm of insulation stripped off the wire.

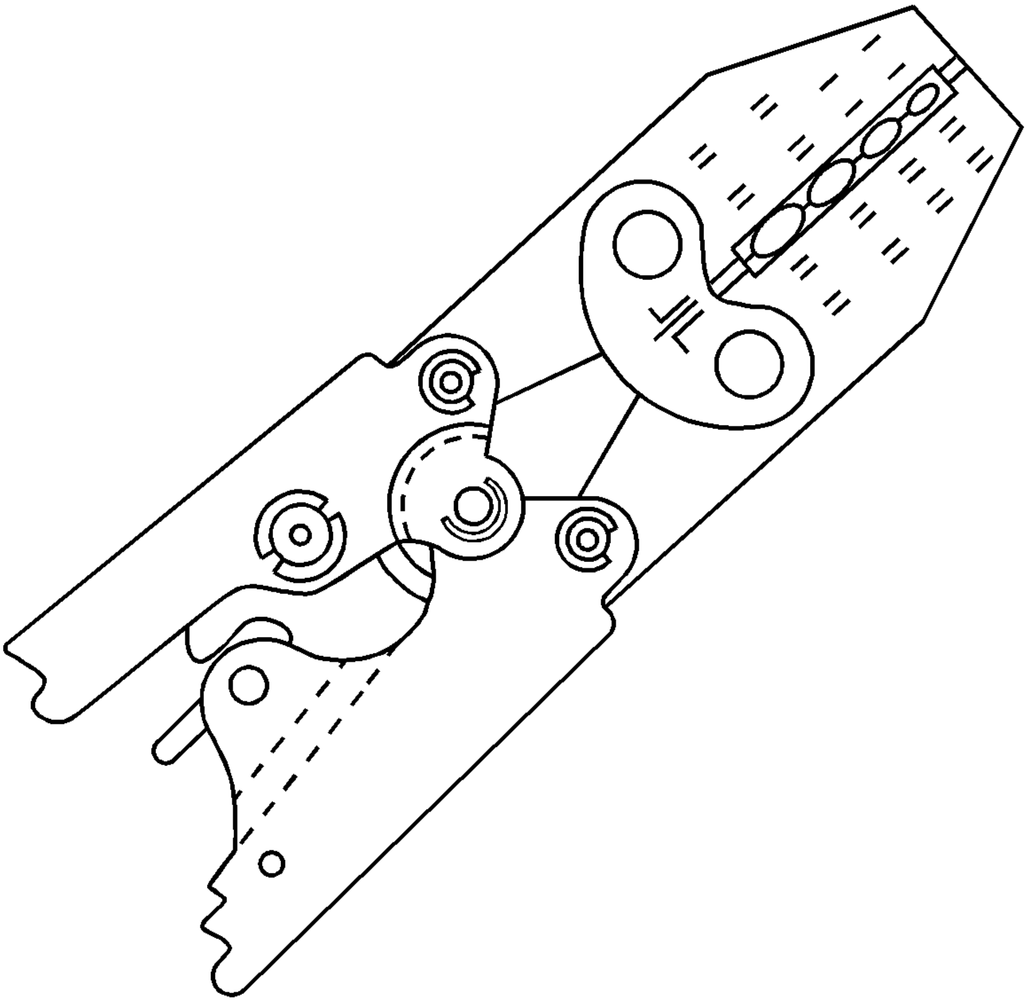

Fig. 7: Splice Sleeve Crimping Tool
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Use EL-38125-10 splice sleeve crimping tool (non GMNA) or J-38125-8 splice sleeve crimping tool (GMNA).**

1. For wiring repair, refer to **Wire to Wire Repair**.

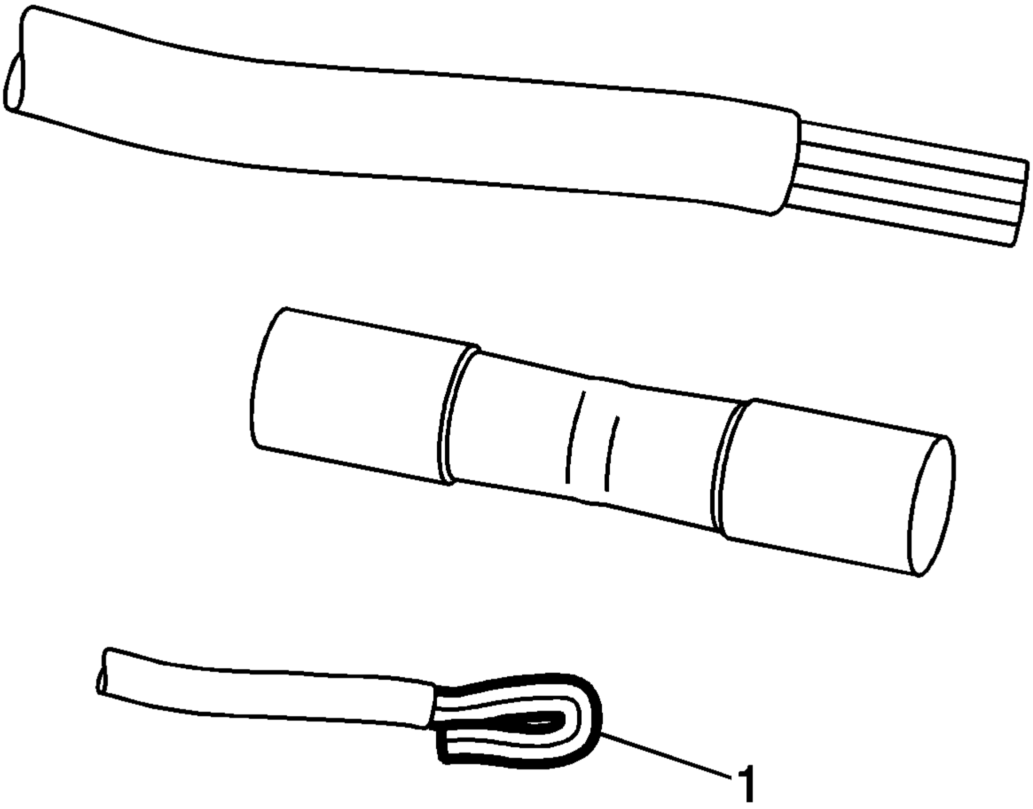

Fig. 8: View Of Twisted And Folded Wire To Length
Courtesy of GENERAL MOTORS COMPANY

2. Twist the wires before you fold them over to prevent the wire strands from opening up. Fold over the copper wire strands of the smaller (1) gauge wire so that it is the same length as the non-folded wire.

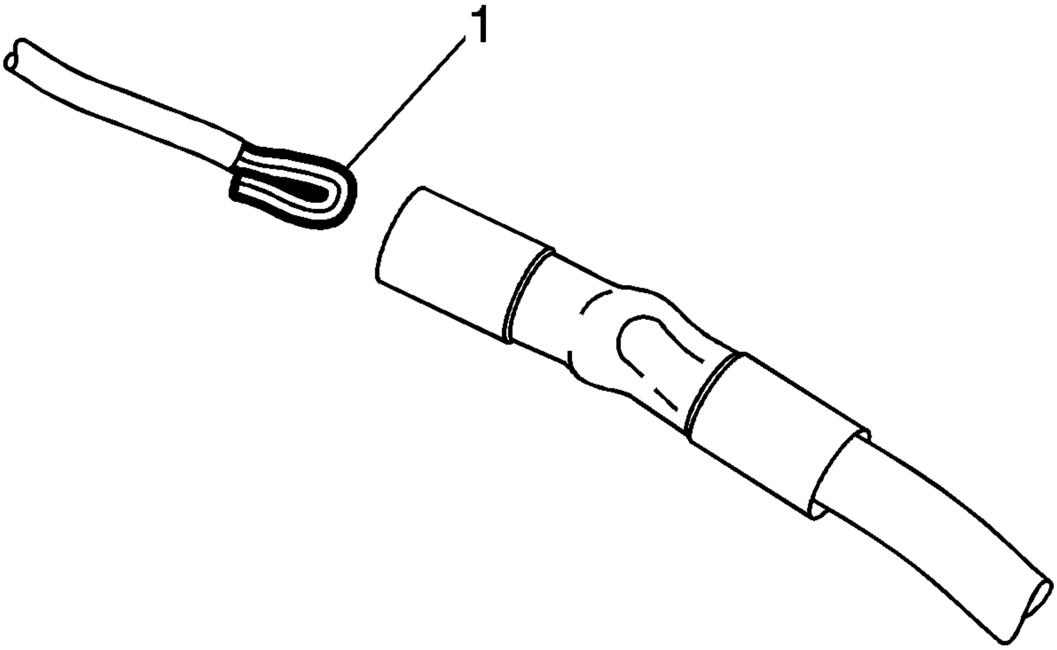

Fig. 9: View Of Folded Wire & Splice Sleeve
Courtesy of GENERAL MOTORS COMPANY

3. Insert the folded over wire (1) into the splice sleeve.

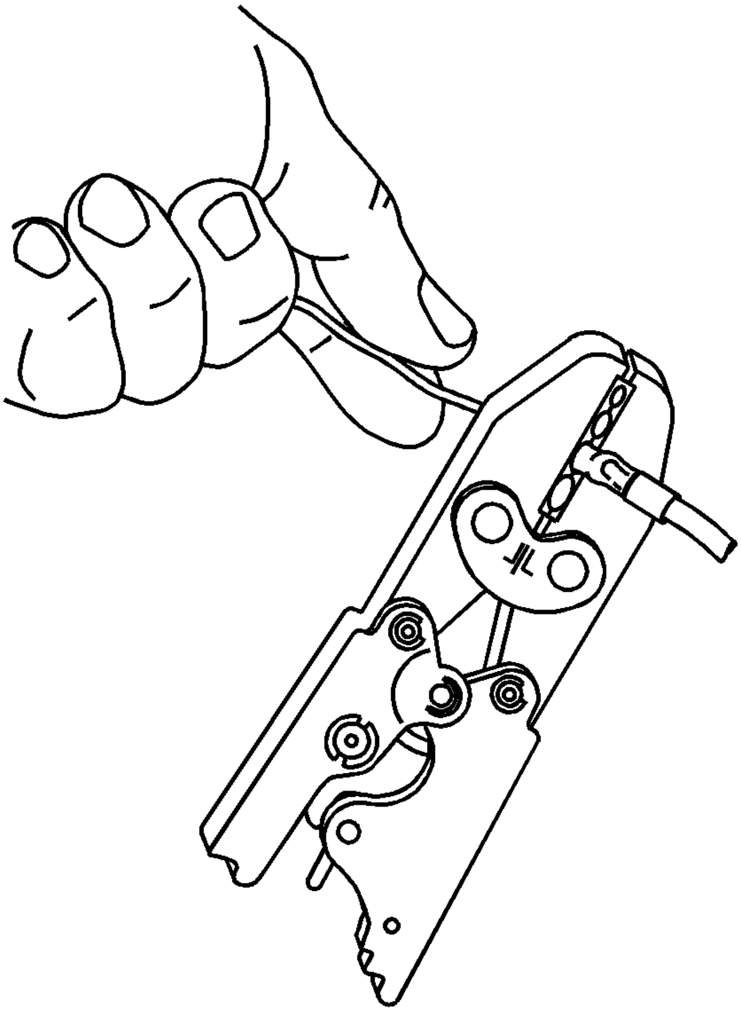

Fig. 10: Crimping The Splice Sleeve
Courtesy of GENERAL MOTORS COMPANY

4. Use the proper crimp tool to crimp the splice sleeve to the smaller wire (harness side of repair). Complete the crimp as usual (using the heat tool to shrink the tube).

SERIAL DATA CIRCUIT WIRING REPAIRS

Special Tools

- **EL-38125-10** Splice Sleeve Crimping Tool
- DuraSeal splice sleeves
- A wire stripping tool

For equivalent regional tools, refer to Special Tools .

The DuraSeal splice sleeves have the following 2 critical features:

- A special heat shrink sleeve environmentally seals the splice. The heat shrink sleeve contains a sealing adhesive inside.
- A cross hatched (knurled) core crimp provides necessary contact integrity for the sensitive, low energy circuits.

The GM Local Area Network (GMLAN) System requires special wiring repair procedures due to the sensitive nature of the circuitry. Follow the specific procedures and instructions when working on GMLAN connectors and terminals.

GMLAN Repairs

NOTE:	**When making a repair to any GMLAN network, the original wire length after the repair must be the same length as before the repair. If the network is a**

twisted pair, the twist must be maintained after the repair is completed.

GMLAN has 2 types of networks, low speed and high speed. Low speed GMLAN has a single wire and works at slow speeds. High speed GMLAN has 2 wires in a twisted pair and works at higher speeds. For more information on GMLAN, refer to **Data Link Communications Description and Operation** .

GMLAN Connector Terminal Repair

NOTE: **A terminated lead can be used to replace damaged connector terminals for both high speed and low speed GMLAN systems. When making a connector terminal repair on a GMLAN high speed system with twisted pair wires, do not untwist the wires more than necessary to make the repair.**

If the individual terminals are damaged on any GMLAN connection, use the appropriate connector repair procedure in order to repair the terminal. Refer to **Connector Repairs** for the appropriate connector repair procedure.

GMLAN Wire Repair

NOTE: **Refer to Wiring Repairs in the service information connector end views or the vehicle schematics in order to determine the correct wire size for the circuit you are repairing. You must obtain this information in order to ensure circuit integrity.**

If any wire except the pigtail is damaged, repair the wire by splicing in a new section of wire of the same gauge size (0.5 mm^2 , 0.8 mm^2 , 1.0 mm^2 etc.). Use the DuraSeal splice sleeves and **EL-38125-10** tool. For wiring repair, refer to **Wire to Wire Repair**.

Media Oriented Systems Transport (MOST) Wiring Repair

NOTE: **If harness repair/analysis is performed, MOST bus Twist Pair unshielded wire should be 0.35 mm^2 (22 AWG) wire with at least one twist per each 1 45/64 inch (45 mm) and must not be untwisted for more than 3 15/16 of an inch (10 cm).**

The following conditions need to be met to ensure a valid continuity:

- Untwisted length for all MOST 50 circuits at each wire harness connector should be no longer 50 mm max (25 mm preferred).
- When wire repairs are made, a minimum 25 twists/meter for all MOST 50 circuits.
- MOST 50 has specific receive and transmit I/O.

The transmit of one module is connected to receive of the next module in ring topology.

HEATED OXYGEN SENSOR WIRING REPAIRS

CAUTION: **Do not solder repairs under any circumstances as this could result in the air reference being obstructed.**

If the heated oxygen sensor pigtail wiring, connector, or terminal is damaged the entire oxygen sensor assembly must be replaced. Do not attempt to repair the wiring, connector, or terminals. In order for the sensor to function properly it must have a clean air reference. This clean air reference is obtained by way of the oxygen sensor signal and heater wires. Any attempt to repair the wires, connectors or terminals could result in the obstruction of the air reference and degrade oxygen sensor performance.

The following guidelines should be used when servicing the heated oxygen sensor:

- Do not apply contact cleaner or other materials to the sensor or vehicle harness connectors. These materials may get into the sensor, causing poor performance. Also, the sensor pigtail and harness wires must not be damaged in such a way that the wires inside are exposed. This could provide a path for foreign materials to enter the sensor and cause performance problems.

- Neither the sensor nor vehicle lead wires should be bent sharply or kinked. Sharp bends, kinks, etc., could block the reference air path through the lead wire.
- Do not remove or defeat the oxygen sensor ground wire (where applicable). Vehicles that utilize the ground wire sensor may rely on this ground as the only ground contact to the sensor. Removal of the ground wire will also cause poor engine performance.
- To prevent damage due to water intrusion, be sure that the peripheral seal remains intact on the vehicle harness connector.

HIGH TEMPERATURE WIRING REPAIRS

NOTE: **All wiring repairs need to be 200 mm from the heat zone. Areas of consideration would be any area located near the exhaust manifolds, catalytic converter, exhaust pipes, and turbocharged engines.**

Items Required

- DuraSeal splice sleeves to crimp and seal connections
- High temperature SCT1 shrink tubing to protect the splice sleeves
- Terminated leads or pigtails
- The correct tools to remove the terminals from the connectors

Use high temperature bulk wire rated at 150Â°C (302Â°F) continuous temperature of the same or larger gauge size as the original wire when repair damage wire. Also replace any reflective tape that you remove during the repair.

High Temperature Wiring

Wiring that is exposed to high temperatures, 135Â°C (275Â°F) or higher, for prolonged periods of time may use materials i.e. wires, connectors, and shielding that has a higher heat rating than typical wiring. When making a repair in a high temperature area observe the following:

- Use high temperature bulk wire rated at 150Â°C (302Â°F) continuous temperature to replace any damaged wire.
- Replace any heat shielding that is removed.
- Cover any DuraSeal splice sleeves with SCT1 shrink tubing.
- After making a wiring repair, ensure that the location of the wiring is not moved closer to the heat source.

Identifying High Temperature Wiring

NOTE: **High temperature areas would be areas located near exhaust manifolds, catalytic converters, exhaust pipes, and turbocharged engines.**

Wiring that is exposed to high temperature, 135Â°C (275Â°F) or higher, for prolonged periods of time need special considerations when making wiring repairs. Areas that may be exposed to higher temperatures can be identified by heat resistant materials that are being used in those areas. These materials may include heat reflective tape and high temperature shrink tubing. Also conduit and other protective coverings may be used. Because conduit or similar coverings are used throughout the vehicle regardless of the temperature, it may be necessary for the technician to determine if an area is exposed to excessive heat before making a wiring repair.

SIR/SRS WIRING REPAIRS

NOTE: **Refer to SIR Service Precautions .**

For European Regions

CAUTION: **If the SIR/SRS wiring, connector, or terminal is damaged, the affected wiring harness must be replaced. Do not attempt to repair the wiring, connector, or terminals. Any attempt to repair the wires, connectors, or**

terminals could result in performance problems of the SIR/SRS System. Operations on restraint systems must only be performed by trained and qualified personnel.

For Non-European Regions

Special Tools

Splice Sleeve Crimping Tool, refer to **Special Tools** .

The Supplemental Inflatable Restraint (SIR) System/Supplemental Restraint System (SRS) requires special wiring repair procedures due to the sensitive nature of the circuitry. Follow the specific procedures and instructions when working with the SIR/SRS, and the wiring components, such as connectors and terminals.

SIR/SRS Connector Repair (Plastic Body and Terminal Metal Pin)

NOTE: **Do not use the terminals in the kit in order to replace damaged SIR/SRS system terminals. Use either an SIR/SRS pigtail or a terminated lead from the SIR Repair Kit Tray.**

The terminals in the SIR/SRS system are made with a special plating. This plating provides the necessary contact integrity for the sensitive, low energy circuits.

Pigtail repair packs are available for SIR/SRS connectors with eight or less terminals. Only the connector body is available for connectors with more than eight terminals. Terminated leads can be used to replace damaged terminals when replacing the connector body.

SIR/SRS Component Wire Pigtail Repair

NOTE: **Do not make wire, connector, or terminal repairs on components with wire pigtails.**

A wire pigtail is a wire or wires attached directly to the device, not by a connector. If a wiring pigtail is damaged, you must replace the entire component, with pigtail. The inflatable restraint steering wheel module coil is an example of a pigtail component.

SIR/SRS Wire Repair

CAUTION: **Do not install more than 2 DuraSeal splice sleeves per SIR deployment loop. A deployment loop consists of both wires from the K36 Inflatable Restraint Sensing and Diagnostic Module to the deployable component. If more than 2 DuraSeal splice sleeves are required for any SIR deployment loop, the complete circuit of the loop must be replaced. More than 2 DuraSeal splice sleeves per deployment loop may increase the resistance in the circuit causing a DTC to be set.**

NOTE: **Refer to Wiring Repairs in the service information connector end views or the vehicle schematics in order to determine the correct wire size for the circuit you are repairing. You must obtain this information in order to ensure circuit integrity.**

If any wire except the pigtail is damaged, repair the wire by splicing in a new section of wire of the same gauge size (0.5 mm, 0.8 mm, 1.0 mm etc.). Use the DuraSeal splice sleeves and the appropriate splice sleeve crimping tool. For wiring repair, refer to **Wire to Wire Repair**.

For connector position assurance (CPA), refer to **Connector Position Assurance Locks**.

For terminal position assurance (TPA), refer to **Terminal Position Assurance Locks**.

SPLICING INLINE HARNESS DIODES

Many vehicle electrical systems use a diode to isolate circuits and protect the components from voltage spikes. When installing a new diode use the following procedure.

1. Open the harness.
    - If the harness is taped, remove the tape.
    - To avoid wiring insulation damage, use a sewing seam ripper (available from sewing supply stores) in order to cut open the harness.
    - If the harness has a black plastic conduit, pull out the diode.
2. If the diode is taped to the harness, remove all of the tape.
3. Check and record the current flow direction and orientation of diode.
4. Remove the inoperative diode from the harness with a suitable soldering tool.

NOTE: **If the diode is located next to a connector terminal remove the terminal(s) from the connector to prevent damage from the soldering tool.**

5. Carefully strip away a section of insulation next to the old soldered portion of the wire(s). Do not remove any more than is needed to attach the new diode.
6. Check current flow direction of the new diode, being sure to install the diode with correct bias. Reference the appropriate service manual wiring schematic to obtain the correct diode installation position.
7. Attach the new diode to the wire(s) using 60/40 rosin core solder. Before soldering attach some heat sinks (aluminum alligator clips) across the diode wire ends to protect the diode from excessive heat. Follow the manufacturer's instruction for the soldering equipment.
8. Reinstall terminal(s) into the connector body if previously removed.

NOTE: **To prevent shorts to ground and water intrusion, completely cover all exposed wire and diode attachment points with tape.**

9. Tape the diode to the harness or connector using electrical tape.

SPLICING TWISTED OR SHIELDED CABLE

WARNING: **In order to reduce the risk of personal injury, loss of high voltage isolation to ground and higher system impedance, do not attempt to repair any HV wiring, connector, or terminal that is damaged. High voltage coaxial type cables are not repairable. Never attempt to repair a coaxial type cable. The entire cable/harness or component must be replaced. In order to maintain system integrity and personal safety, never attempt to repair any high voltage wiring, cables, or terminals. Performing this procedure on high voltage circuits may result in serious injury or death.**

Twisted/shielded cable is used in order to protect wiring from electrical noise. Two-conductor cable of this construction is used between the radio and the Delco-BoseÂ® speaker/amplifier units and other applications where low level, sensitive signals must be carried. Follow the instructions below in order to repair the twisted/shielded cable.

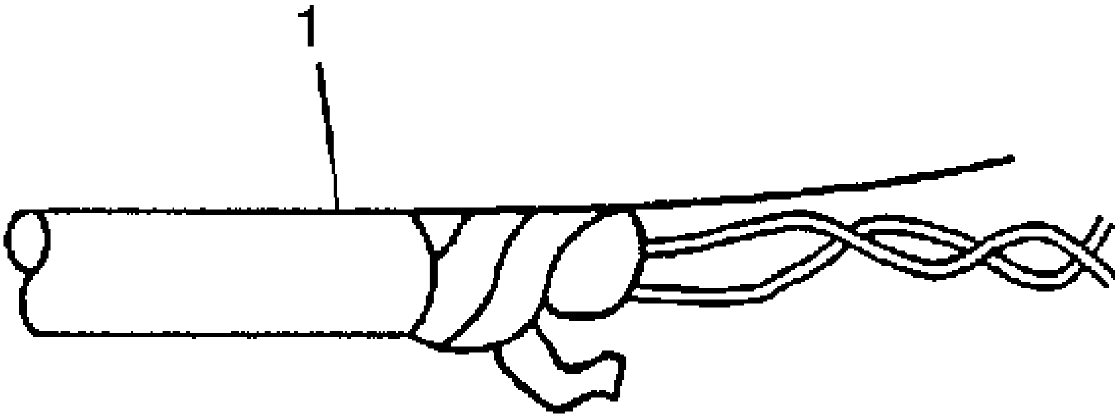

Fig. 11: View Of Outer Wiring Jacket
Courtesy of GENERAL MOTORS COMPANY

1. Remove the outer jacket (1). Use care not to cut into the drain wire of the mylar tape.
2. Unwrap the tape. Do not remove the tape. Use the tape in order to rewrap the twisted conductors after the splice is made.

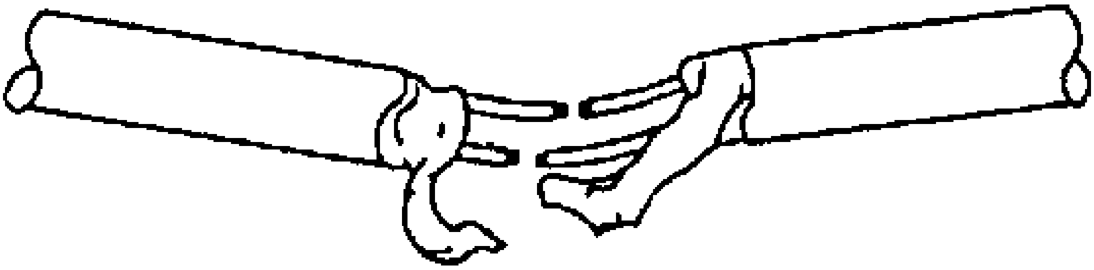

Fig. 12: Preparing Splice
Courtesy of GENERAL MOTORS COMPANY

3. Prepare the splice. Untwist the conductors and follow the instructions for **Wire to Wire Repair**. Staggering the splices by 65 mm (2.5 in) is recommended.

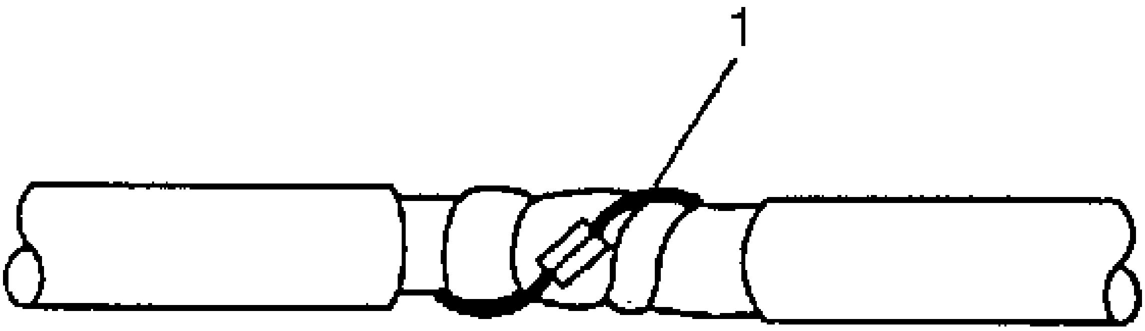

Fig. 13: Identifying Diode On Wire
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Apply the mylar tape with the aluminum side inward. This ensures good electrical contact with the drain wire.**

4. Re-assemble the cable.
    - Rewrap the conductors with the mylar tape. If the mylar tape is damaged, use 3M product AL-36FR to replace the damaged mylar tape.
    - Use caution not to wrap the drain wire in the tape (1).
    - Follow the splicing instructions for copper wire and splice the drain wire.
    - Wrap the drain wire around the conductors and tape with electrical tape to replace the outer insulation.

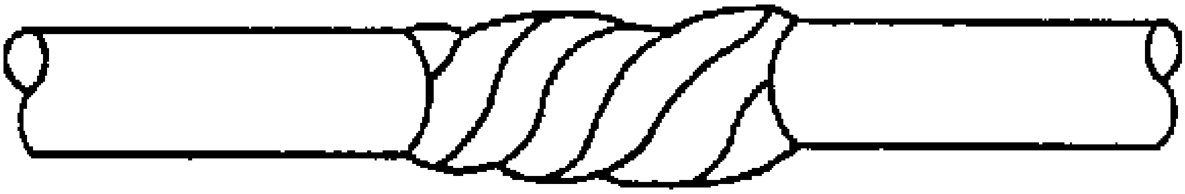

Fig. 14: View Of Repaired Wire Covered With Electrical Tape
Courtesy of GENERAL MOTORS COMPANY

5. Tape over the entire cable. Use a winding motion when you apply the tape.

WIRE TO WIRE REPAIR

Special Tools

- **EL-38125-10** Splice Sleeve Crimping Tool
- **EL-38125-5** Ultra Torch Special Tool
- DuraSeal splice sleeves, in order to repair the SIR/SRS wiring

For equivalent regional tools, refer to Special Tools .

WARNING: **In order to reduce the risk of personal injury, loss of high voltage isolation to ground and higher system impedance, do not attempt to repair any HV wiring, connector, or terminal that is damaged. High voltage coaxial type cables are not repairable. Never attempt to repair a coaxial type cable. The entire cable/harness or component must be replaced. In order to maintain system integrity and personal safety, never attempt to repair any high voltage wiring, cables, or terminals. Performing this procedure on high voltage circuits may result in serious injury or death.**

NOTE: **If the wiring harness internal to the transmission is damaged, the wiring harness must be replaced. The use of splice sleeves in an attempt to**

repair the internal transmission wires, connectors, or terminals could result in performance issues.

NOTE: **Do not splice wires in Door Harness Grommets.**

NOTE:

- **Use only DuraSeal splice sleeves. Other splice sleeves may not protect the splice from moisture or provide a good electrical connection.**
- **For wire Gauge smaller than.5 mm (18 gauge) refer to Folded-Over Wire Repair**

Use DuraSeal splice sleeves to form a one-to-one splice on all types of insulation except high voltage and specialty cables. Use DuraSeal splice sleeves where there are special requirements such as moisture sealing. Follow the instructions below in order to splice copper wire using DuraSeal splice sleeves.

Splice Sleeve Color	Crimp Tool Nest Color		Wire Gauge mm^2 / (AWG)
	3 Crimp Nests	4 Crimp Nests	
Salmon (Yellow-Pink) 19168446	Red (1) or Red/Green (1)	Red (2)	0.5 - 0.8/(18 - 20)
Blue 19168447	Blue (2)	Blue (3)	1.0 - 2.6/(14 - 16)
Yellow 19168448	Yellow (3)	Yellow (4)	3.0 - 5.0/(10 - 12)

NOTE: **You must perform the following procedures in the listed order. Repeat the procedure if any wire strands are damaged. You must obtain a clean strip with all of the wire strands intact.**

1. Open the harness by removing any tape:
    - Use a sewing seam ripper, available from sewing supply stores, in order to cut open the harness in order to avoid wire insulation damage.
    - Use the DuraSeal splice sleeves on all types of insulation except Tefzel and coaxial.
    - Do not use the crimp and DuraSeal splice sleeve to form a splice with more than 2 wires coming together.
2. Cut as little wire off the harness as possible. You may need the extra length of wire in order to change the location of a splice.

    Adjust splice locations so that each splice is at least 40 mm (1.5 in) away from the other splices, harness branches, or connectors.

3. Strip the insulation:
    - When adding a length of wire to the existing harness, use the same size wire as the original wire.
    - Perform one of the following items in order to find the correct wire size:
        - Find the wire on the schematic and convert to regional wiring gauge size.
        - If you are unsure of the wire size, begin with the largest opening in the wire stripper and work down until achieving a clean strip of the insulation.
    - Strip approximately 5.0 mm (0.20 in) of insulation from each wire to be spliced.
    - Do not nick or cut any of the strands. Inspect the stripped wire for nicks or cut strands.
    - If the wire is damaged, repeat this procedure after removing the damaged section.
4. For high temperature wiring, slide a section of high temperature SCT1 shrink tubing down the length of wire to be spliced. Ensure that the shrink tubing will not interfere with the splice procedure.
5. Select the proper DuraSeal splice sleeve according to the wire size. Refer to the above table at the beginning of the repair procedure for the color coding of the DuraSeal splice sleeves and the crimp

tool nests.

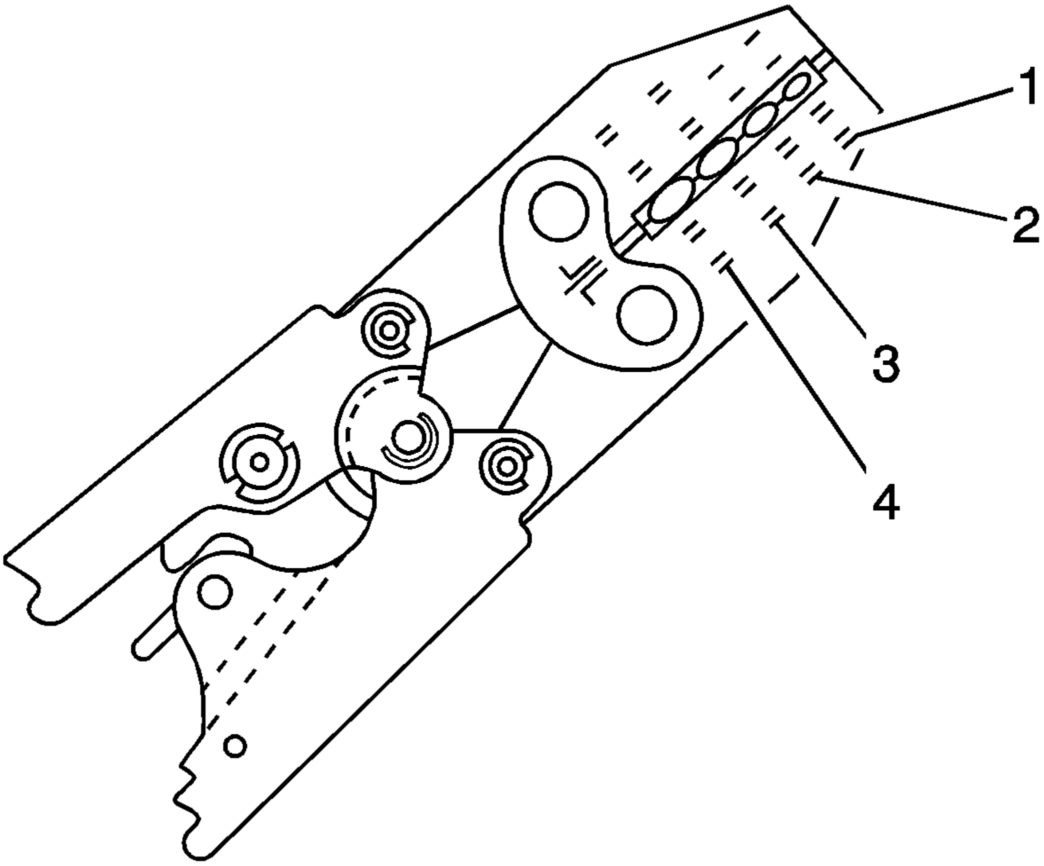

Fig. 15: Splice Sleeve Crimping Tool With 4 Crimp Nests
Courtesy of GENERAL MOTORS COMPANY

6. The **EL-38125-10** splice sleeve crimping tool has four crimp nests. The largest crimp nest (4) is used for crimping 10 and 12 gauge wires. The second largest crimp nest (3) is used for crimping 14 and 16 gauge wires. The third largest crimp nest (2) is used for crimping 18 and 20 gauge wires. The smallest crimp nest (1) is used for crimping 22 to 26 gauge wires. The crimp nests are referenced in the table (farther above) under the crimp tool nest color.

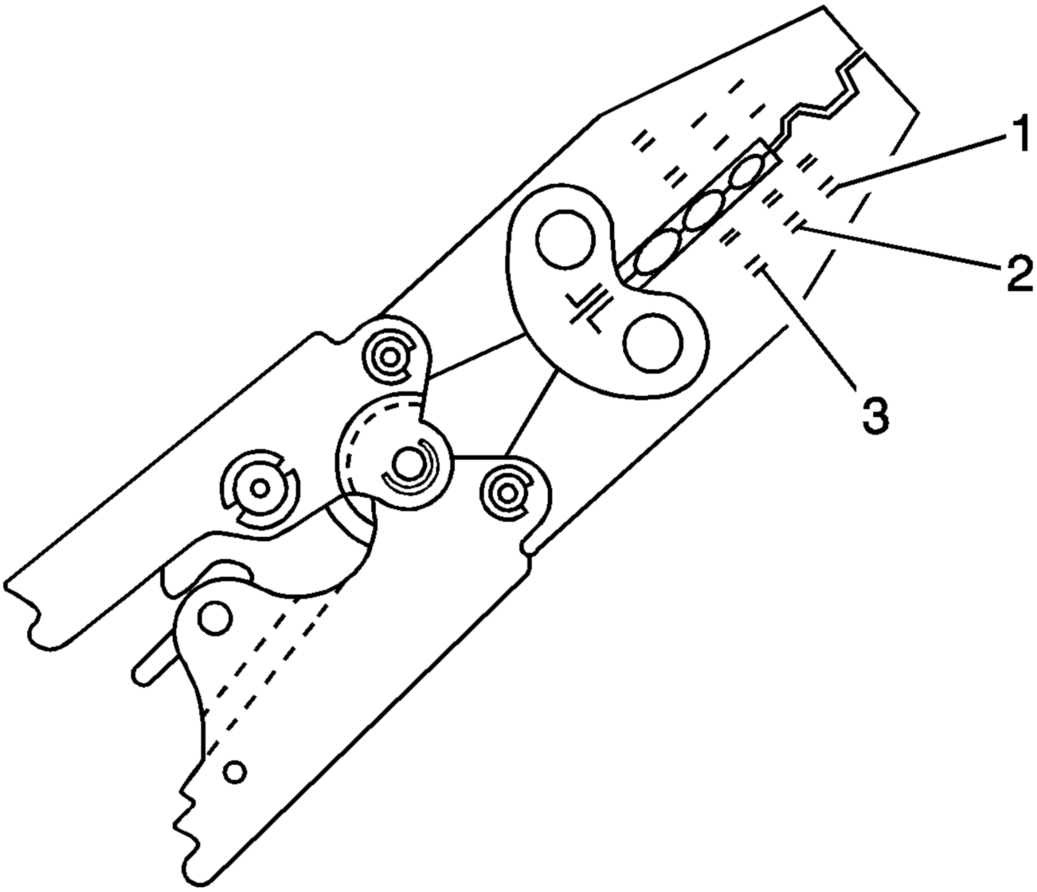

Fig. 16: Splice Sleeve Crimping Tool With 3 Crimp Nests
Courtesy of GENERAL MOTORS COMPANY

7. The **J-38125-8** splice sleeve crimping tool has three crimp nests. The largest crimp nest (3) is used for crimping 10 and 12 gauge wires. The second largest crimp nest (2) is used for crimping 14 and 16 gauge wires. The smallest crimp nest (1) is used for crimping 18 to 20 gauge wires. The crimp nests are referenced in the table (farther above) under the crimp tool nest color.
8. Use the splice sleeve crimp tool in order to position the DuraSeal splice sleeve in the proper color nest of the splice sleeve crimp tool. For the four crimp nest tool, use the three largest crimp nests to crimp the splice sleeves. For the three crimp nest tool, use all three crimp nests to crimp the splice sleeves. Use the four and three crimp tool diagrams (above) and the table (farther above) to match the splice sleeve with the correct crimp nest. The crimp tool diagram callout numbers match the numbers in the table (under crimp tool nest color).

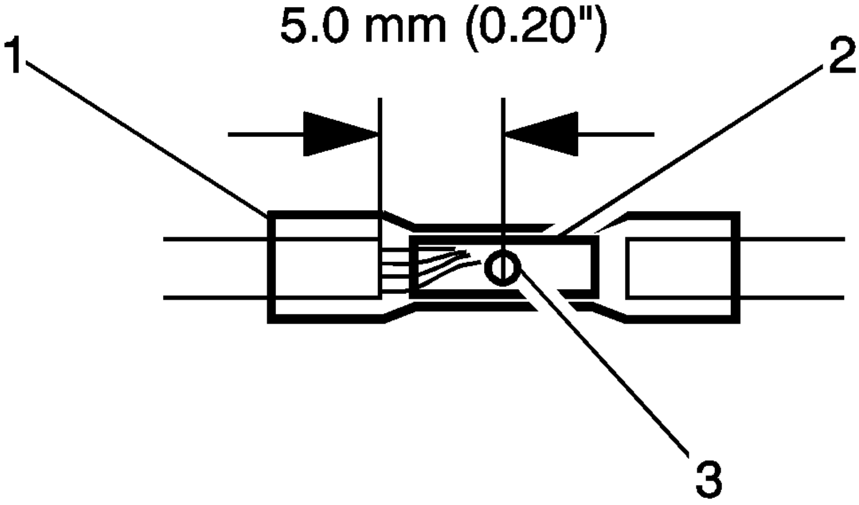

Fig. 17: Identifying Duraseal Splice Sleeve
Courtesy of GENERAL MOTORS COMPANY

9. Place the DuraSeal splice sleeve in the nest. Ensure that the crimp falls midway between the end of the barrel and the stop. The sleeve has a stop (3) in the middle of the barrel (2) in order to prevent the wire (1) from going further. Close the hand crimper handles slightly in order to firmly hold the DuraSeal splice sleeve in the proper nest.

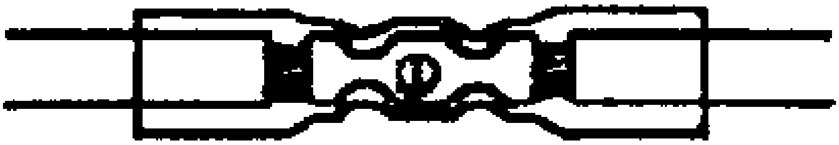

Fig. 18: Crimped Duraseal Splice Sleeve
Courtesy of GENERAL MOTORS COMPANY

10. Insert the wire into the splice sleeve barrel until the wire hits the barrel stop.
11. Tightly close the handles of the crimp tool until the crimper handles open when released.

    The crimper handles will not open until you apply the proper amount of pressure to the DuraSeal splice sleeve. Repeat steps 4 and 6 for the opposite end of the splice.

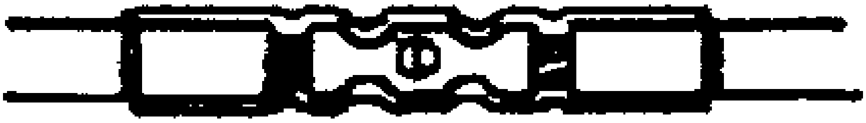

Fig. 19: Crimped Duraseal Splice Sleeve
Courtesy of GENERAL MOTORS COMPANY

12. Using the EL-38125 - 5 ultra torch, apply heat to the crimped area of the barrel.
13. Start in the middle and gradually move the heat barrel to the open ends of the tubing:
    - The tubing will shrink completely as the heat is moved along the insulation.
    - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.

Weatherpack™ Wiring Repair

NOTE: **Some replacement pigtail connectors may be delivered without the terminated leads installed into the connector. For Weatherpack™ connectors, all terminated leads included in the package should to be installed into the connector. If the connector end view shows that a terminal is not occupied, the extra terminated lead(s) need to be installed and the end(s) sealed using a DuraSeal splice sleeve and taped back into the harness.**

1. Insert the wire into the splice sleeve barrel until the wire hits the barrel stop. Refer to **Folded-Over Wire Repair** for splicing wires of 0.35 mm or less (22, 24, 26 gauge sizes) and for splicing wires of different gauges.

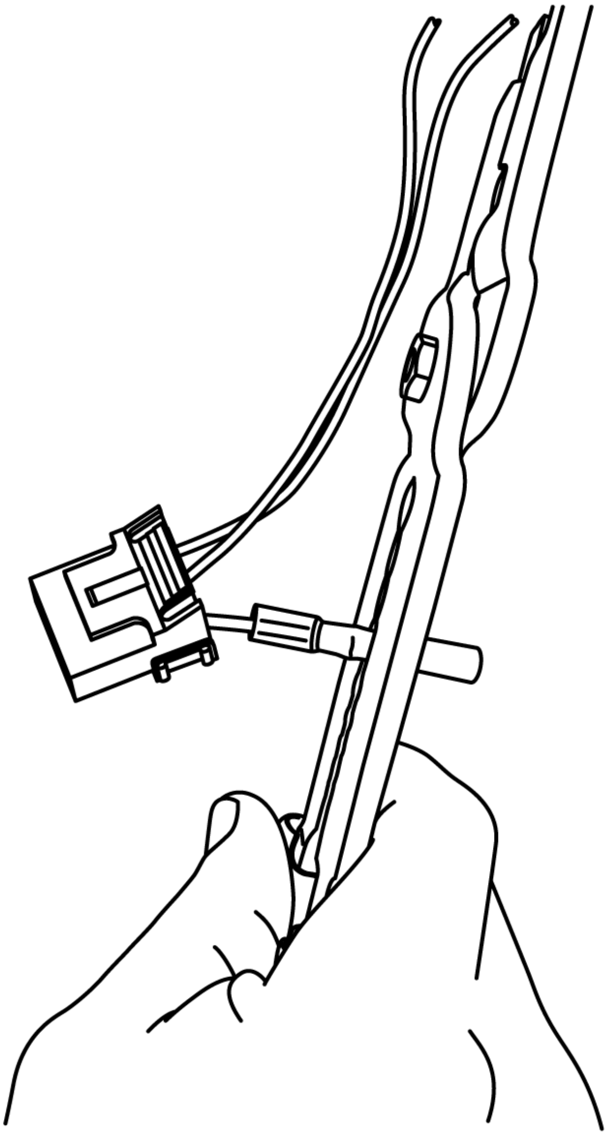

Fig. 20: Tightly Close Handles Of Crimp Tool
Courtesy of GENERAL MOTORS COMPANY

2. Tightly close the handles of the crimp tool until the crimper handles open when released.

   The crimper handles will not open until you apply the proper amount of pressure to the DuraSeal splice sleeve. Holding the DuraSEAL with one hand gently tug on the wire to ensure it is crimped in the DuraSeal.

3. Using the heat torch, apply heat to the crimped area of the barrel.

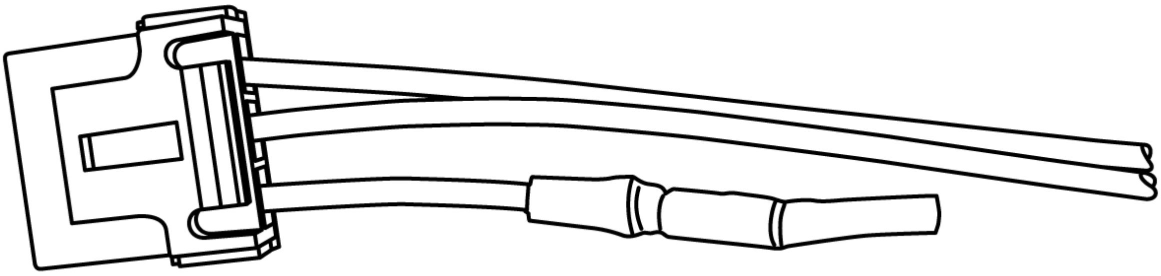

Fig. 21: Heat To Crimped Area Of Barrel
Courtesy of GENERAL MOTORS COMPANY

4. Start in the middle and gradually move the heat barrel to the open ends of the tubing:
    - The tubing will shrink completely as the heat is moved along the insulation.
    - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.

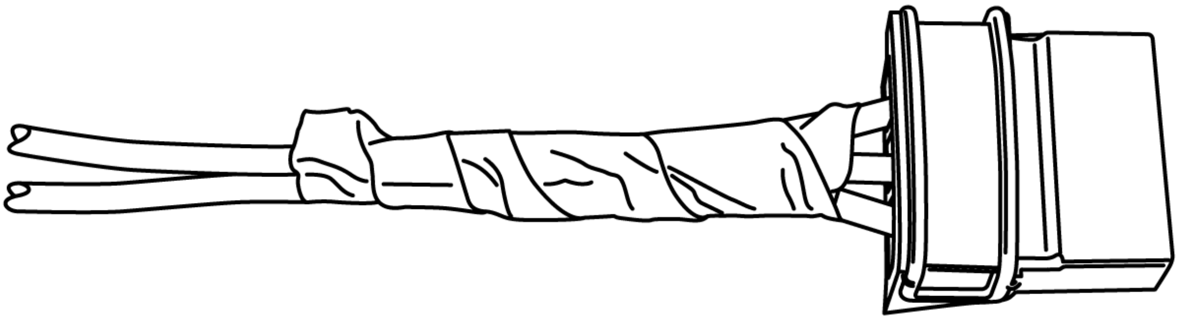

Fig. 22: Taping Extra Terminated Leads Back Into Harness
Courtesy of GENERAL MOTORS COMPANY

5. Tape the extra terminated lead(s) back into the harness.

High Temperature Wiring Repairs

Use the following procedures to perform high temperature wiring repairs:

1. Center the high temperature SCT1 shrink tube over the DuraSeal splice sleeve.
2. Using the EL-38125 - 5 ultra torch, apply heat to the high temperature heat shrink tubing.
3. Gradually move the heat from the center to the open end of the tubing:
   - The tubing will shrink completely as the heat is moved along the insulation.
   - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.
4. Replace any reflective tape and clips that may have been removed during the repair.

CONNECTOR POSITION ASSURANCE LOCKS

The connector position assurance (CPA) is a small plastic insert that fits through the locking tabs of the connector. CPAs are used in various connectors throughout the vehicle. CPAs are also used in all SIR system electrical connectors. The CPA ensures that the connector halves cannot vibrate apart. You must have the CPA in place in order to ensure good contact between the mating terminals of the connector.

TERMINAL POSITION ASSURANCE LOCKS

The terminal position assurance (TPA) insert resembles the plastic combs used in the control module connectors. The TPA keeps the terminal securely seated in the connector body. Do not remove the TPA from the connector body unless you remove a terminal for replacement. If the TPA is removed, be sure to reinstall it before reconnecting the connector.

AFL/EPC CONNECTORS

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-12A** Terminal Release Tool
- **J-38125-216** Terminal Release Tool

For equivalent regional tools, refer to Special Tools .

Terminal Removal Procedure

Follow the steps below in order to remove terminals from the connector.

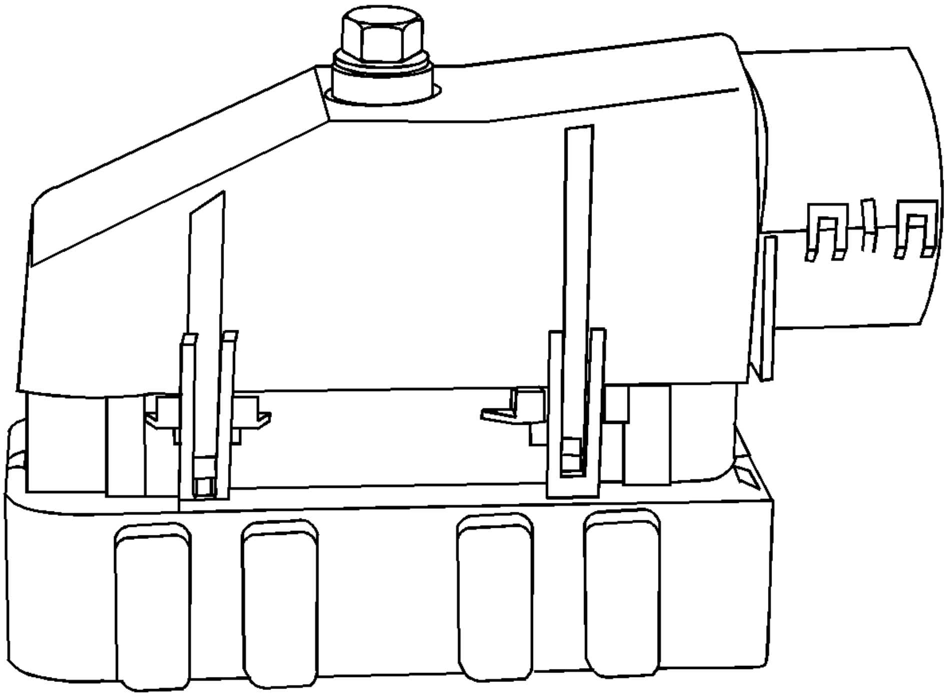

Fig. 23: View Of Bolt On Connector Cover
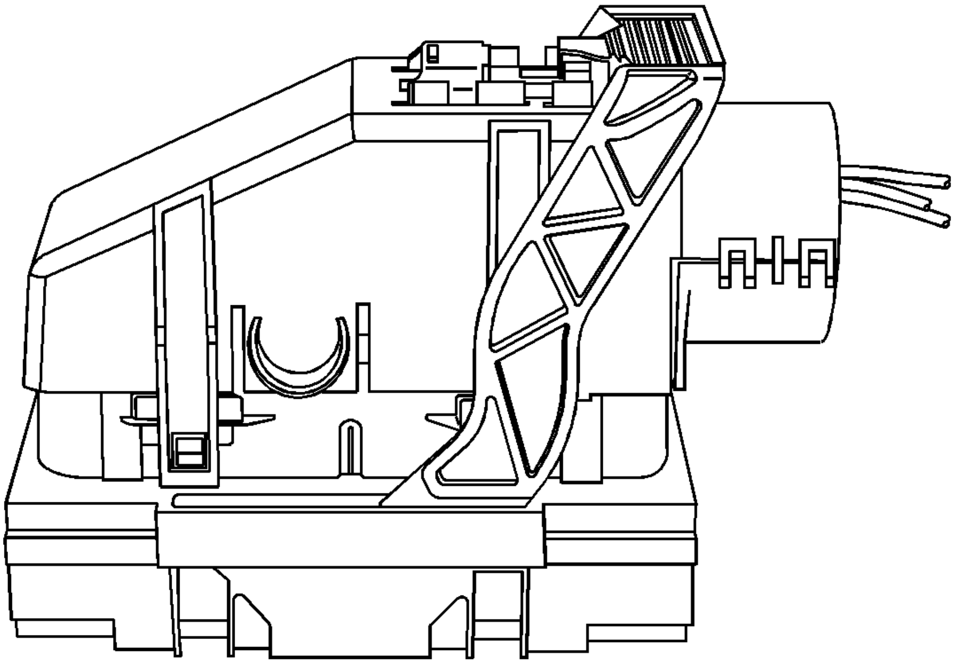
Courtesy of GENERAL MOTORS COMPANY



[Fig. 24: Identifying Connector Position Assurance (CPA)](#)
Courtesy of GENERAL MOTORS COMPANY

1. For connectors with a bolt in the dress cover, turn the bolt counterclockwise to remove the connector from the component.
2. Locate the connector position assurance (CPA) on the top of the wire dress cover. Slide the CPA forward.

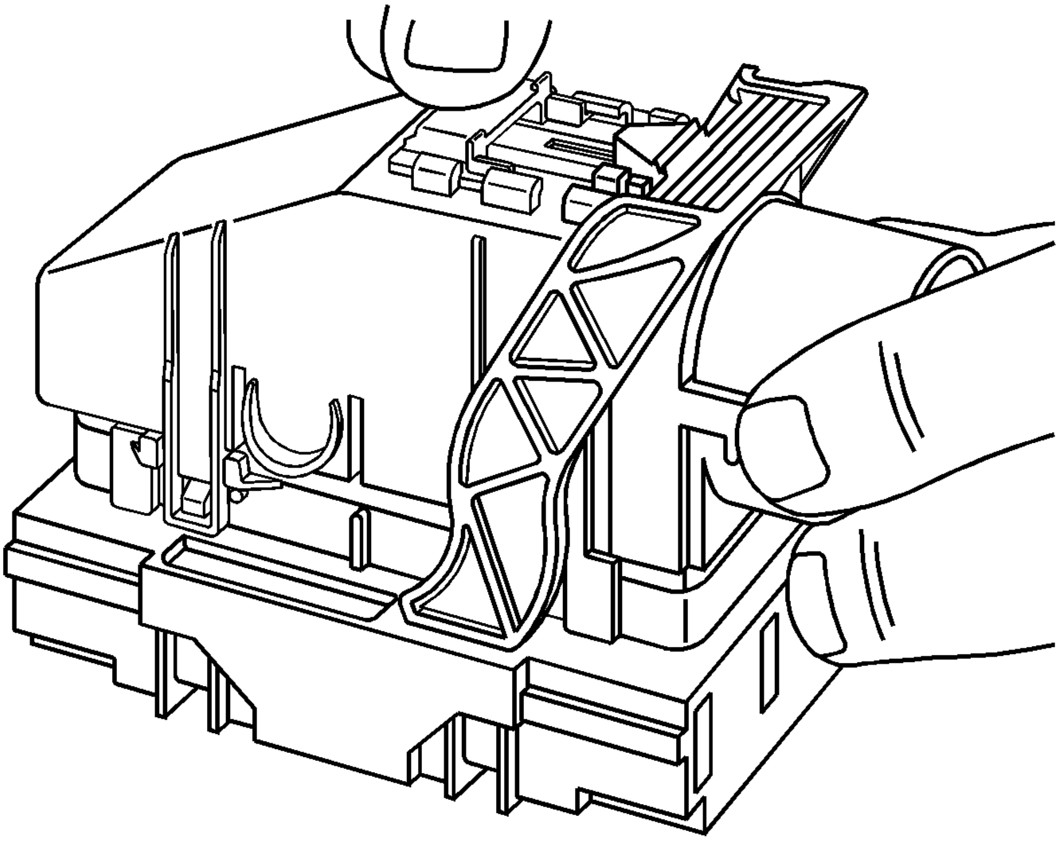


Fig. 25: Identifying Lever Lock & Lever Lock Release Tab
Courtesy of GENERAL MOTORS COMPANY

3. Slide the lever lock forward while pressing down on the lever lock release tab.

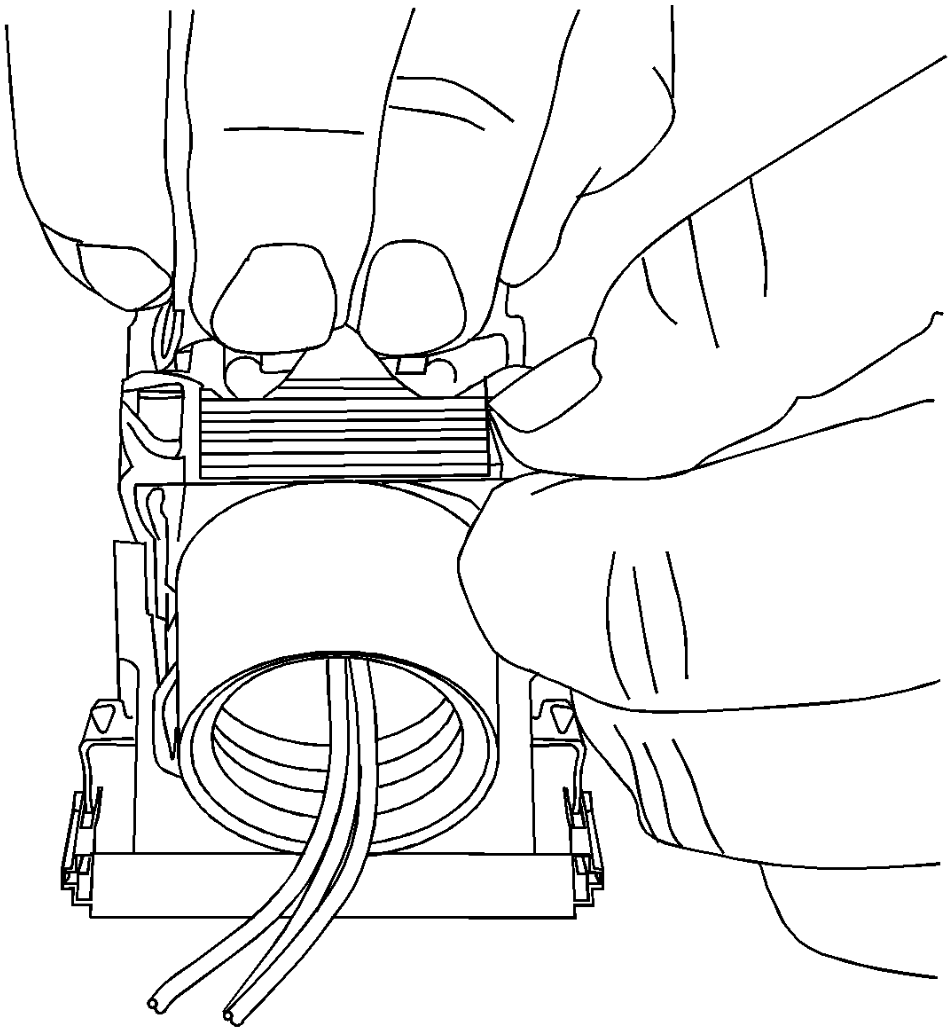

Fig. 26: View Showing Depressing Lever Lock Release Tab
Courtesy of GENERAL MOTORS COMPANY

4. View showing depressing of the lever lock release tab.

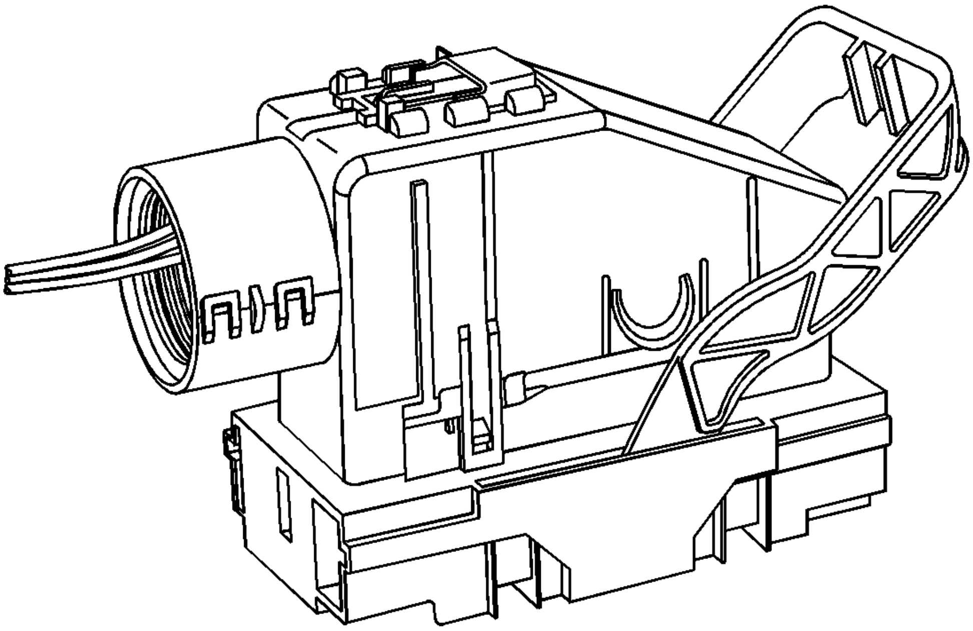

Fig. 27: View Of Connector In Released Position
Courtesy of GENERAL MOTORS COMPANY

5. View of connector in released position.
6. Disconnect the connector from the component.
7. Locate the dress cover locking tabs at the corners of the dress cover. Use a small flat-blade tool to release the locking tabs and remove the dress cover.

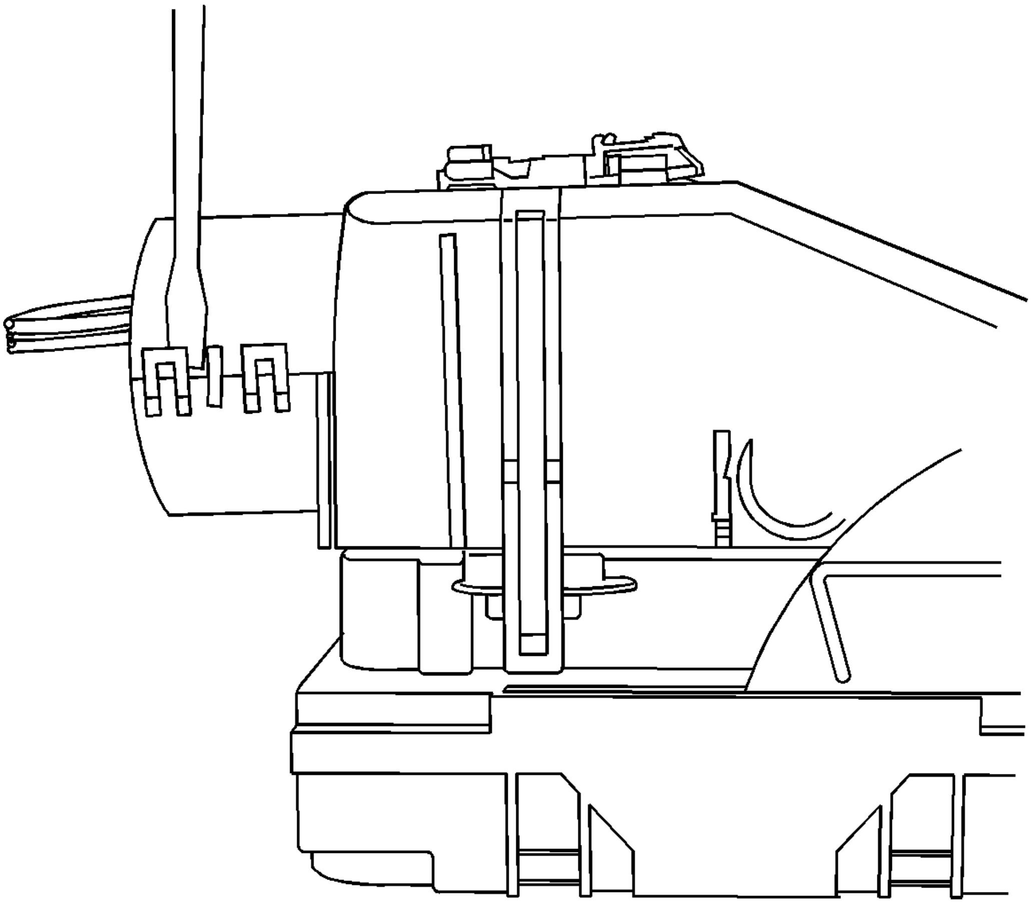

Fig. 28: View Of Connector In Released Position
Courtesy of GENERAL MOTORS COMPANY

8. Release the rear lower half of the wiredress cover.

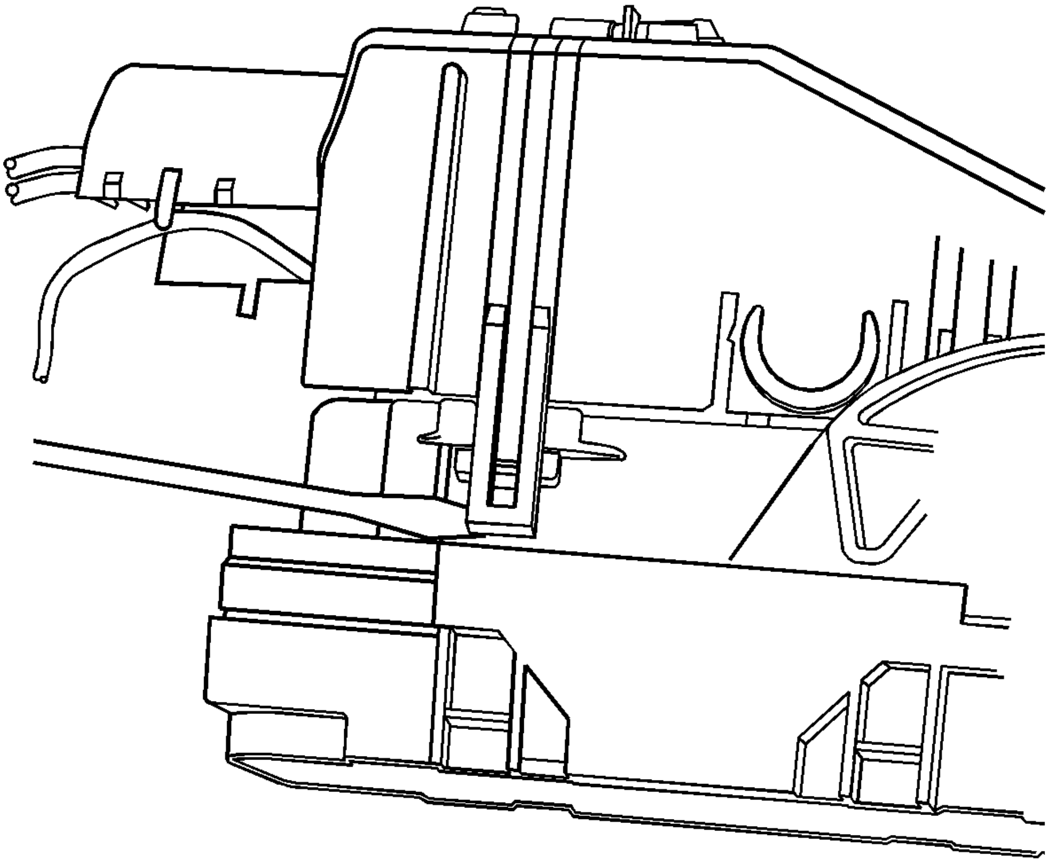

Fig. 29: Identifying Tabs Holding Wiredress Cover
Courtesy of GENERAL MOTORS COMPANY

9. Release the tabs that are holding the wiredress cover to the connector body.
10. Remove the nose piece by inserting a small flat-blade tool into the slots on both ends of the connector body. Gently pry the nose piece out of the connector. J-38125-216 can also be used to remove the nose piece.

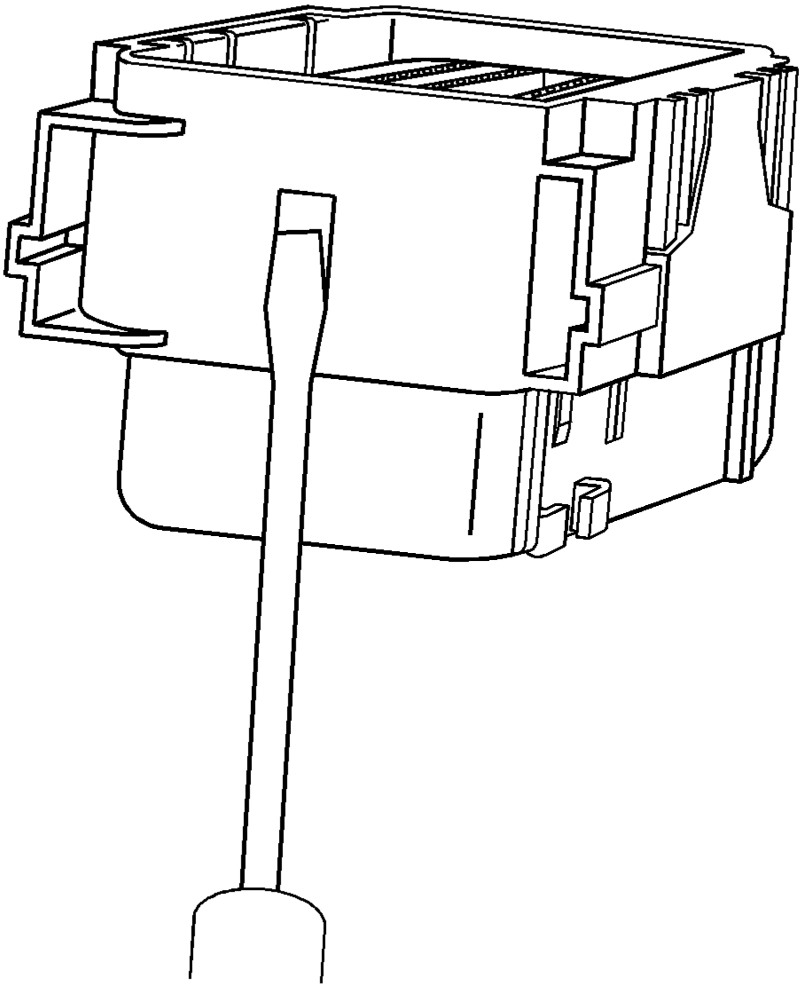

Fig. 30: Lifting Terminal Retaining Tabs
Courtesy of GENERAL MOTORS COMPANY

11. Use the J-38125-12A tool to release the terminals by lifting the terminal retaining tabs on the inside of the connector.

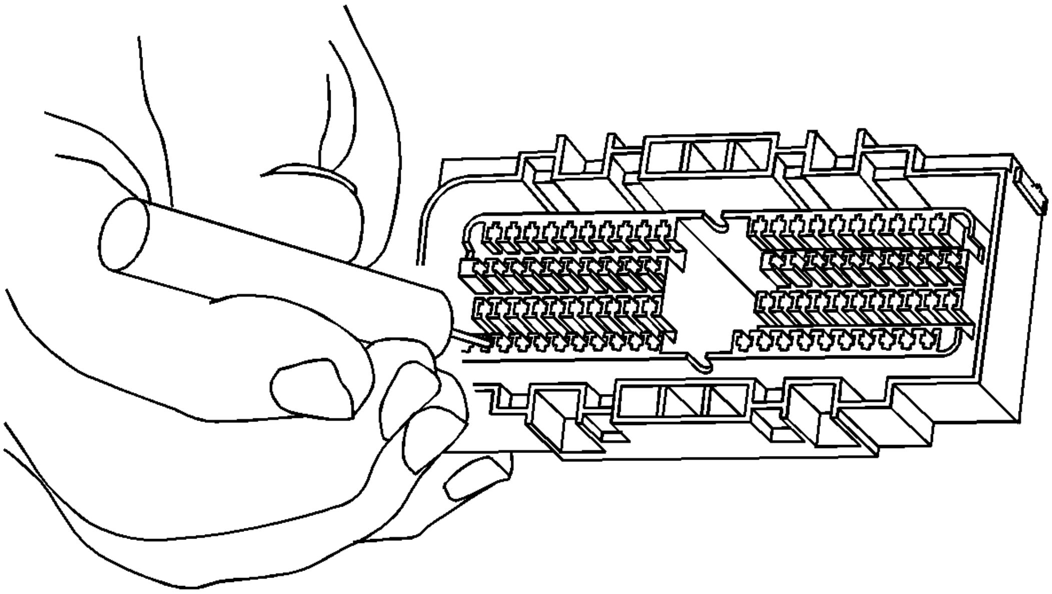

Fig. 31: Pulling Wire Out Of Back Of Connector
Courtesy of GENERAL MOTORS COMPANY

12. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
13. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
14. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

BOSCH CONNECTORS (BSK)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-561** Terminal Release Tool

For equivalent regional tools, refer to **Special Tools** .

Terminal Removal Procedure

1. Disconnect the connector from the component.
2. Remove the wire dress cover, if necessary.
3. Push the wire side of the terminal that is being removed toward the connector and hold it in position.

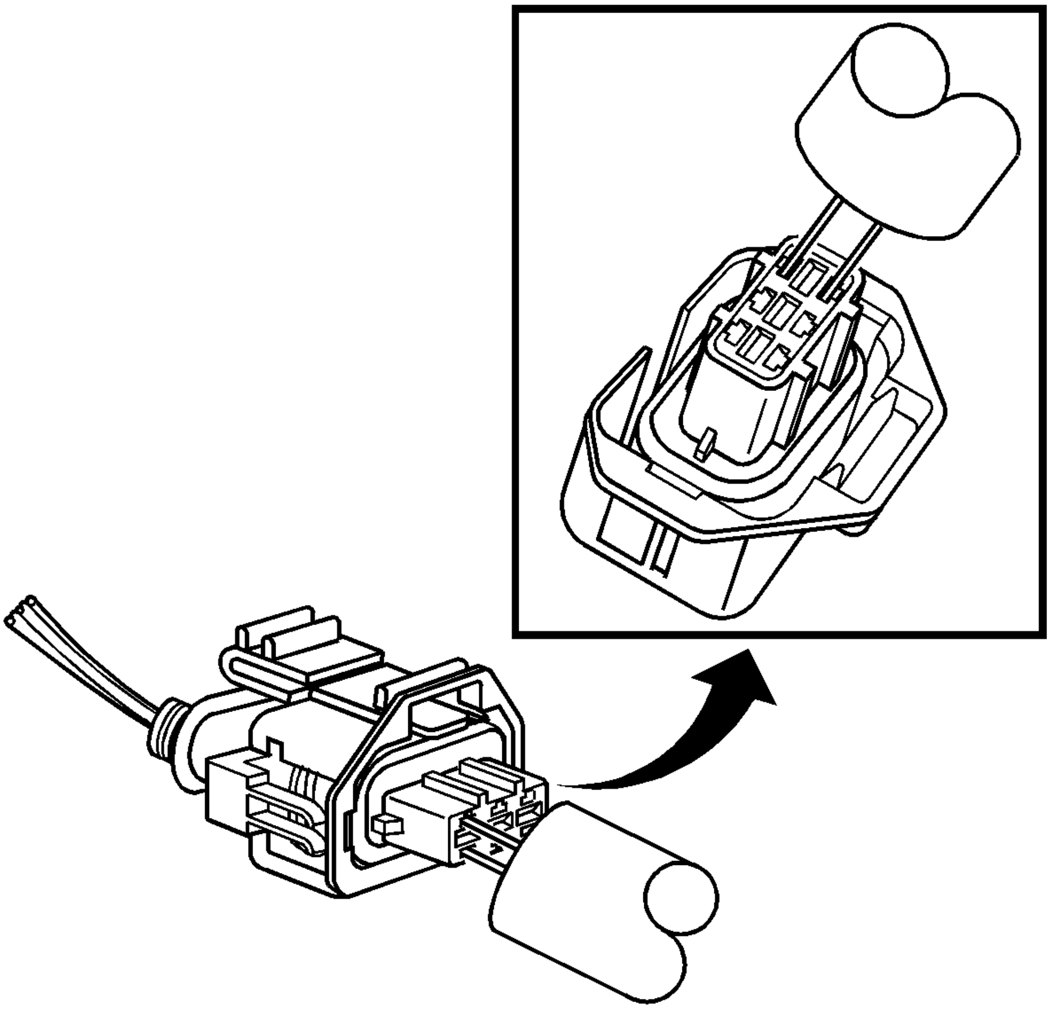

Fig. 32: View Of Bosch Connector Terminals (BSK)
Courtesy of GENERAL MOTORS COMPANY

4. Insert the J-38125-561 tool into the 2 cavities on each side of the terminal at the front of the connector and push until you feel the tool disengage the terminal retainers.
5. Carefully pull the terminal out of the connector. Always remember never use force when pulling a terminal out of a connector. If the terminal is difficult to remove, repeat the entire procedure.
6. Repair the terminal by following the Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair) procedure.
7. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

BOSCH CONNECTORS (0.64)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-560** Terminal Release Tool

For equivalent regional tools, refer to Special Tools .

Terminal Removal Procedure

1. Locate the lever lock on the wire dress cover. While pressing the lock, pull the lever over and past the lock until the lever is at the end of its travel.
2. Disconnect the connector from the component.
3. Pull the rubber boot that covers the wires back to expose the end of the connector dress cover.
4. Place the connector locking lever in the center of the connector.

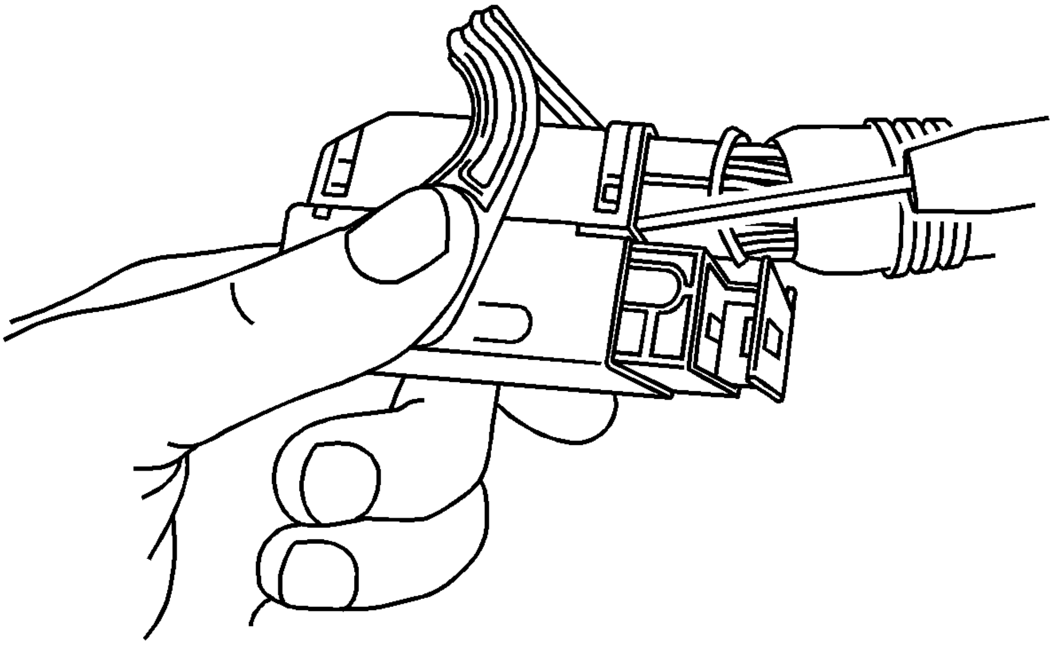

Fig. 33: View Of Flat-Bladed Tool Being Inserted Between Cover & Connector Body
Courtesy of GENERAL MOTORS COMPANY

5. Locate the 2 dress cover locking tabs that are on the wire end of the connector. Insert a small flat-bladed tool between the cover and connector body and pry up.

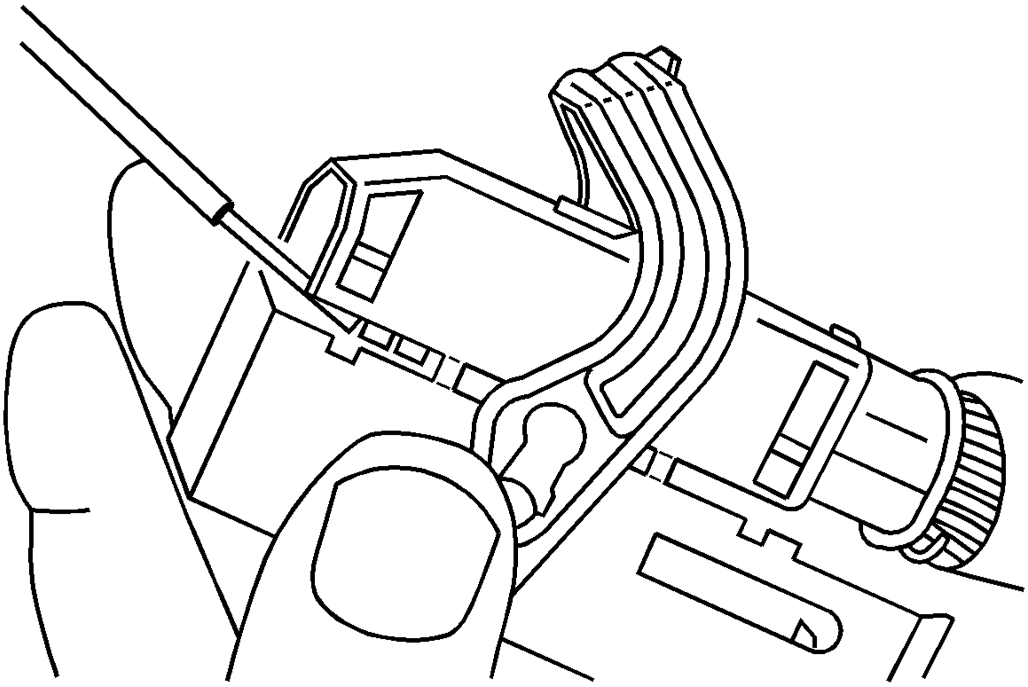

Fig. 34: View Of Flat-Bladed Tool Between Cover & Connector End
Courtesy of GENERAL MOTORS COMPANY

6. Locate the 2 dress cover locking tabs located on the opposite side of the connector. Insert a small flat-bladed tool between the cover at the connector end and pry up.
7. Remove the dress cover.
8. Cut the tie wrap on the wire bundle.

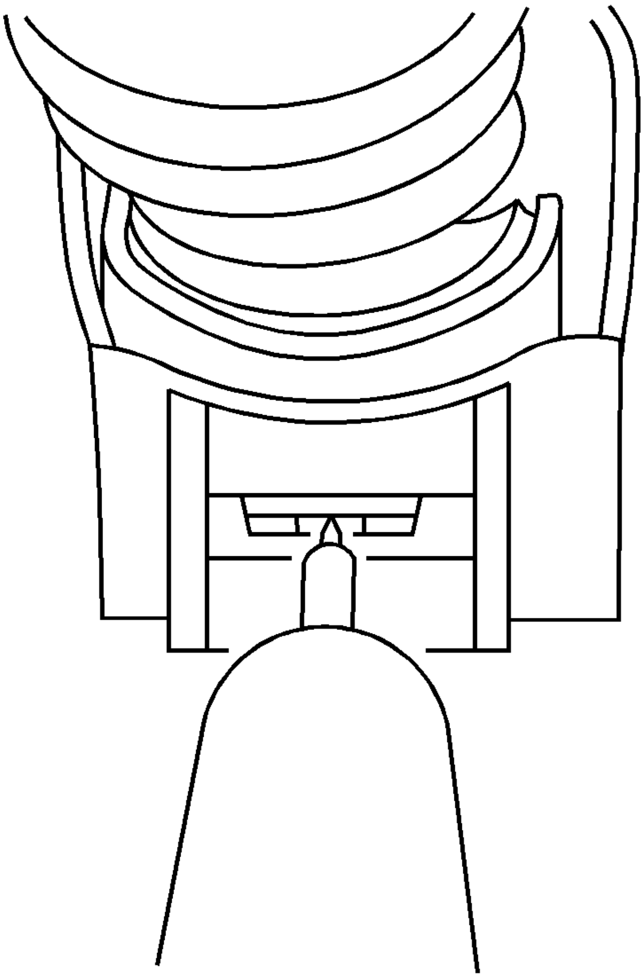

Fig. 35: View Of Terminal Position Assurance (TPA)
Courtesy of GENERAL MOTORS COMPANY

9. Remove the terminal position assurance (TPA) by inserting a small flat-bladed tool into the small slot in the end of the slider and pushing on the TPA until it comes out of the connector. When the TPA exits the opposite side of the connector, gasp the TPA and pull it completely out of the connector.
10. Push the wire side of the terminal that is being removed toward the connector and hold it in position.

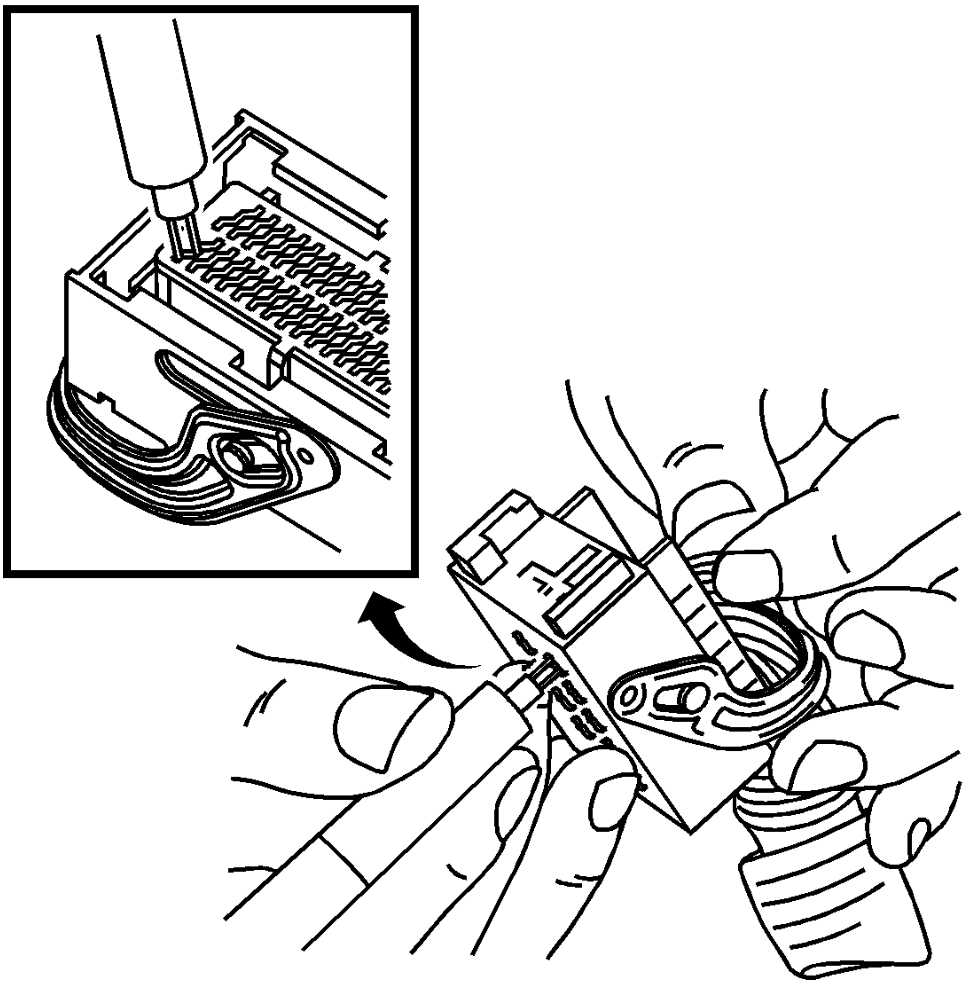

Fig. 36: View Of J 38125-560 Being Inserted Into Triangular Cavities
Courtesy of GENERAL MOTORS COMPANY

11. Insert the J-38125-560 into the 2 triangular cavities on each side of the terminal at the front of the connector.
12. Carefully pull the terminal out of the connector. Always remember never use force when pulling a terminal out of a connector. If the terminal is difficult to remove, repeat the entire procedure.
13. Repair the terminal by following the Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair) procedure.
14. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Terminal Insertion Procedure

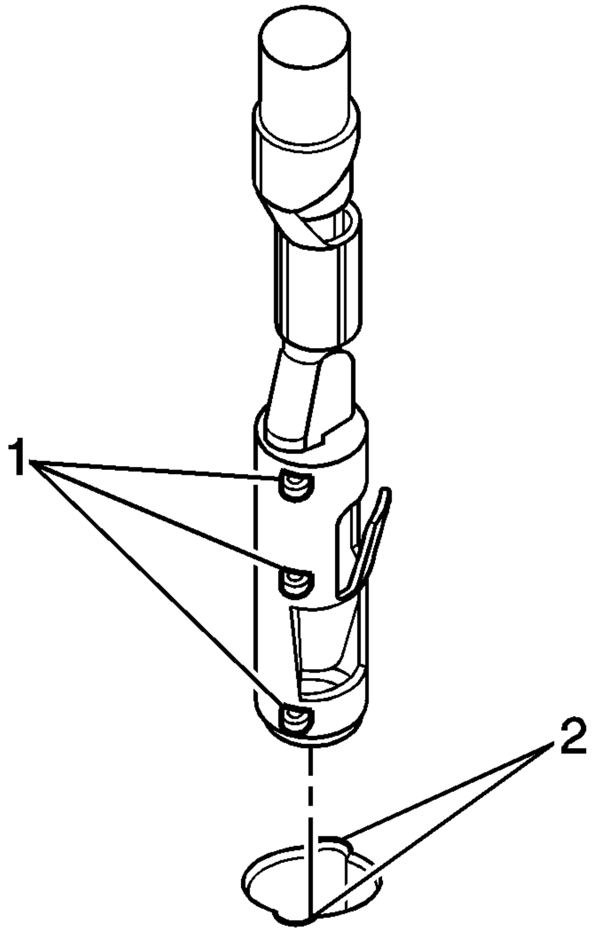

Fig. 37: Aligning Coding Lugs With Connector Coding Grooves
Courtesy of GENERAL MOTORS COMPANY

1. Prior to installation the terminal must be aligned so the (1) coding lugs align with the (2) coding grooves on the connector.
2. Once the terminal is aligned, slide the terminal into the cavity until the retainer has engaged in the cavity of the connector.
3. Slide the TPA in the connector body and seat it using a small flat bladed tool. The TPA is seated when it is flush with the contact housing.
4. Secure the wires to the connector body using a tie wrap and replace the dress cover and grommet.

BOSCH CONNECTORS (2.8 JPT)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-557** Terminal Release Tool

For equivalent regional tools, refer to Special Tools .

Terminal Removal Procedure

1. Pull out the slider on the connector position assurance (CPA) until it is at the end of its travel.
2. Disconnect the connector from the component.
3. Remove the wire dress cover, if necessary.
4. Push the wire side of the terminal that is being removed toward the connector and hold it in position.

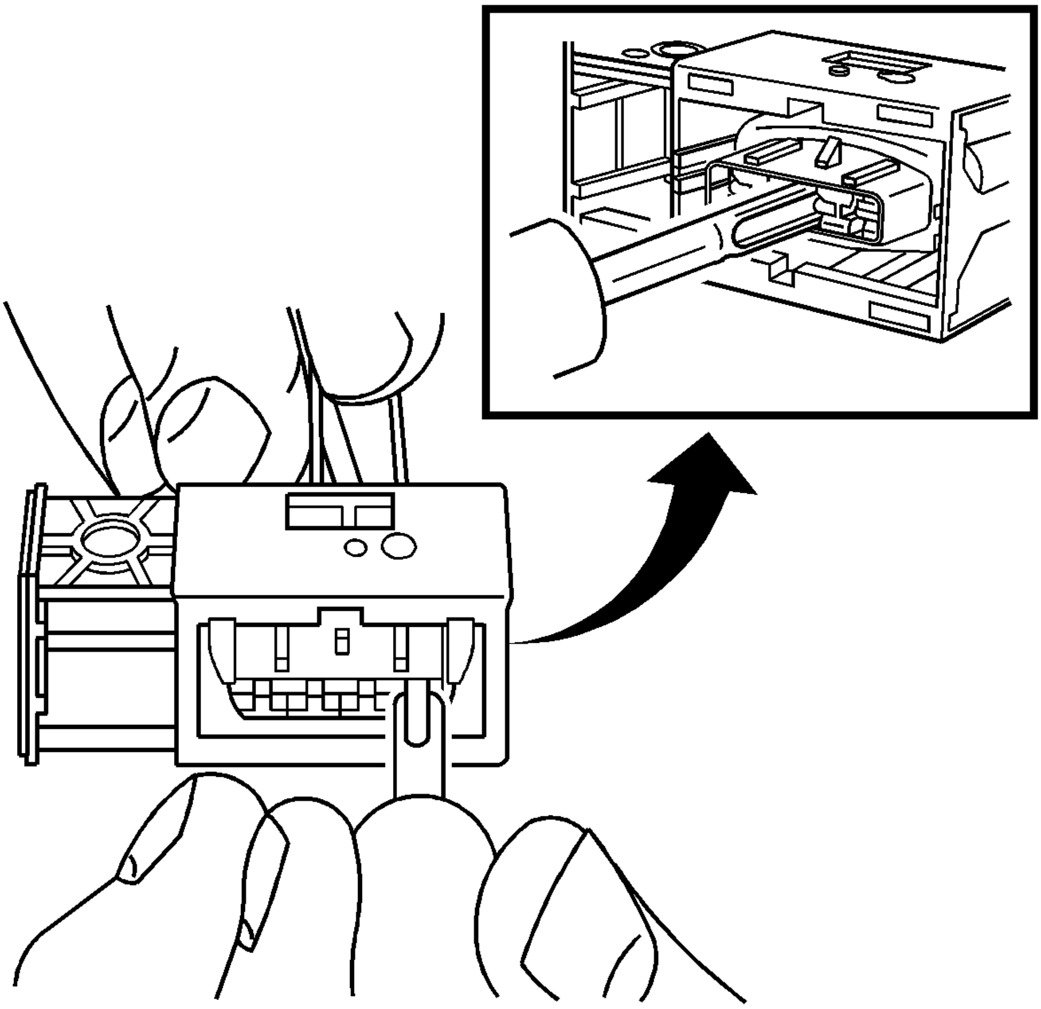

Fig. 38: View Of Bosch Connector Terminals (2.8 JPT)
Courtesy of GENERAL MOTORS COMPANY

5. Insert the J-38125-557 into the 2 cavities on each side of the terminal at the front of the connector and push until you feel the tool disengage the terminal retainers.
6. Carefully pull the terminal out of the connector. Always remember never use force when pulling a terminal out of a connector. If the terminal is difficult to remove, repeat the entire procedure.
7. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
8. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

BOSCH CONNECTORS (ECM)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-213** Terminal Release Tool
- **J-38125-556** Terminal Release Tool

For equivalent regional tools, refer to **Special Tools** .

Terminal Removal Procedure

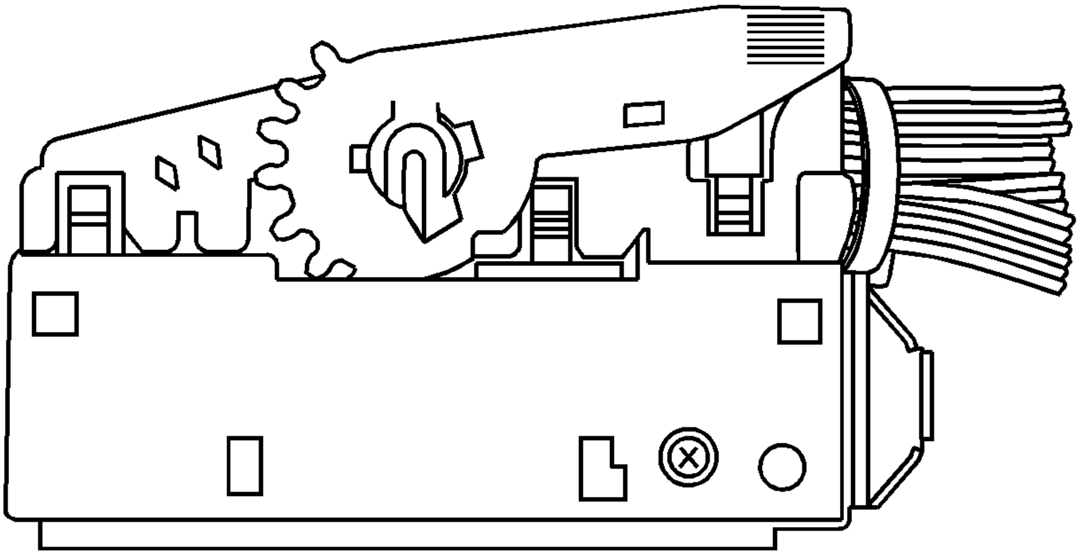

Fig. 39: View Of Bosch Connectors
Courtesy of GENERAL MOTORS COMPANY

1. Locate the assist lever on the top of the connector. Move the assist lever to the forward position.

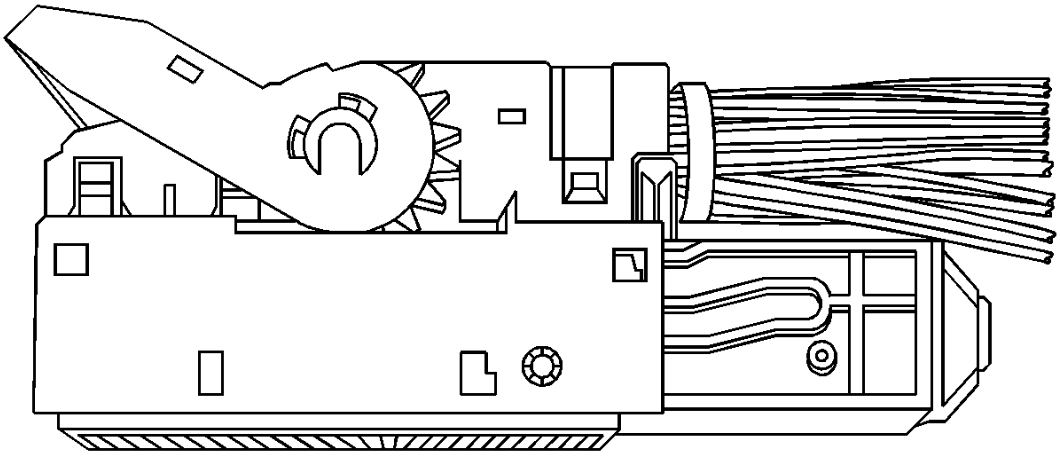

Fig. 40: Identifying Assist Lever In Forward Position
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect the connector from the component.

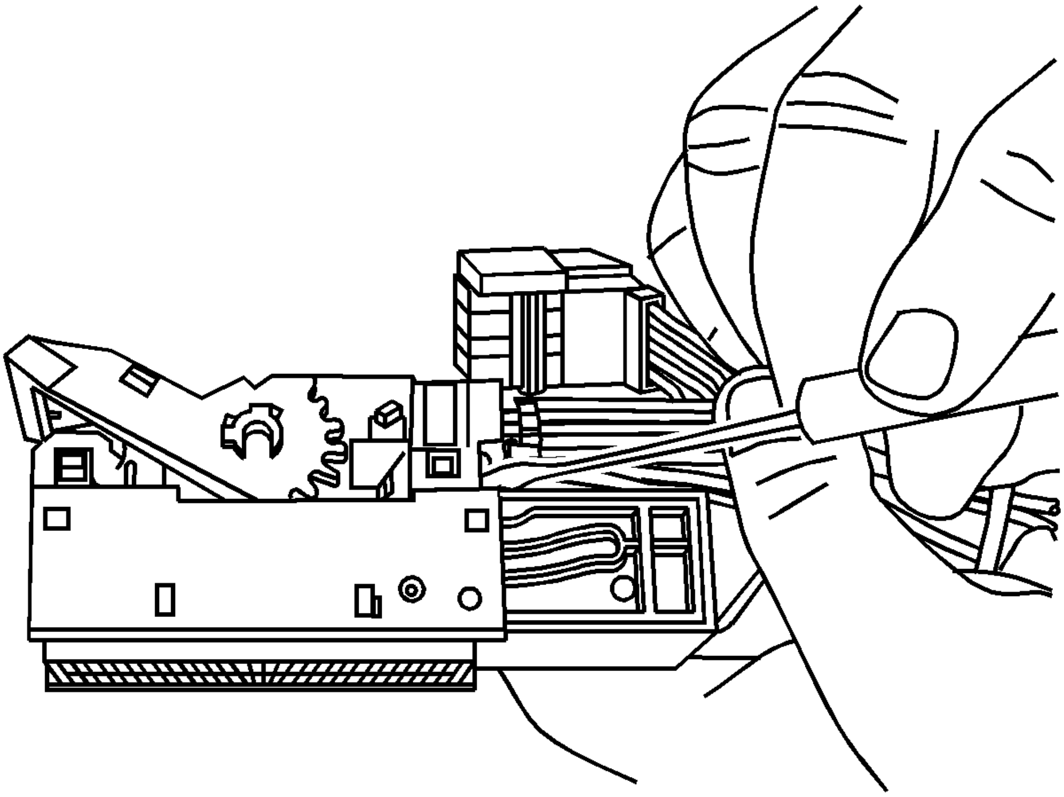

Fig. 41: View Of Releasing Locking Tabs
Courtesy of GENERAL MOTORS COMPANY

3. Locate the dress cover locking tabs at the corners of the connector. Use a small flat-blade tool to release the locking tabs and remove the dress cover.

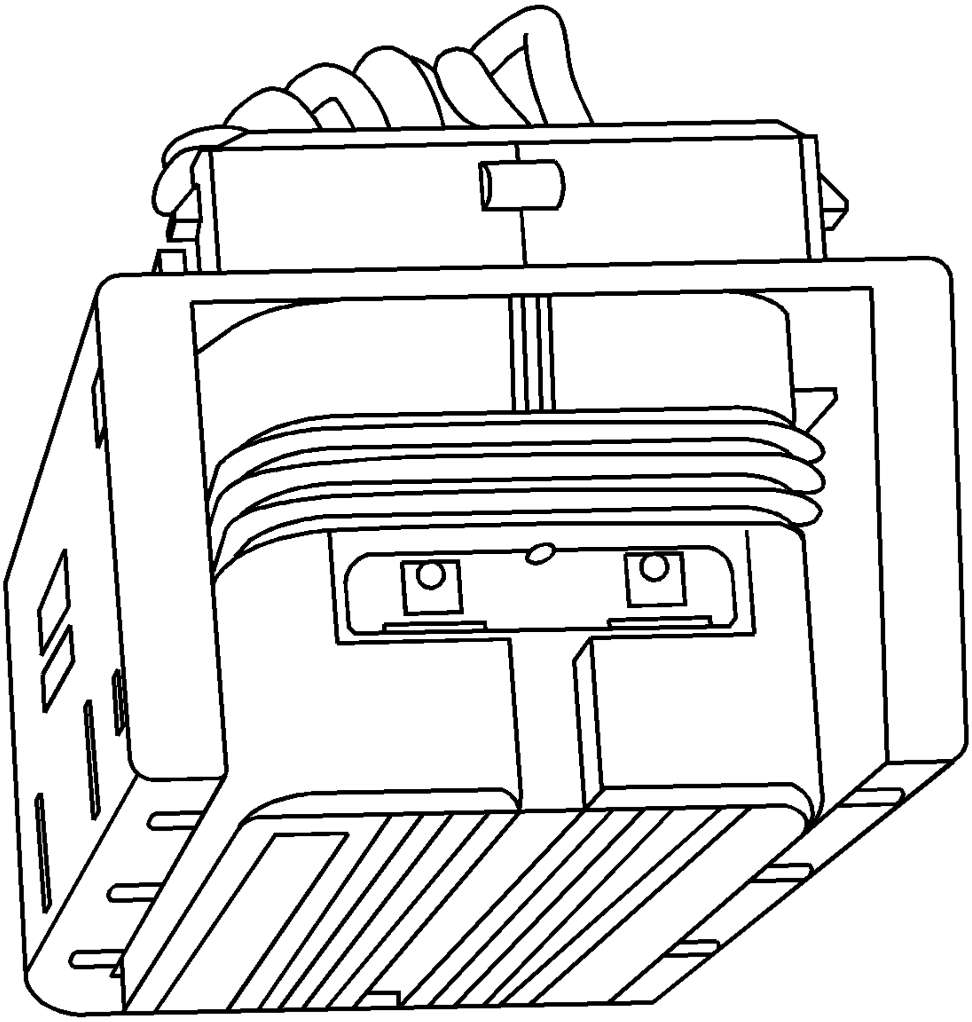

Fig. 42: View Of Terminal Positive Assurance (TPA) Connector
Courtesy of GENERAL MOTORS COMPANY

4. The terminal positive assurance (TPA) is located in the front of the connector.

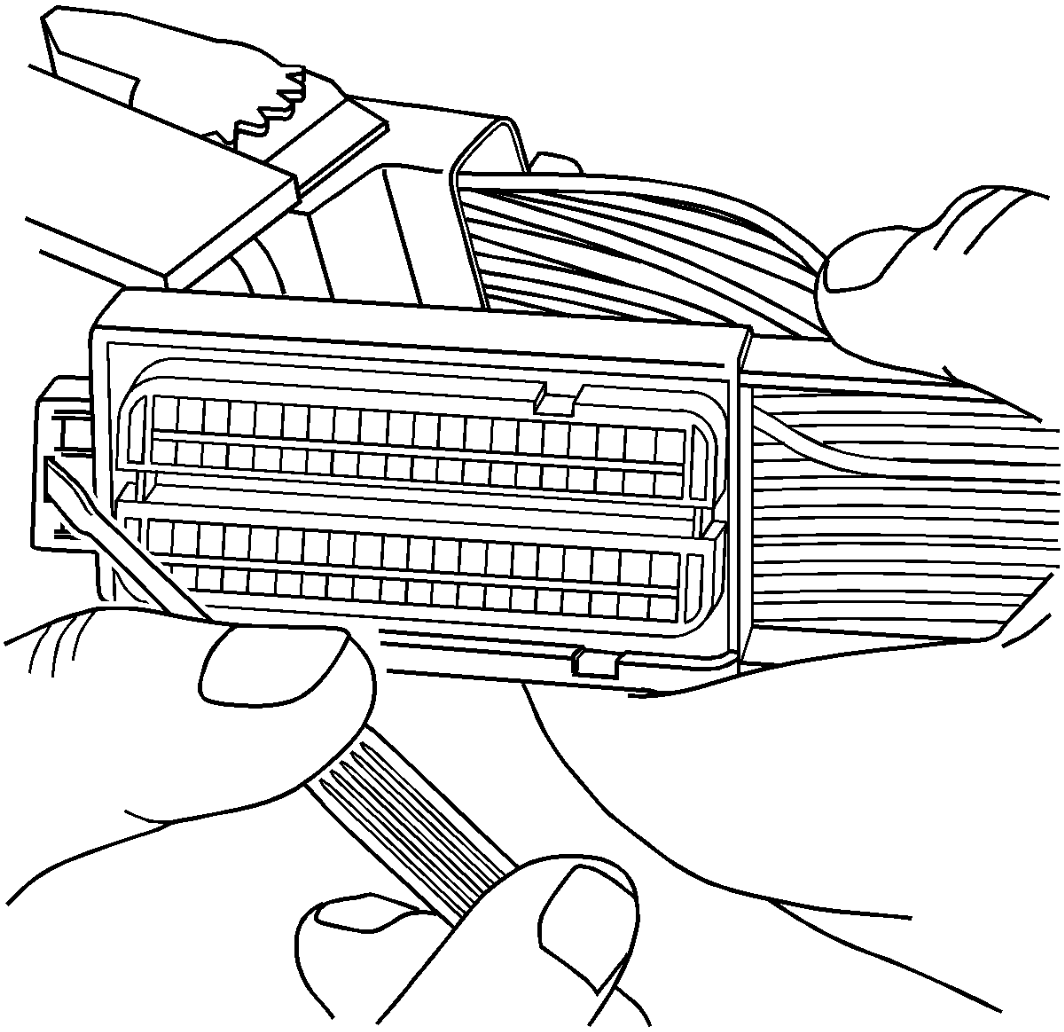

Fig. 43: View Of Removing TPA From Connector
Courtesy of GENERAL MOTORS COMPANY

5. Use a small flat-blade tool to remove TPA from the connector.

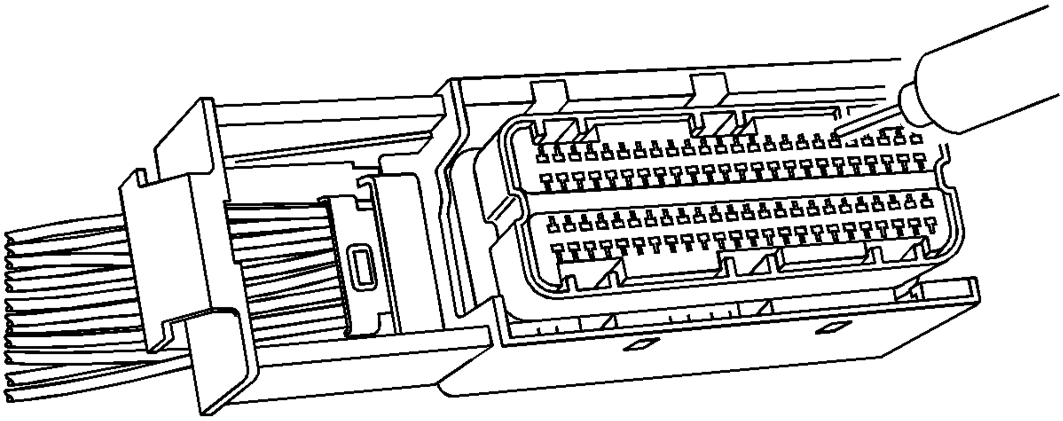

Fig. 44: View Of Special Tools And Terminals
Courtesy of GENERAL MOTORS COMPANY

6. Use the J-38125-213 or the J-38125-556 tool to release the terminals by inserting the tool into the terminal release cavity.
7. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
8. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
9. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

NOTE: **Ensure that the dress cover and connector body are both in the released position before reassembling. Failure to do so may cause damage to the connector and component.**

10. Reconnect the connector bodies.

DELPHI CONNECTORS (WEATHER PACK)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-10A** Terminal Release Tool

For equivalent regional tools, refer to **Special Tools** .

Terminal Removal Procedure

The following is the proper procedure for the repair of Weather PackÂ® Connectors.

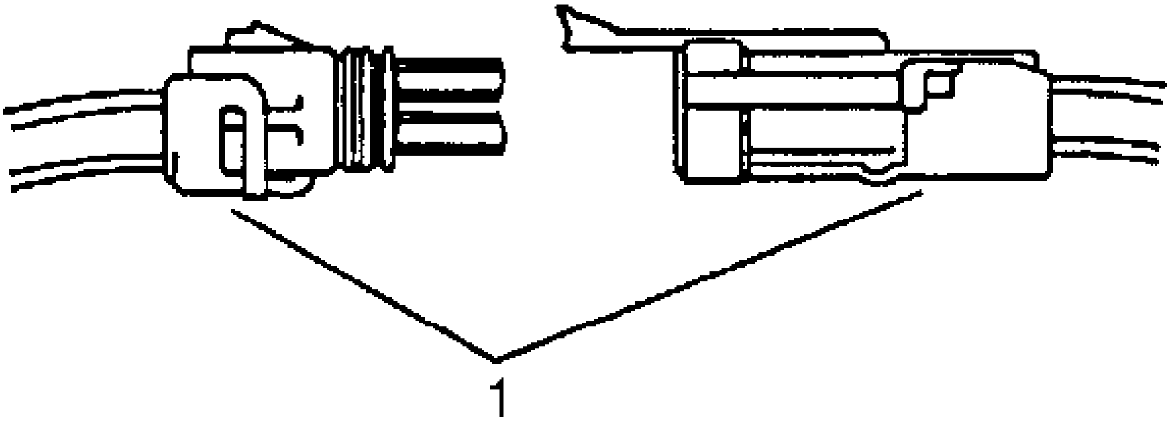

Fig. 45: View Of Connector Halves
Courtesy of GENERAL MOTORS COMPANY

1. Separate the connector halves (1).
2. Open the secondary lock. A secondary lock aids in terminal retention and is usually molded to the connector (1).
3. Grasp the wire and push the terminal to the forward most position. Hold the wire in this position.

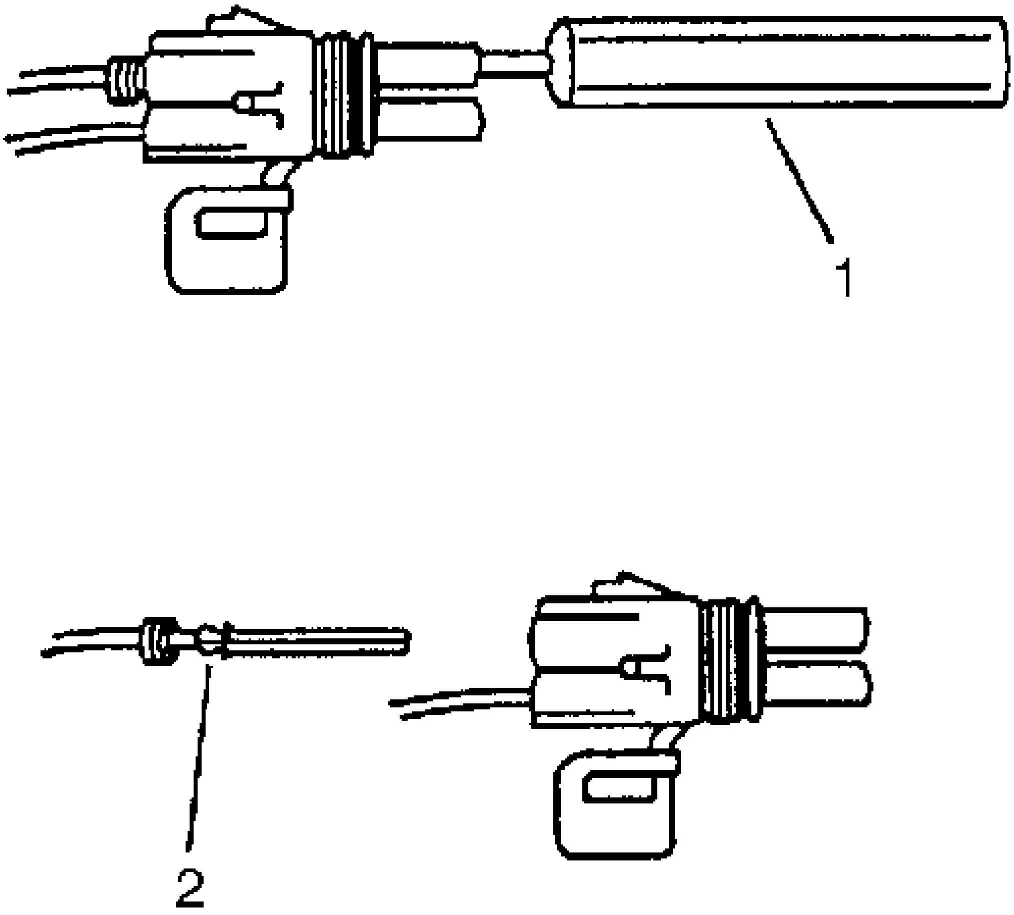

Fig. 46: Identifying Removal Tool & Terminal
Courtesy of GENERAL MOTORS COMPANY

4. Insert the Weather PackÂ® terminal removal tool J-38125-10A into the front (mating end) of the connector cavity until it rests on the cavity shoulder (1).
5. Gently pull on the wire to remove the terminal through the back of the connector (2).

NOTE: **Never use force to remove a terminal from a connector.**

6. Inspect the terminal and connector for damage. Repair as necessary. Refer to **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)**.
7. Reform the lock tang (2) and reset terminal in connector body.
8. Close secondary locks and join connector halves.
9. Verify that circuit is complete and working satisfactorily.
10. Perform system check.
11. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
12. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

DELPHI CONNECTORS (PUSH TO SEAT)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit

For equivalent regional tools, refer to **Special Tools** .

Terminal Removal Procedure

Follow the steps below in order to repair push to seat connectors.

1. Remove the terminal position assurance (TPA) device, the connector position assurance (CPA) device, and/or the secondary lock.

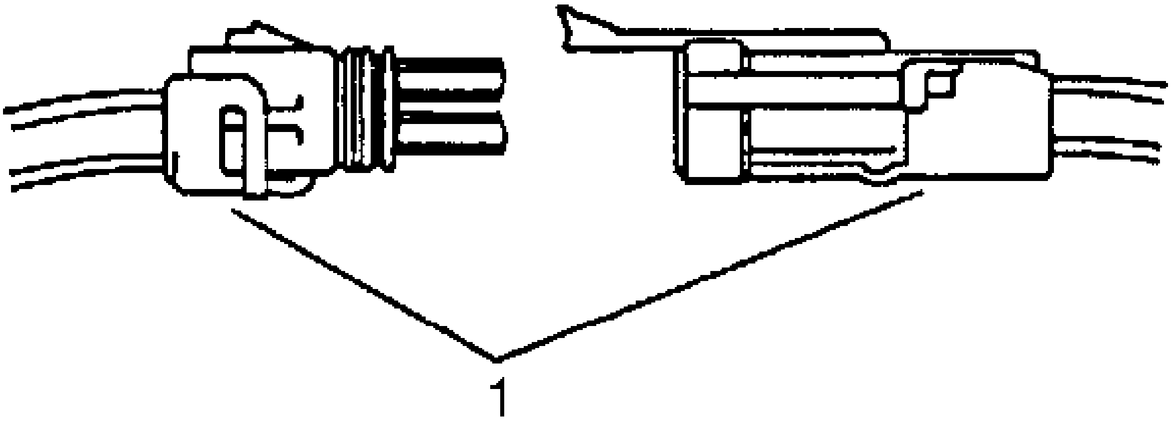

Fig. 47: View Of Connector Halves
Courtesy of GENERAL MOTORS COMPANY

2. Separate the connector halves (1).

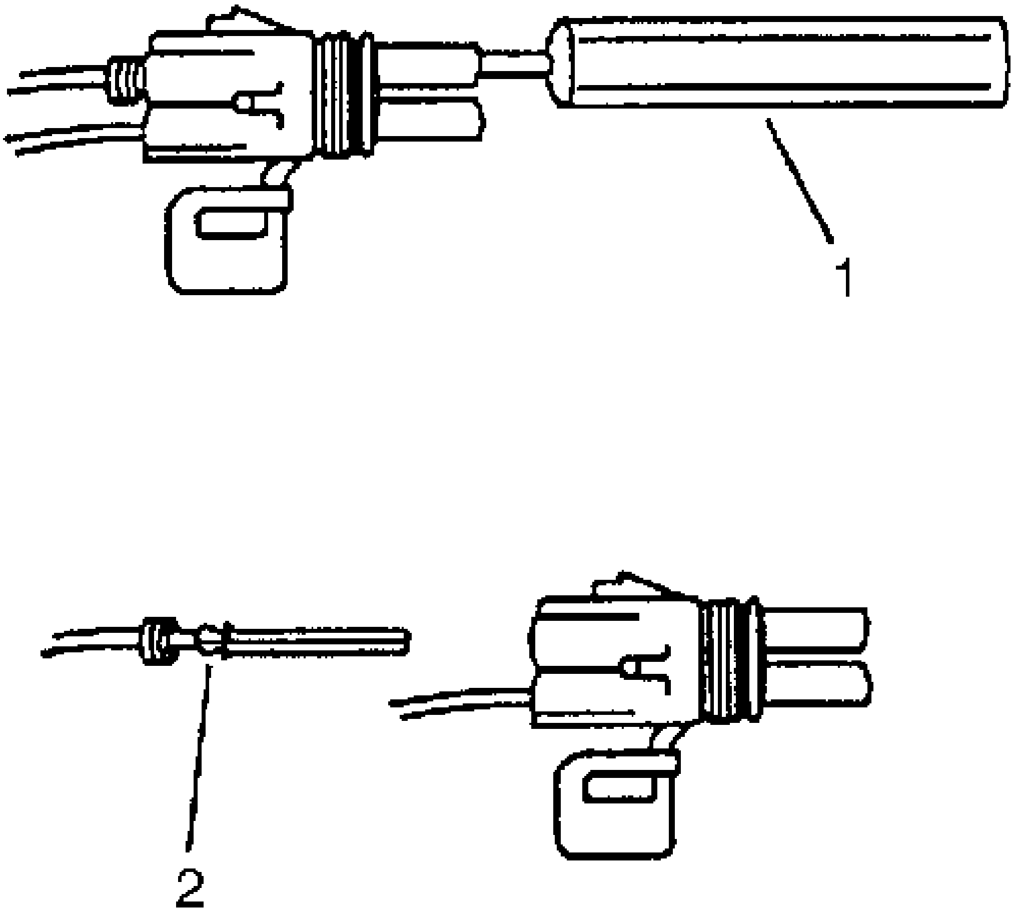

Fig. 48: Identifying Removal Tool & Terminal
Courtesy of GENERAL MOTORS COMPANY

3. Use the proper pick or removal tool (1) in order to release the terminal.
4. Gently pull the cable and the terminal (2) out of the back of the connector.

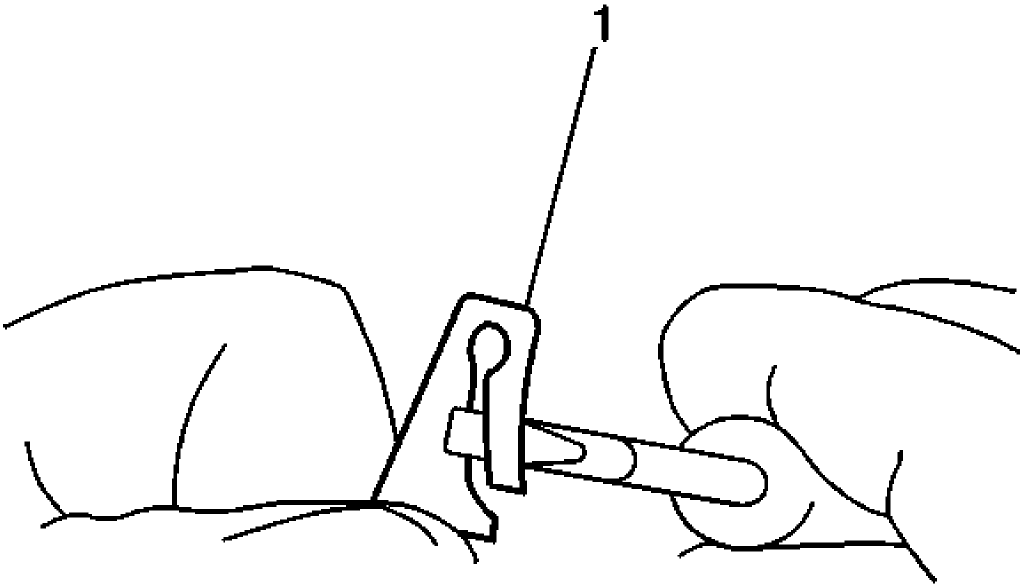

Fig. 49: Identifying Locking Device
Courtesy of GENERAL MOTORS COMPANY

5. Re-form the locking device if you are going to reuse the terminal (1).
6. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
7. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Terminal Insertion Procedure

1. In order to reuse a terminal or lead assembly, refer to **Wiring Repairs** .
2. Ensure that the cable seal is kept on the terminal side of the splice.
3. Insert the lead from the back until it catches.
4. Install the TPA, CPA, and/or the secondary locks.

DELPHI CONNECTORS (PULL TO SEAT)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit

For equivalent regional tools, refer to **Special Tools** .

Terminal Removal Procedure

If the terminal is visibly damaged or is suspected of having a faulty connection, the terminal should be replaced.

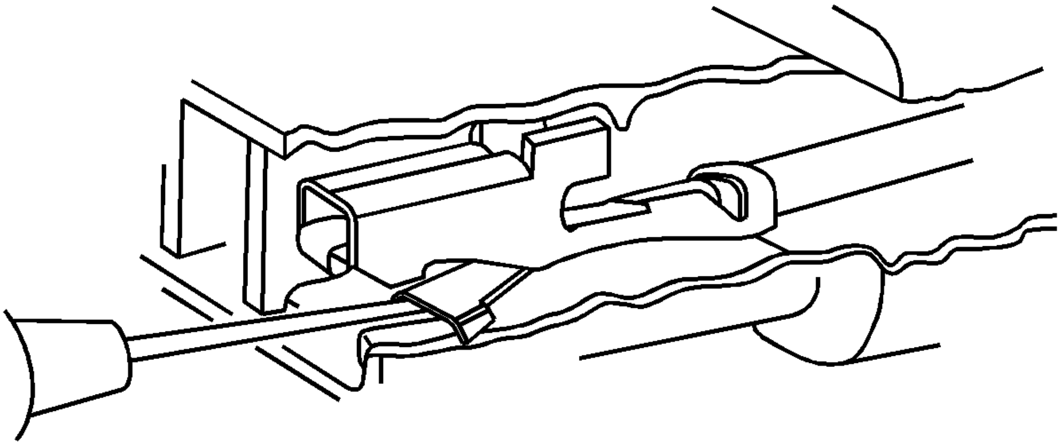

Fig. 50: Aligning Removal Tool - Delphi (Pull To Seat)
Courtesy of GENERAL MOTORS COMPANY

Follow the steps below in order to repair pull-to-seat connectors:

1. Remove the connector position assurance (CPA) device and/or the secondary lock.
2. Disconnect the connector from the component or separate the connectors for in-line connectors.
3. Remove the terminal position assurance (TPA) device.
4. Review the connector end view to determine the proper test probe and release tool.
5. Insert the release tool into the front of the connector body.
6. Grasp the wire at the back of the connector body and gently push the terminal out the front of the connector body.
7. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
8. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Terminal Insertion Procedure

1. Align the terminal and pull the wire from the back of the connector in order to seat the terminal.
2. If the connector is outside of the passenger compartment, apply dielectric grease to the connector.
3. Install the TPA, CPA, and/or the secondary locks.

DELPHI CONNECTORS (MICRO-PACK 100W)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit

- **J-38125-12A** Terminal Release Tool

For equivalent regional tools, refer to Special Tools .

Terminal Removal Procedure

There are 2 styles of Micro-Pack 100W connectors. These connectors are very similar but use different terminals and have some minor physical differences also.

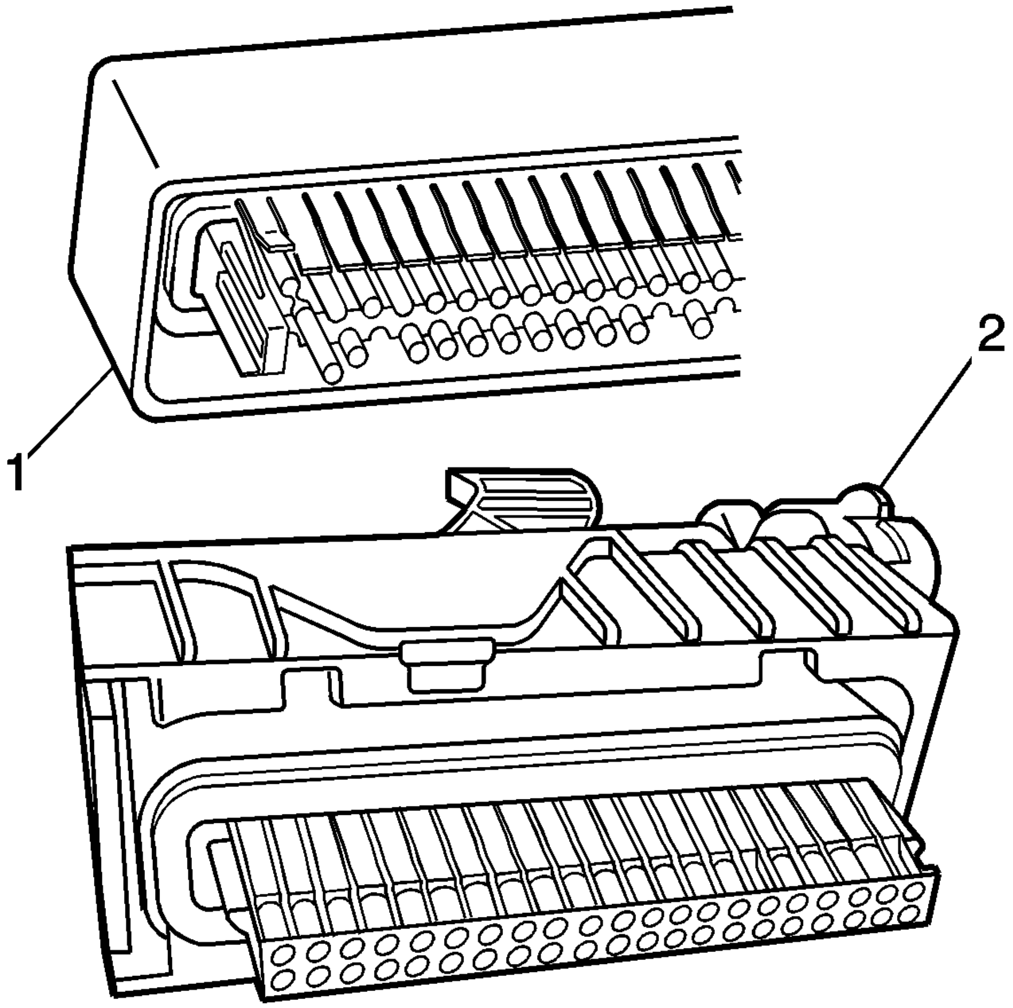

Fig. 51: Identifying Micro-Pack 100W First & Second Connector Designs
Courtesy of GENERAL MOTORS COMPANY

The first connector design of the Micro-Pack 100W (1) has a white connector interface that holds the terminals. The second design of the Micro-Pack 100W (2) has a gray interface to hold the terminals. Also, the first design has terminal cavities that are further apart (3 mm centerline) and offset from the other row of terminal cavities in the connector. The second design has terminals cavities that are closer together (2.54 mm centerline) and aligned vertically. One other way to identify the second design is the thin strip of material that runs along the outside of the cavities.

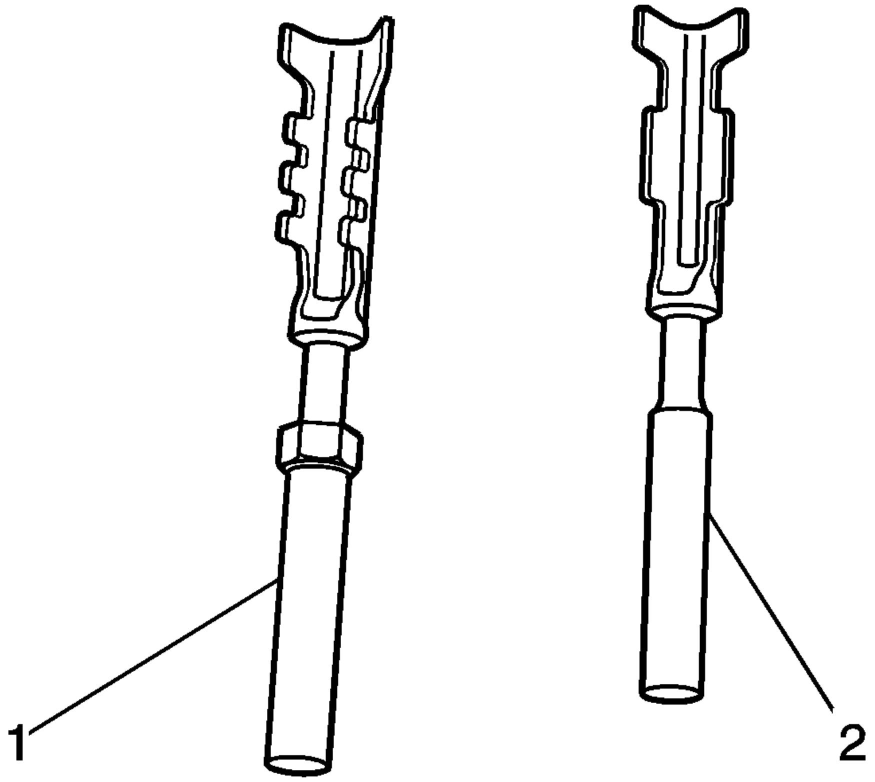

Fig. 52: Identifying Micro-Pack 100W Short & Long Terminals
Courtesy of GENERAL MOTORS COMPANY

NOTE: **There are 2 styles of Micro-Pack 100W terminals which are very similar. Ensure that you have the correct terminal before crimping the new terminal to the wire. The first design connector uses the longer terminal (1) that has a raised area in front of the recess in the terminal. The second design connector uses the shorter terminal without the raised area.**

Follow the steps below in order to remove terminals from Micro-Pack 100W connectors. Some Micro-Pack 100W connector disassembly procedures will vary. Use this procedure as a guide.

1. Disconnect the connector from the component.

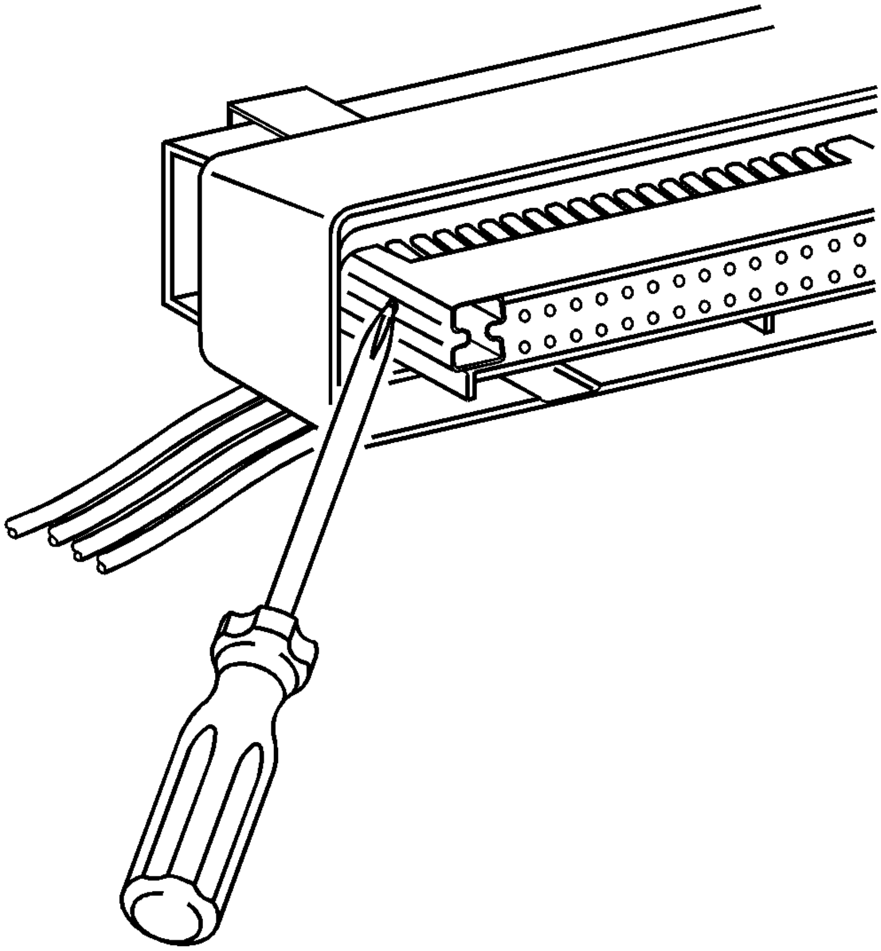

Fig. 53: Locating Nose Piece Locking Tabs
Courtesy of GENERAL MOTORS COMPANY

2. Locate the nose piece locking tabs that are positioned on the side of the connector nose piece. The connector nose piece acts as a terminal positive assurance (TPA) and may be referred to as such.

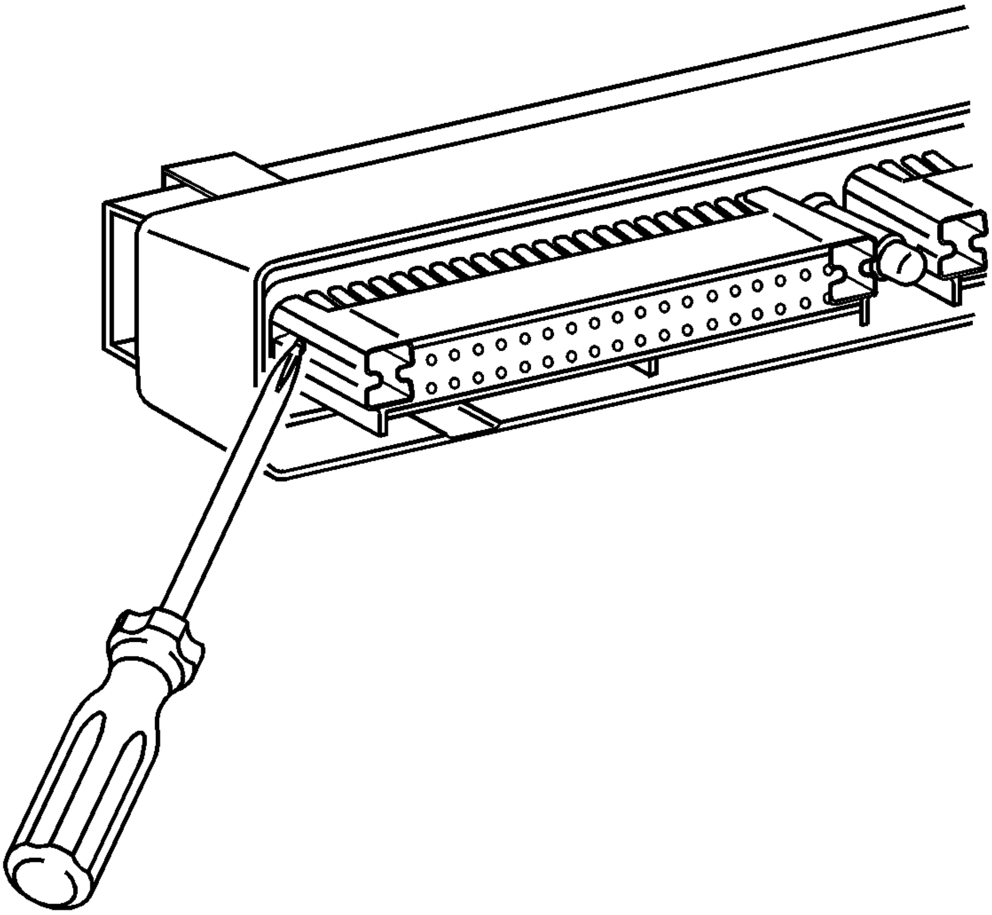

Fig. 54: Loosening Nose Piece Locking Tabs
Courtesy of GENERAL MOTORS COMPANY

3. Use a small flat-blade tool to push in one of the locking tabs while gently pulling on the same side of the nose piece.
4. Repeat the procedure for the other locking tab and remove the nose piece.
5. Remove the wire dress cover. The following is a general procedure for wire dress cover removal. Use this procedure as a guide, some dress cover removal procedures may vary.

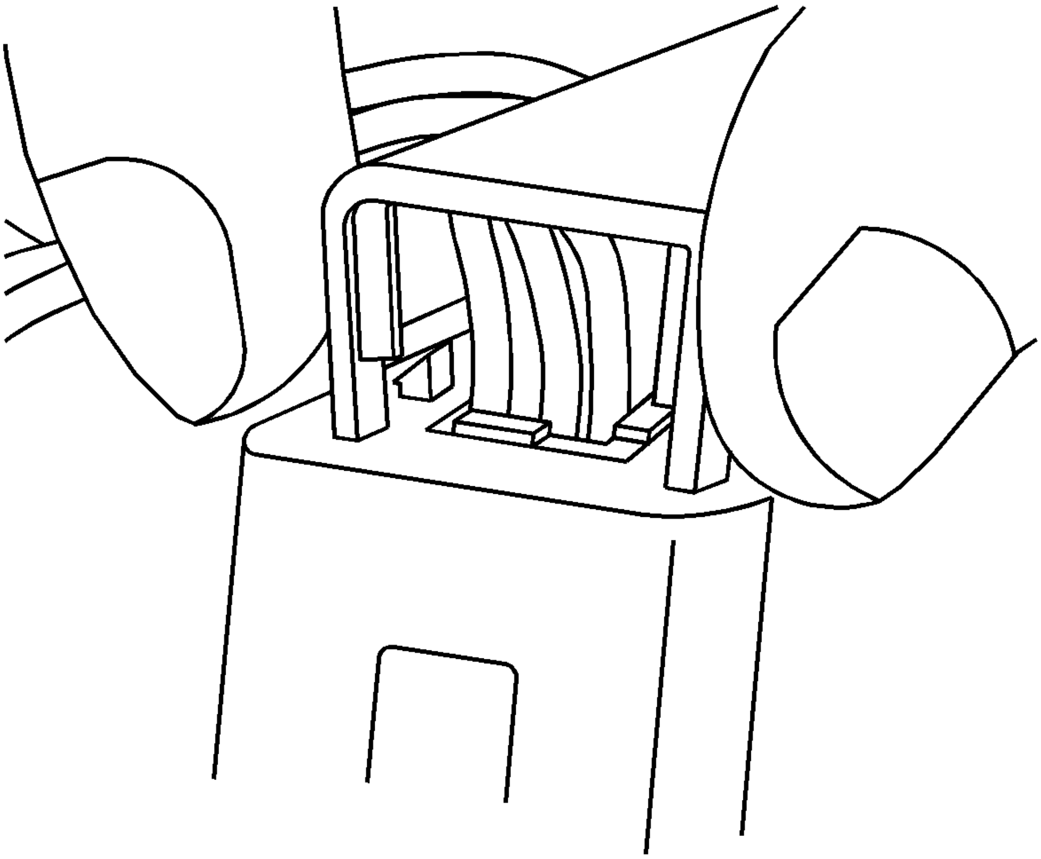

Fig. 55: Squeezing Cover Locking Legs
Courtesy of GENERAL MOTORS COMPANY

6. Use fingers to squeeze the 2 locking legs of the cover.

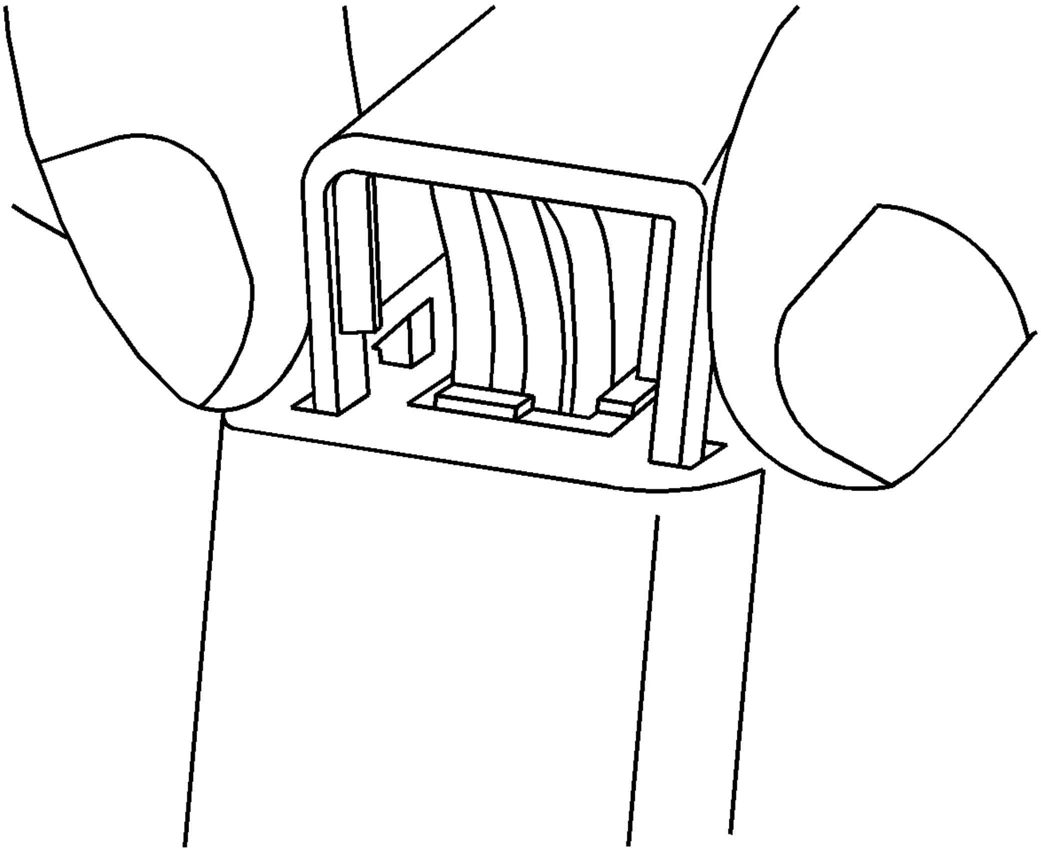

Fig. 56: Unseating Locking Leg
Courtesy of GENERAL MOTORS COMPANY

7. Apply pressure and gently rock the cover until one locking leg is unseated.

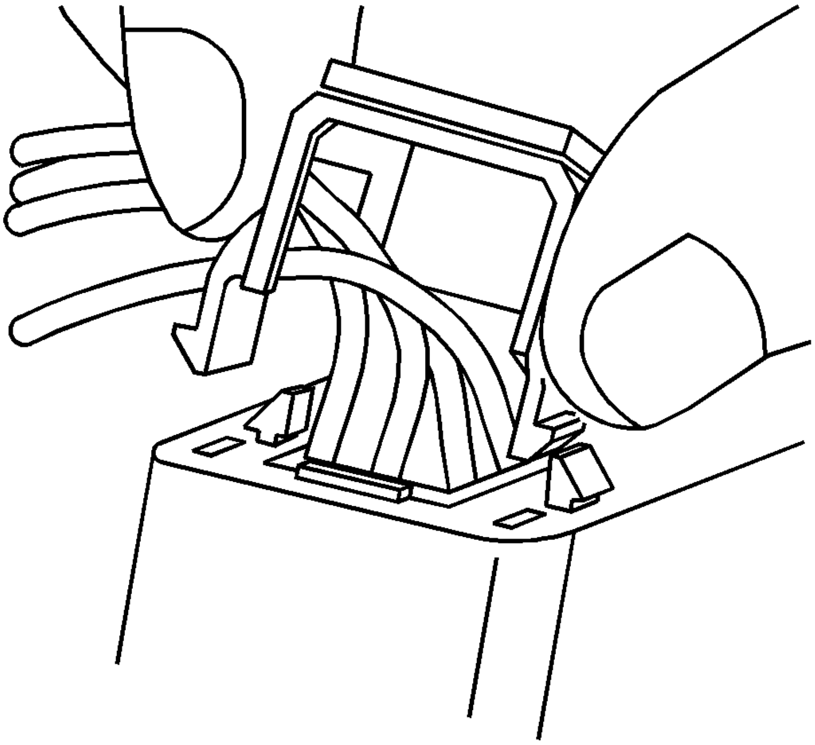

Fig. 57: Removing Cover
Courtesy of GENERAL MOTORS COMPANY

8. Continue to apply pressure and rock the cover until the second locking leg is unseated. Repeat procedure for the other side of the dress cover and remove the cover.

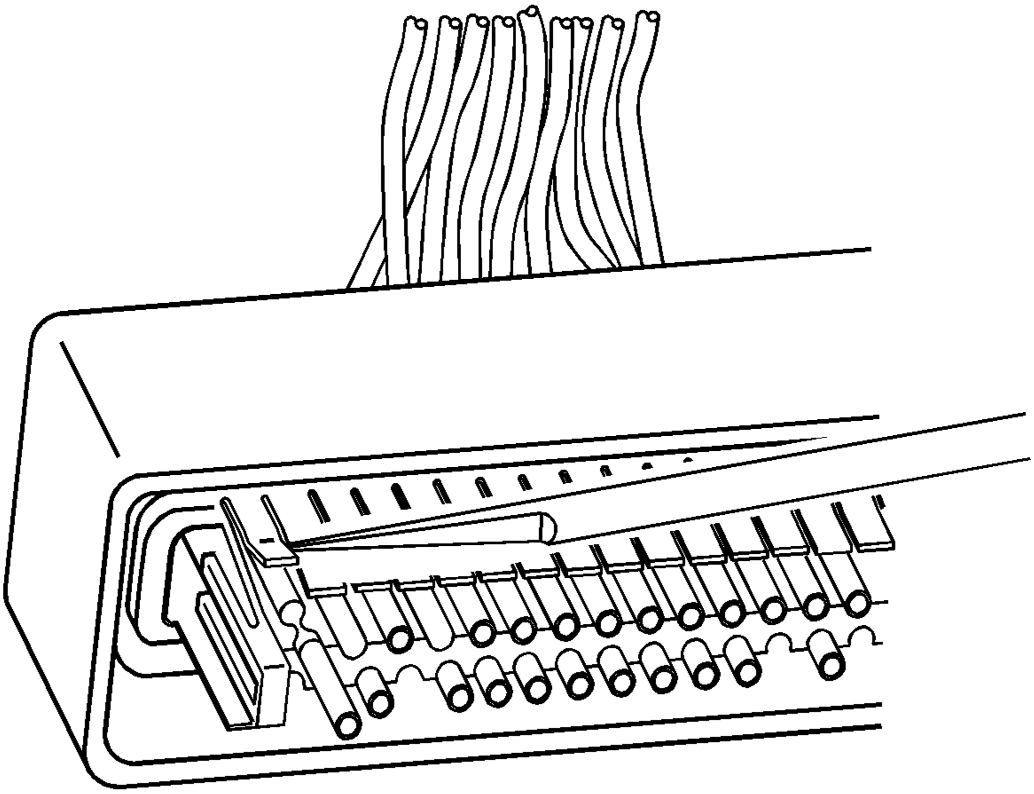

Fig. 58: Identifying Terminal Retaining Tab
Courtesy of GENERAL MOTORS COMPANY

9. Use J-38125-12A to gently lift the terminal retaining tab while gently pulling the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
10. If the terminal is severely bent or damaged, it may be possible on some connectors to push the wire out of the front of the connector instead of pulling it through. This will prevent damage to the internal seals of the connector. Once the terminal is pushed out of the connector, cut the wire as close to the terminal as possible and pull the wire through the connector.
11. Repair the terminal by following the Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair) procedure.
12. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Terminal Insertion Procedure

After the terminal is crimped to the wire perform the following procedure in order to replace Micro-Pack 100 terminals.

1. Slide the new terminal into the correct cavity at the back of the connector.
2. Push the terminal into the connector until it locks into place. The new terminal should be even with the other terminals. Ensure that the terminal is locked in place by gently pulling on the wire.
3. To assemble the connector, reverse the Terminal Removal Procedure.

DELPHI CONNECTORS (MICRO.64)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit

- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-21** Terminal Release Tool

For equivalent regional tools, refer to **Special Tools** .

Terminal Removal Procedure

Follow the steps below in order to remove terminals from Micro.64 connectors.

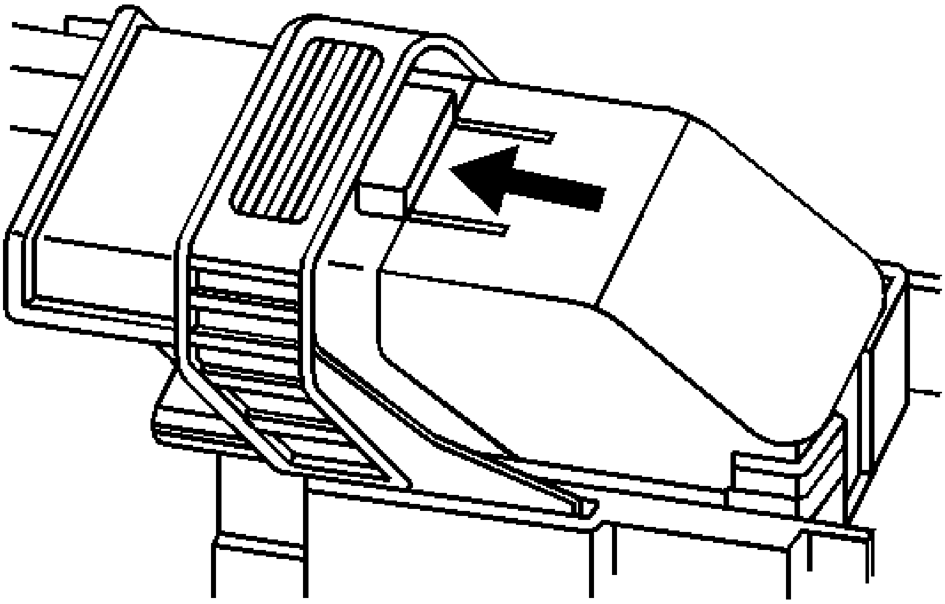

Fig. 59: Identifying Wire Dress Cover Lever Lock
Courtesy of GENERAL MOTORS COMPANY

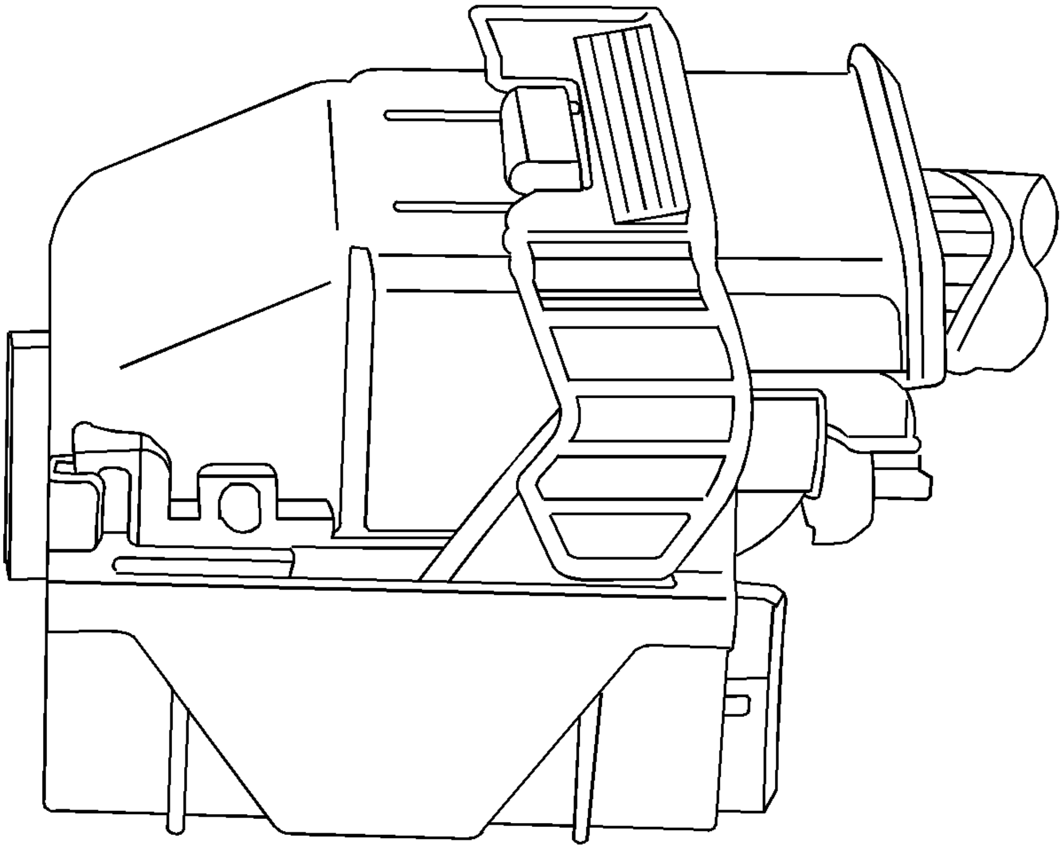

Fig. 60: View Of Typical Micro 64 Connector
Courtesy of GENERAL MOTORS COMPANY

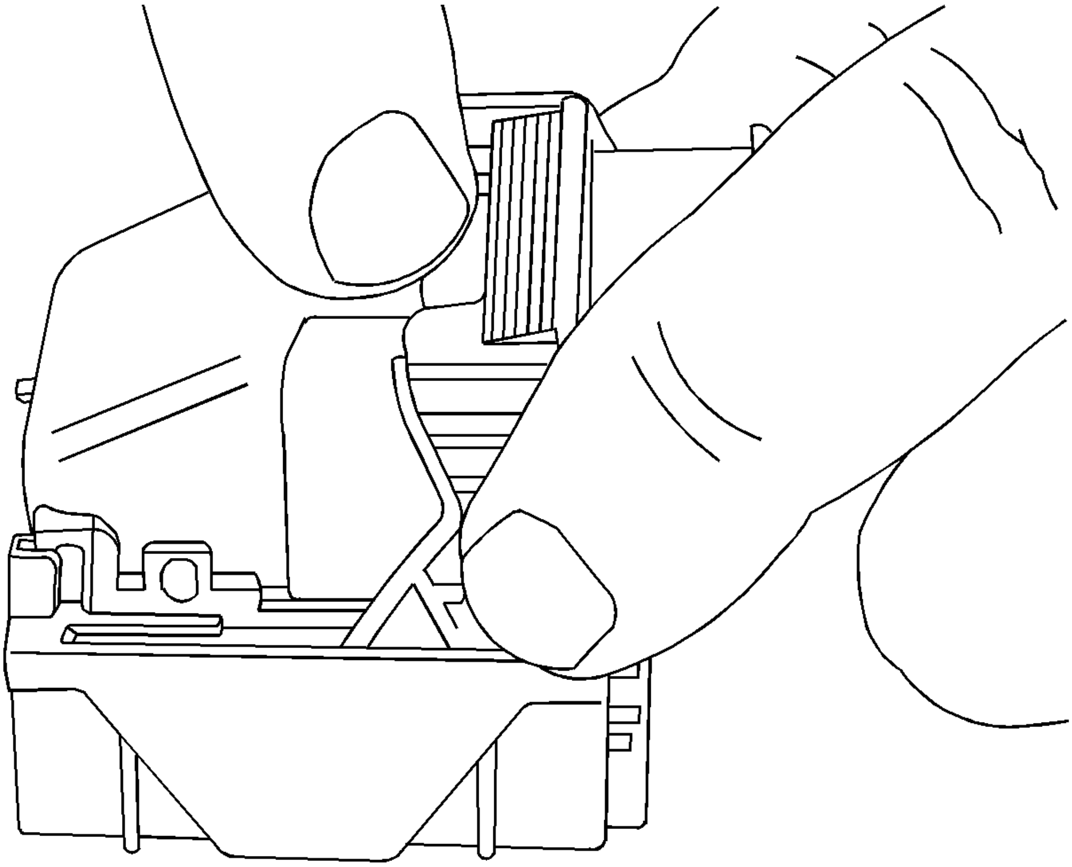

Fig. 61: Depressing Lock And Pulling Lever
Courtesy of GENERAL MOTORS COMPANY

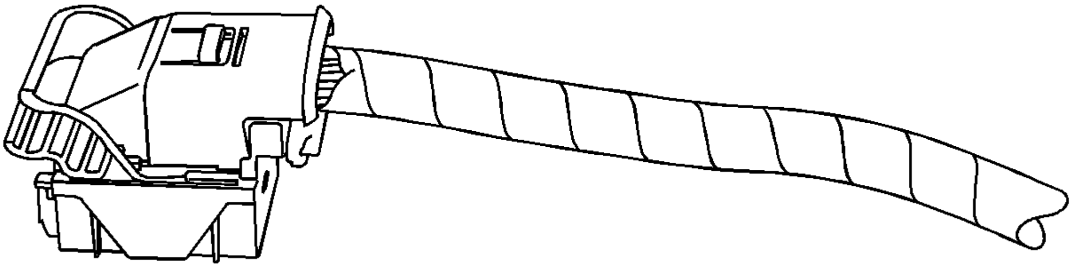

Fig. 62: View Of Connector When Released From Component

Courtesy of GENERAL MOTORS COMPANY

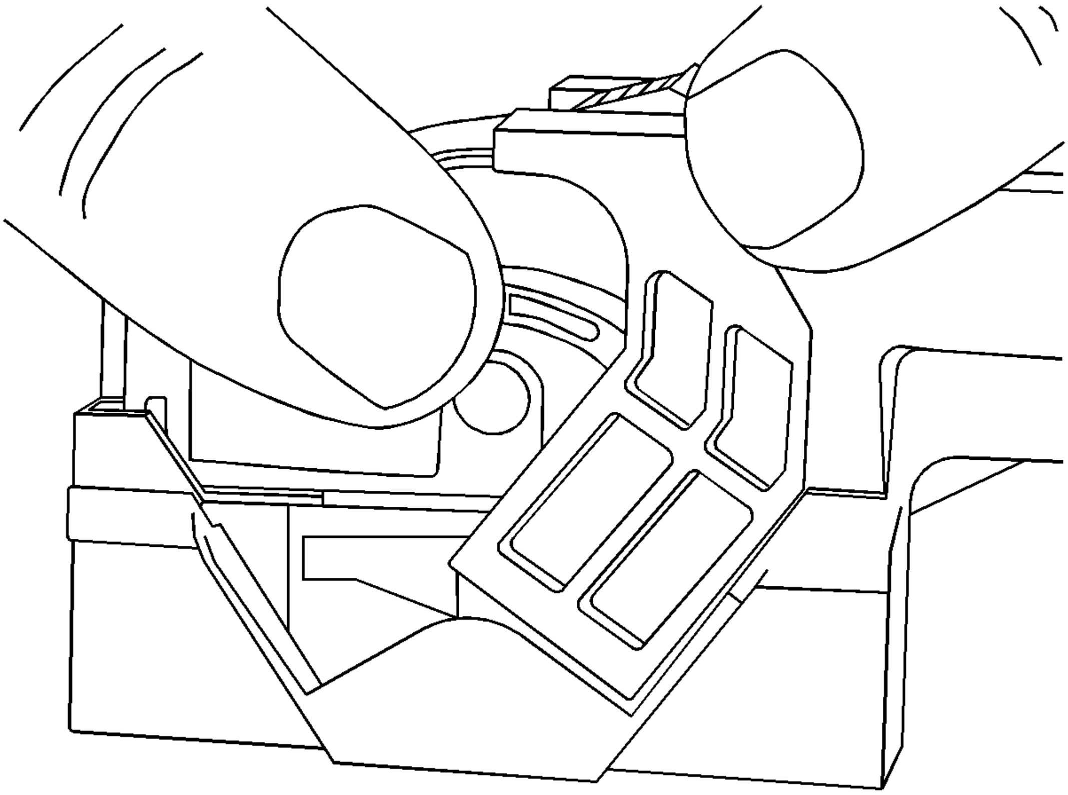

Fig. 64: Locating Locks On Both Sides Of Wiredress Cover
Courtesy of GENERAL MOTORS COMPANY

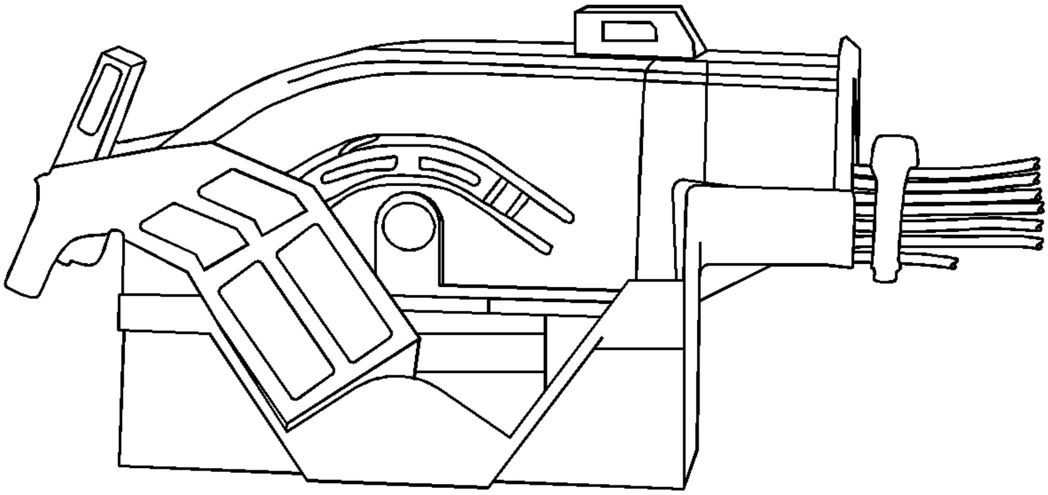

Fig. 65: View Of Connector When Released From Component
Courtesy of GENERAL MOTORS COMPANY

1. Locate the lever lock on the wire dress cover. While depressing the lock, pull the lever over and past the lock. The lever lock may be located on the top or sides of the wire dress cover.

   View of a typical Micro 64 connector.

   Depress the lock and pull the lever over and past the lock.

   View of the connector when released from the component.

   View of another type of Micro 64 connector.

   Depress the locks that are located on both sides of the wire dress cover and pull the lever over and past the locks.

   View of the connector when released from the component.

2. Disconnect the connector from the component.

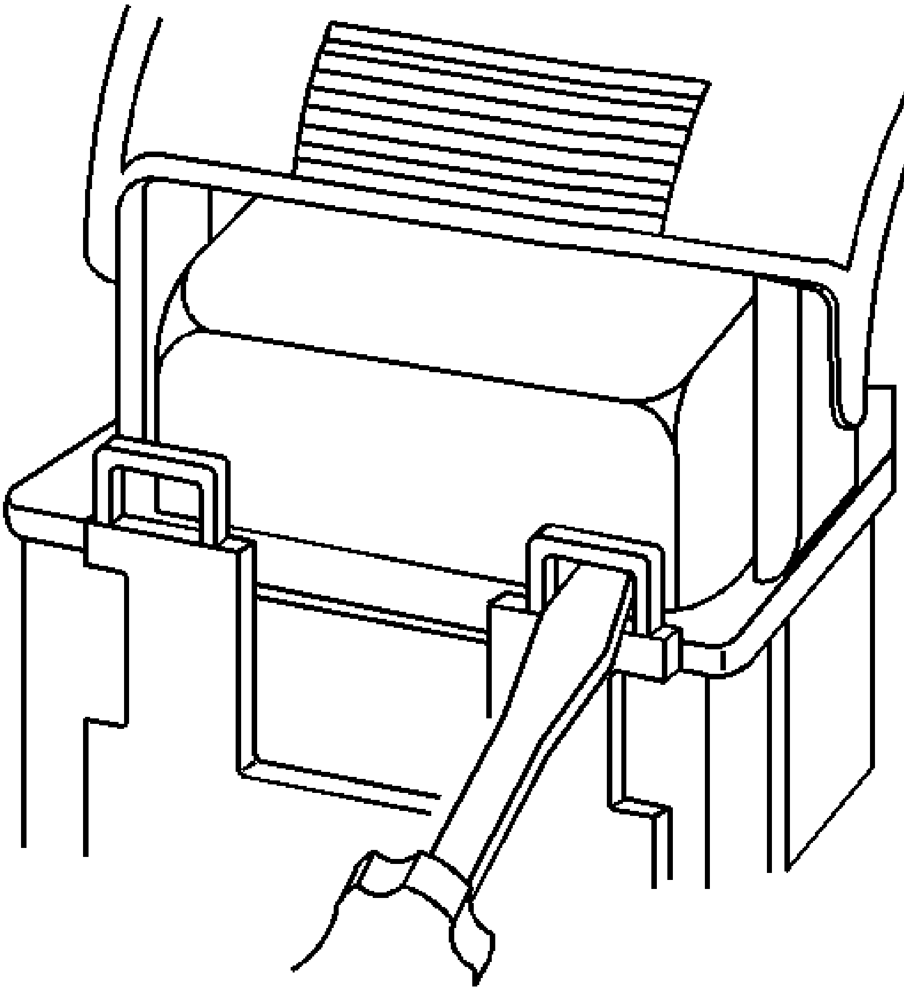

Fig. 66: View Of Releasing Locking Tabs
Courtesy of GENERAL MOTORS COMPANY

3. Locate the dress cover locking tabs at the front of the connector. Using a small flat-blade tool push down on one of the locking tabs and pull the cover up until the dress cover releases. Repeat this procedure for the other locking tab.
4. Once the front 2 locks are unlocked, lift the front of the dress cover and pull it forward.

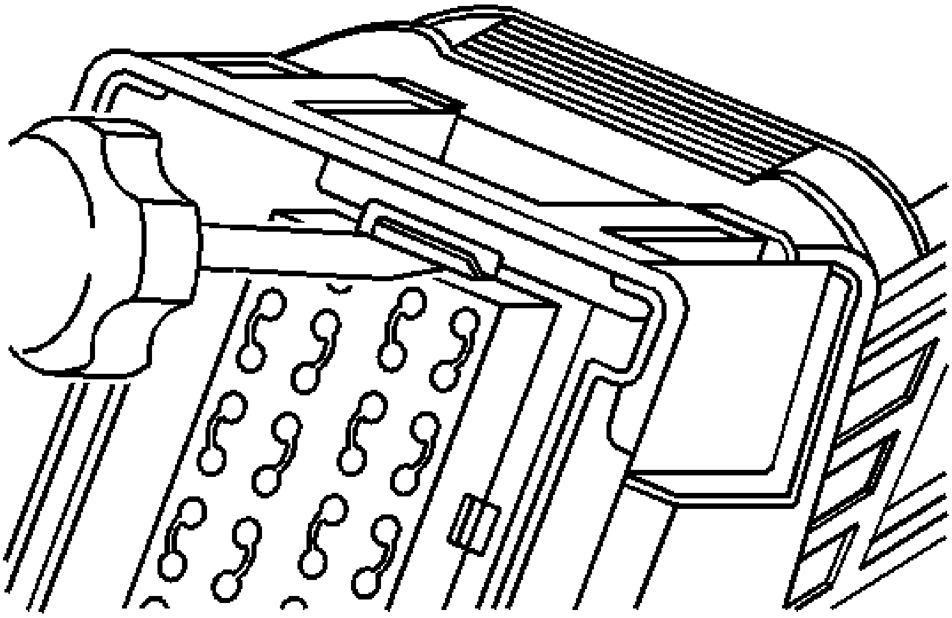

Fig. 67: View Of Removing Terminal Position Assurance
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Always use care when removing a terminal position assurance (TPA) in order to avoid damaging it.**

5. Remove the TPA by inserting a small flat-blade tool into the small slot on the TPA and pushing down until the TPA releases. Gently pry the TPA out of the connector.

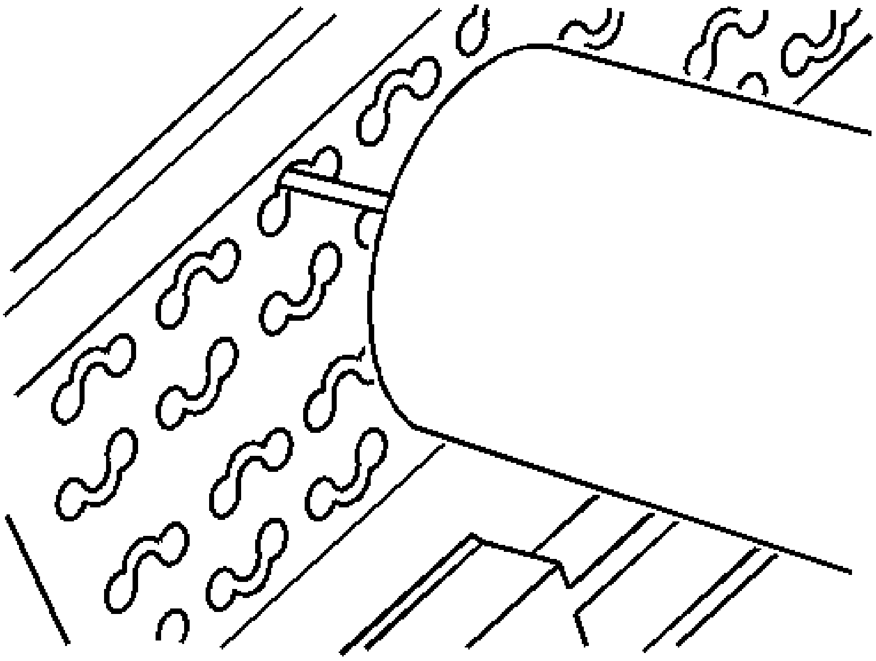

Fig. 68: Identifying Terminal Release Tool
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Be careful not to angle or rock the J-38125-21 tool when inserting it into the connector or the tool may break.**

6. Insert the J-38125-21 tool into the round canal between the terminals cavities at the front of the connector.

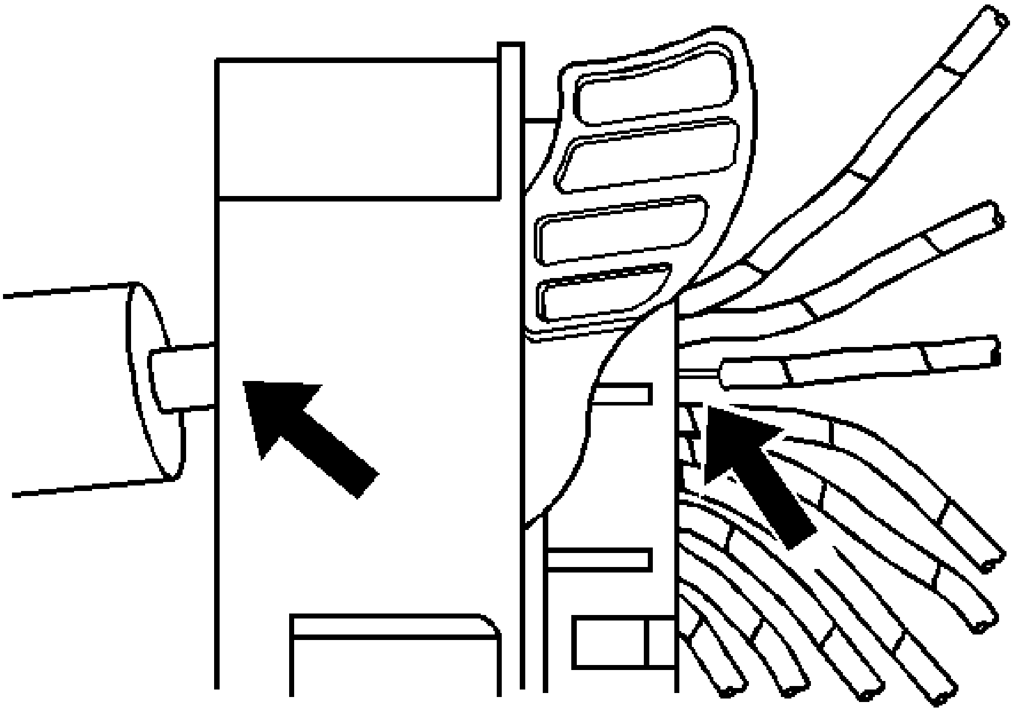

Fig. 69: Removing Wire From Back Of Connector
Courtesy of GENERAL MOTORS COMPANY

7. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
8. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
9. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

DELPHI CONNECTORS (12-WAY)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-12A** Terminal Release Tool

For equivalent regional tools, refer to **Special Tools** .

Terminal Removal Procedure

Follow the steps below in order to remove terminals from the connector.

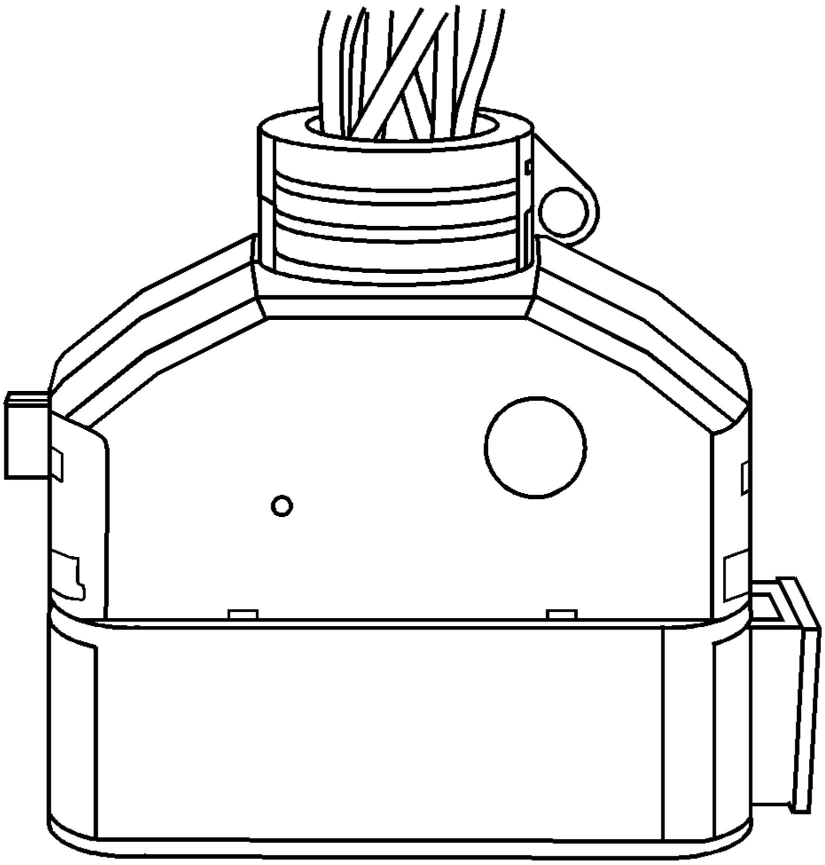

Fig. 70: Identifying Lever Lock
Courtesy of GENERAL MOTORS COMPANY

1. Locate the lever lock on the wire dress cover. Remove the connector position assurance (CPA) and slide the lever lock away from the connector body.
2. Disconnect the connector from the component.

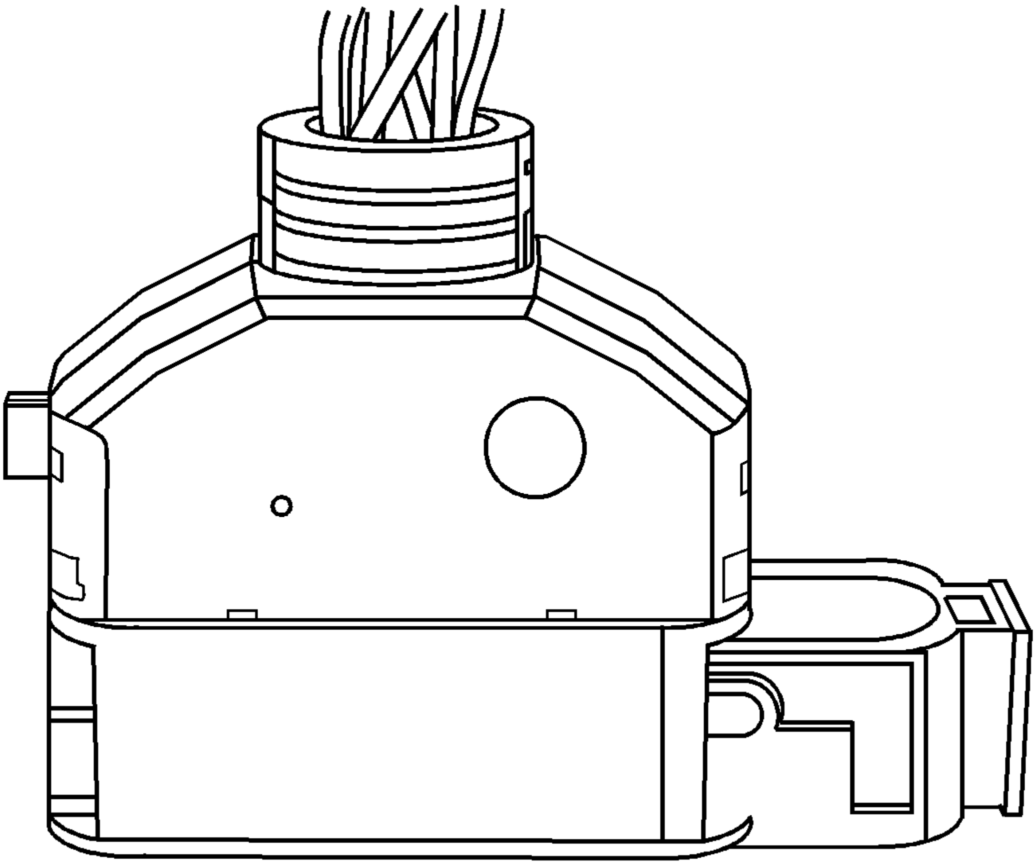

Fig. 71: Identifying Dress Cover Locking Tabs
Courtesy of GENERAL MOTORS COMPANY

3. Locate the dress cover locking tabs on the dress cover of the connector. Using a small flat-blade tool release all of the locking tabs.

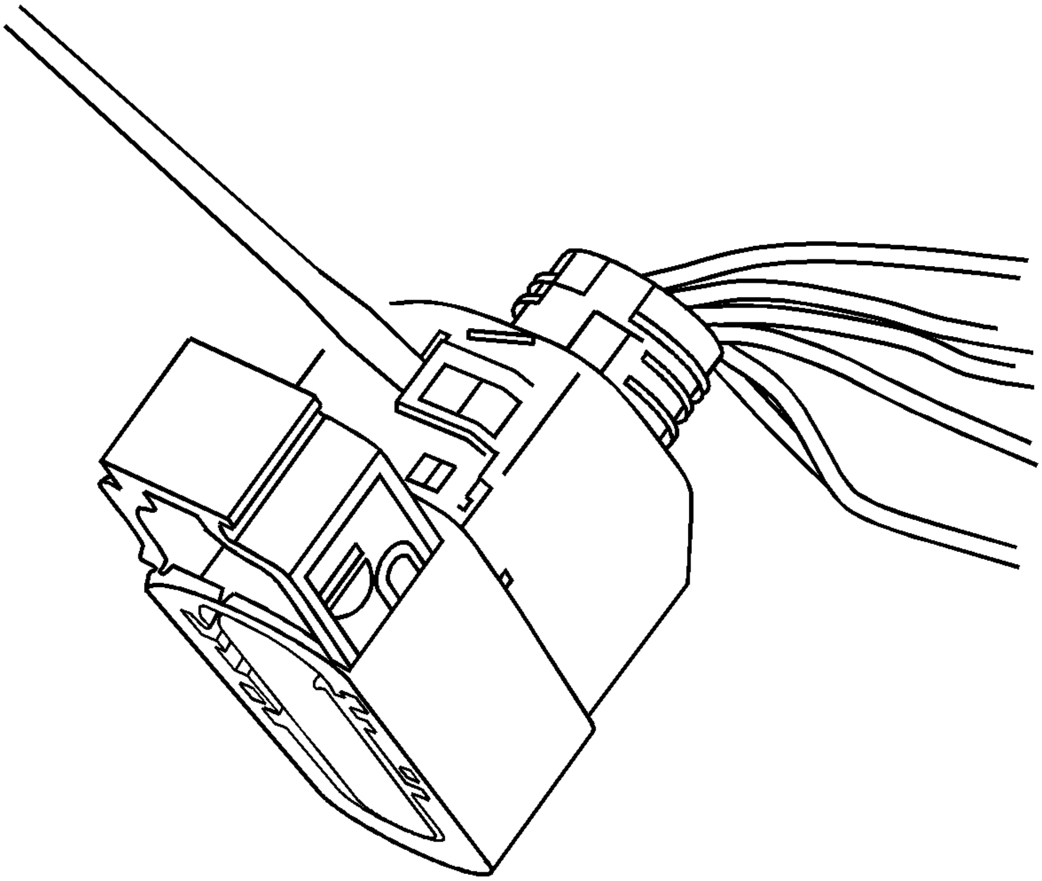

Fig. 72: Identifying Lower Wire Dress Cover Locking Tab
Courtesy of GENERAL MOTORS COMPANY

4. Release the lower wire dress cover locking tab.

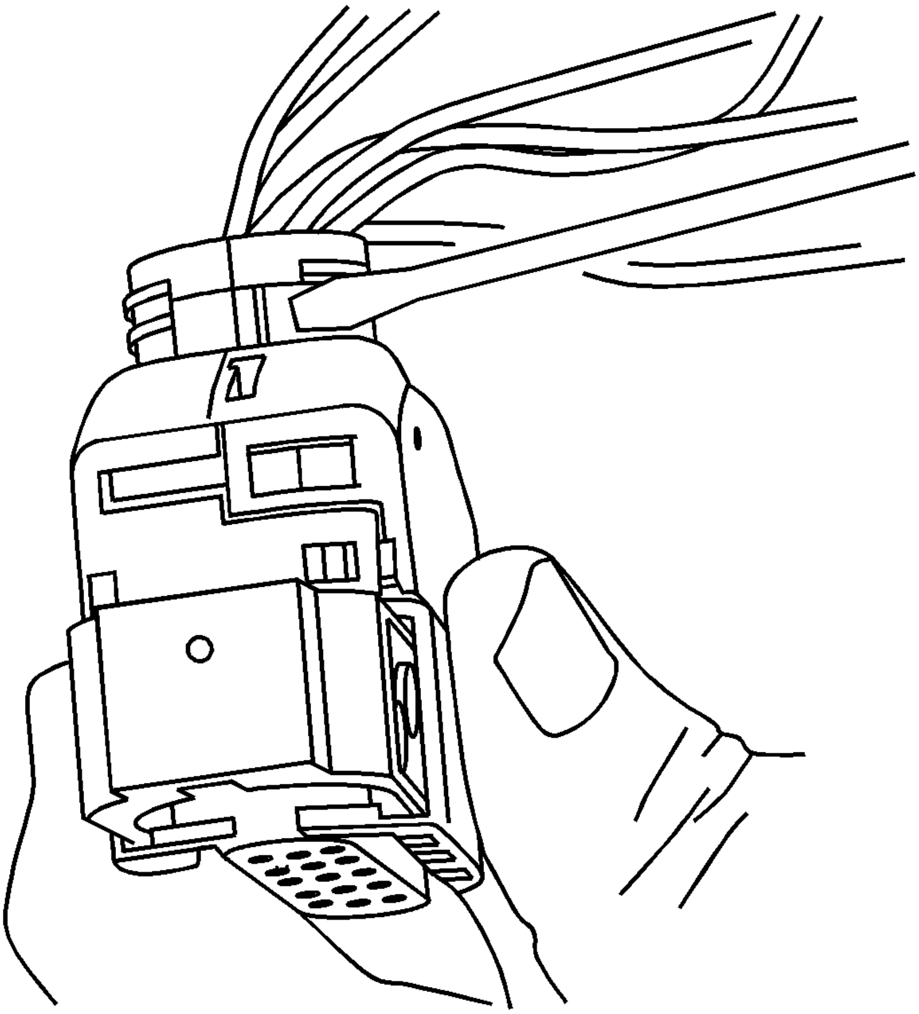

Fig. 73: Identifying Upper Wire Dress Cover Locking Tab
Courtesy of GENERAL MOTORS COMPANY

5. Release the upper wire dress cover locking tab.
6. Once the locks are unlocked, lift the dress cover off.

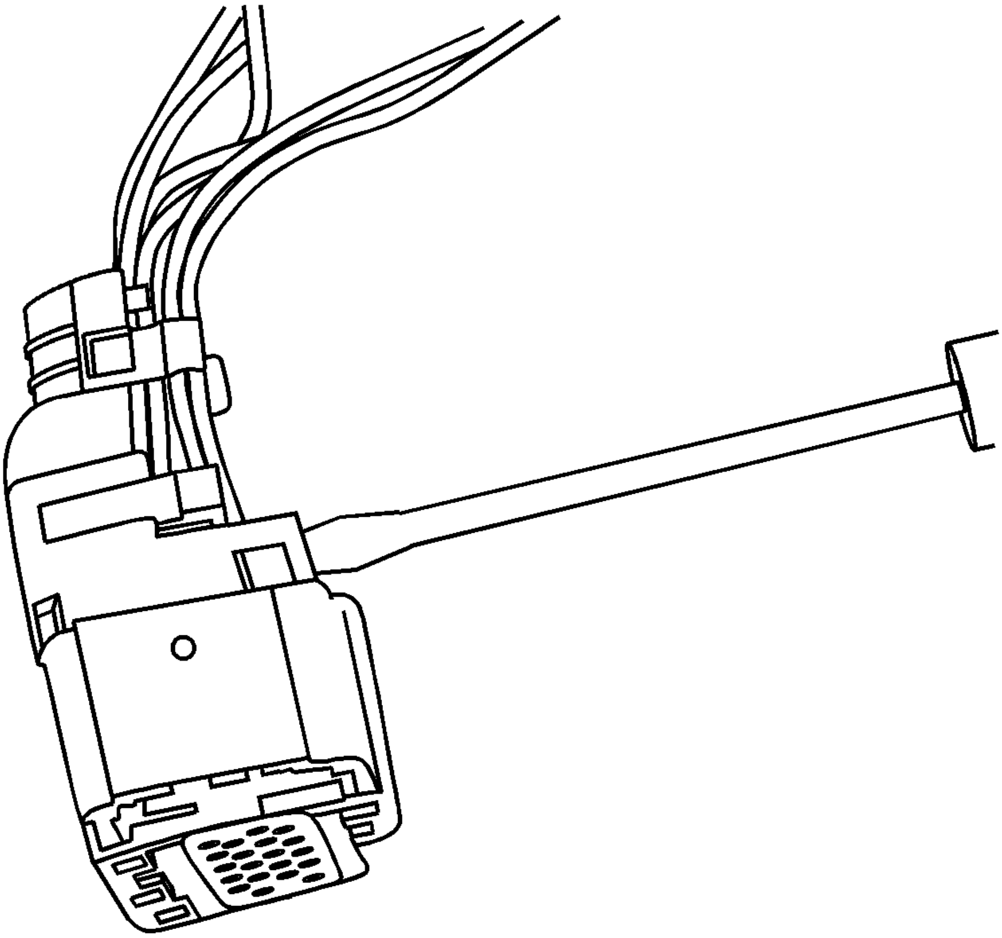

Fig. 74: View Of TPA Being Pried Out Of Connector
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Always use care when removing a terminal position assurance (TPA) in order to avoid damaging it.**

7. Remove the TPA by inserting a small flat-blade tool into the locking tabs on both sides of the TPA. Gently pry the TPA out of the connector.

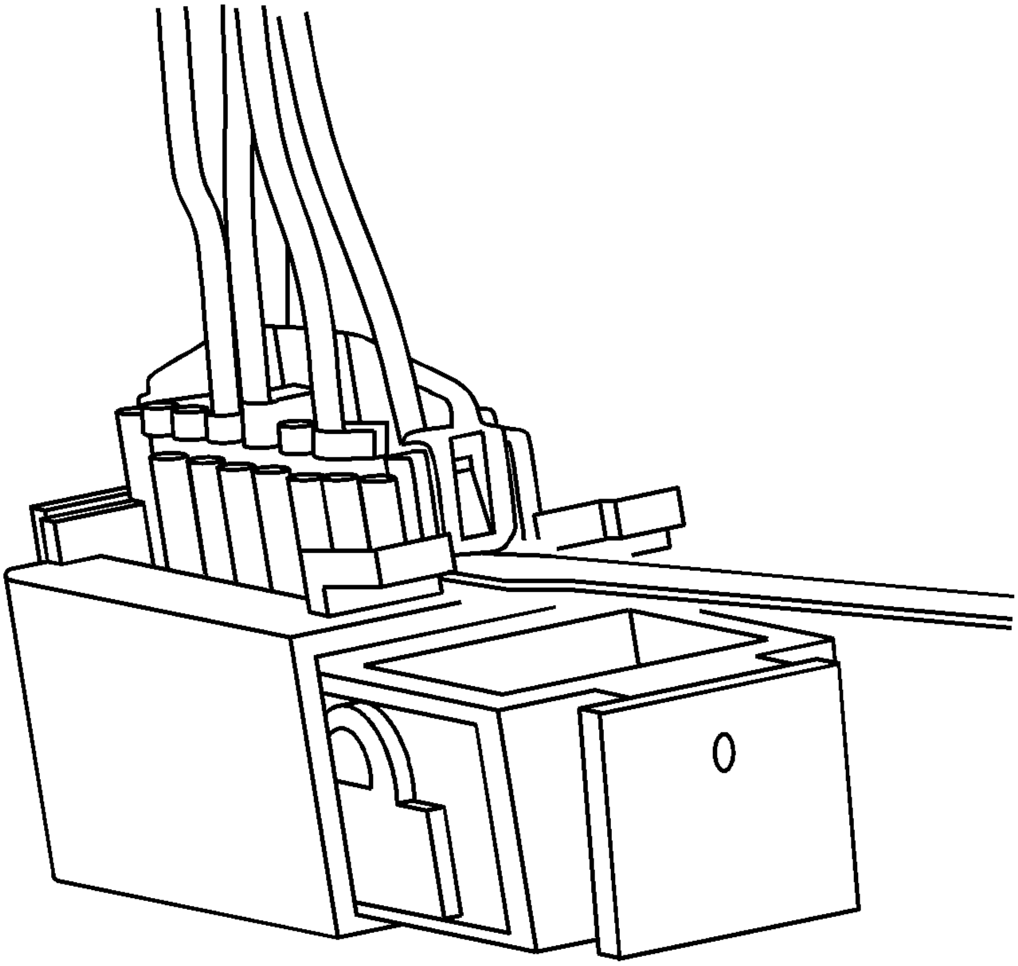

Fig. 75: Removing Nose Piece
Courtesy of GENERAL MOTORS COMPANY

8. Remove the nose piece by inserting a small flat-blade tool into the locking tabs on both sides of the nose piece. Gently pry the nose piece out of the connector.

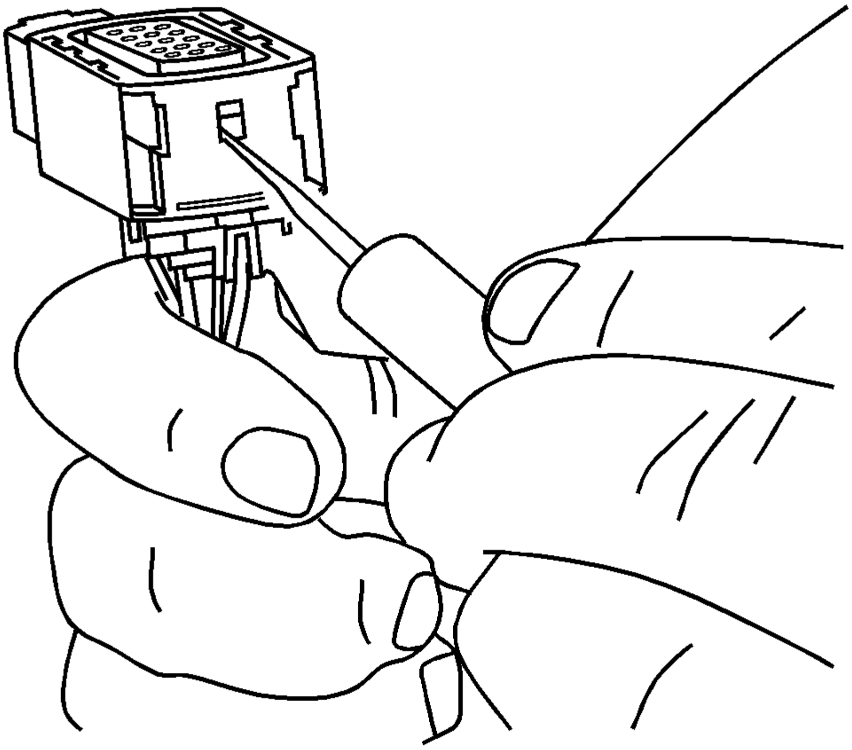

Fig. 76: Inserting Special Tool Into Terminal Release Cavity
Courtesy of GENERAL MOTORS COMPANY

9. Insert the J-38125-12A tool to release the terminals by inserting the tool into the terminal release cavity.

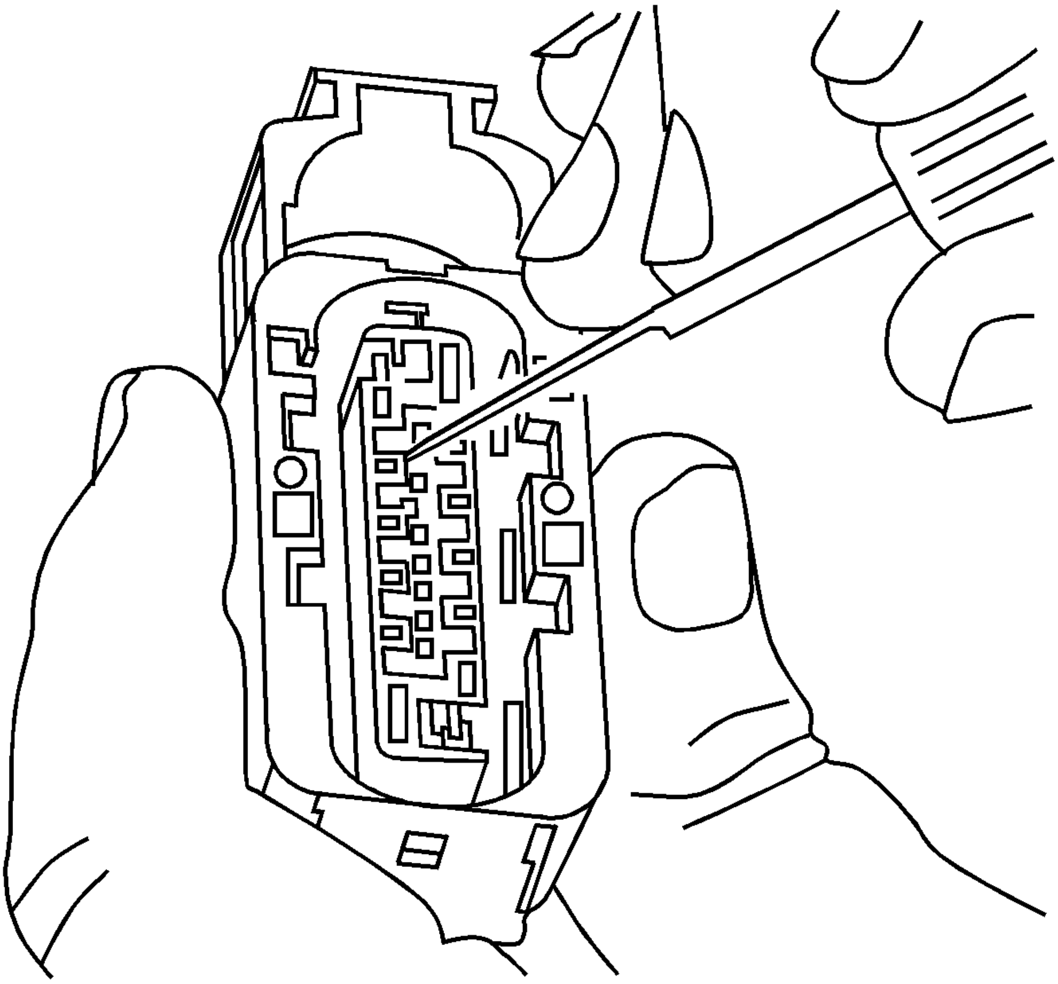

Fig. 77: Pulling Wire Out Of Back Of Connector
Courtesy of GENERAL MOTORS COMPANY

10. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
11. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
12. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

DELPHI CONNECTORS (STEERING GEAR)

Removal Procedure

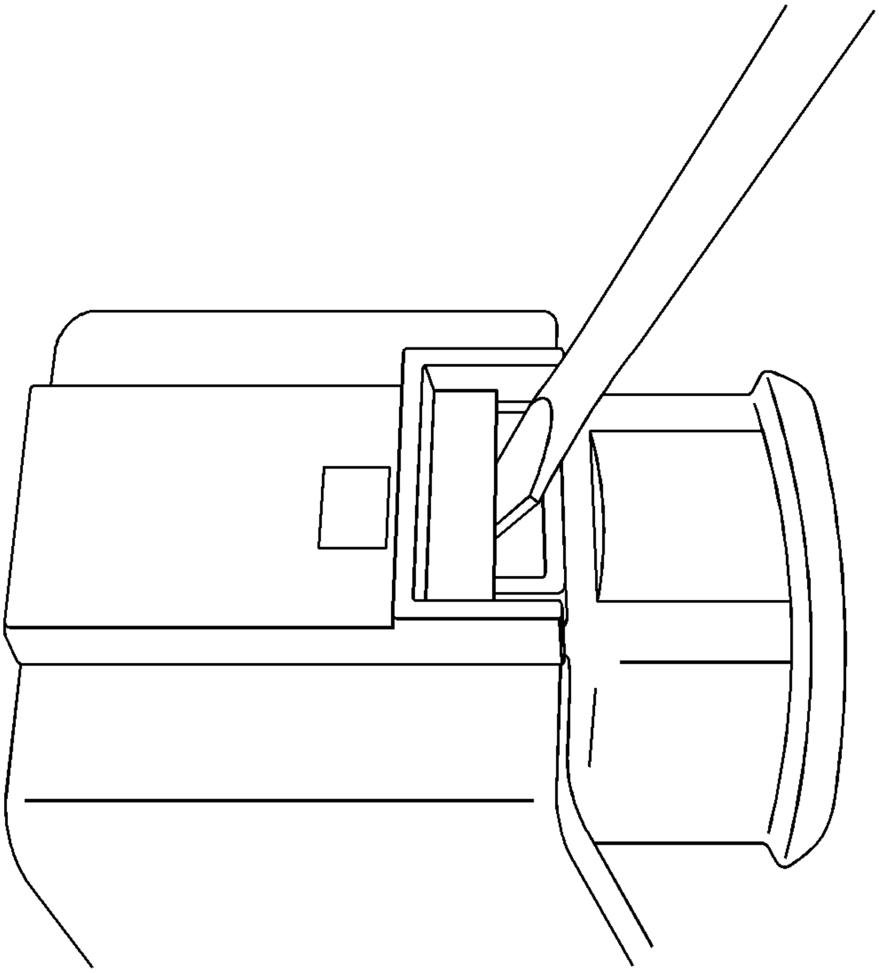

Fig. 78: Releasing Locking Tab On Connector
Courtesy of GENERAL MOTORS COMPANY

1. Use a small flat-bladed tool to release the locking tab on the connector.

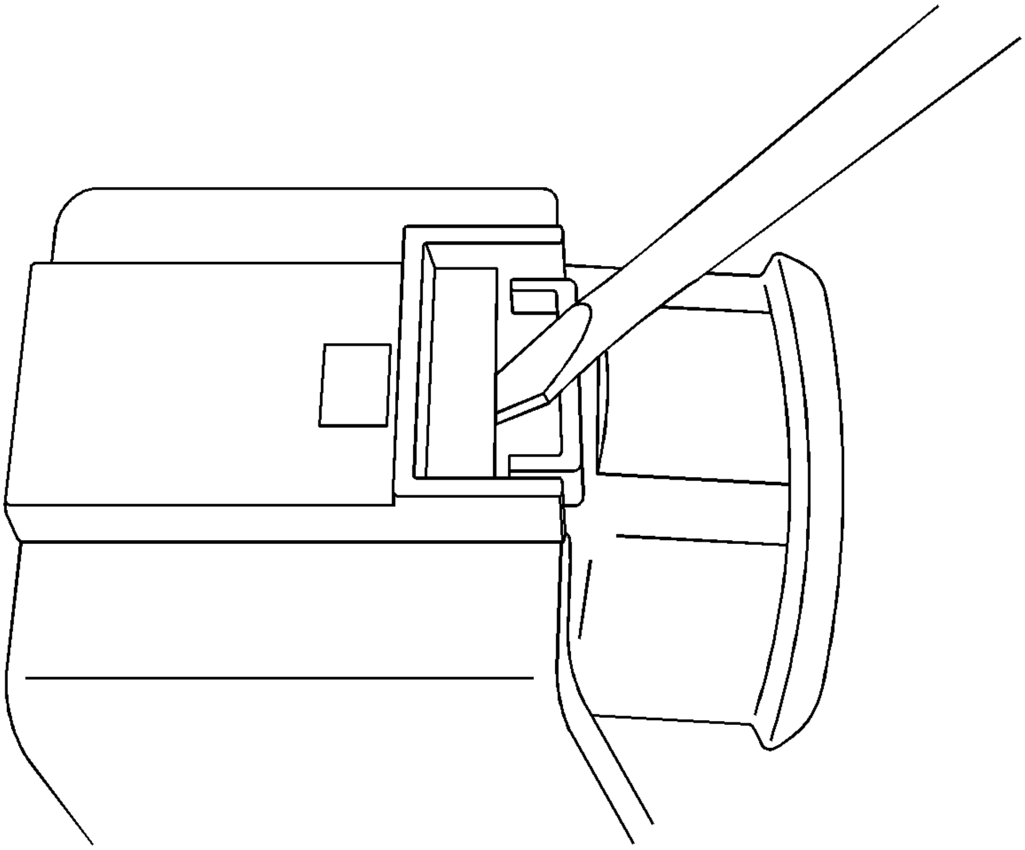

Fig. 79: Releasing Connector
Courtesy of GENERAL MOTORS COMPANY

2. Push down the locking tab to release the connector. The small flat-bladed tool may need to be pushed down and angled back slightly to depress the locking tab. Pull on the connector body while releasing the locking tab to disconnect the connector.

FCI CONNECTORS (LEVER LOCK)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-556** Terminal Release Tool

For equivalent regional tools, refer to Special Tools .

Terminal Removal Procedure

Follow the steps below in order to remove terminals from the connector.

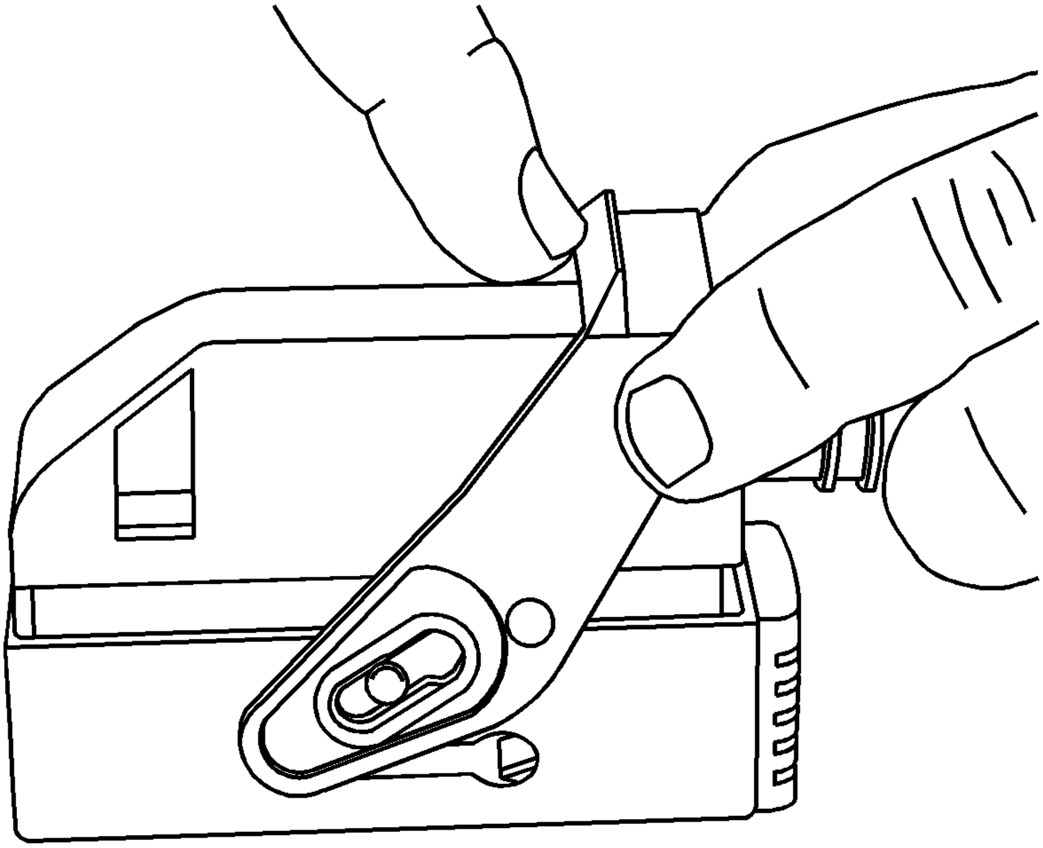

Fig. 80: Identifying Release Tab
Courtesy of GENERAL MOTORS COMPANY

1. Slide the lever lock forward while pressing down on the lever lock release tab.
2. The release tab is located on the top of the wiredress cover.

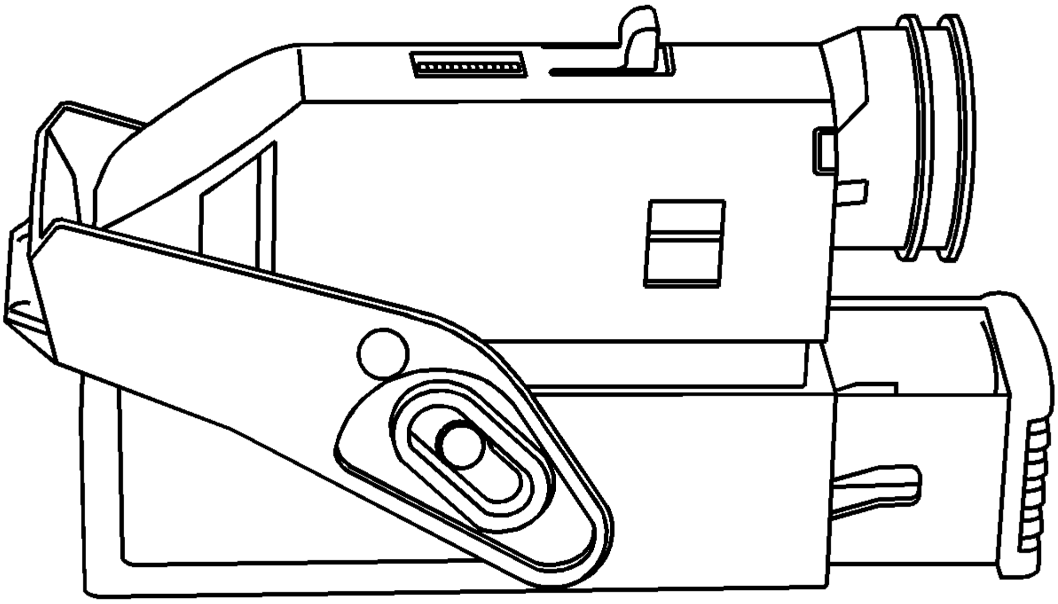

Fig. 81: View Of Connector In Released Position
Courtesy of GENERAL MOTORS COMPANY

3. View of connector in released position.
4. Disconnect the connector from the component.
5. Locate the dress cover locking tabs at the corners of the dress cover. Use a small flat-blade tool to release the locking tabs and remove the dress cover.

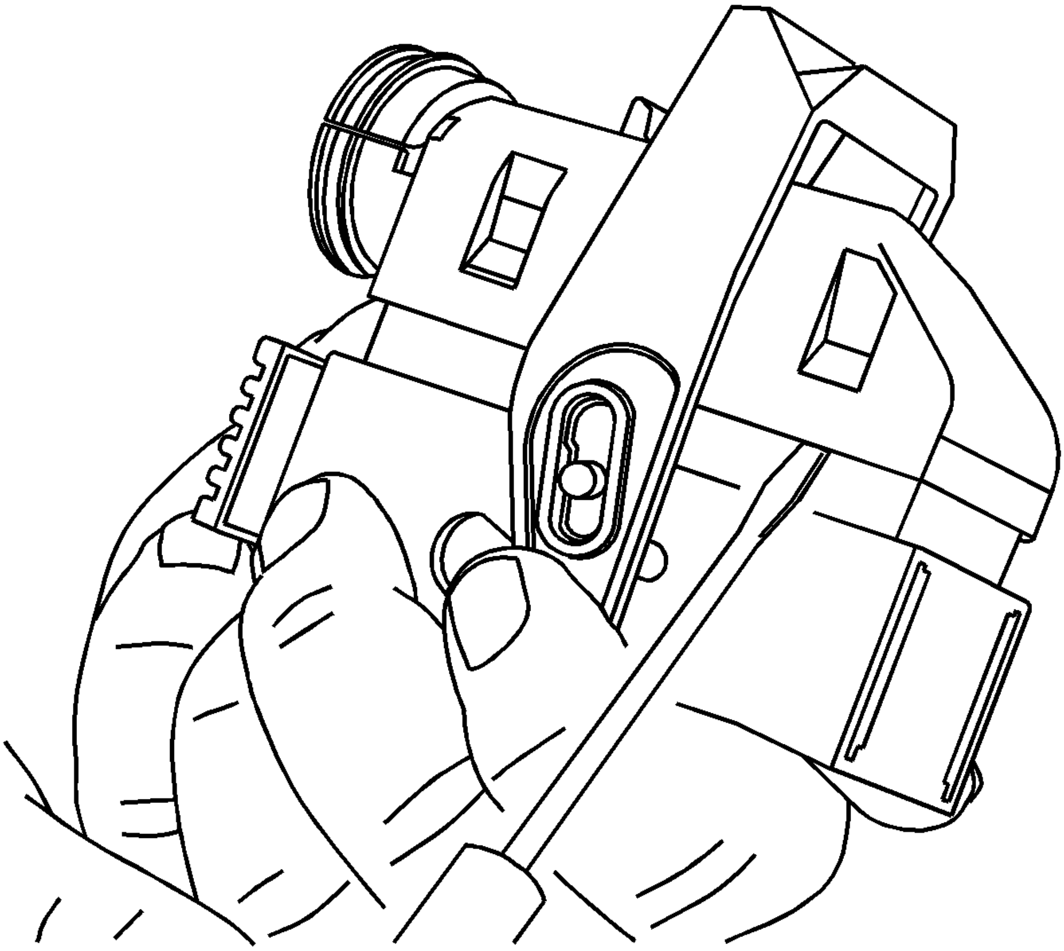

Fig. 82: View Of Sliding Terminal Position Assurance (TPA) Up One Notch
Courtesy of GENERAL MOTORS COMPANY

6. Use a small flat-blade tool to slide the terminal position assurance (TPA) up one notch on both ends of the connector. The TPA is located underneath the wire dress cover.

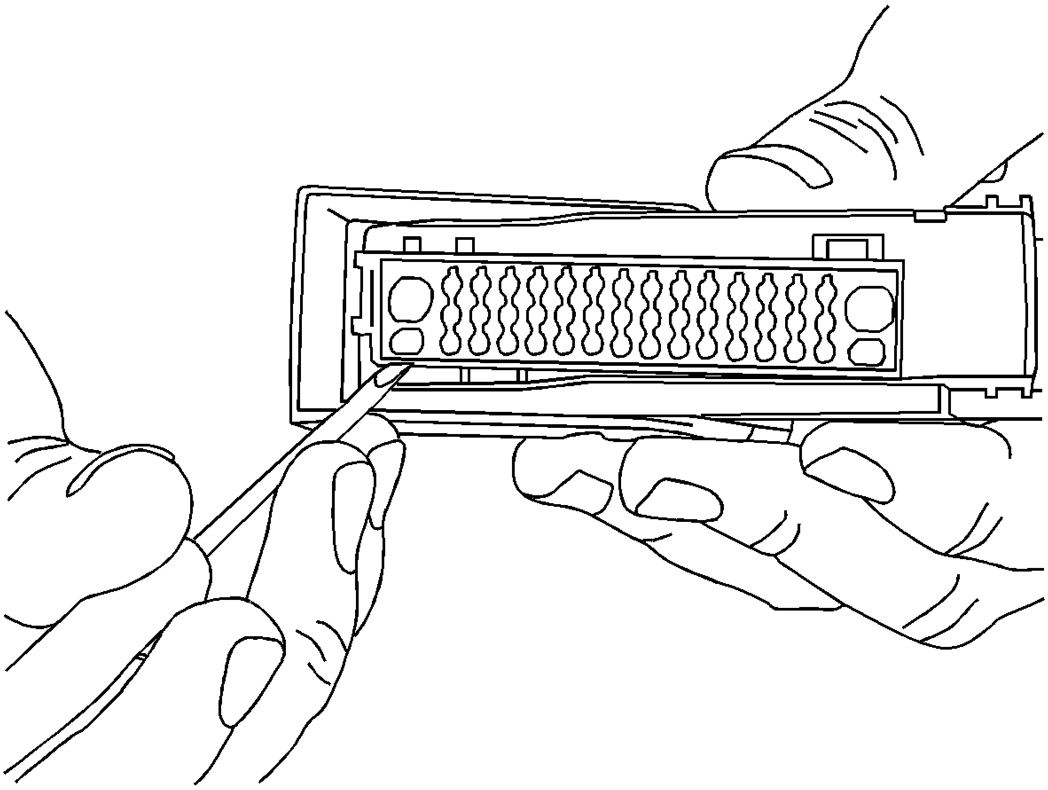

Fig. 83: View Of Releasing Terminals
Courtesy of GENERAL MOTORS COMPANY

7. For the larger terminals insert the J-38125-556 tool to release the terminals by inserting the tool into the terminal release cavity. For the smaller terminals insert the J-38125-560 tool to release the terminals by inserting the tool into the terminal release cavity.

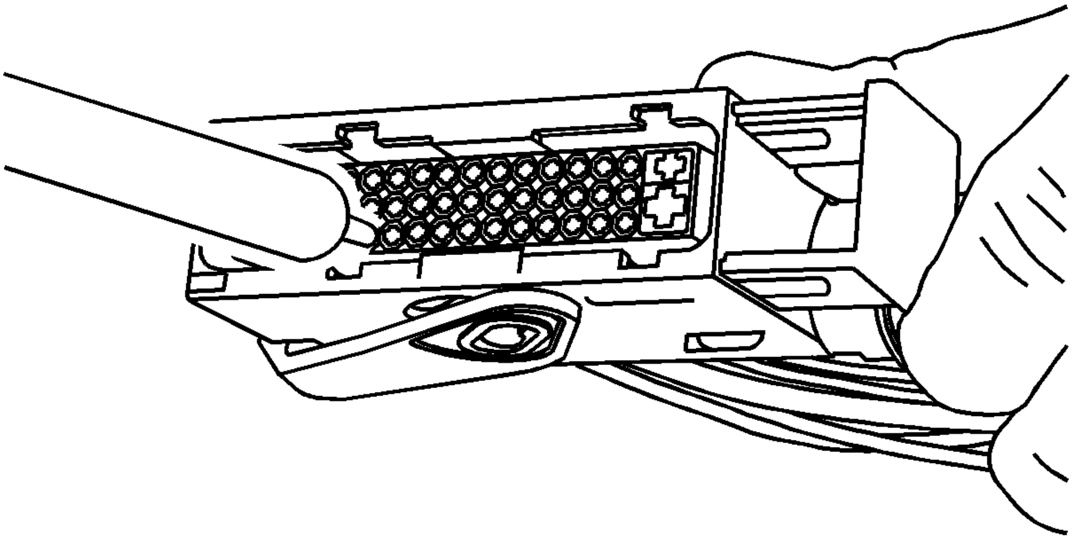

Fig. 84: View Of Wire Being Pulled Out Of Back Of Connector While Holding Removal Tool In Place

Courtesy of GENERAL MOTORS COMPANY

8. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
9. Repair the terminal by following the Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair) procedure.
10. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

FCI CONNECTORS (SIR)

Removal Procedure

NOTE: **The orange or yellow connector position assurance (CPA) must be released first to disconnect or to connect the connector.**

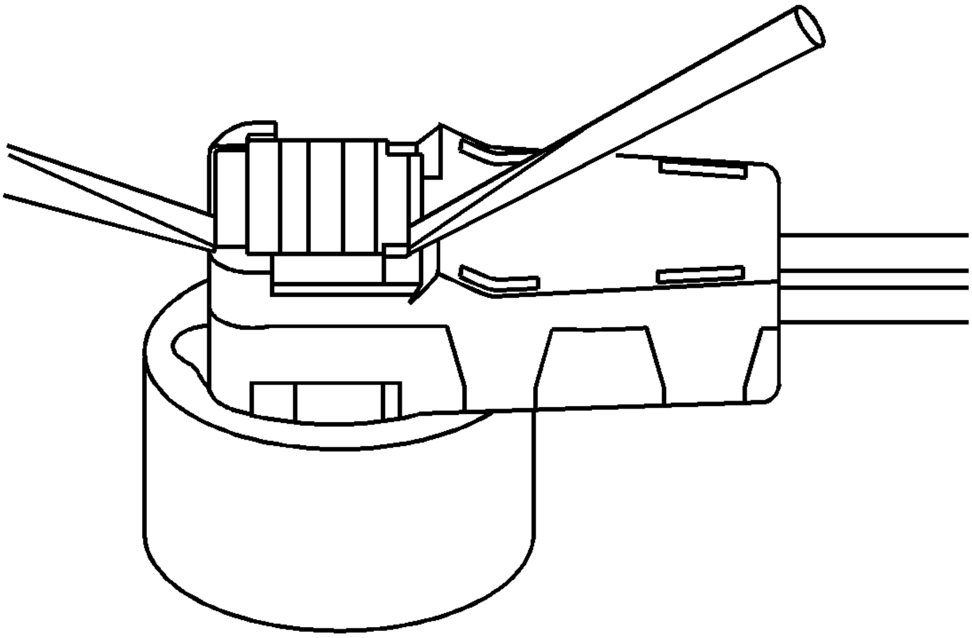

Fig. 85: Lifting Orange CPA
Courtesy of GENERAL MOTORS COMPANY

1. Lift the orange or yellow CPA vertically (avoid lifting on an angle to the connector) approximately 4 mm to release the connector. Use a small flat-bladed tool to help release the CPA. The CPA may also be released manually without any tools.

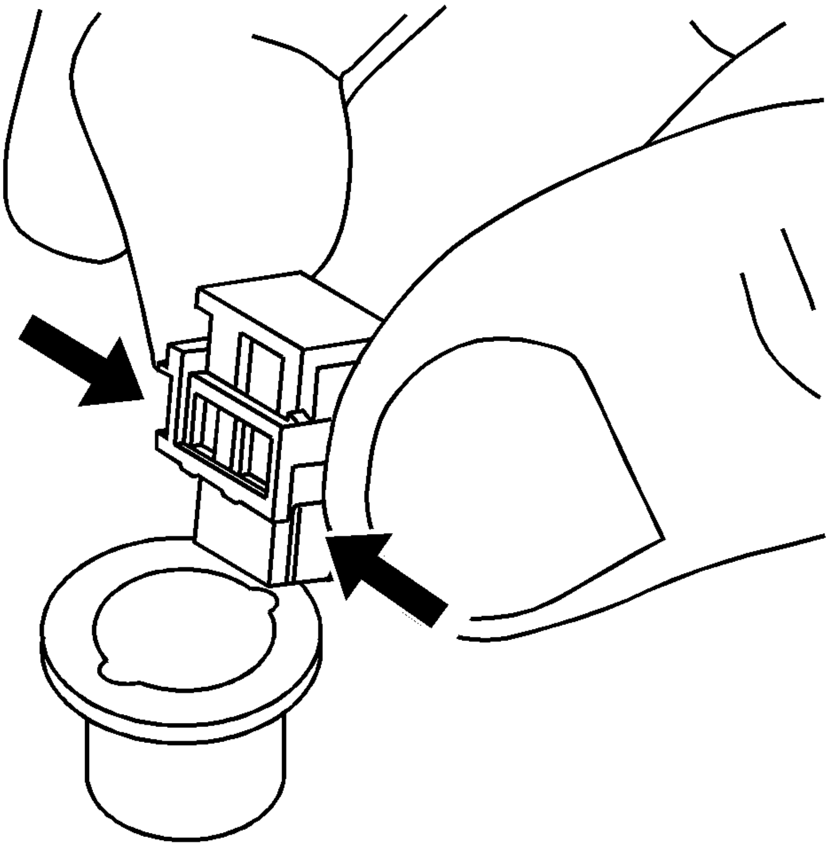

Fig. 86: Grabbing Connector On Both Sides
Courtesy of GENERAL MOTORS COMPANY

2. Grab the connector on both sides and lift vertically to disconnect the connector.

Installation Procedure

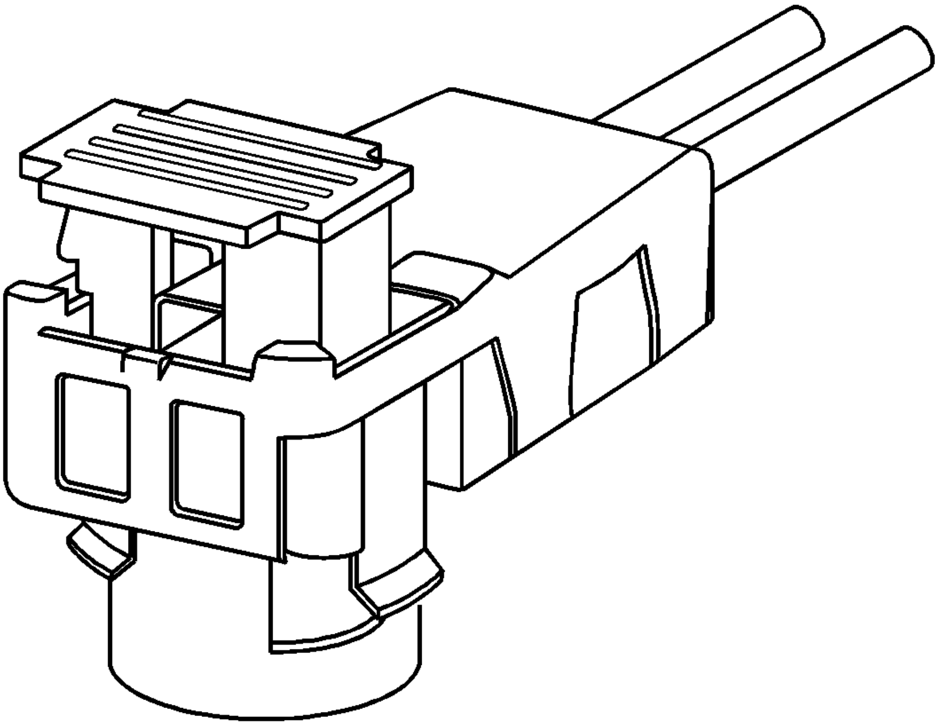

Fig. 87: Lifting Orange CPA
Courtesy of GENERAL MOTORS COMPANY

1. The CPA should be approximately 4 mm above the yellow cover before installing the connector. If not, use a small flat-bladed tool to help release the CPA. The CPA may also be released manually without any tools.

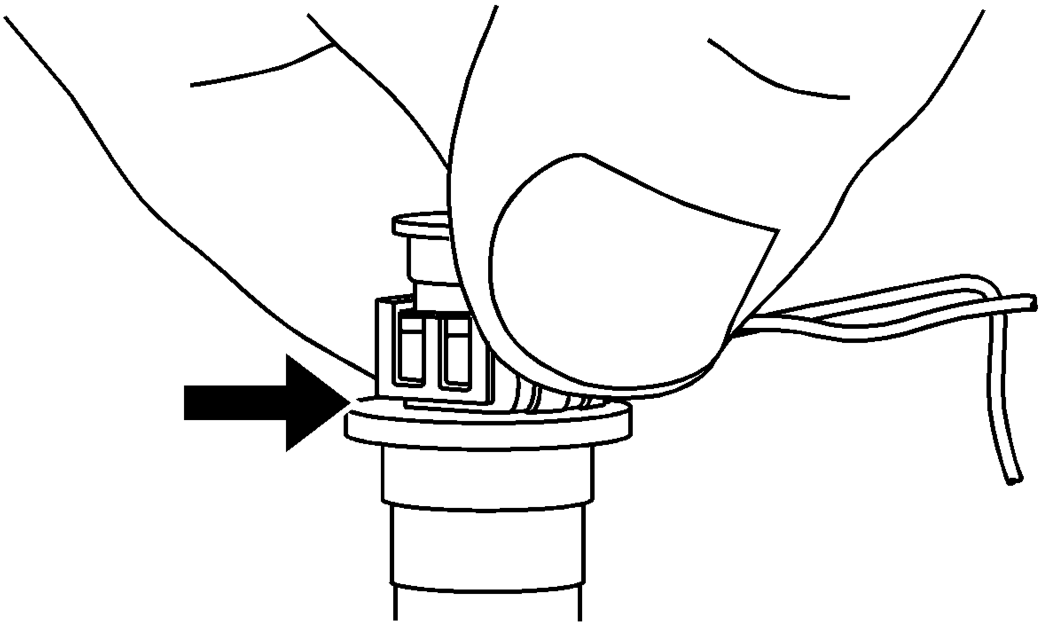

Fig. 88: Seating Connector Sub-Assembly
Courtesy of GENERAL MOTORS COMPANY

2. Line up the connector key tabs with the initiator key slots. Grab the connector on both sides and push down into the initiator connector sub assembly until fully seated.

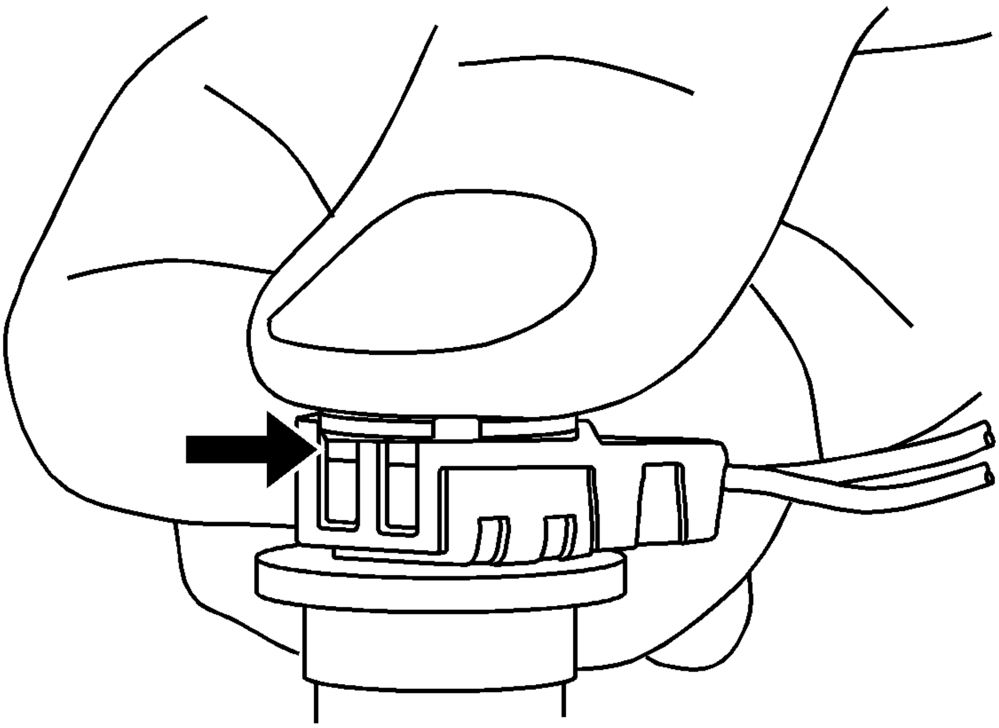

Fig. 89: Pushing CPA Down
Courtesy of GENERAL MOTORS COMPANY

3. After the connector is fully seated, push the CPA down with your thumb until the CPA is touching the yellow cover on the connector.
4. After the CPA is seated, lightly pull on the connector, it should not pull off if the connector and CPA are properly engaged.

FEP CONNECTORS (STEERING GEAR)

Removal Procedure

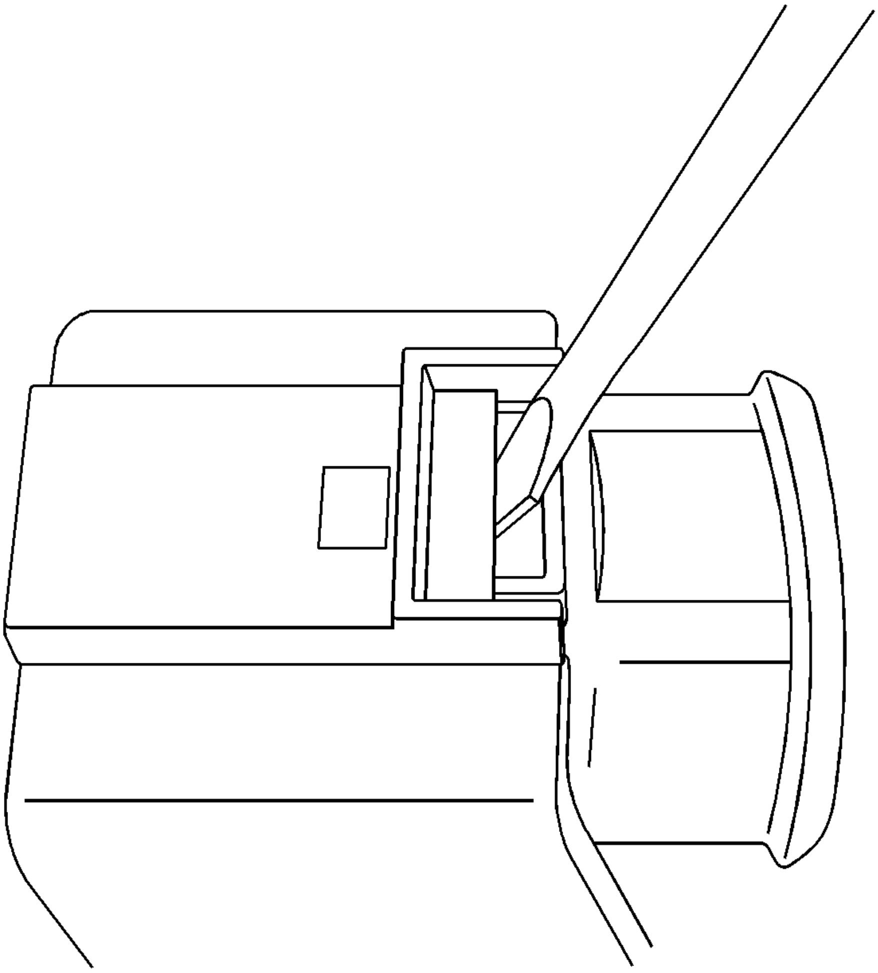

Fig. 90: Releasing Locking Tab On Connector
Courtesy of GENERAL MOTORS COMPANY

1. Use a flat-bladed tool to release the locking tab on the connector.

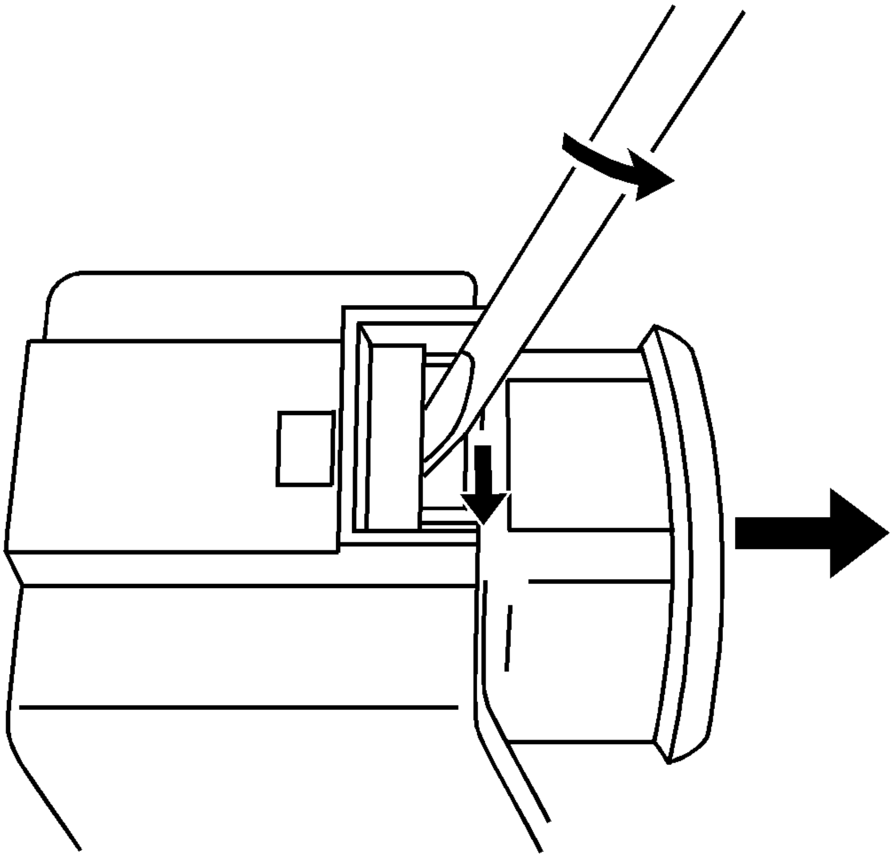

Fig. 91: Twisting Flat-Bladed Tool To Push Top Of Locking Tab Inward
Courtesy of GENERAL MOTORS COMPANY

2. Option 1: Twist the flat-bladed tool to push the top of the locking tab inward while pulling the connector body out.

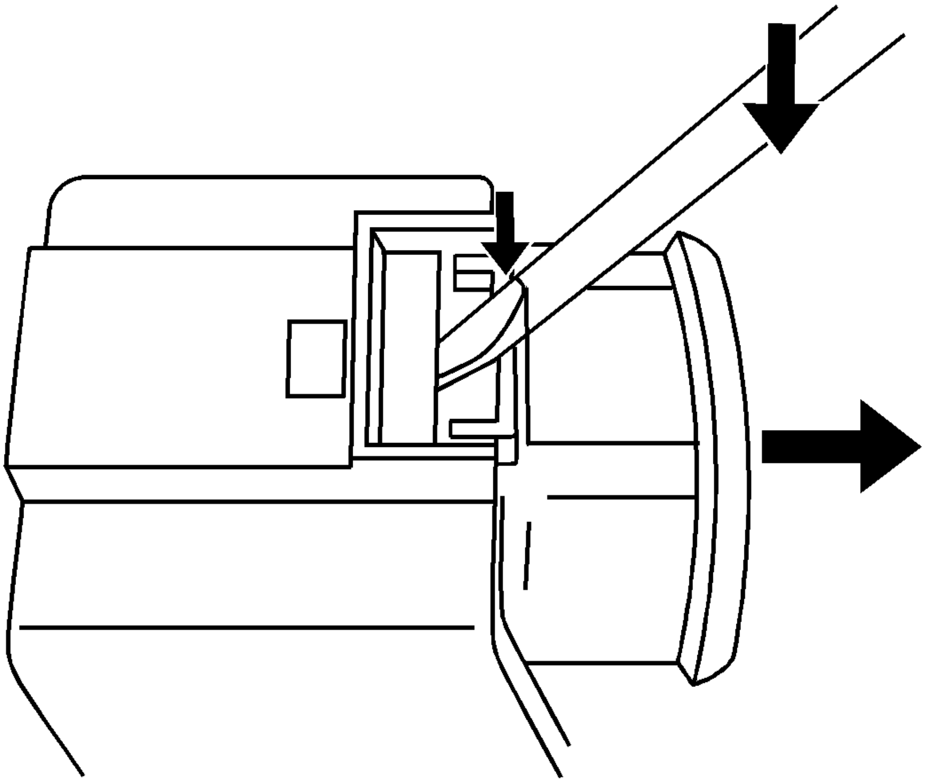

Fig. 92: Using Flat-Bladed Tool To Depress Locking Tab
Courtesy of GENERAL MOTORS COMPANY

3. Option 2: Pry using the flat-bladed tool to depress the locking tab while pulling the connector body out.

JST CONNECTORS

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-553** Terminal Release Tool

For equivalent regional tools, refer to **Special Tools** .

Terminal Removal Procedure

The JST connector family consists of seven unique connector housings differentiated by color and keying. This connector family is designed to use both 0.64 and 2.8 sized terminals.

JST BCM Connector

GM Service Part #	Color
88988806	Gray
88988837	Brown
88988838	Lt Green
88988839	Natural
88988840	Lt Blue
88988841	Black
88988842	Pink

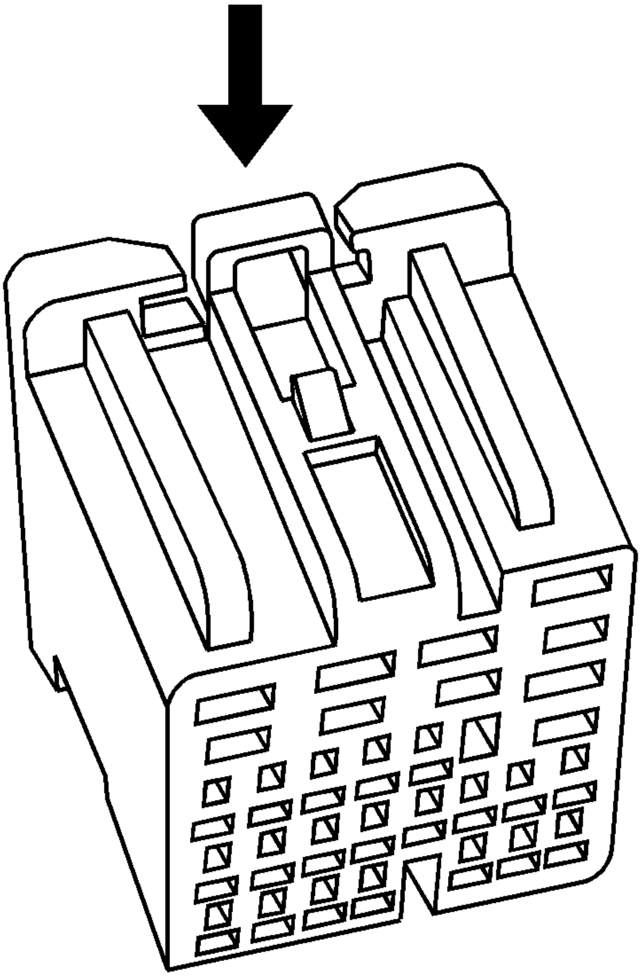

Fig. 93: Identifying Terminal Position Assurance (TPA)
Courtesy of GENERAL MOTORS COMPANY

1. While depressing the lock, remove the connector from the component.

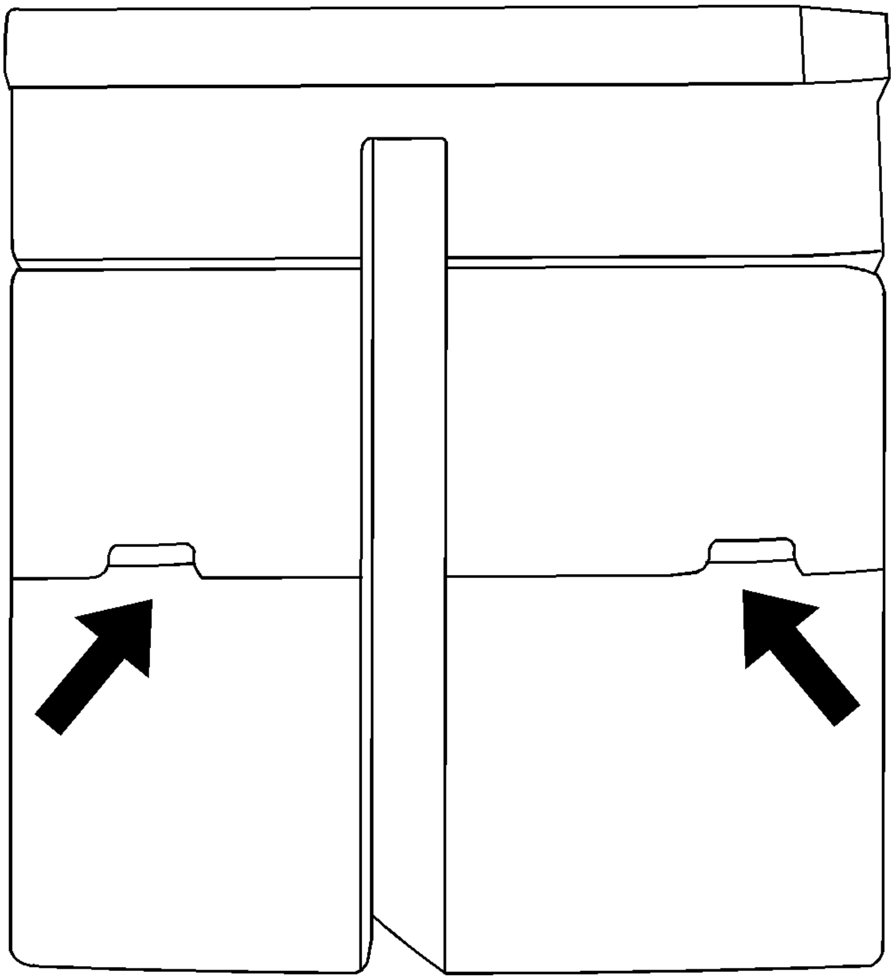

Fig. 94: Identifying TPA On Both Sides Of Connector
Courtesy of GENERAL MOTORS COMPANY

2. Unlock the terminal position assurance (TPA):
    - Position connector as shown (above) and locate TPA staging cavities.

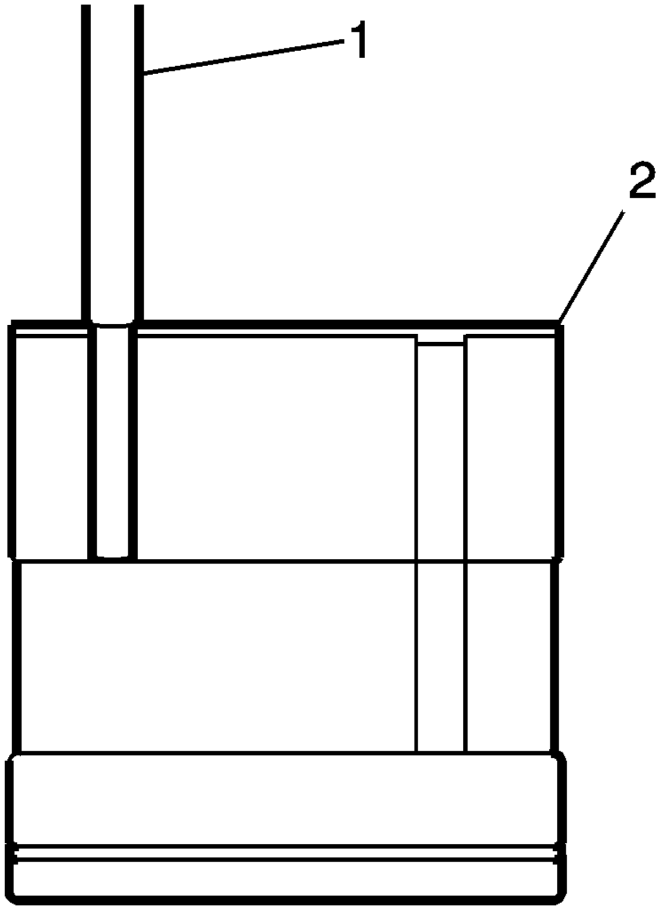

Fig. 95: Terminal Release Tool
Courtesy of GENERAL MOTORS COMPANY

- Using connector terminal release tool J-38125-553 (1) lift the TPA into the staged position. Perform this step on both sides of the TPA.

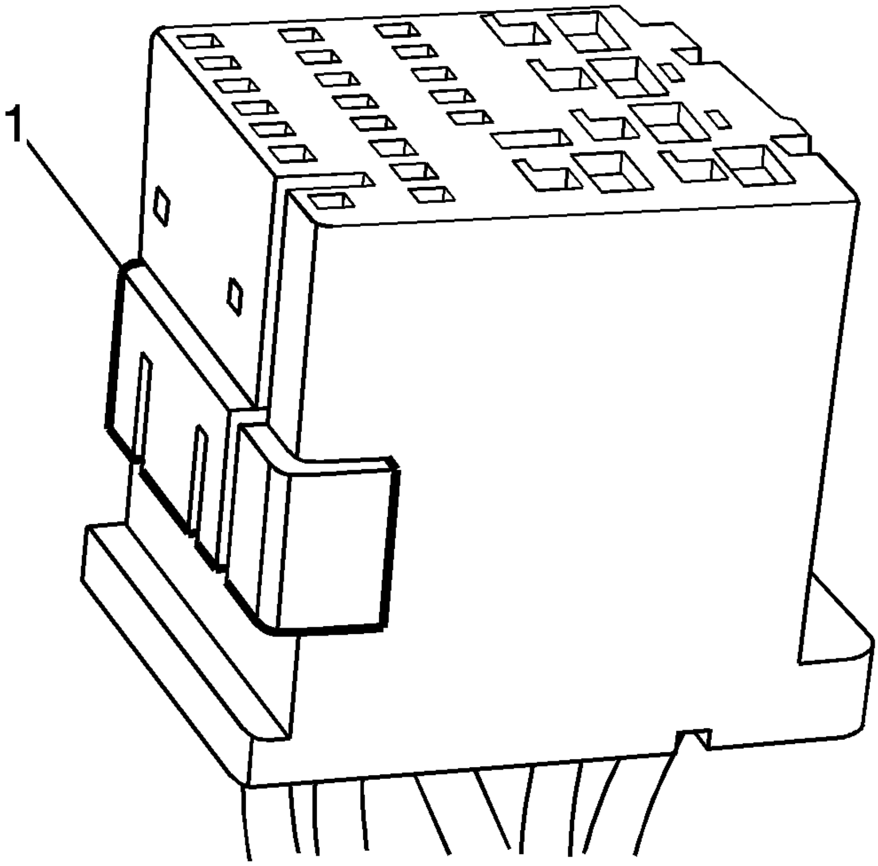

Fig. 96: TPA In Staged Position
Courtesy of GENERAL MOTORS COMPANY

- You will feel the TPA click into place when fully extended into the staged position. The figure above shows the TPA (1) in the staged position.

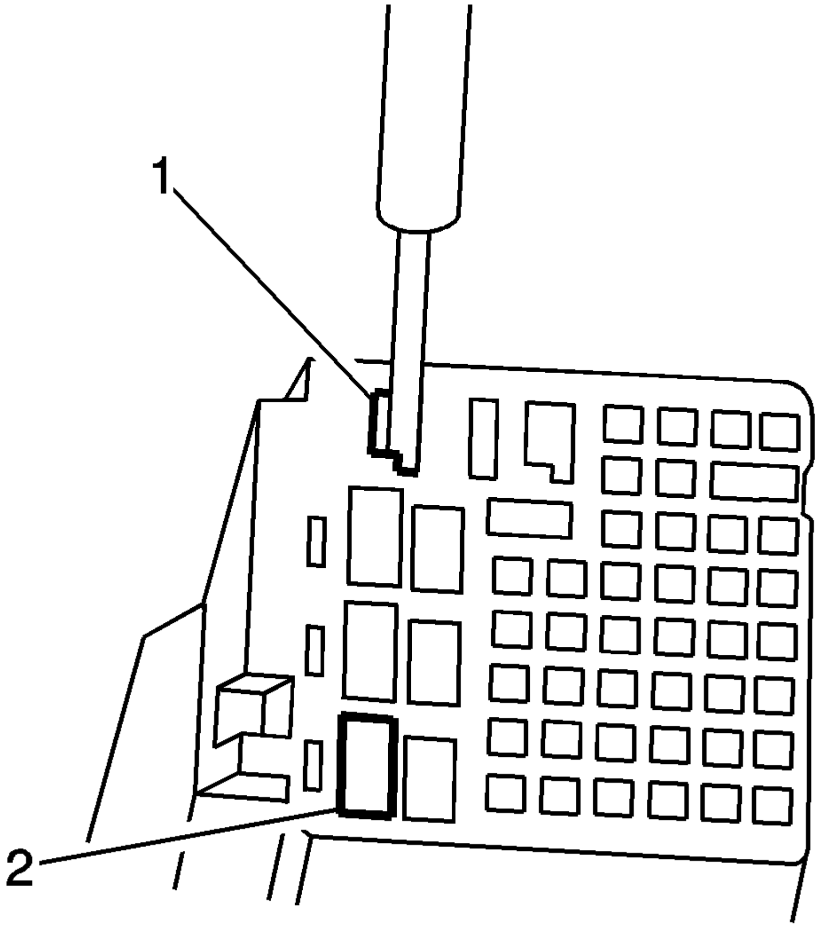

Fig. 97: Connector Terminal Release Tool
Courtesy of GENERAL MOTORS COMPANY

3. Release the terminal from the connector:
    - Position the connector as shown (above) and locate the terminal release entry canal (1) of the suspect terminal.
    - Insert the connector terminal release tool J-38125-553 into the entry canal with the angled side of the tool facing the connector wall containing cavity 4 (2).

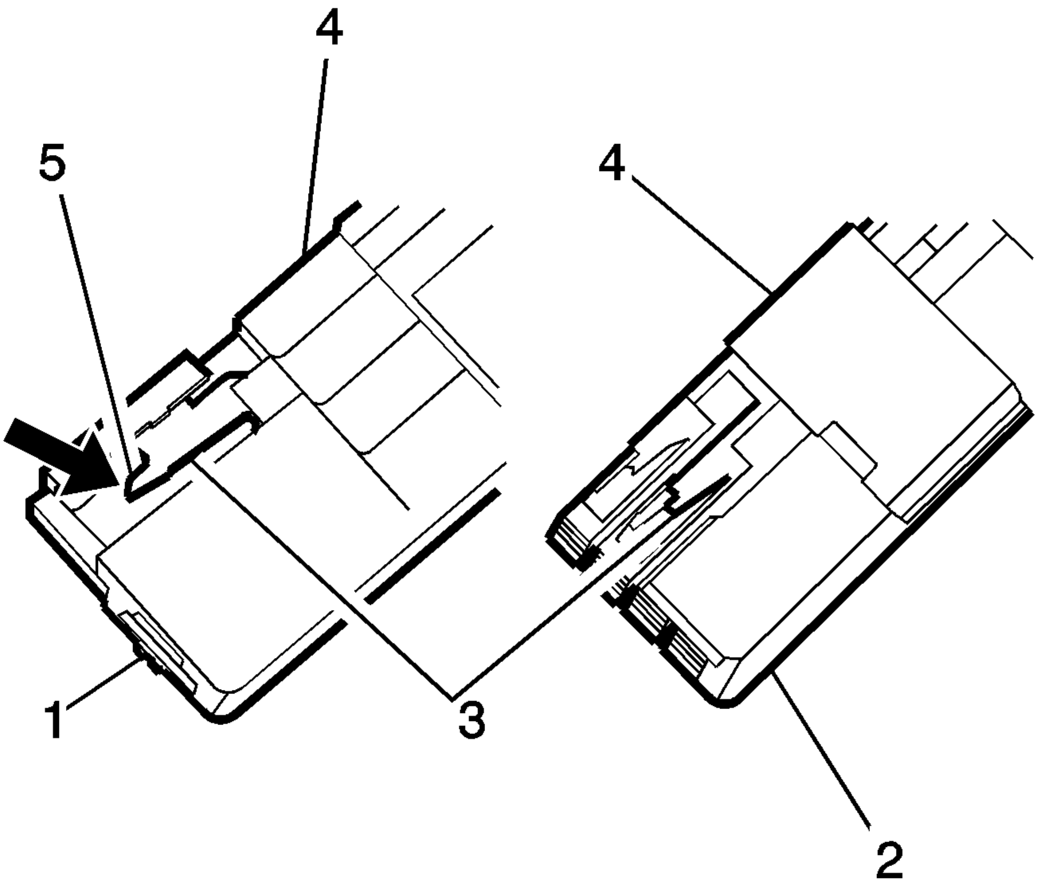

Fig. 98: Connector Lance And TPA
Courtesy of GENERAL MOTORS COMPANY

- The cavity on the left (1) is a 2.8 mm^2 cavity and the cavity on the right (2) is a 0.64 mm^2 cavity.
- Place the tip of the connector terminal release tool onto the connector lance (3) and deflect the lance to the right (5) to release the lock. Hold this released position.
- Holding the lance in the released position, slightly pull on the suspect terminal to remove it from the connector housing. The side TPA (4) is a secondary lock.

4. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
5. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

KOSTAL CONNECTORS (GLOW PLUG CONTROL MODULE)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit

View of typical connector.

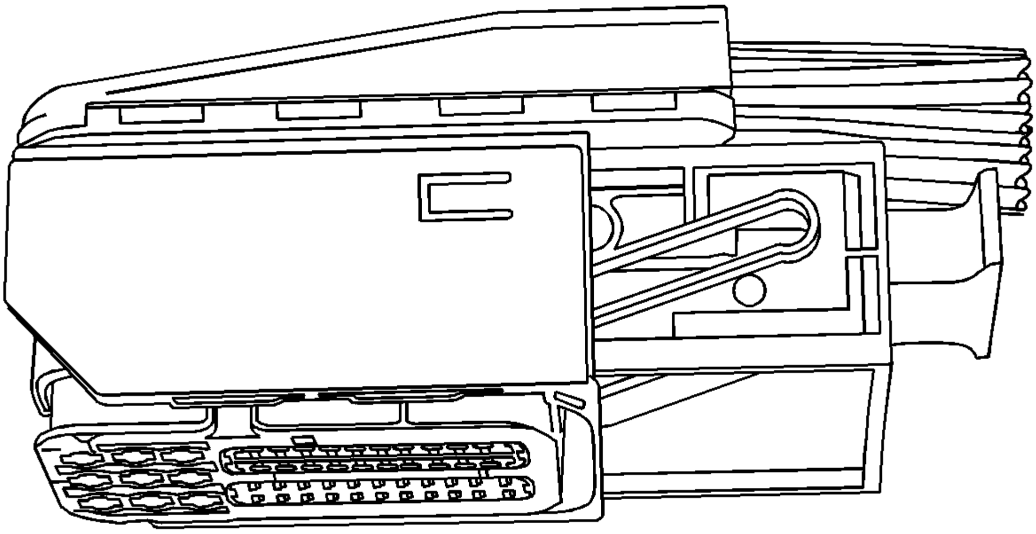

Fig. 100: View Of Connector In Released Position
Courtesy of GENERAL MOTORS COMPANY

View of connector in released position.

1. Locate the assist lever at the back of the connector. Move the assist lever to the rear position.
2. Disconnect the connector from the component.

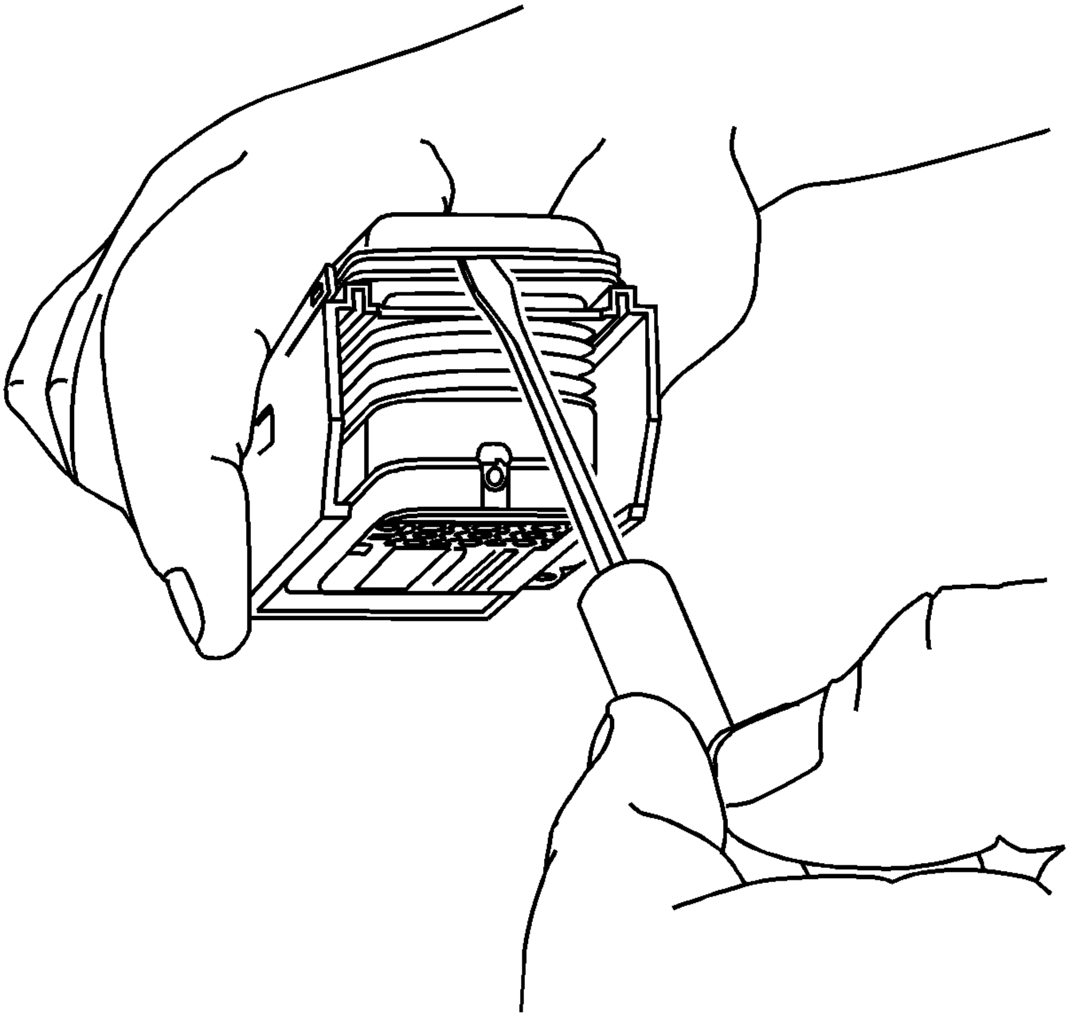

Fig. 101: Using Small Flat-Blade Tool To Remove Dress Cover
Courtesy of GENERAL MOTORS COMPANY

3. Use a small flat-blade tool to remove the dress cover.

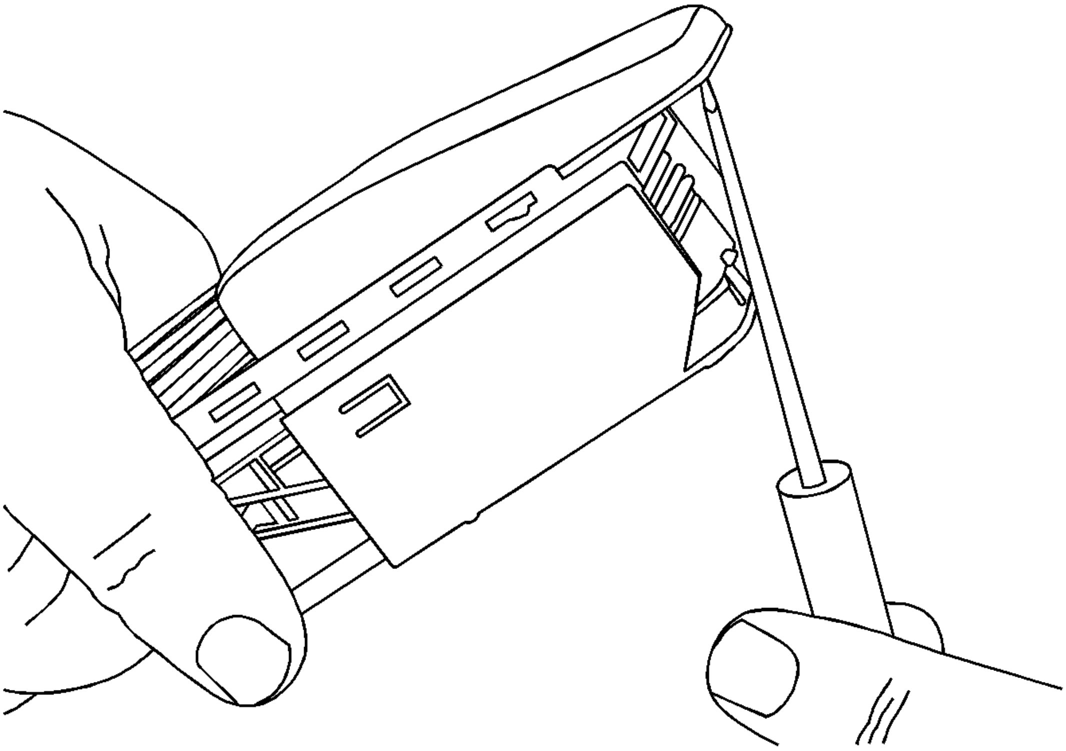

Fig. 102: Sliding Dress Cover Forward & Off Of Kostal Connector (Glow Plug Control Module)
Courtesy of GENERAL MOTORS COMPANY

4. Slide the dress cover forward and off of the connector.

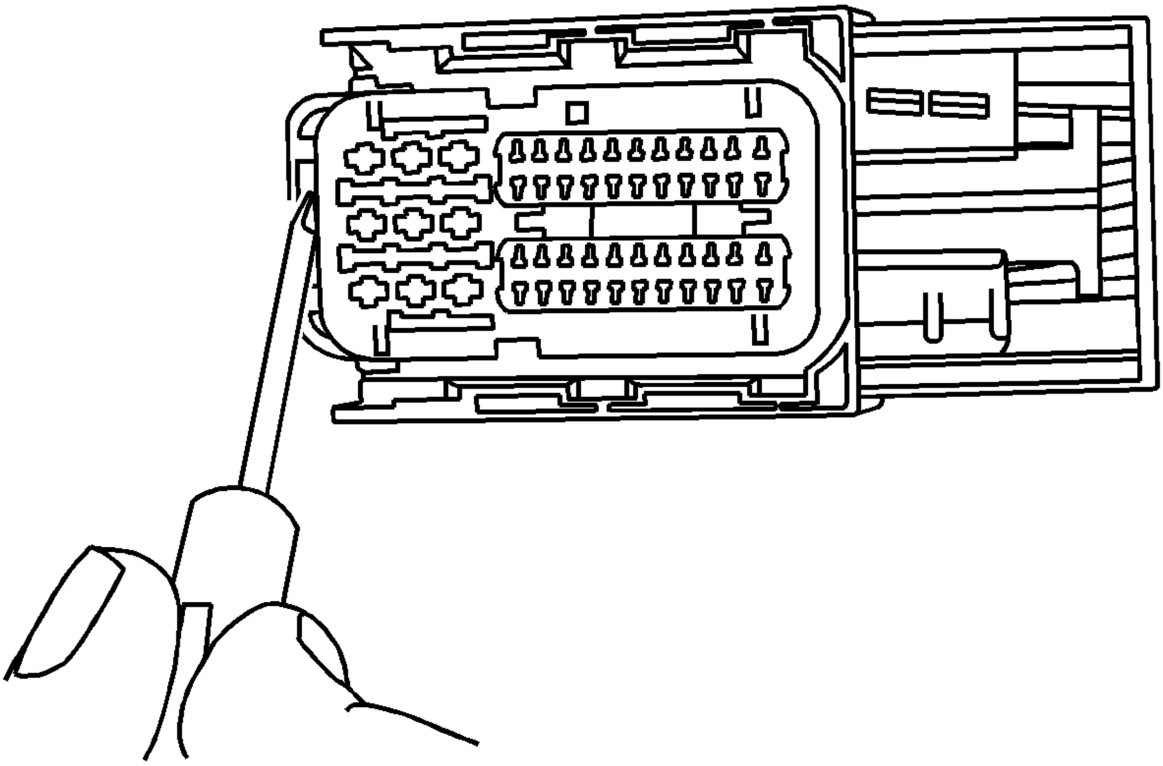

Fig. 103: Locating TPA In Front & Rear Of Connector
Courtesy of GENERAL MOTORS COMPANY

5. The terminal positive assurance (TPA) is located in the front and rear of the connector.

NOTE: **The front TPA cannot be removed from the connector. Only move it to the preset position.**

6. Use a small flat-blade tool to move the front TPA to the preset position, outboard approximately 0.125 in. (3 mm).

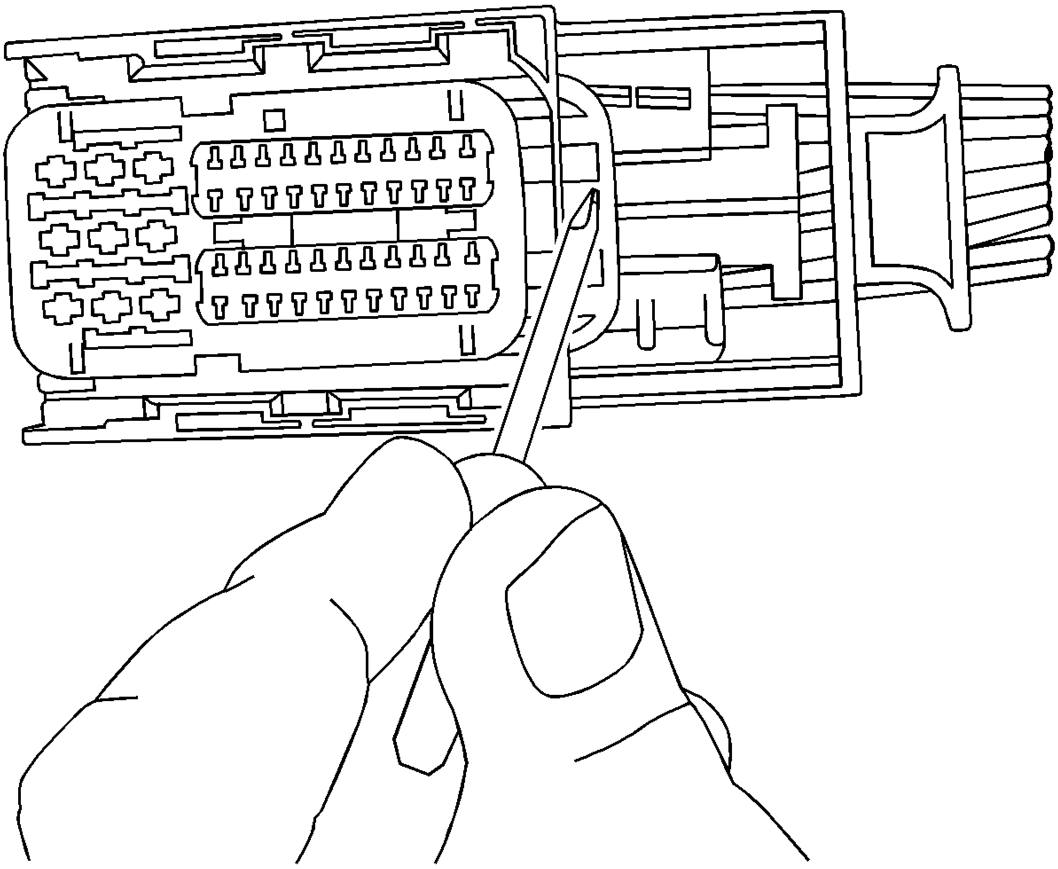

Fig. 104: Using Small Flat-Blade Tool To Remove Rear TPA
Courtesy of GENERAL MOTORS COMPANY

7. Use a small flat-blade tool to completely remove the rear TPA from the connector.

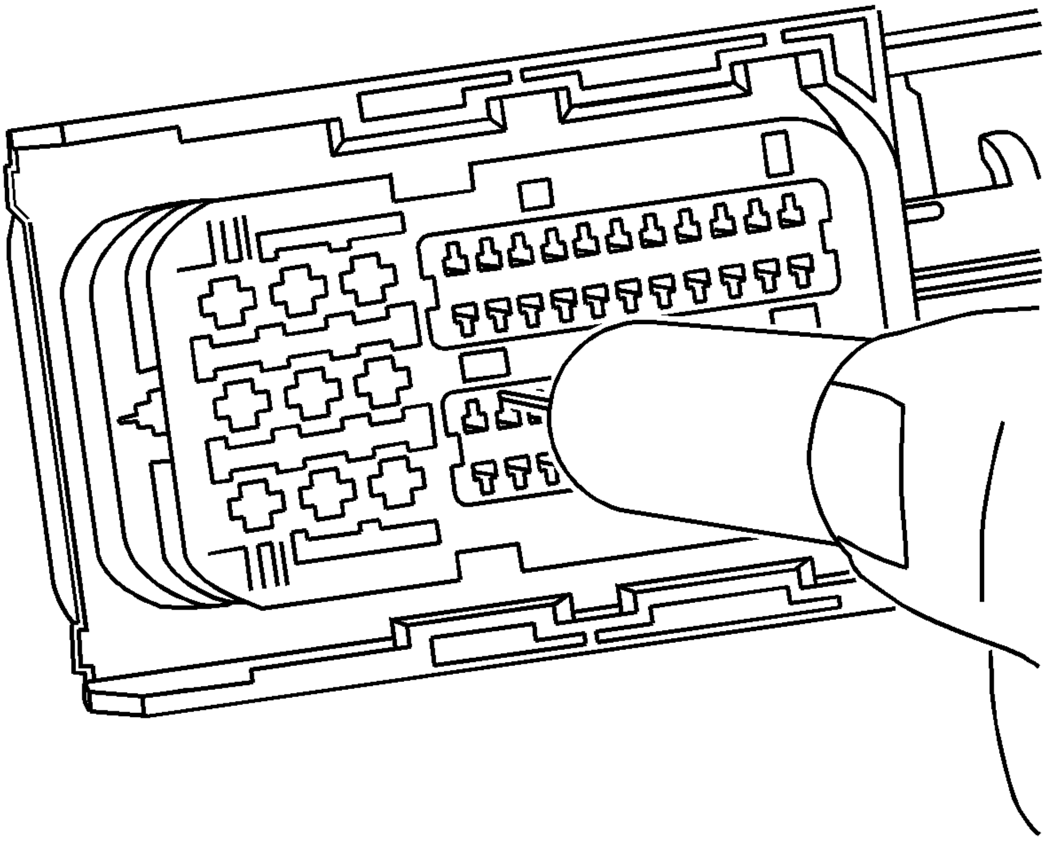

Fig. 105: Using Special Tool To Release Terminals
Courtesy of GENERAL MOTORS COMPANY

8. Use the J-38125-24 or the J-38125-560 tool to release the terminals by inserting the tool into the terminal release cavity.
9. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
10. Repair the terminal by following the Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair) procedure.

KOSTAL CONNECTORS (TRANSMISSION)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-28** Terminal Release Tool

For equivalent regional tools, refer to Special Tools .

Terminal Removal Procedure

2. Locate the terminal position assurance (TPA).

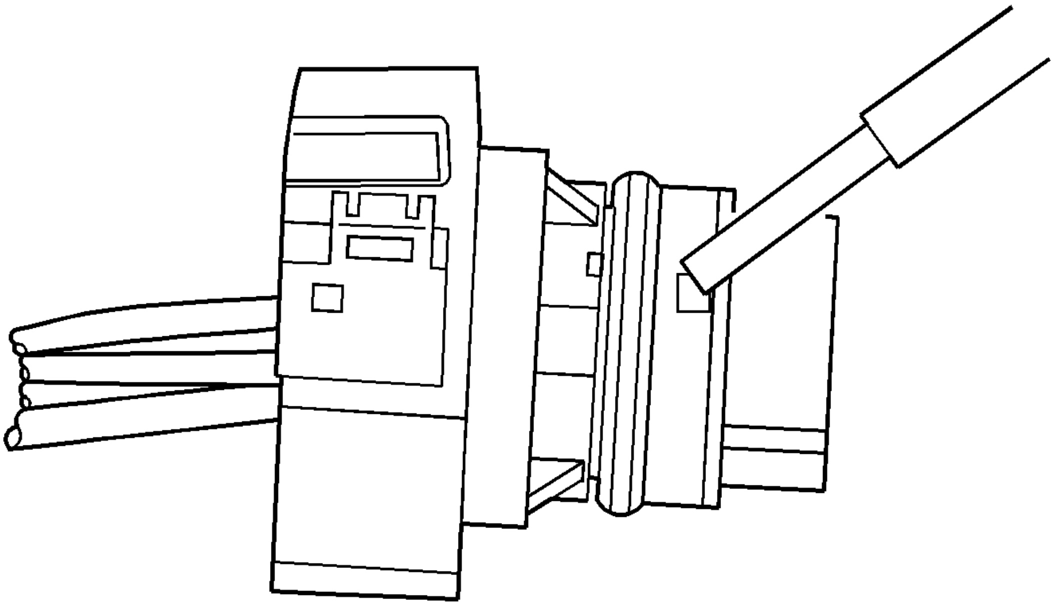

Fig. 108: View Of TPA & Flat-Bladed Tool

Courtesy of GENERAL MOTORS COMPANY

NOTE: **The TPA cannot be removed from the connector while there are terminals present in the connector body.**

3. Use a small flat-blade tool to push the TPA until it bottoms out.

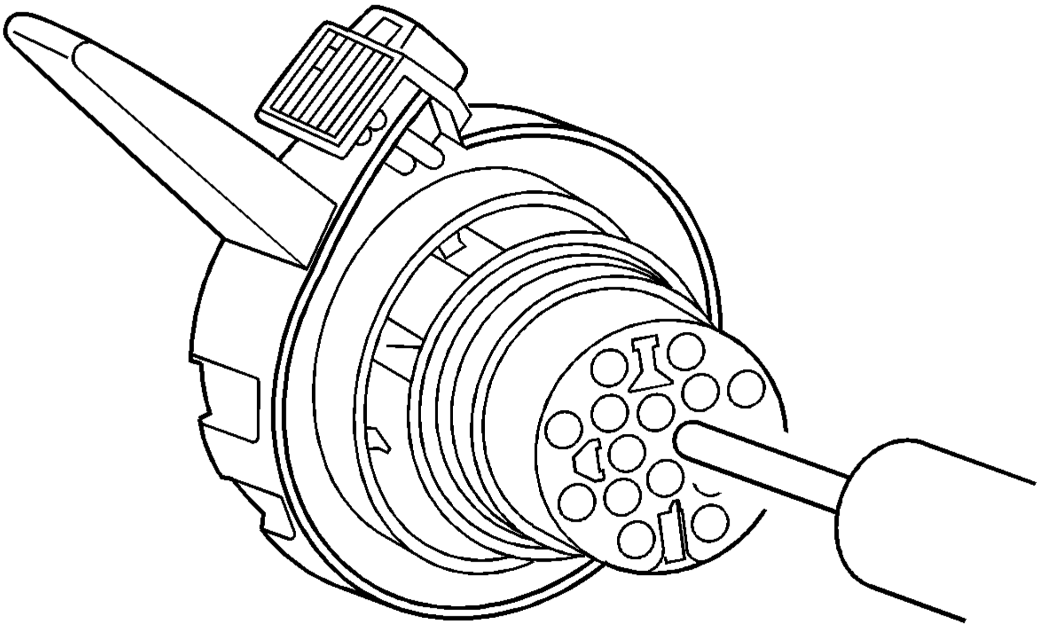

Fig. 109: Using J 38125-28 Tool To Release Terminals
Courtesy of GENERAL MOTORS COMPANY

4. Use the J-38125-28 tool to release the terminals by inserting the tool into the terminal cavity as shown in the graphic.
5. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
6. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.

Terminal Insertion Procedure

After the terminal is replaced, perform the following procedure in order to insert the terminal.

1. Slide the new terminal into the correct cavity at the back of the connector.
2. Push the terminal into the connector until it locks into place. The new terminal should be even with the other terminals. Ensure that the terminal is locked in place by gently pulling on the wire.

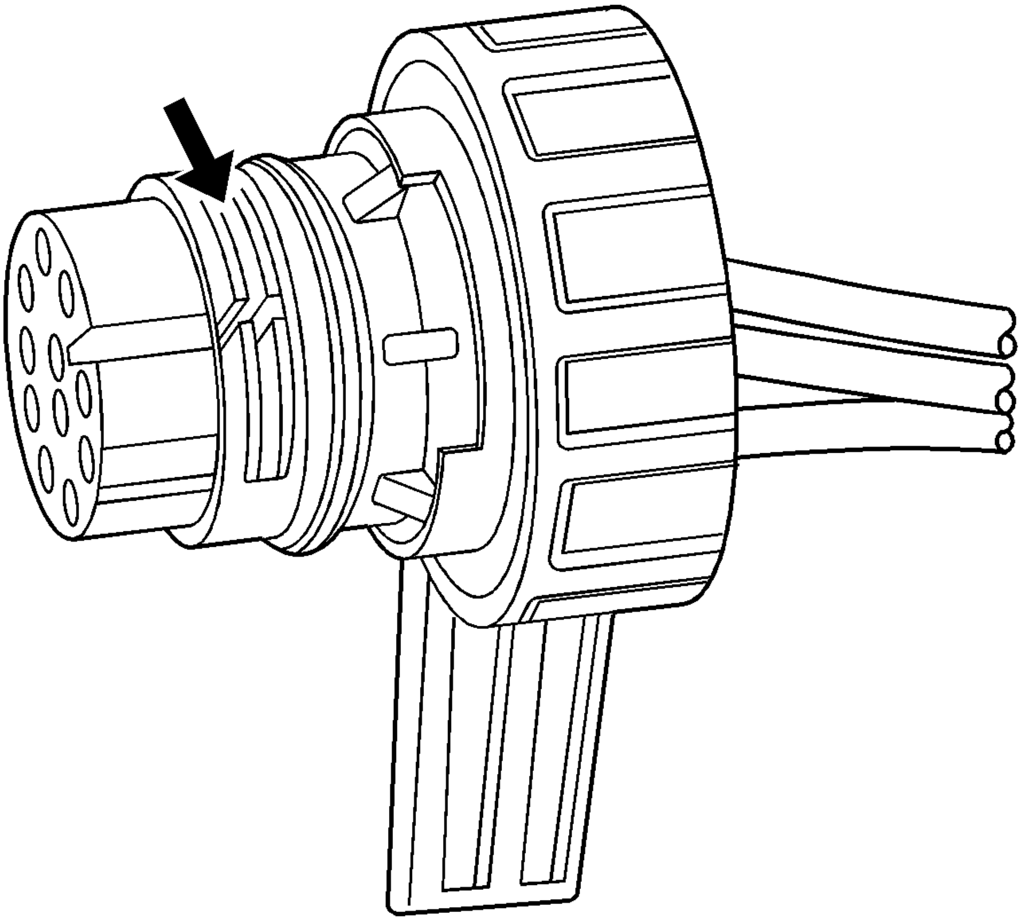

Fig. 110: Locating Terminal Position Assurance (TPA)
Courtesy of GENERAL MOTORS COMPANY

3. Locate the TPA.

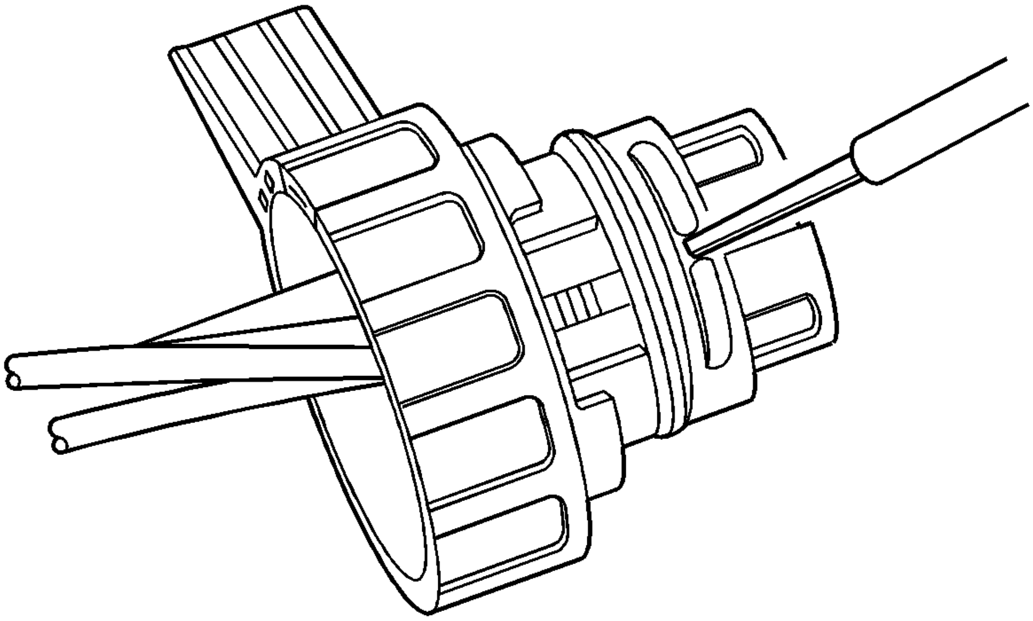

Fig. 111: View Of TPA & Flat-Bladed Tool
Courtesy of GENERAL MOTORS COMPANY

4. Use a small flat-blade tool to push the TPA until it bottoms out.

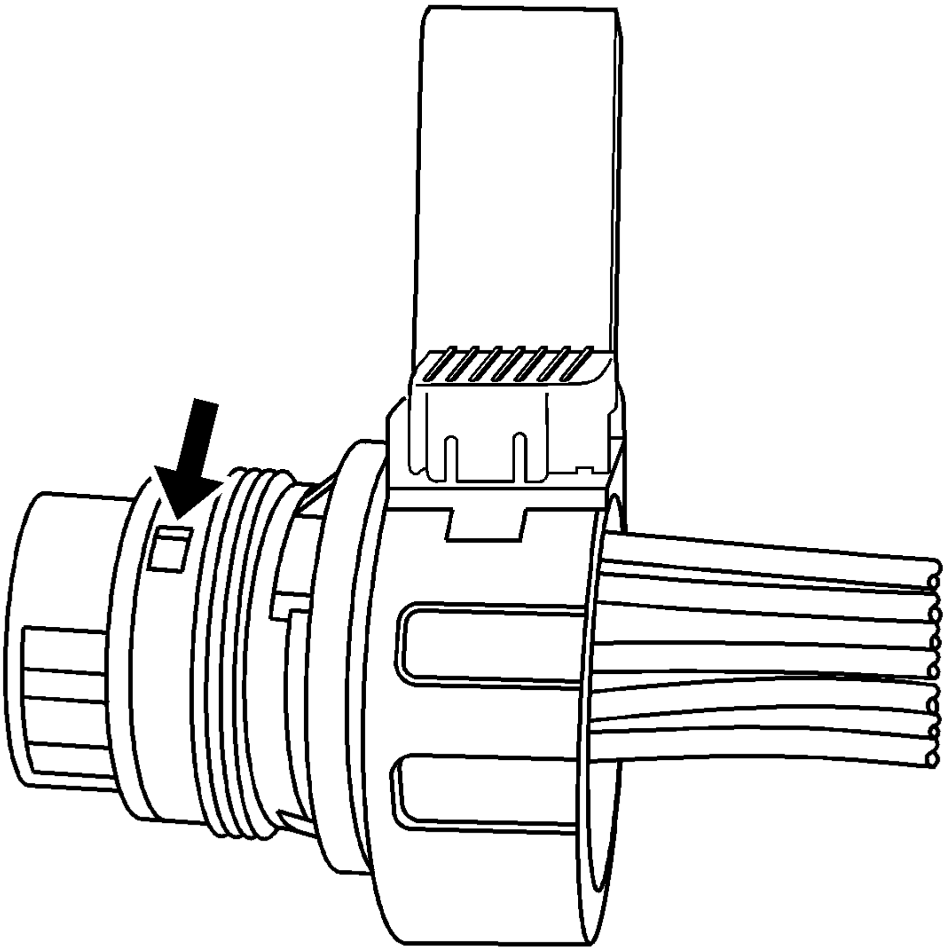

Fig. 112: View Of Terminal Position Assurance (TPA)
Courtesy of GENERAL MOTORS COMPANY

5. Ensure the TPA is fully seated. The TPA should be centered and flush with the connector body when viewed.

MOLEX CONNECTORS (LEVER LOCK)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-213** Terminal Release Tool

For equivalent regional tools, refer to **Special Tools** .

Terminal Removal Procedure

1. Locate the connector position assurance (CPA) on the top of the wire dress cover. Slide the CPA forward.

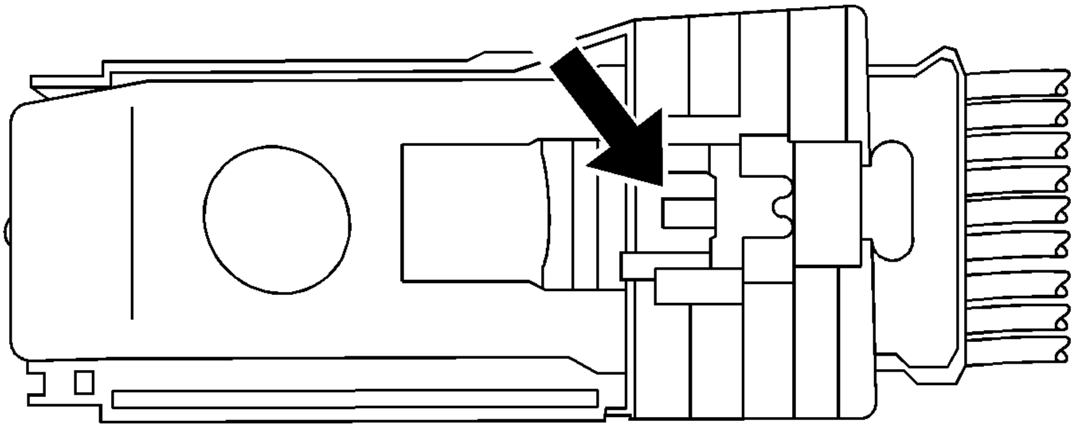

Fig. 113: Identifying Lever Lock Release Tab
Courtesy of GENERAL MOTORS COMPANY

2. Slide the lever lock forward while pressing down on the lever lock release tab.

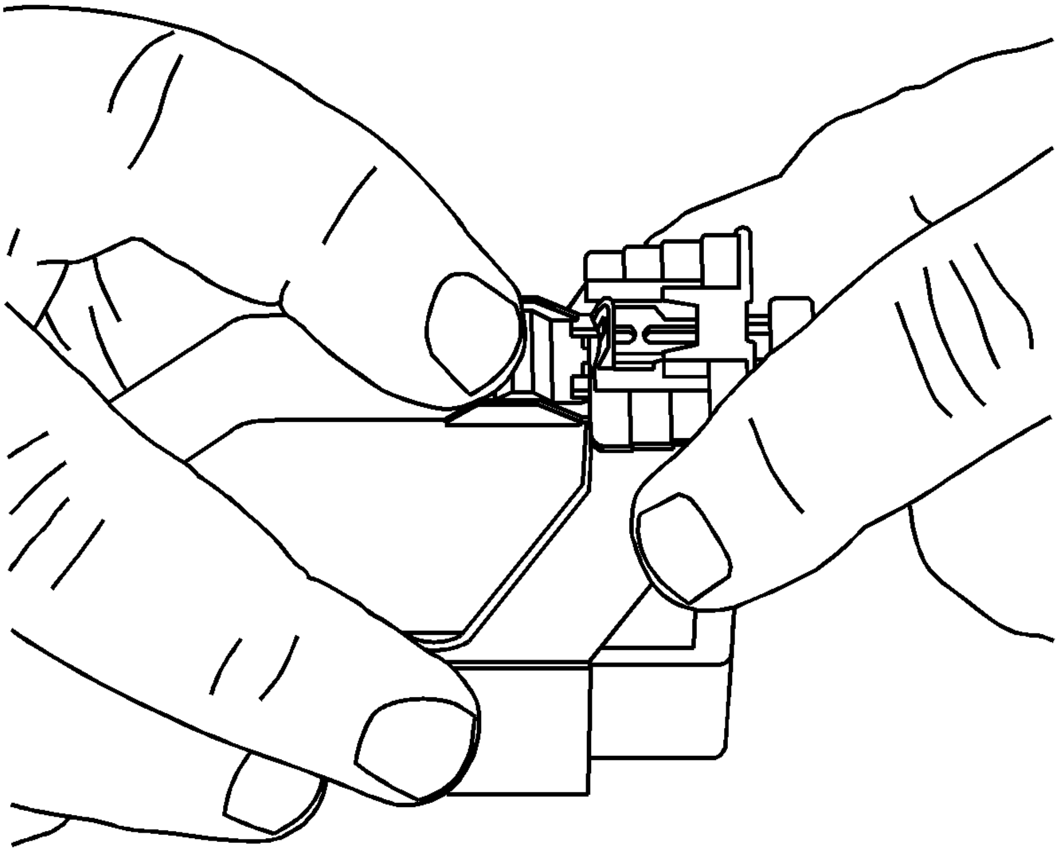

Fig. 114: View Of Lever In Full Forward Position
Courtesy of GENERAL MOTORS COMPANY

3. The lever should be in the full forward position.

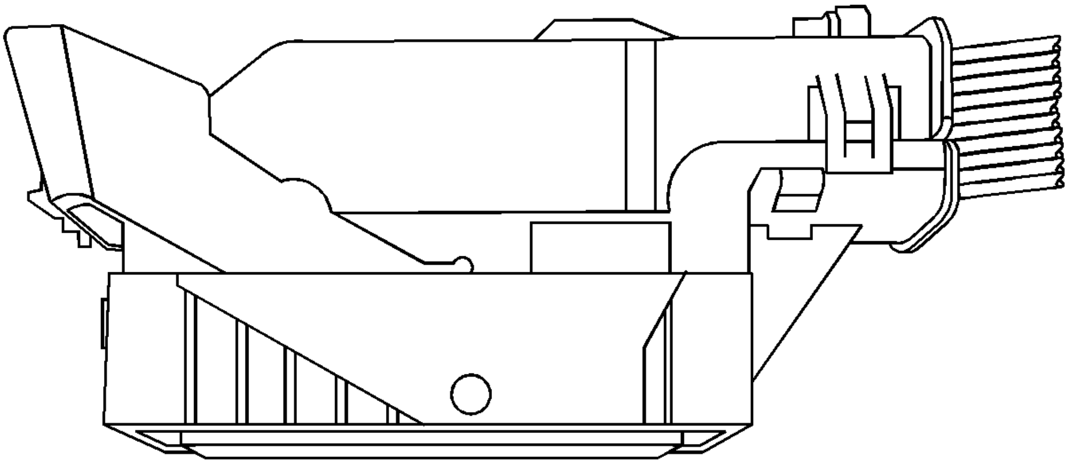

Fig. 115: View Of CPA Connector
Courtesy of GENERAL MOTORS COMPANY

4. Disconnect the connector from the component.

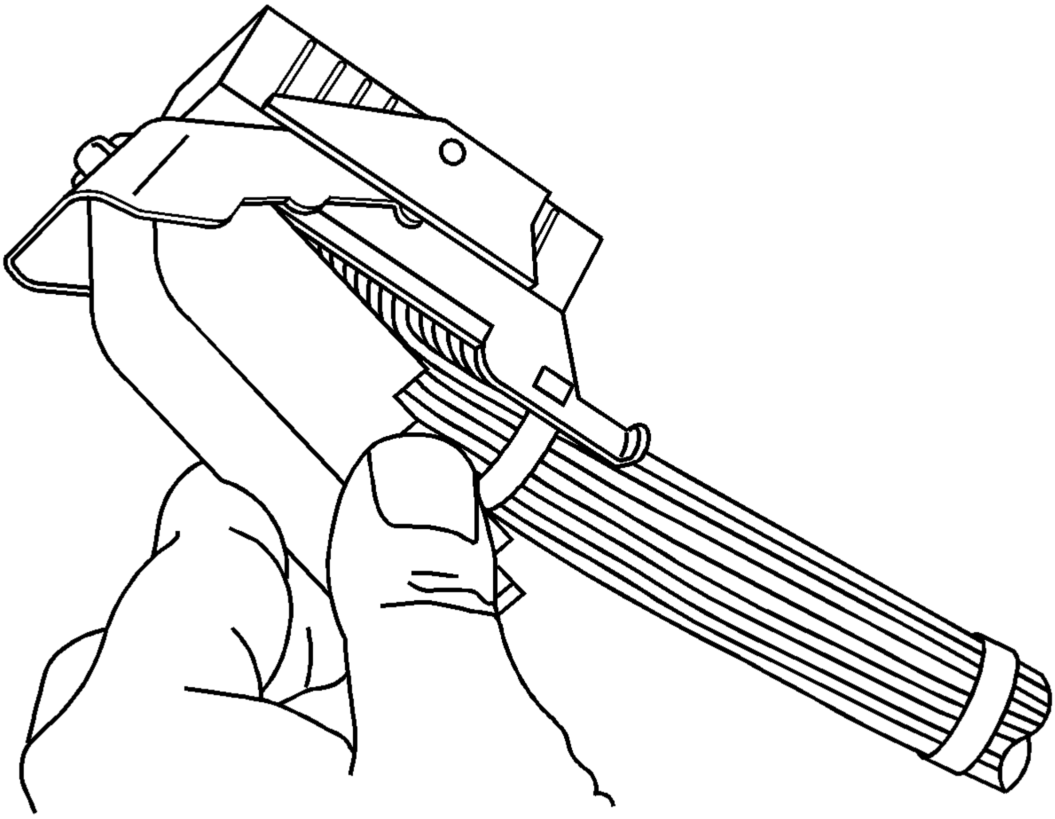

Fig. 116: View Of Dress Cover
Courtesy of GENERAL MOTORS COMPANY

5. Remove the dress cover by using a flat bladed tool to release the dress cover locking tabs and lift up on the dress cover.
6. Cut the tie wrap that holds the wires to the connector body.

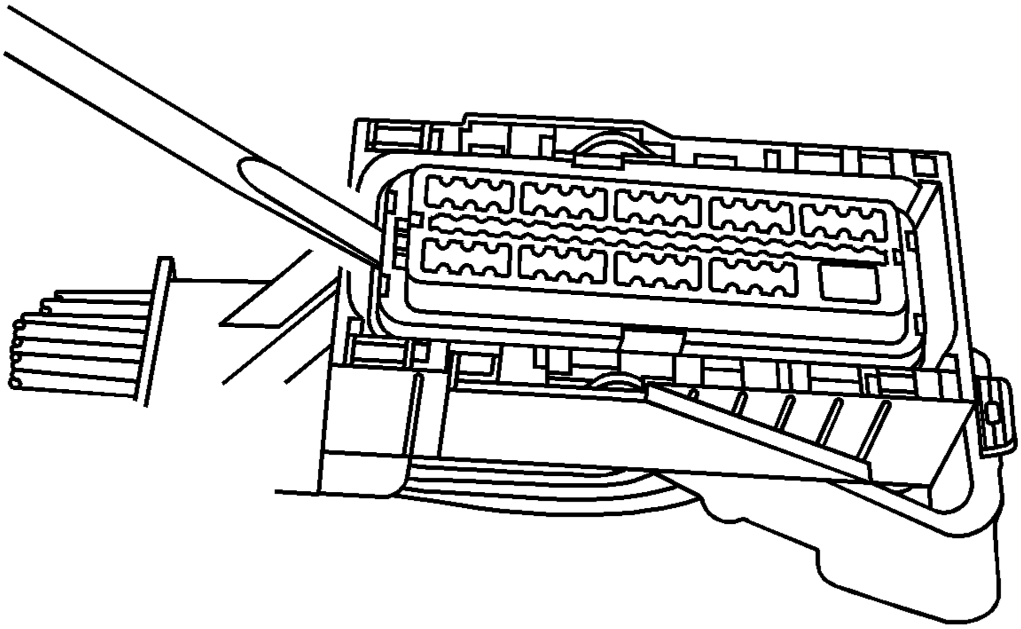

Fig. 117: Prying One Side Of Nose Piece
Courtesy of GENERAL MOTORS COMPANY

7. Use a small flat-blade tool to pry one side of the nose piece up to the pre-stage position. When the nose piece is in the pre-staged position, the nose piece will be raised above the connector body the length of the step in the nose piece.

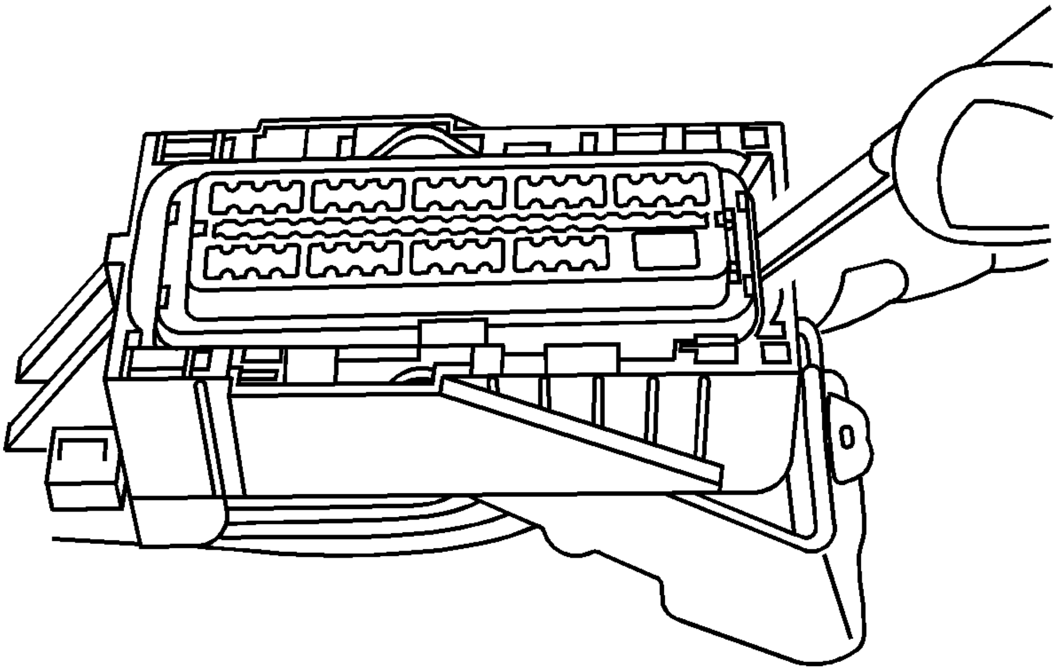

Fig. 118: Prying Side Of Nose Piece
Courtesy of GENERAL MOTORS COMPANY

8. Use a small flat-blade tool to pry the other side of the piece to the pre-stage position. If the nose piece is higher than the first step in the nose piece, gently push down on the nose piece until it meets with resistance from the connector body, you should feel the nose piece click into position.

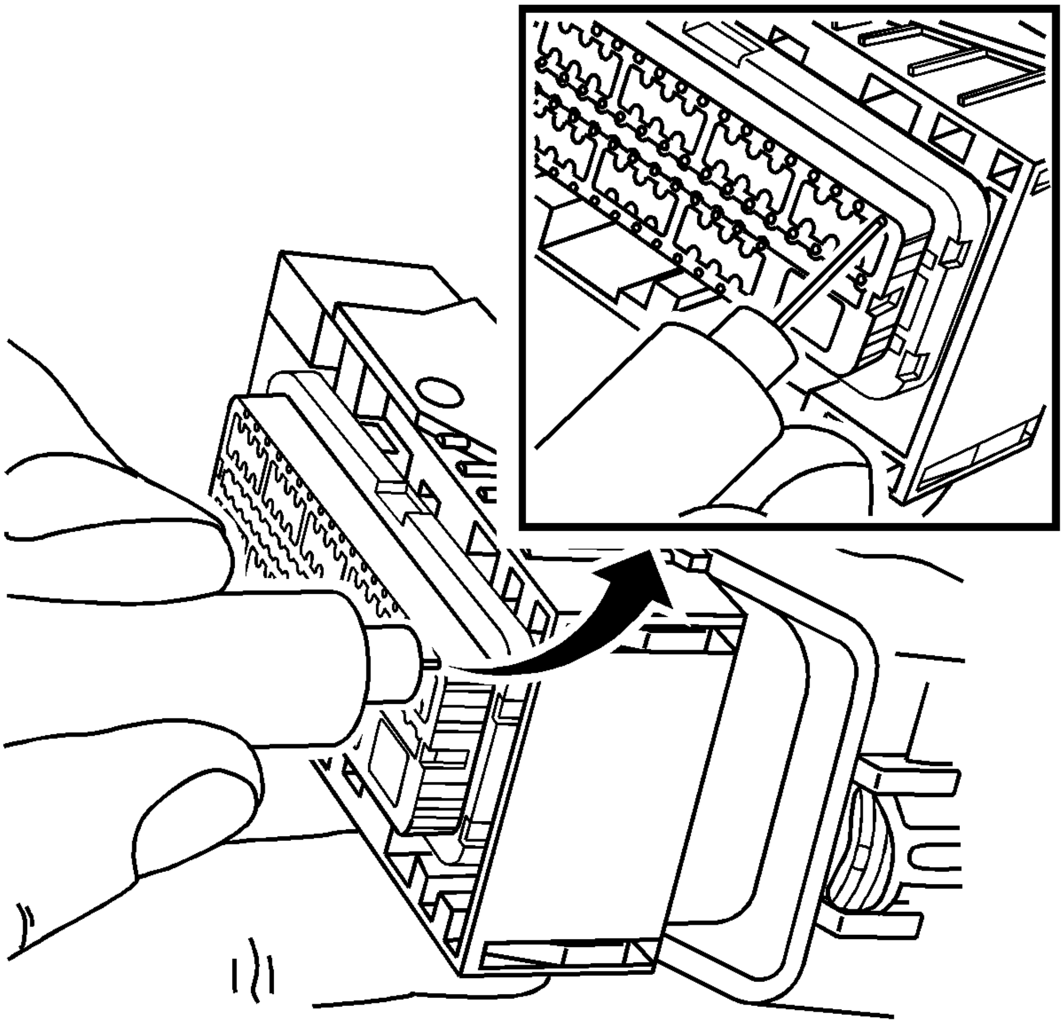

Fig. 119: Releasing Terminal
Courtesy of GENERAL MOTORS COMPANY

9. Insert the J-38125-213 into the small terminal release hole on the nose piece and gently pull on the back of the wire.
10. Repair the terminal by following the Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair) procedure.
11. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Terminated Lead Repair

1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gauge size.
4. Refer to Wire to Wire Repair.

Terminal Insertion Procedure

After the terminal is replaced, perform the following procedure in order to insert the terminal.

1. Slide the new terminal into the correct cavity at the back of the connector.
2. Push the terminal into the connector until it locks into place. The new terminal should be even with the other terminals. Insure that the terminal is locked in place by gently pulling on the wire.
3. To assemble the connector, reverse the connector disassembly procedure.

MOLEX CONNECTORS (SIR)

Removal Procedure

NOTE: **The orange or yellow connector position assurance (CPA) must be released first to disconnect or to connect the connector.**

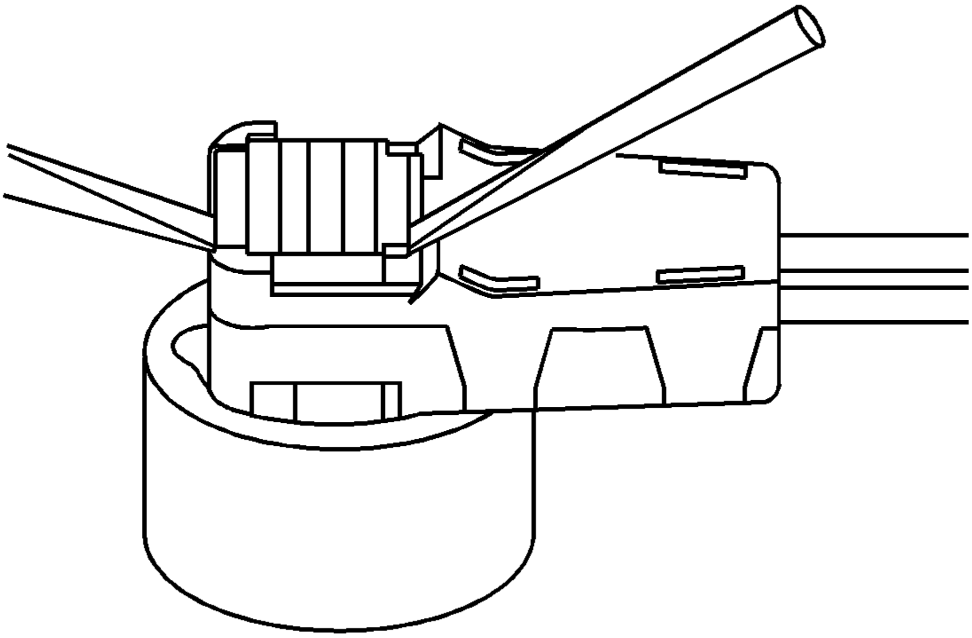

Fig. 120: Lifting Orange CPA
Courtesy of GENERAL MOTORS COMPANY

1. Lift the orange or yellow CPA vertically (avoid lifting on an angle to the connector) approximately 4 mm to release the connector. Use a small flat-bladed tool to help release the CPA. The CPA may also be released manually without any tools.

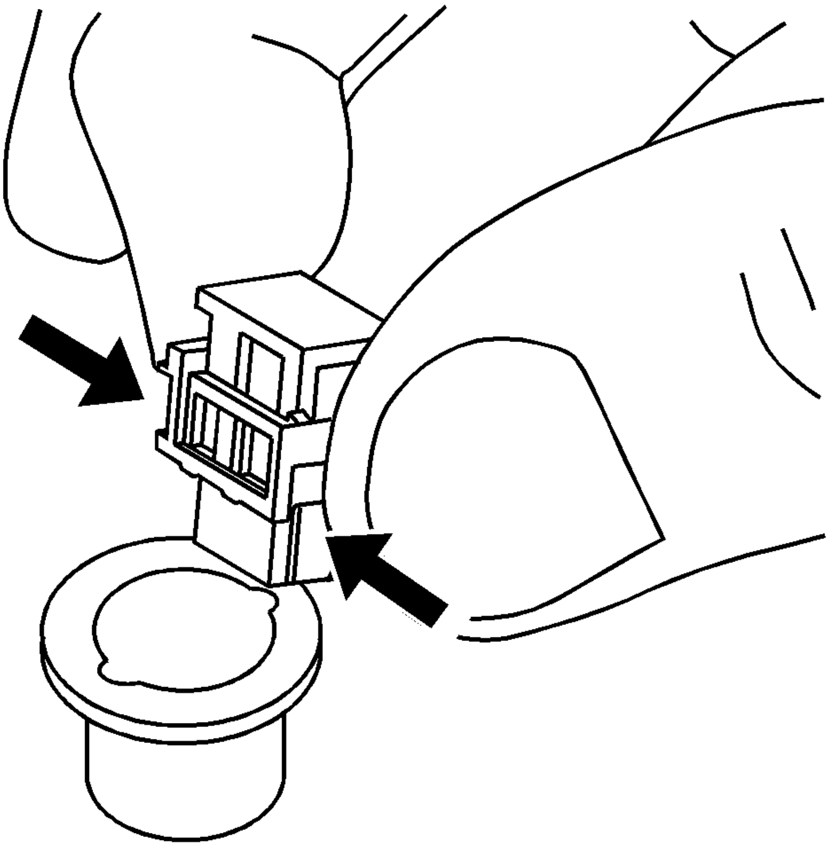

Fig. 121: Grabbing Connector On Both Sides
Courtesy of GENERAL MOTORS COMPANY

2. Grab the connector on both sides and lift vertically to disconnect the connector.

Installation Procedure

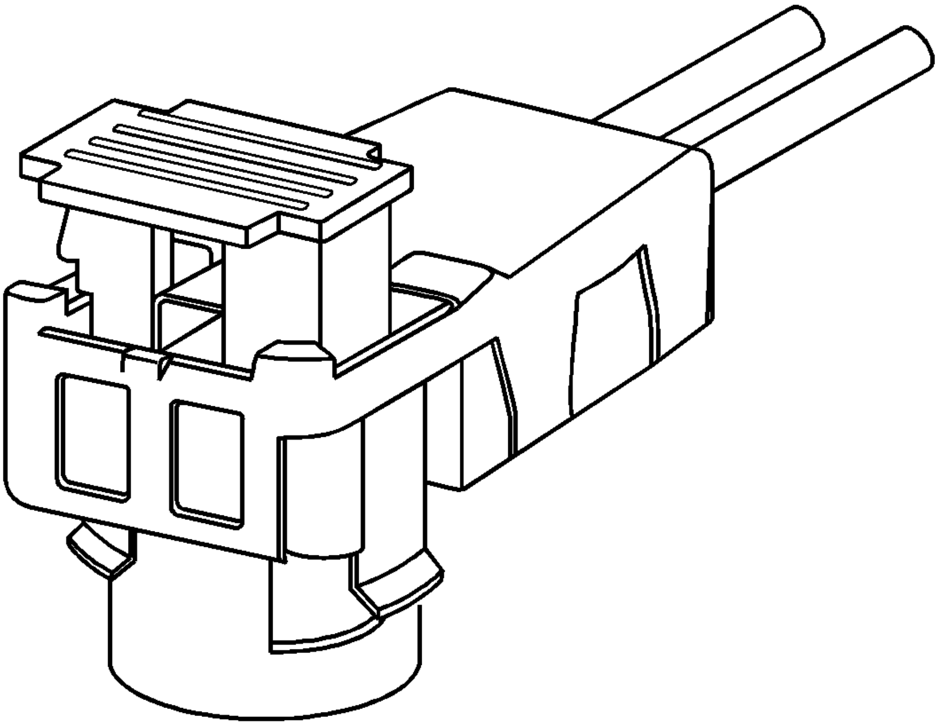

Fig. 122: Lifting Orange CPA
Courtesy of GENERAL MOTORS COMPANY

1. The CPA should be approximately 4 mm above the yellow cover before installing the connector. If not, use a small flat-bladed tool to help release the CPA. The CPA may also be released manually without any tools.

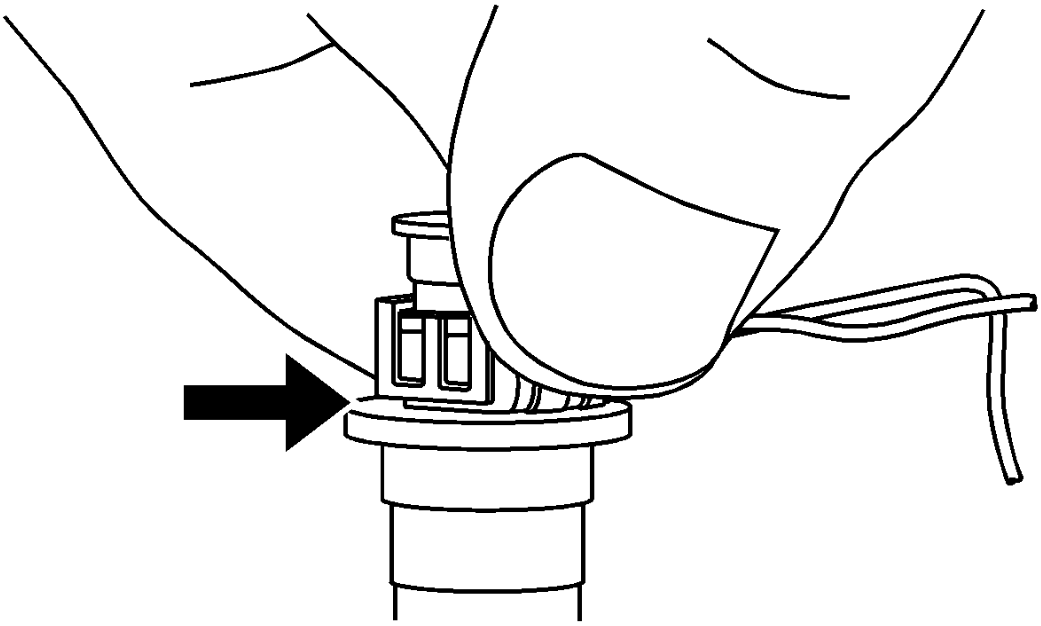

Fig. 123: Seating Connector Sub-Assembly
Courtesy of GENERAL MOTORS COMPANY

2. Line up the connector key tabs with the initiator key slots. Grab the connector on both sides and push down into the initiator connector sub assembly until fully seated.

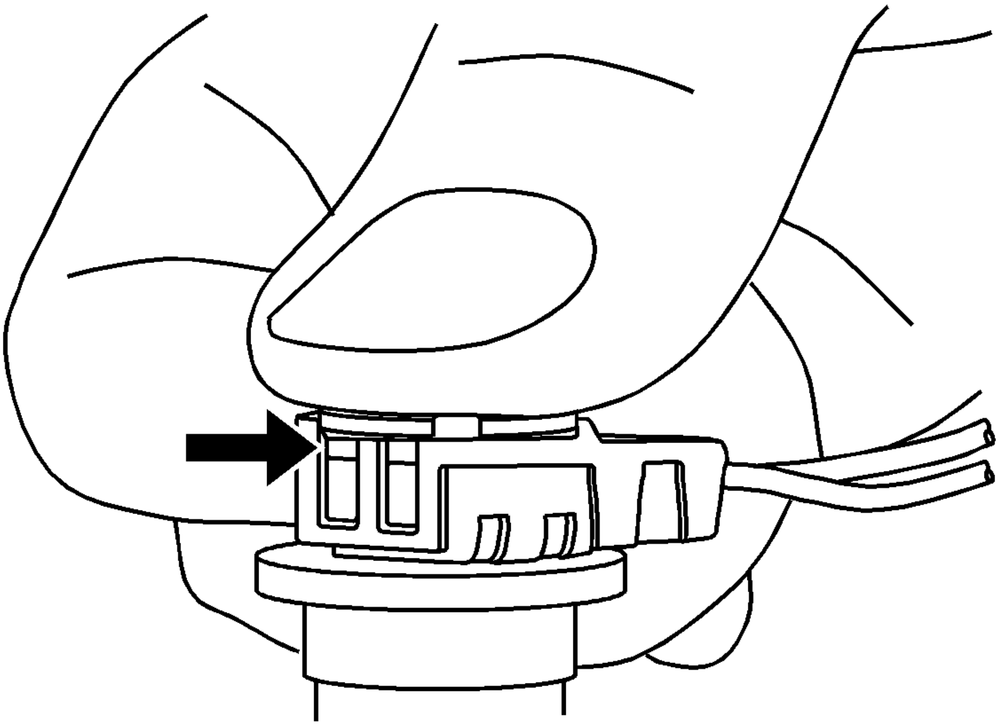

Fig. 124: Pushing CPA Down
Courtesy of GENERAL MOTORS COMPANY

3. After the connector is fully seated, push the CPA down with your thumb until the CPA is touching the yellow cover on the connector.

Terminal Removal Procedure

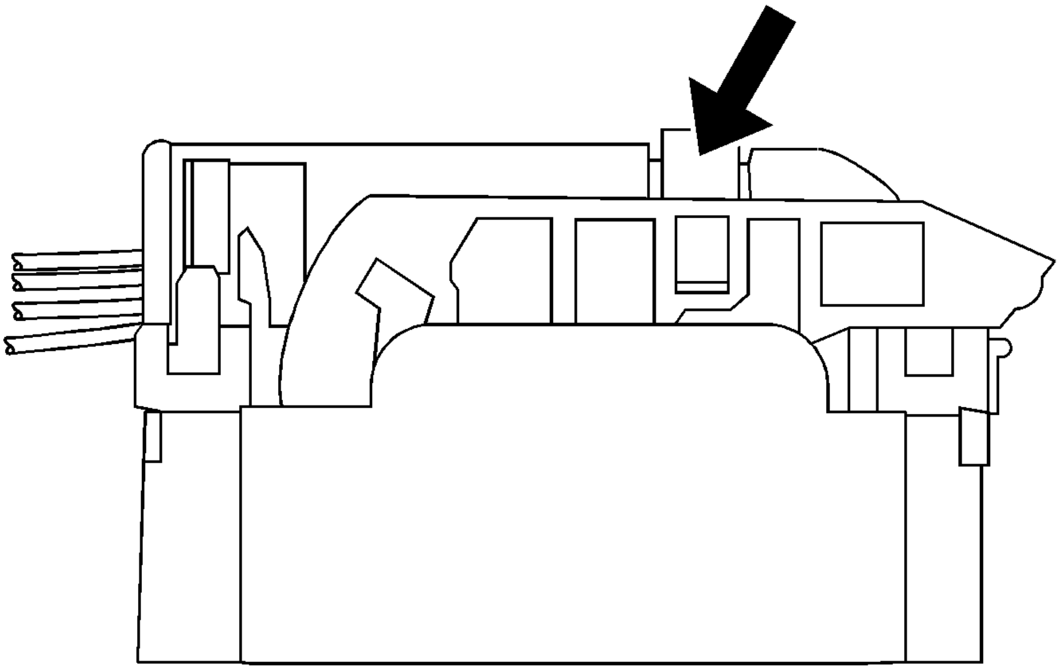

Fig. 125: Identifying Lever Lock

Courtesy of GENERAL MOTORS COMPANY

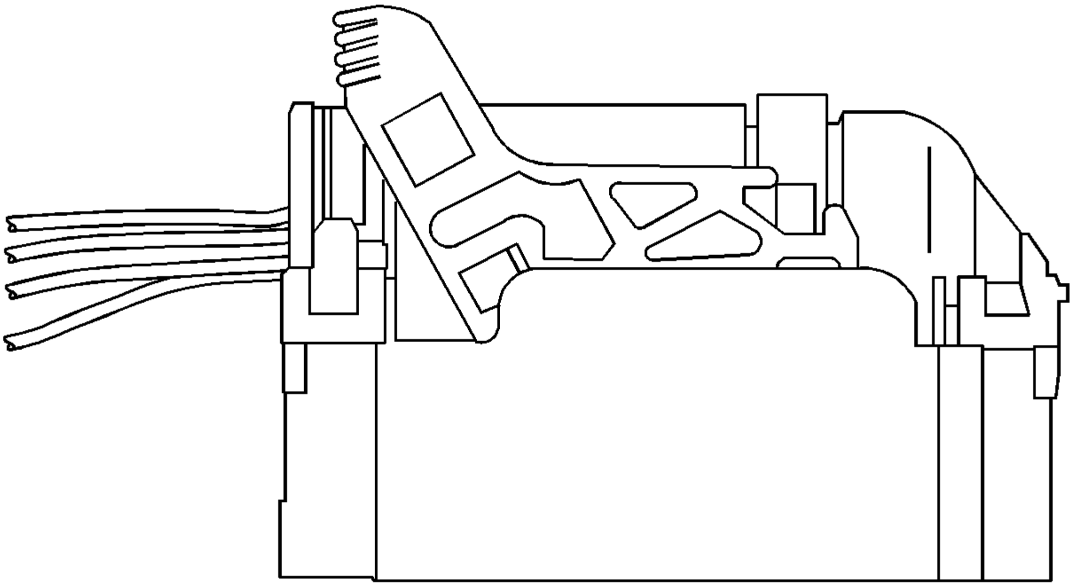

Fig. 126: View Of Lever Lock In Forward Position
Courtesy of GENERAL MOTORS COMPANY

1. Slide the lever lock forward while pressing down on the lever lock release tab.
2. Disconnect the connector from the component.

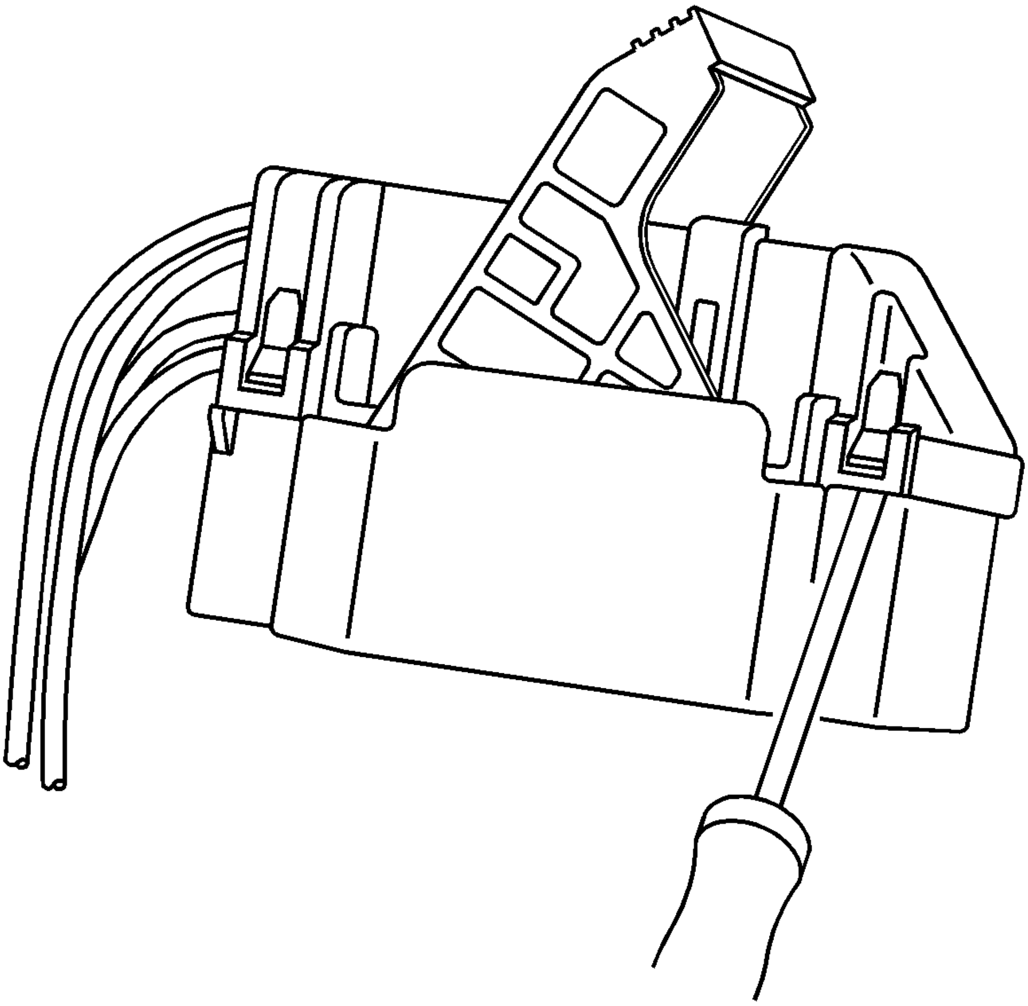

Fig. 127: View Of Connector Locking Tabs
Courtesy of GENERAL MOTORS COMPANY

3. Remove the dress cover by using a flat-blade tool to release the connector locking tabs and pulling off the dress cover.

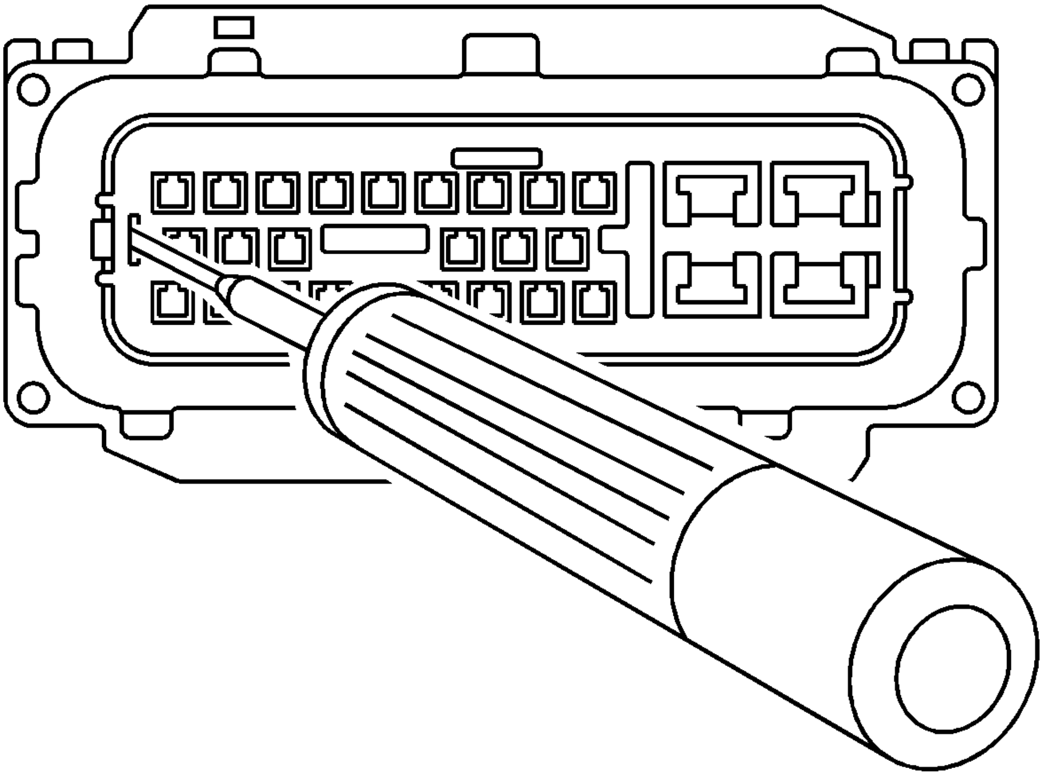

Fig. 128: Identifying Nose Piece Locking Tabs
Courtesy of GENERAL MOTORS COMPANY

4. Relieve the tension on the nose piece retainers by inserting J-38125-12A into the single retainer slot on the end of the nose piece and gently prying out the locking tab. Repeat the process for both of the nose piece locking tabs on the opposite side of the nose piece.

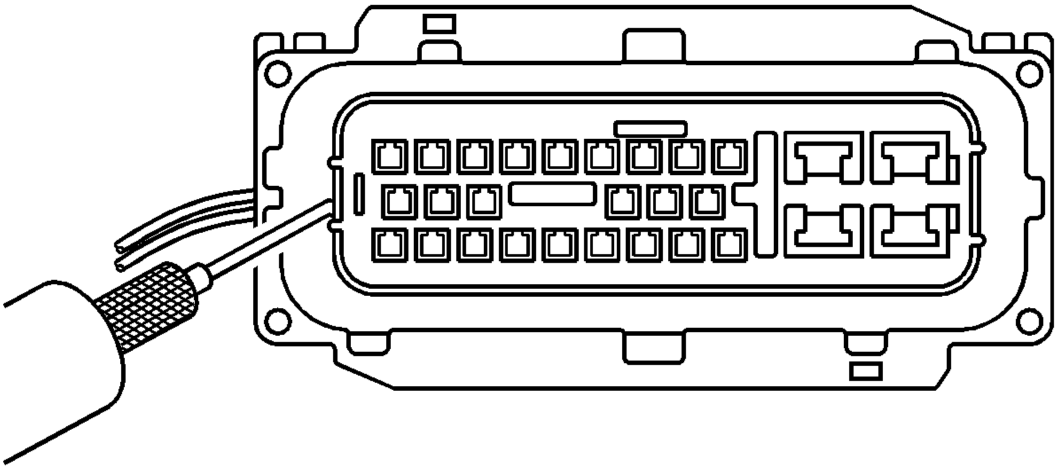

Fig. 129: Pulling Up One End Of Nose Piece (1st Side)
Courtesy of GENERAL MOTORS COMPANY

5. Once the nose piece retainers are relaxed, use the J-38125-552 to pull up the nose piece by hooking the tool under the nose piece and pulling up. The nose piece should raise slightly.

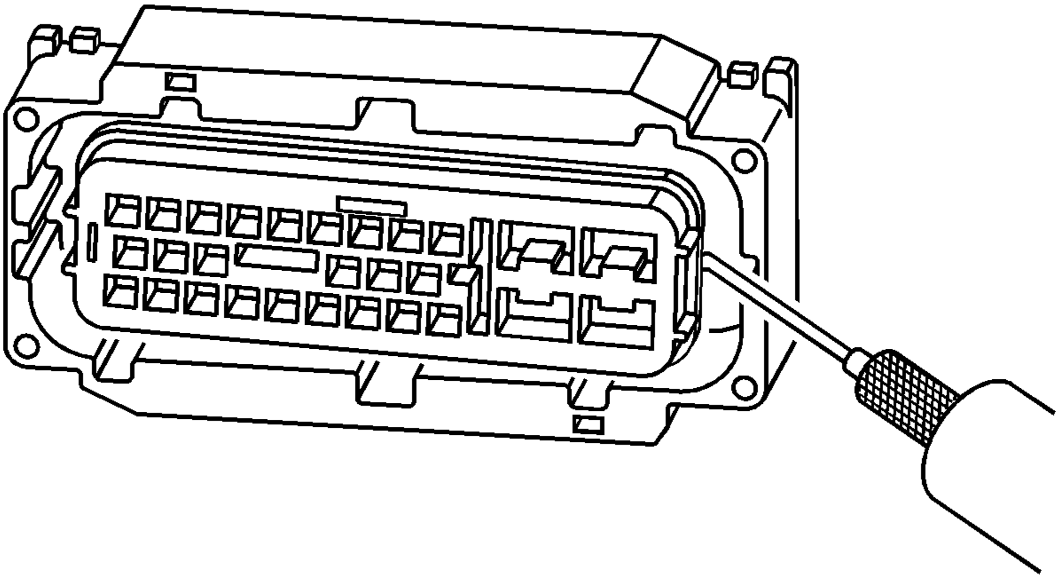

Fig. 130: Pulling Up One End Of Nose Piece (2nd Side)
Courtesy of GENERAL MOTORS COMPANY

6. On the opposite side of the nose piece, use the J-38125-552 pull up the nose piece by hooking the tool under the nose piece and pulling up. The nose piece should release completely. If the nose piece does not come off, repeat the procedure on the opposite side.

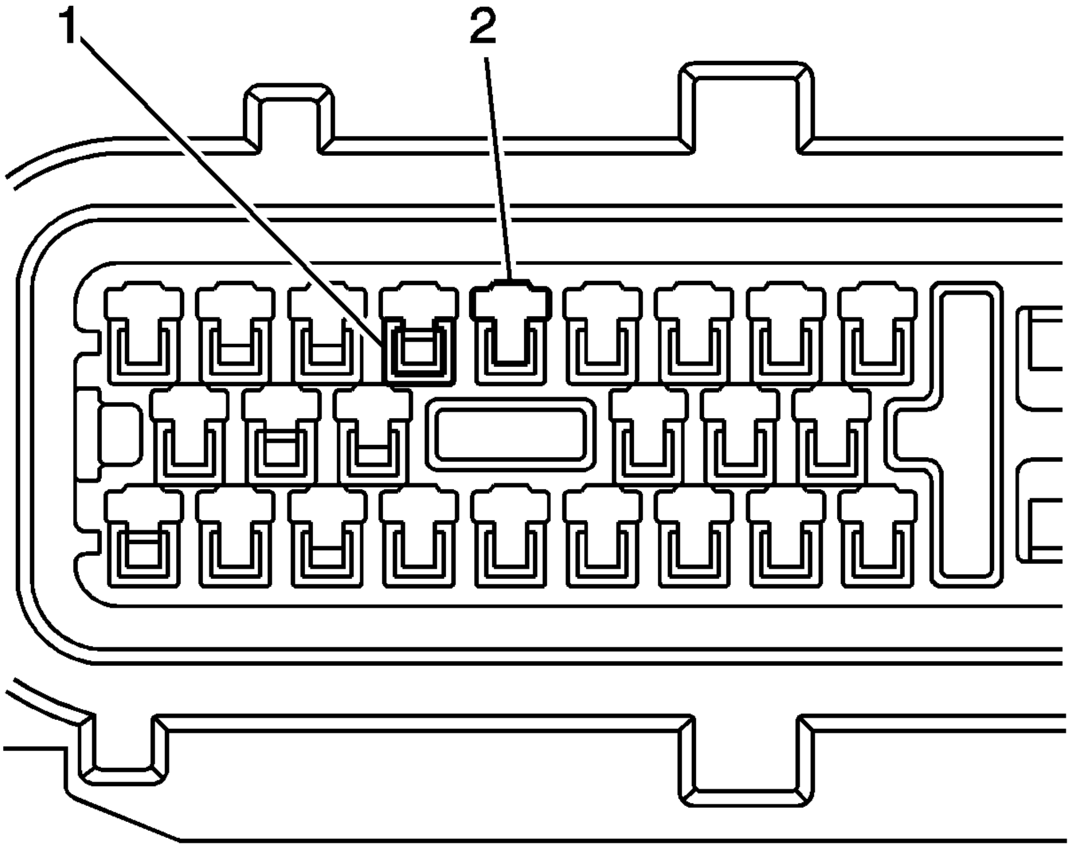

Fig. 131: View Of Terminal & Entry Canal
Courtesy of GENERAL MOTORS COMPANY

7. The illustration above identifies the entry canal where the terminal release tool will be inserted, and the terminal cavity.
    - Terminal (1)
    - Entry Canal (2)

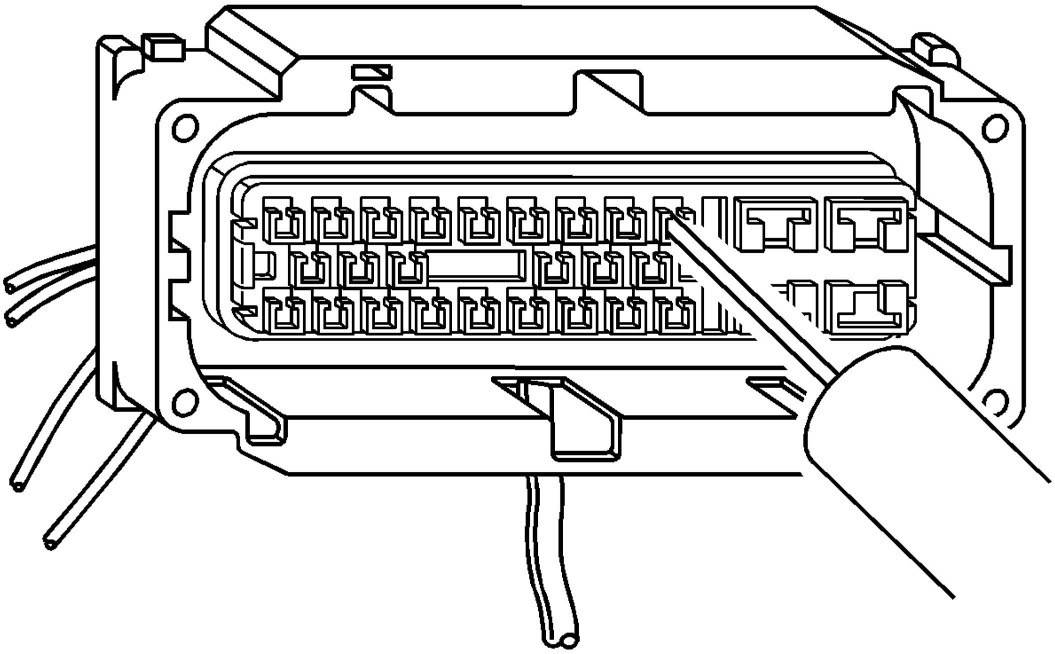

Fig. 132: Inserting J-38125-553 (15315247) Tool Into Entry Canal
Courtesy of GENERAL MOTORS COMPANY

8. Insert the J-38125-553 tool into the entry canal and pry up on the terminal retainer. The terminal retainer is a small plastic piece on the top of the terminal. The terminal retainer must be held up while the terminal is pulled out of the connector.

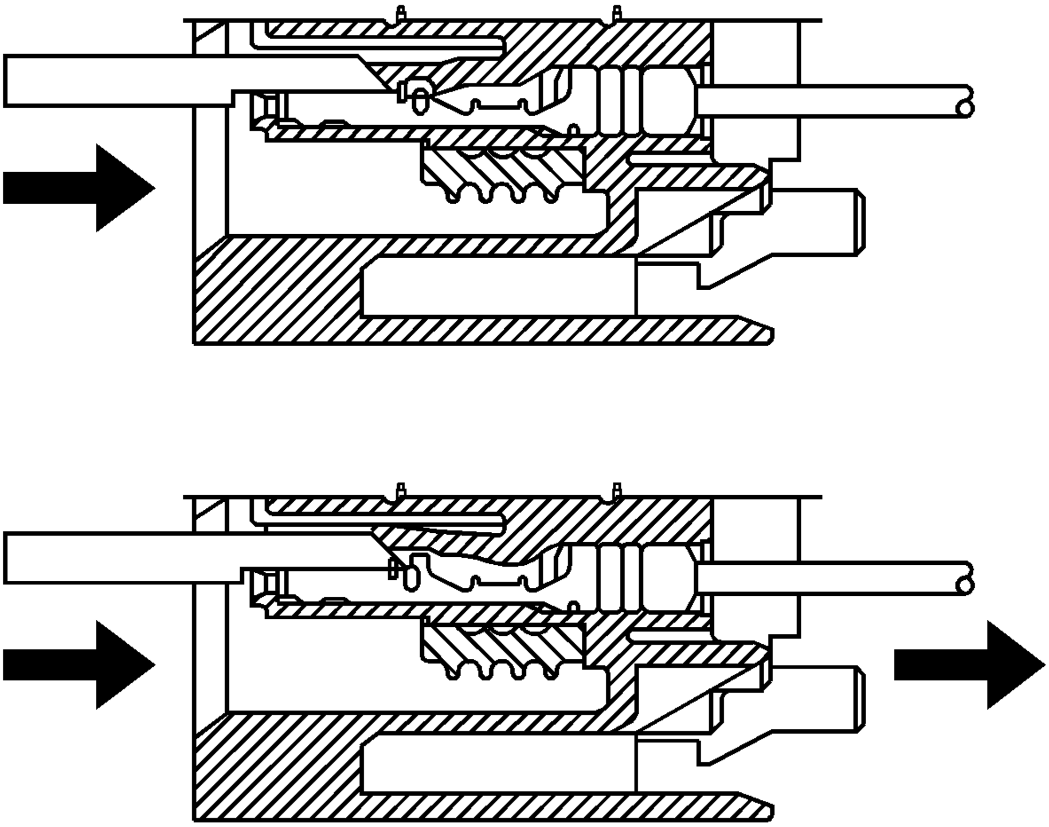

Fig. 133: Cutaway View Of Connector
Courtesy of GENERAL MOTORS COMPANY

9. The illustration shows a cutaway view of the connector to aid the technician in releasing the terminal retainer.
10. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
11. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Terminal Insertion Procedure

After the terminal is replaced, perform the following procedure in order to insert the terminal.

1. Slide the new terminal into the correct cavity at the back of the connector.
2. Push the terminal into the connector until it locks into place. The new terminal should be even with the other terminals. Ensure that the terminal is locked in place by gently pulling on the wire.
3. To assemble the connector, reverse the connector disassembly procedure.

TYCO/AMP CONNECTORS (CM 42-WAY)

- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-12A** Terminal Release Tool

For equivalent regional tools, refer to **Special Tools** .

Terminal Removal Procedure

1. Locate the connector position assurance (CPA) on the connector body and pull the CPA out. The CPA is on the wire harness side of connector.
2. Disconnect the connector from the component.

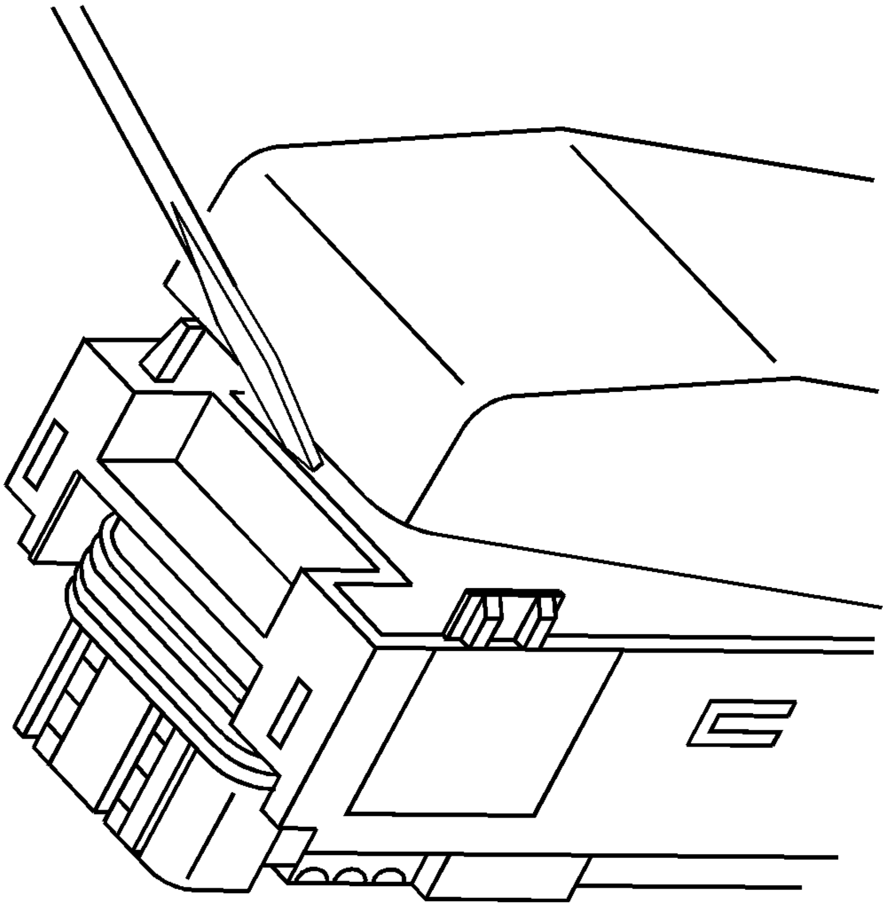

Fig. 134: View Of Dress Cover
Courtesy of GENERAL MOTORS COMPANY

3. Use a small flat-bladed tool to gently pry off the dress cover by inserting the tool under the cover opposite the harness side and prying up.
4. Remove the cover.

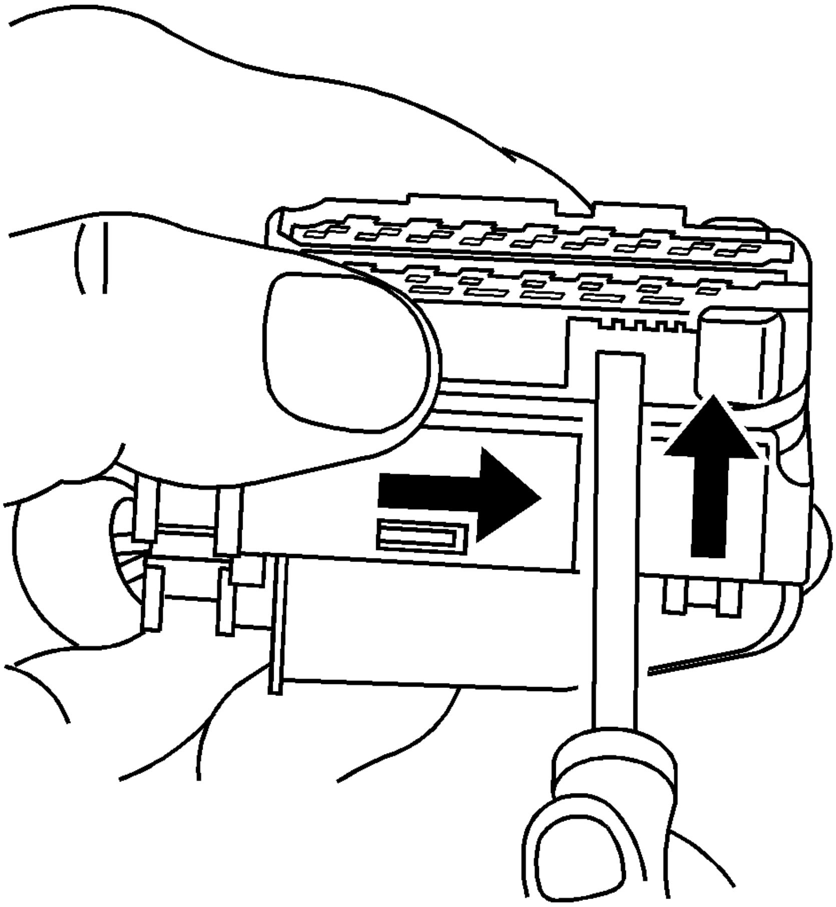

Fig. 135: View Of Terminal Position Assurance (TPA)
Courtesy of GENERAL MOTORS COMPANY

5. Using a small flat-bladed tool, push on the side of the nose piece retainer while pushing the nose piece forward with your thumb. This will release the terminal position assurance (TPA).

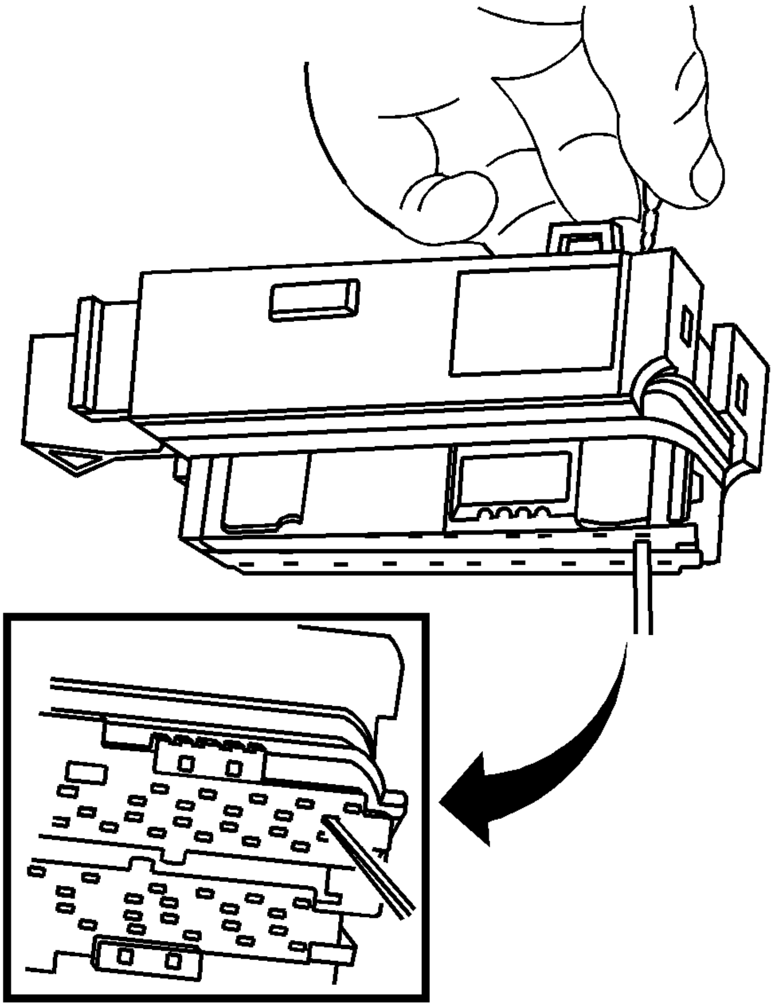

Fig. 136: Inserting Special Tool Into Terminal Release Cavity
Courtesy of GENERAL MOTORS COMPANY

6. Insert the **J-38125-12A** tool into the corresponding terminal release cavity. The release cavities are the 2 center rows of cavities on one half of the connector.

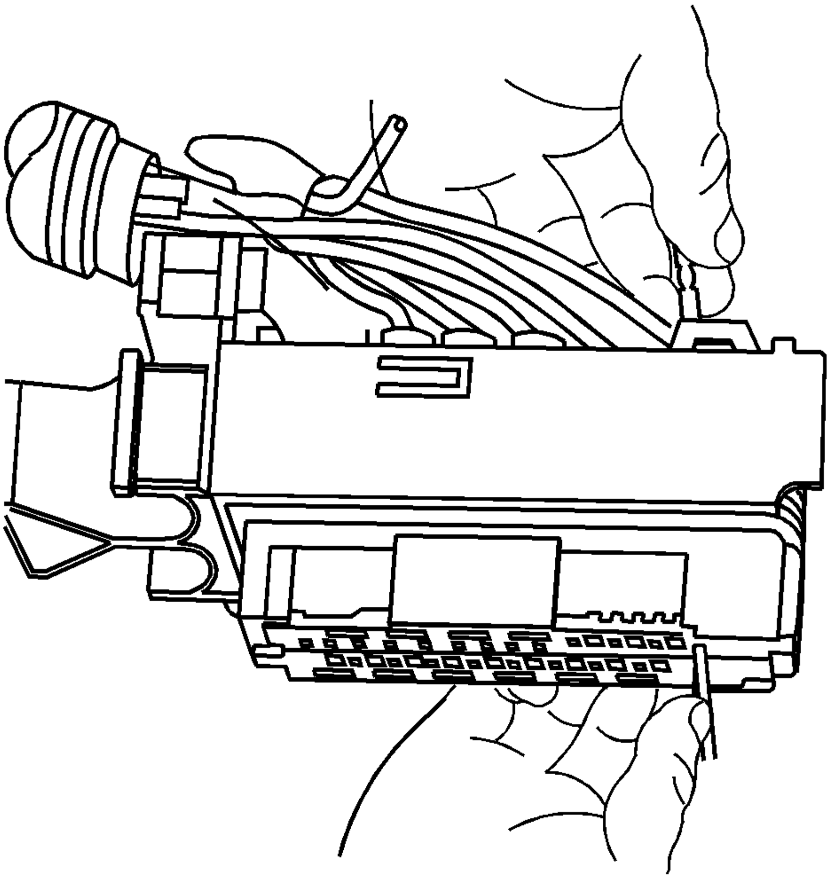

Fig. 137: Identifying Special Tool & Release Cavity
Courtesy of GENERAL MOTORS COMPANY

7. Pressing the **J-38125-12A** tool in the release cavity of the terminal you are removing, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
8. Repair the terminal by following the Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair) procedure.
9. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

TYCO/AMP CONNECTORS (SENSOR)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit

For equivalent regional tools, refer to Special Tools .

Terminal Removal Procedure

1. Disconnect the connector from the component.

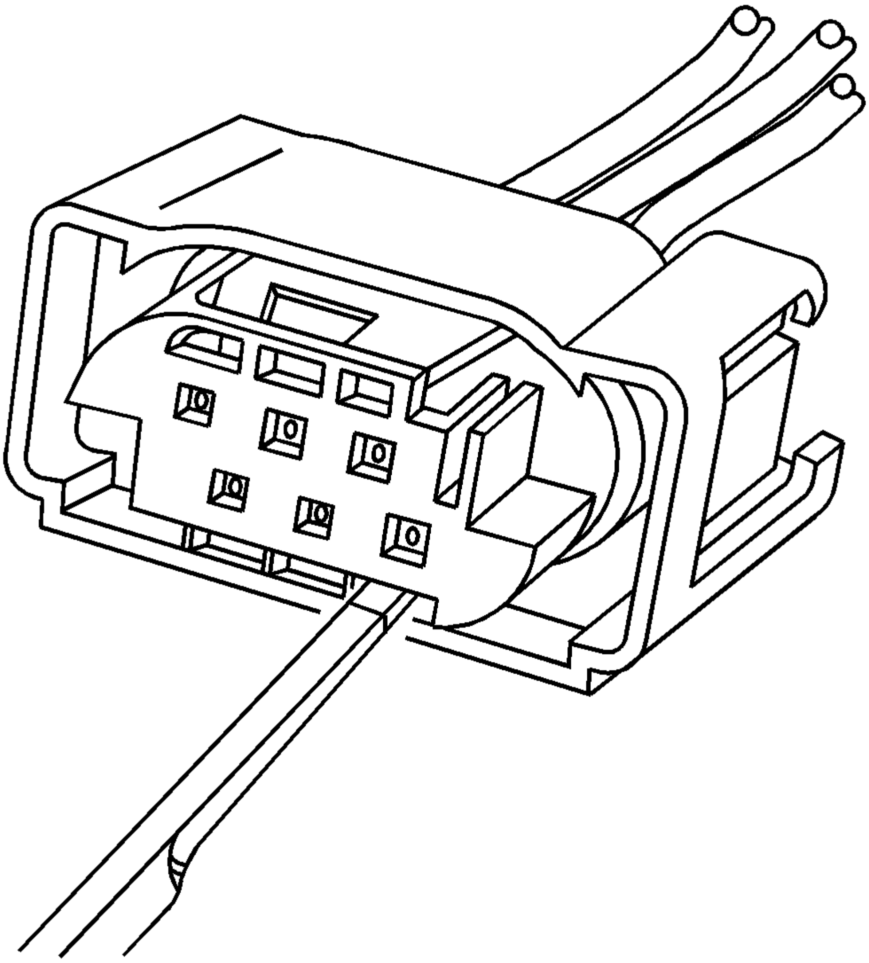

Fig. 138: View Of Inserting Special Tool Into Lower Right Face Cavity
Courtesy of GENERAL MOTORS COMPANY

2. Insert the J-38125-11A tool into the cavity on the lower right hand face of the connector until the terminal release tang access panel slides over.

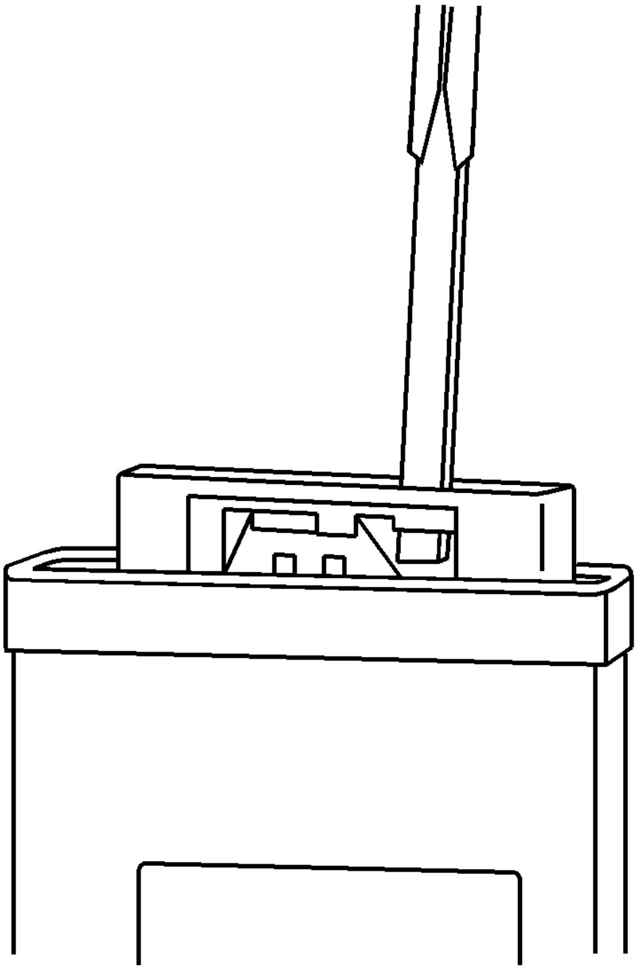

Fig. 139: Pushing Wire Side Of Terminal Toward Connector
Courtesy of GENERAL MOTORS COMPANY

3. Ensure that the terminal release tang access panel is in the correct location to access the terminals.
4. Push the wire side of the terminal that is being removed toward the connector and hold it in position.

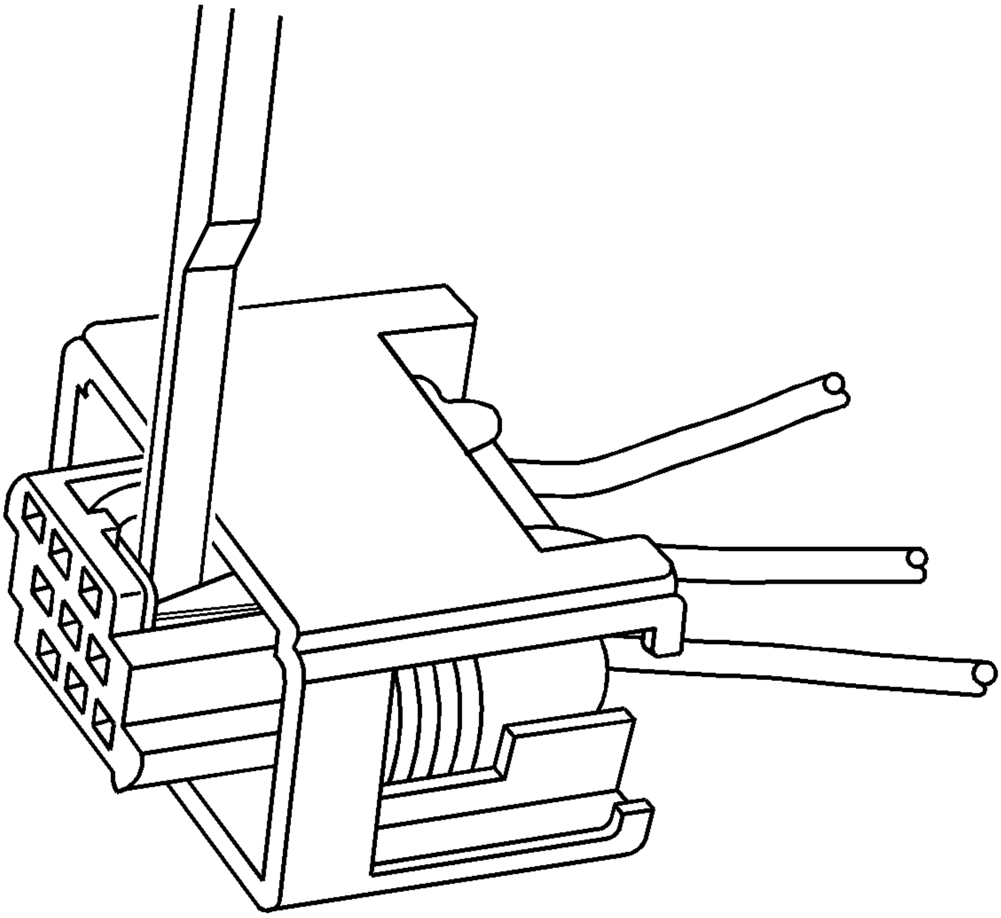

Fig. 140: View Of Inserting Tool Into Terminal Release Tang Access Slot (Sensor)
Courtesy of GENERAL MOTORS COMPANY

5. Insert the J-38125-11A into the terminal release tang access slot located behind the access panel of the connector and press down on the terminal while carefully pulling the terminal out of the connector. Always remember never use force when pulling a terminal out of a connector. If the terminal is difficult to remove, repeat the entire procedure.
6. Repair the terminal by following the Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair) procedure.
7. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-24** Terminal Release Tool

For equivalent regional tools, refer to Special Tools .

Terminal Removal Procedure

1. Disconnect the connector from the component by pressing down on the connector position assurance (CPA).

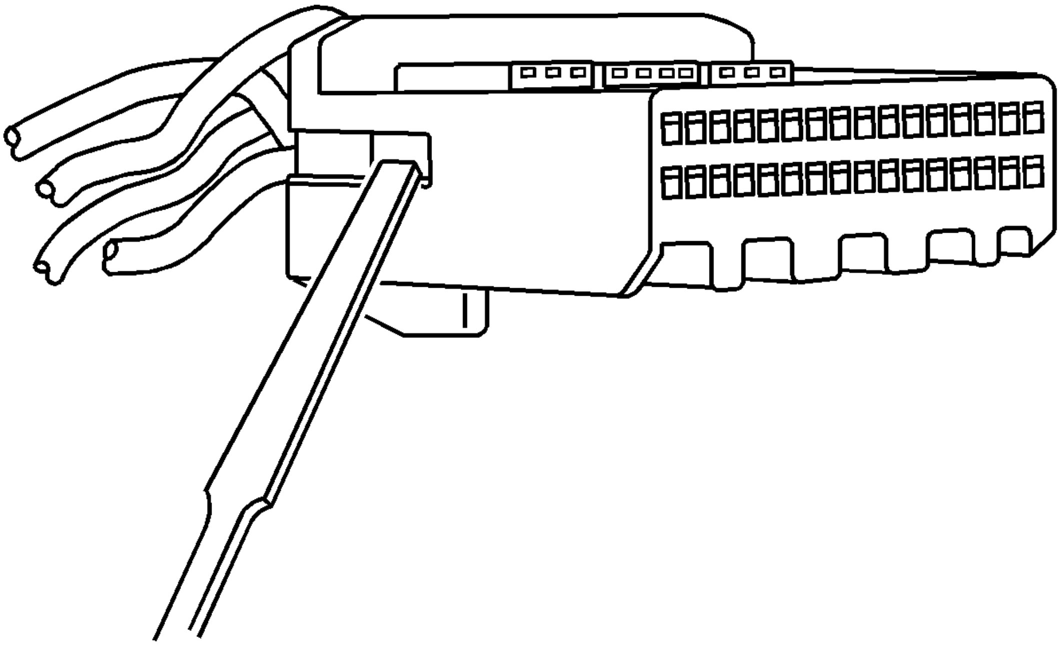

Fig. 141: Releasing TPA Using Small Flat-Bladed Tool
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The TPA on this connector cannot be removed unless the terminals are removed first. The TPA will come out of the connector body, but only slightly. When the TPA is slightly raised the terminals can be removed. Using excessive force to remove the TPA with the terminals still in the connector will damage the connector.**

2. Use a small flat-bladed tool to release the terminal position assurance (TPA) by inserting the tool in the small recess on the side of the connector and pushing up until the TPA releases from the connector body. The TPA should raise just slightly. Do not try to remove the TPA.
3. Repeat the process for the other side of the connector.

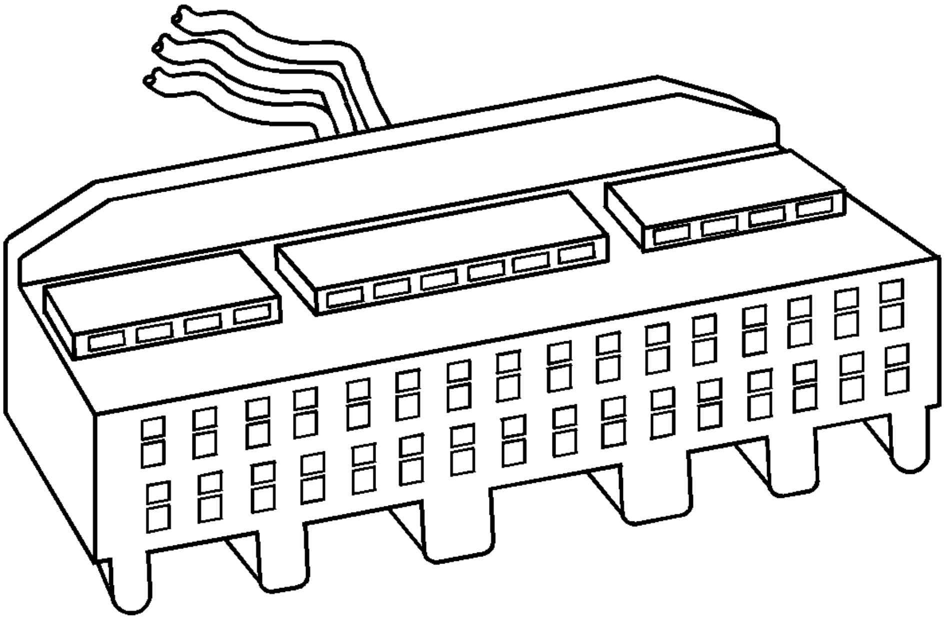

Fig. 142: View Of Terminal Position Assurance
Courtesy of GENERAL MOTORS COMPANY

4. Ensure that the TPA is in the proper position to remove the terminals.

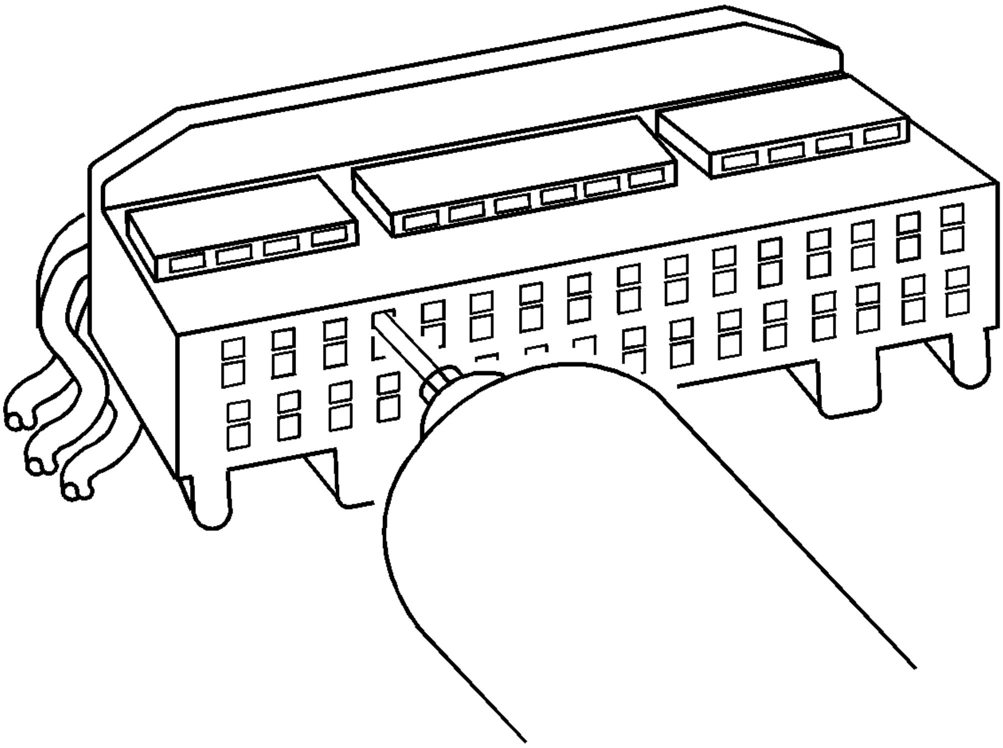

Fig. 143: Identifying Special Tool & Release Cavity
Courtesy of GENERAL MOTORS COMPANY

5. While pushing the terminal forward, insert the J-38125-24 in the release cavity above the terminal you are removing, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
6. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
7. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

TYCO/AMP CONNECTORS (43-WAY)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-12A** Terminal Release Tool

For equivalent regional tools, refer to **Special Tools** .

Terminal Removal Procedure

Follow the steps below in order to remove terminals from the connector.

1. Locate the lever lock on the wire dress cover. Slide the lever lock away from the connector body.
2. Disconnect the connector from the component.
3. Locate the dress cover locking tabs on the dress cover of the connector. Using a small flat-bladed tool release all of the locking tabs.

4. Once the locks are unlocked, lift the dress cover off.

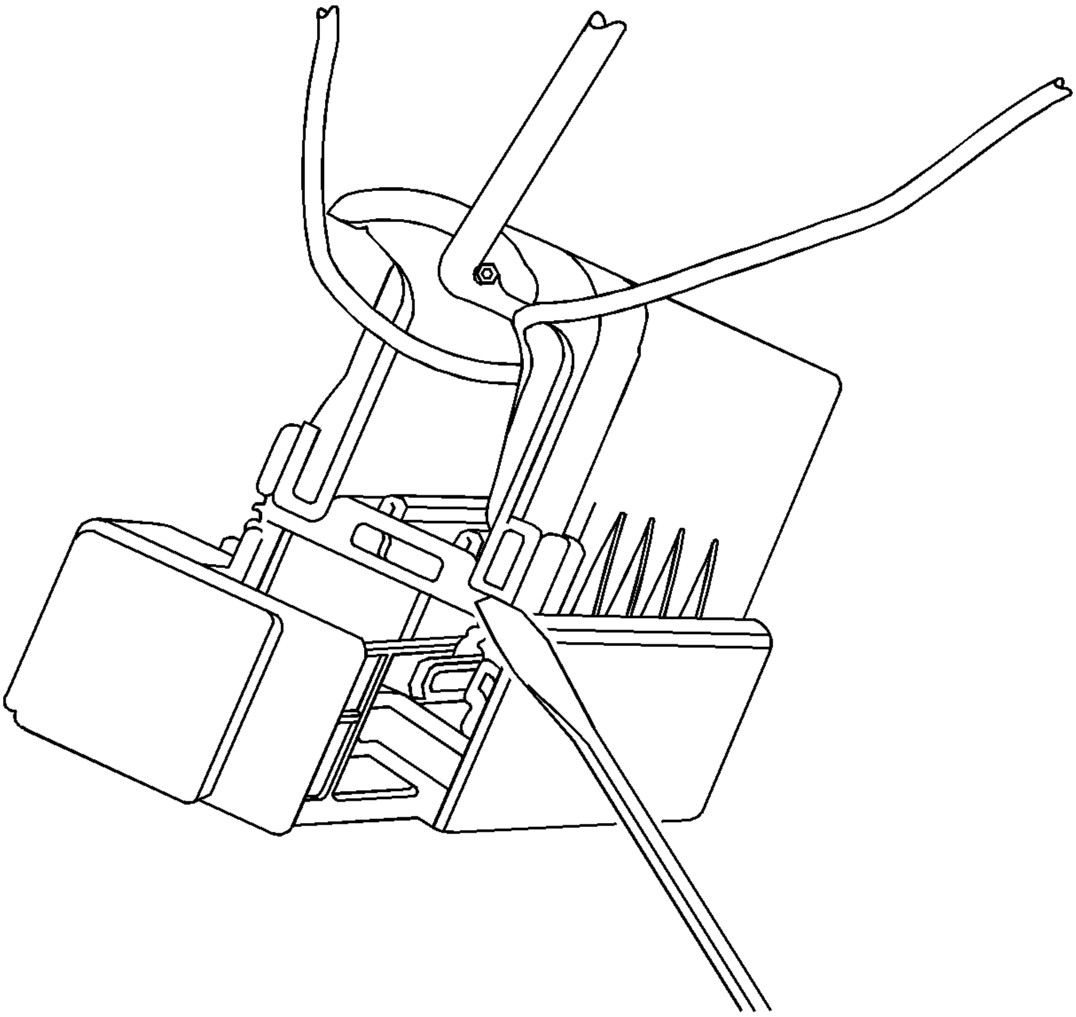

Fig. 144: Releasing TPA
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Always use care when removing a terminal position assurance (TPA) in order to avoid damaging it.**

5. Release the TPA by inserting a small flat-bladed tool into the blue locking tabs on both ends of the connector. Gently slide the TPA up to the released position on both ends.

8. The female connector body may have an additional connector hooked to the edge of the body. Use terminal release tool J-38125-11A or equivalent to release the locking tab and slide the connector off the female body.

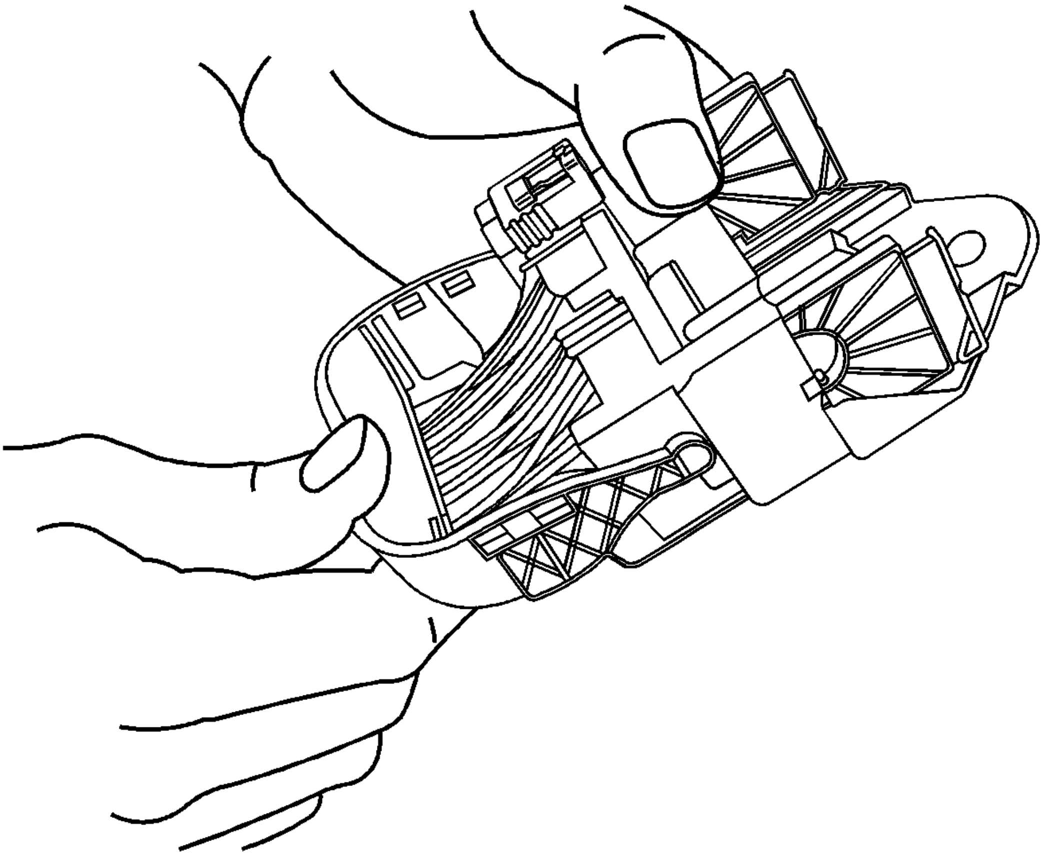

Fig. 174: Moving Locking Lever
Courtesy of GENERAL MOTORS COMPANY

9. Move the locking lever 180 degrees from the connected position.

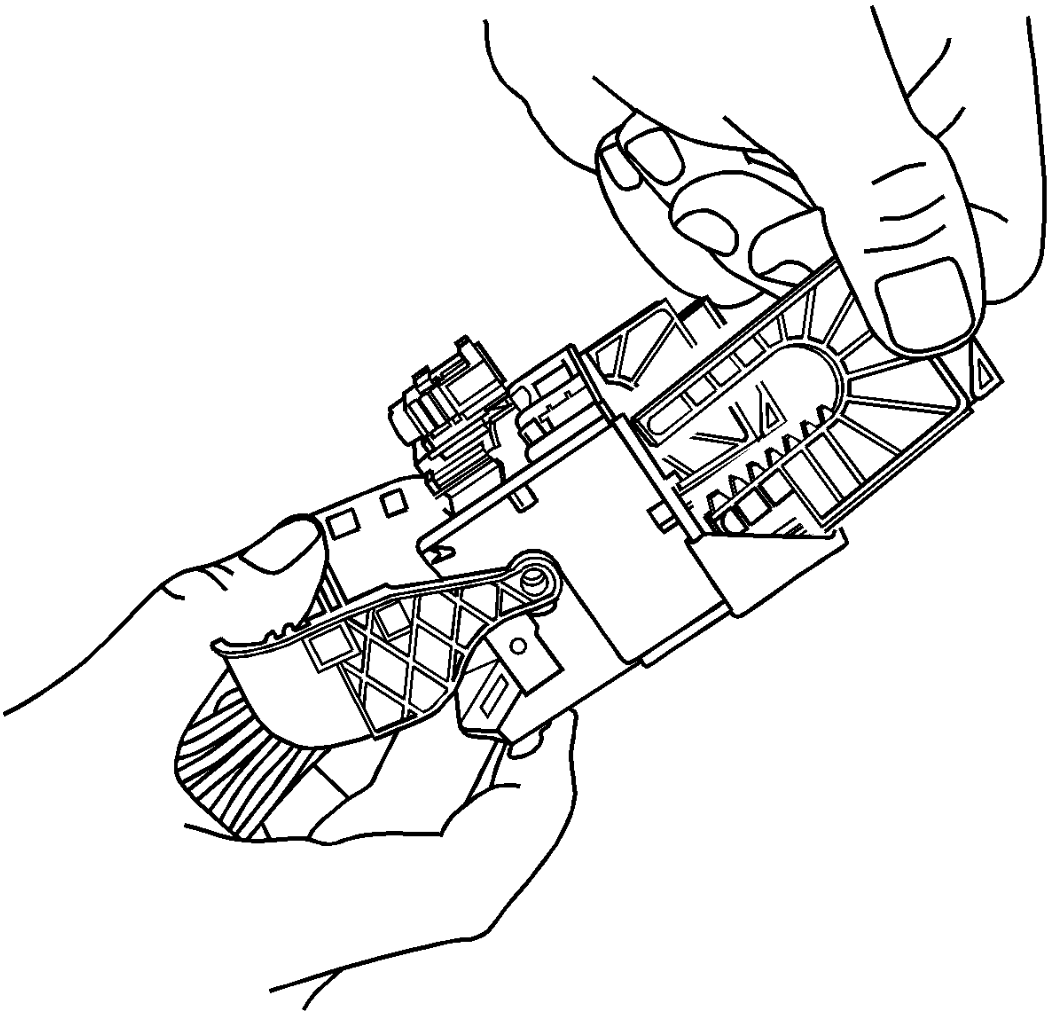

Fig. 175: Removing Guide Plates From Connector Body
Courtesy of GENERAL MOTORS COMPANY

10. With the locking lever in the 180 degree position the guide plates can be removed from the connector body.

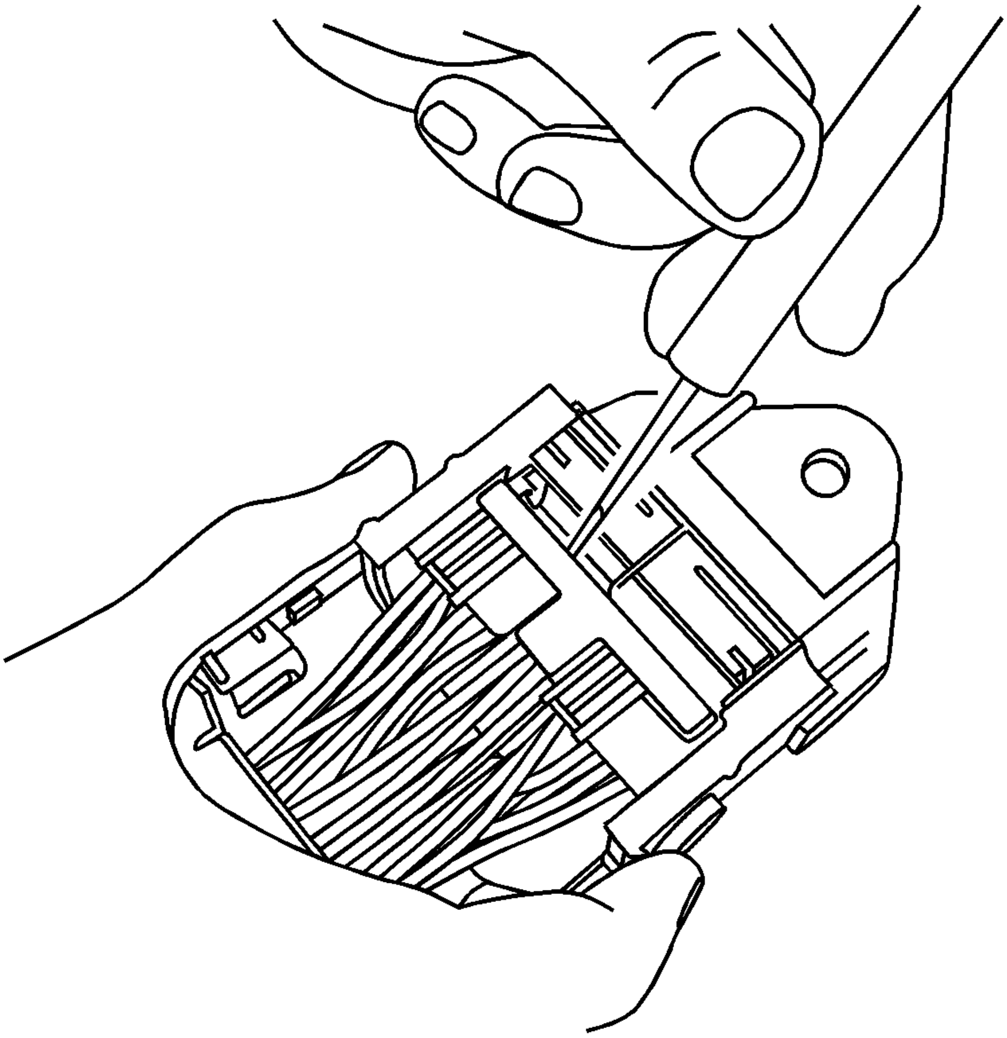

Fig. 176: Removing TPA
Courtesy of GENERAL MOTORS COMPANY

NOTE: **During assembly the TPA will not fully seat if any terminal is not fully seated.**

11. Using terminal release tool J-38125-11A or equivalent, remove the TPA from the connector body.

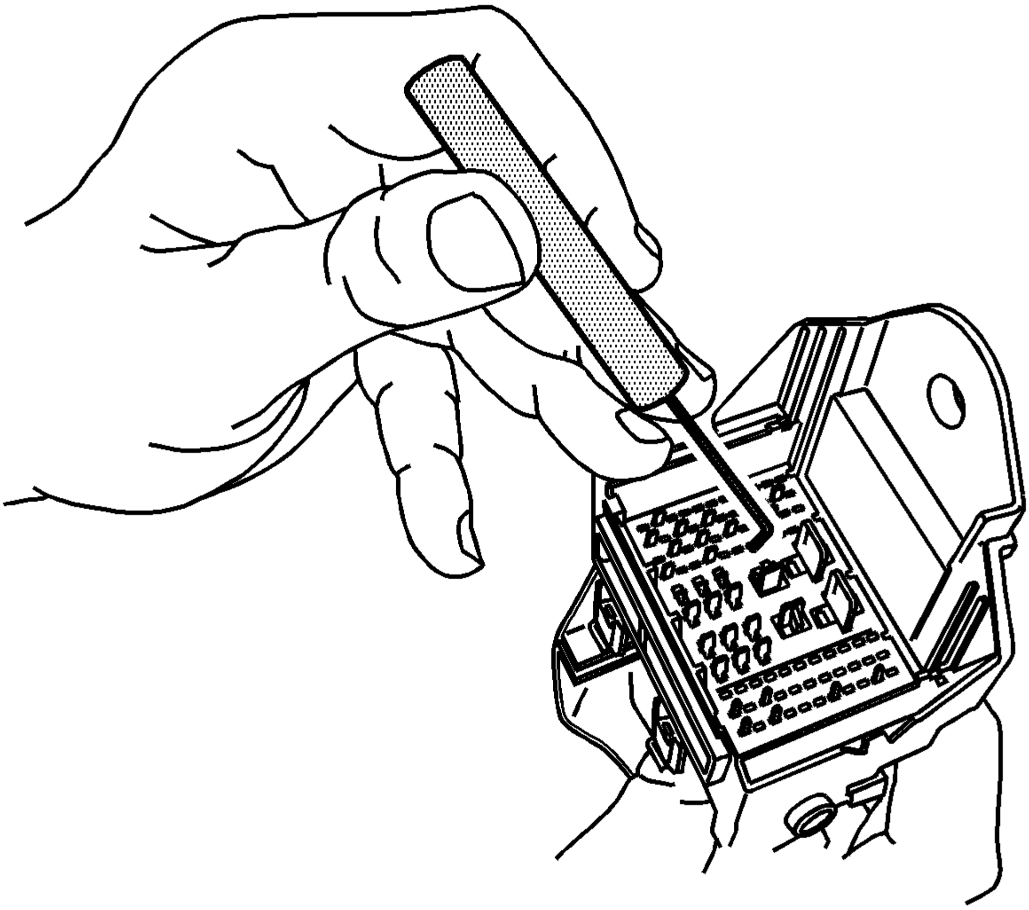

Fig. 177: Lifting Terminal Plate Past The Terminals
Courtesy of GENERAL MOTORS COMPANY

12. Using terminal release tool J-38125-216, lift the terminal plate past the terminals and out of the connector body cavity.

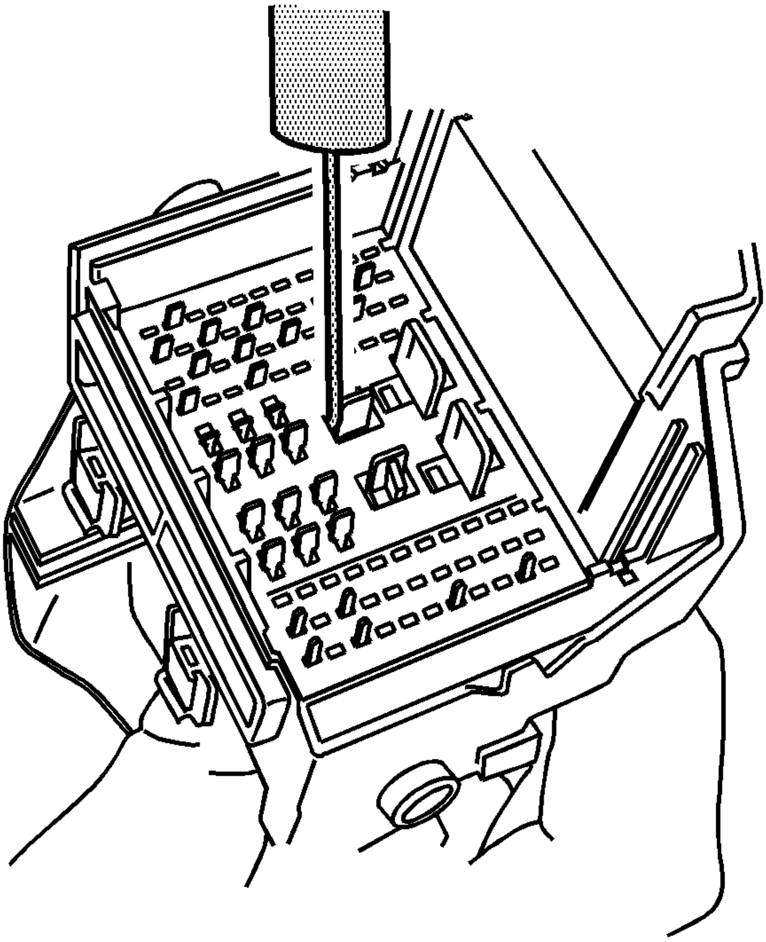

Fig. 178: View Of Terminal Plate
Courtesy of GENERAL MOTORS COMPANY

13. Terminal plate will bind slightly on each corner.

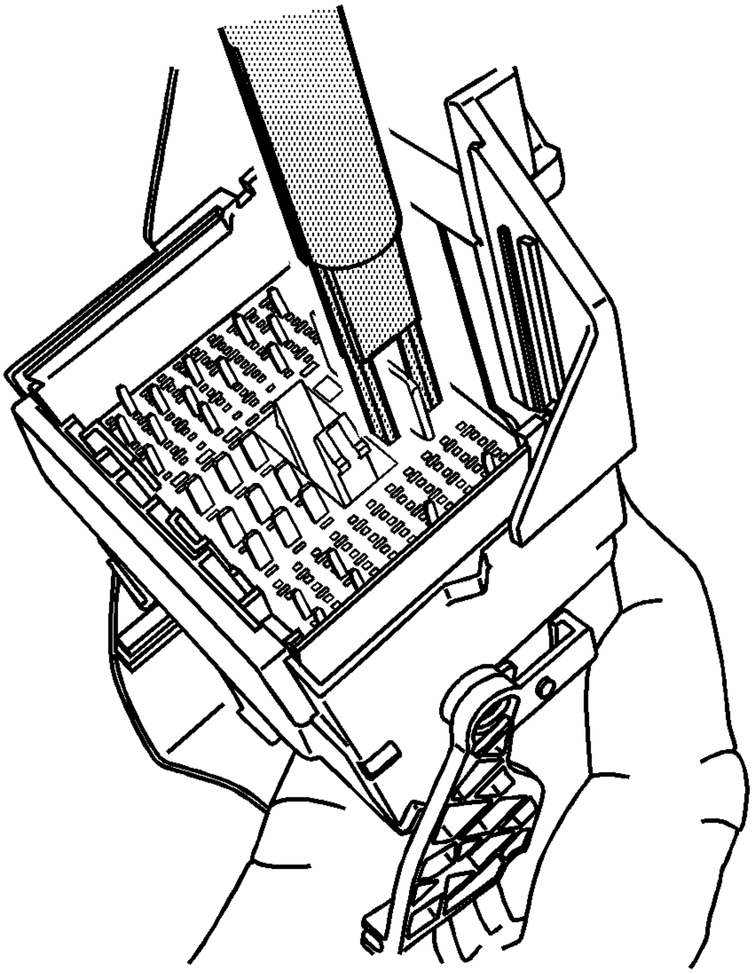

Fig. 179: Releasing Lock Tabs
Courtesy of GENERAL MOTORS COMPANY

14. Using terminal release tool J-38125-221, press the prongs into the holes on each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.

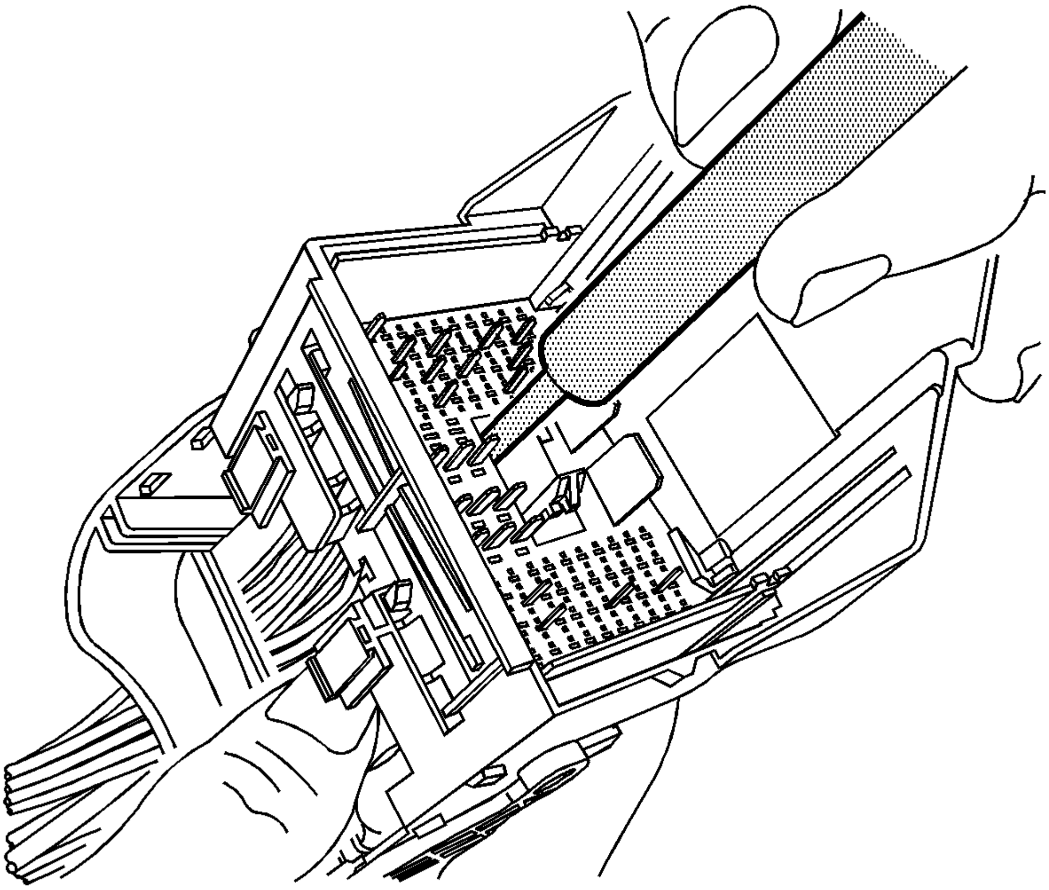

Fig. 180: View of Pressing Prongs On Each Side Of Terminal
Courtesy of GENERAL MOTORS COMPANY

15. Using terminal release tool J-38125-212, press the prongs into the holes on each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.

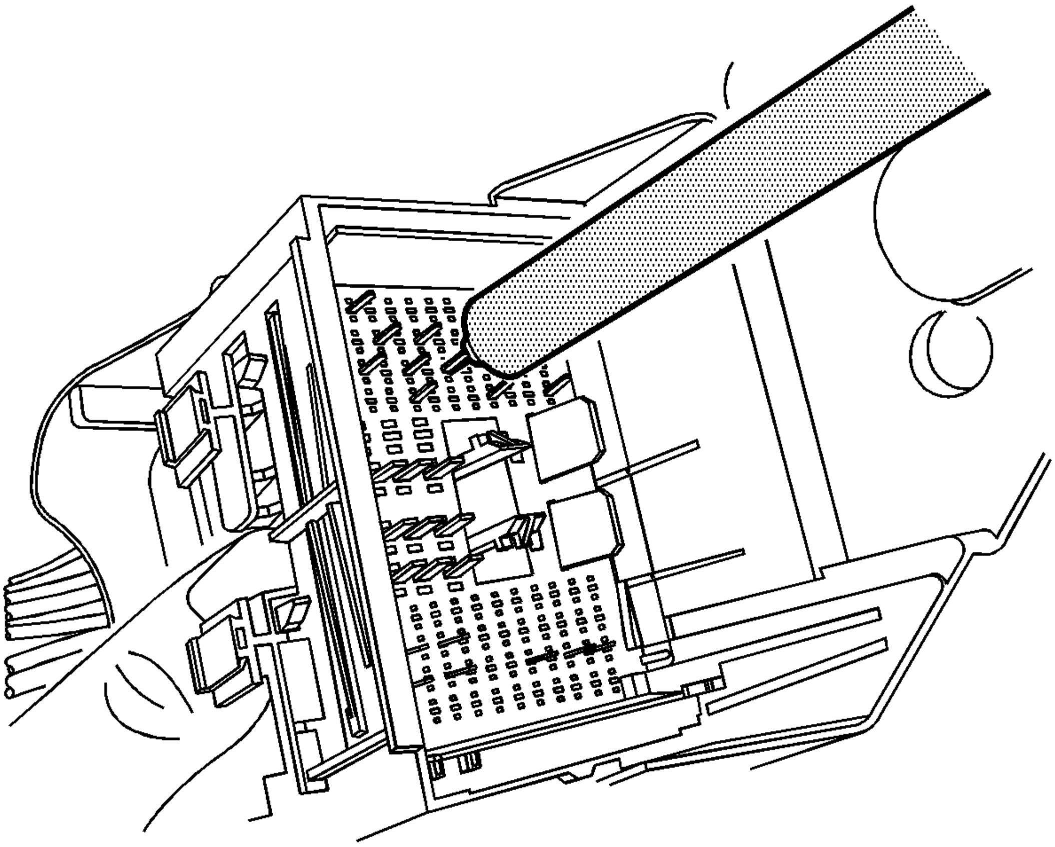

Fig. 181: Pressing Prongs On Each Side Of Terminal - Tyco/AMP (102-Way Inline)
Courtesy of GENERAL MOTORS COMPANY

16. Using terminal release tool J-38125-560, press the prongs into the holes on each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.

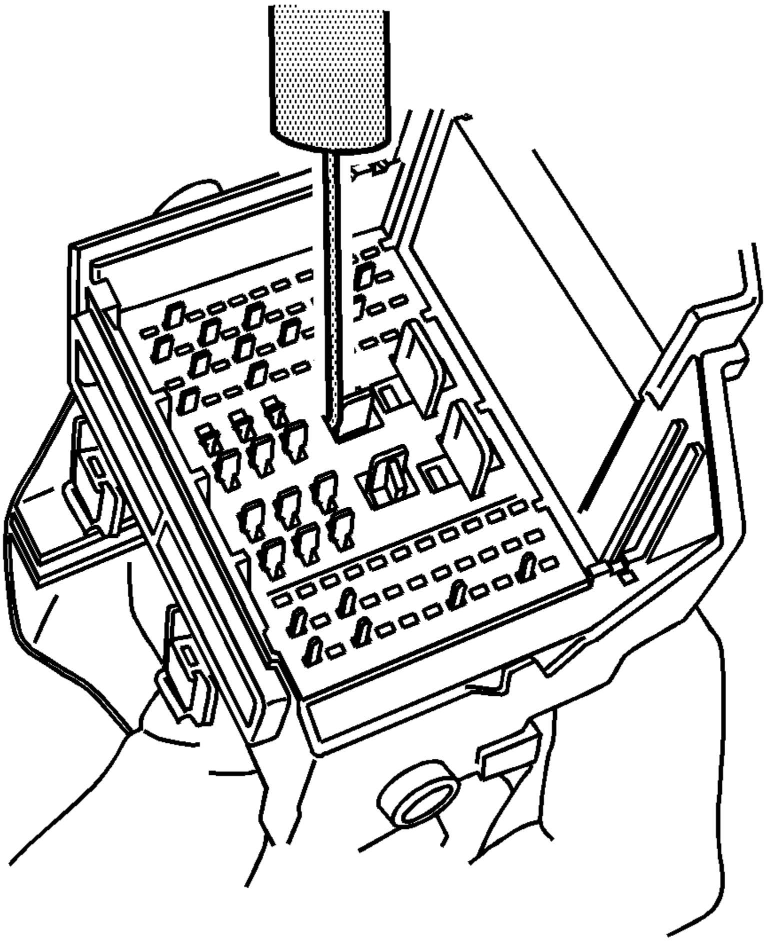

Fig. 182: View Of Terminal Plate
Courtesy of GENERAL MOTORS COMPANY

17. Press the terminal plate back into the female connector to the preset position. The plate will bind slightly on each corner.

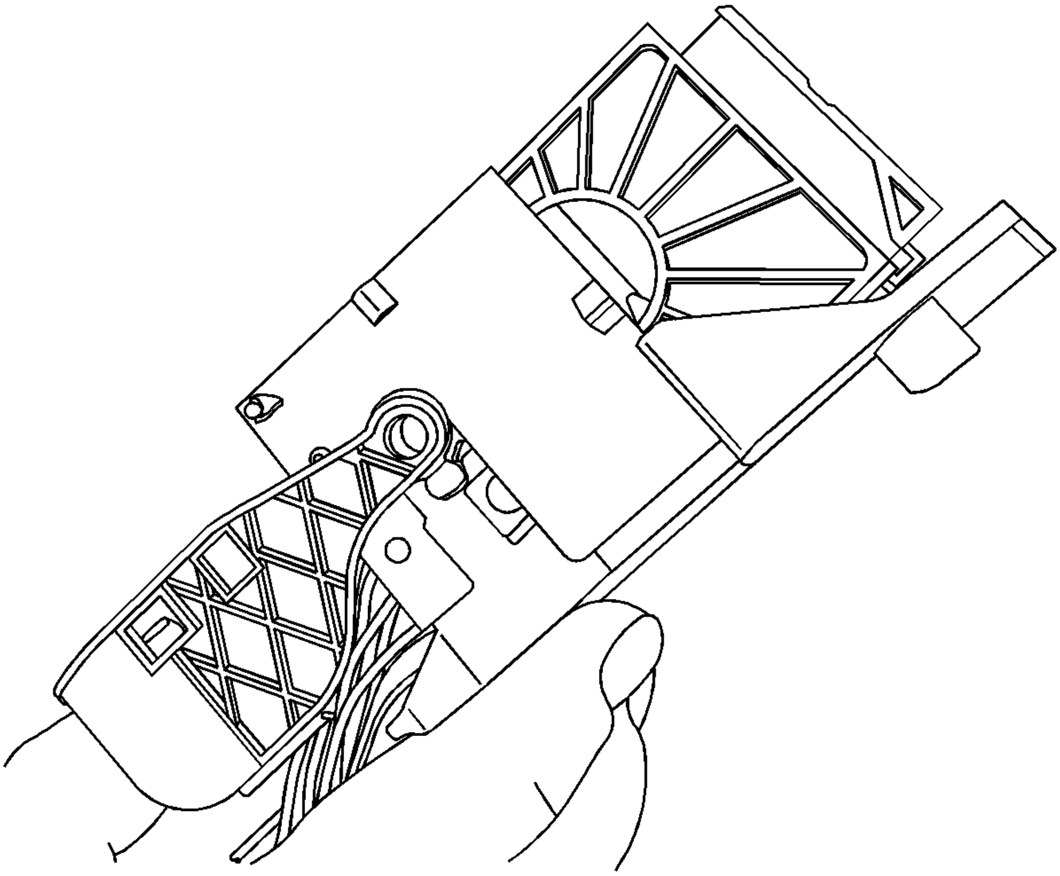

Fig. 183: Aligning Guide Plates To Mesh With Locking Lever Gears
Courtesy of GENERAL MOTORS COMPANY

18. With the locking lever in the 180 degree position, align the guide plates to mesh with the gears on the locking lever.

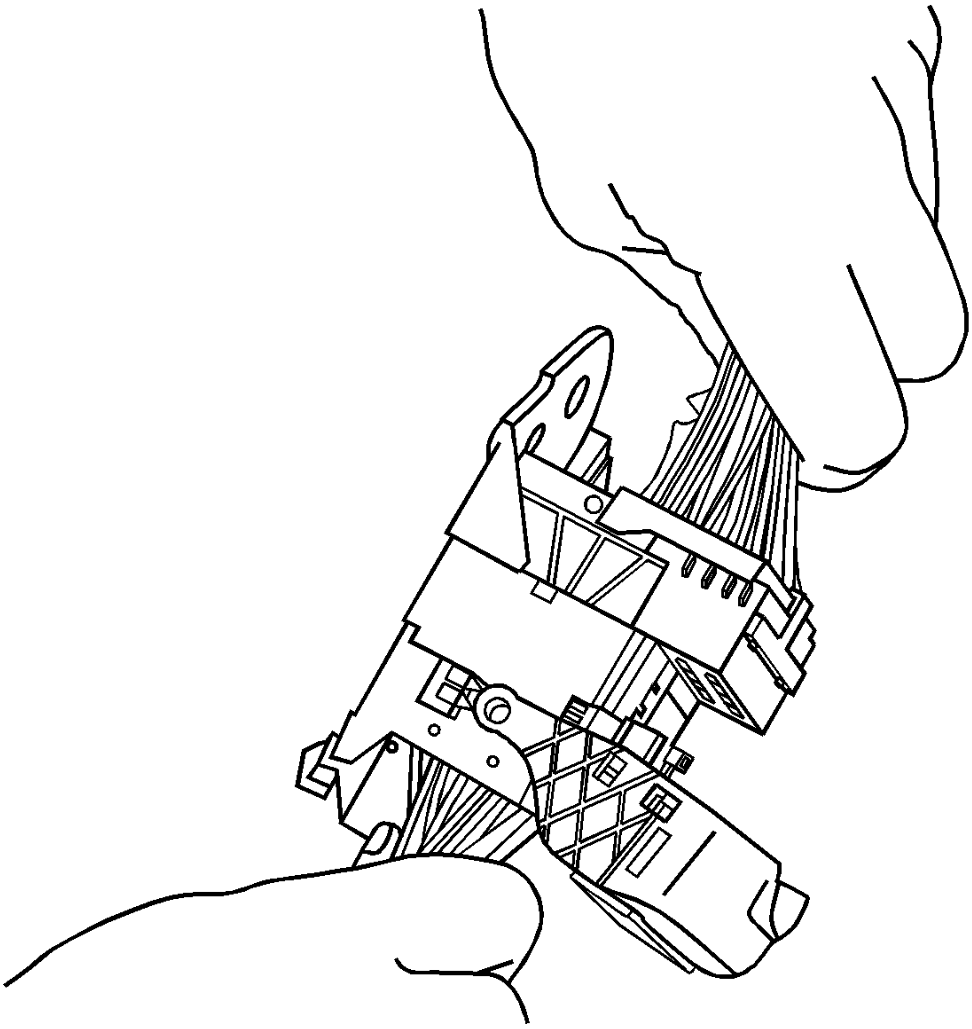

Fig. 184: Sliding Male Connector Body Away From Guide Plates
Courtesy of GENERAL MOTORS COMPANY

19. Slide the male connector body back inward toward the guide plates.

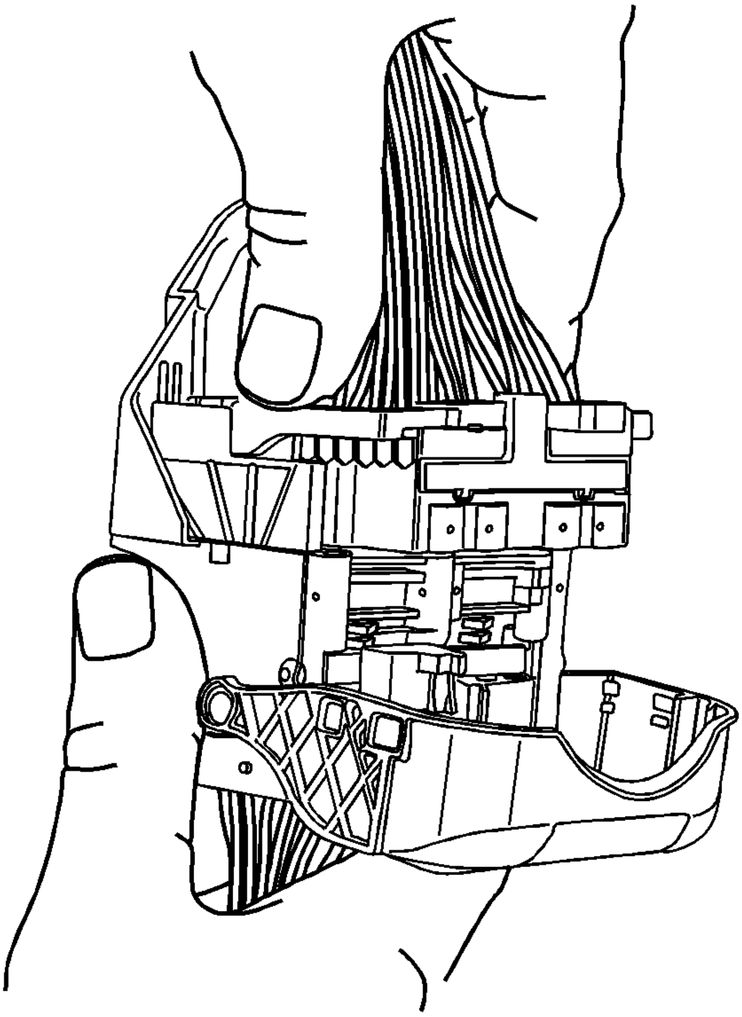

Fig. 185: Assembled View Of Connector - Tyco/AMP (102-Way Inline)
Courtesy of GENERAL MOTORS COMPANY

20. With the locking lever in the 90 degree position and the male connector body connected, it can be slid inward for assembly.

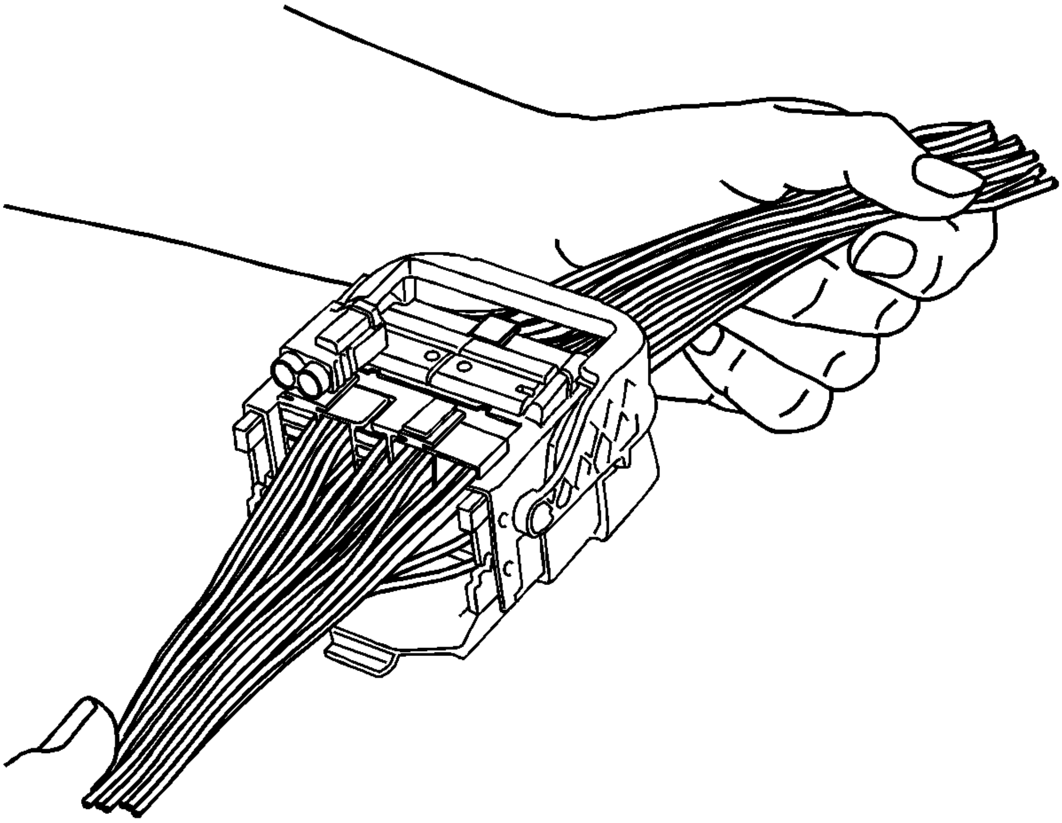

Fig. 186: View Of Typical Connector In Assembled Position
Courtesy of GENERAL MOTORS COMPANY

21. Move the lever into the locked position or in the assembled position. This will pull the male connector down into the female connector.
22. Repair the terminal by following the Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair) procedure.
23. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

TYCO/AMP CONNECTORS (SIR)

Special Tools

4. Pivot connector wire dress cover while removing from the connector body.

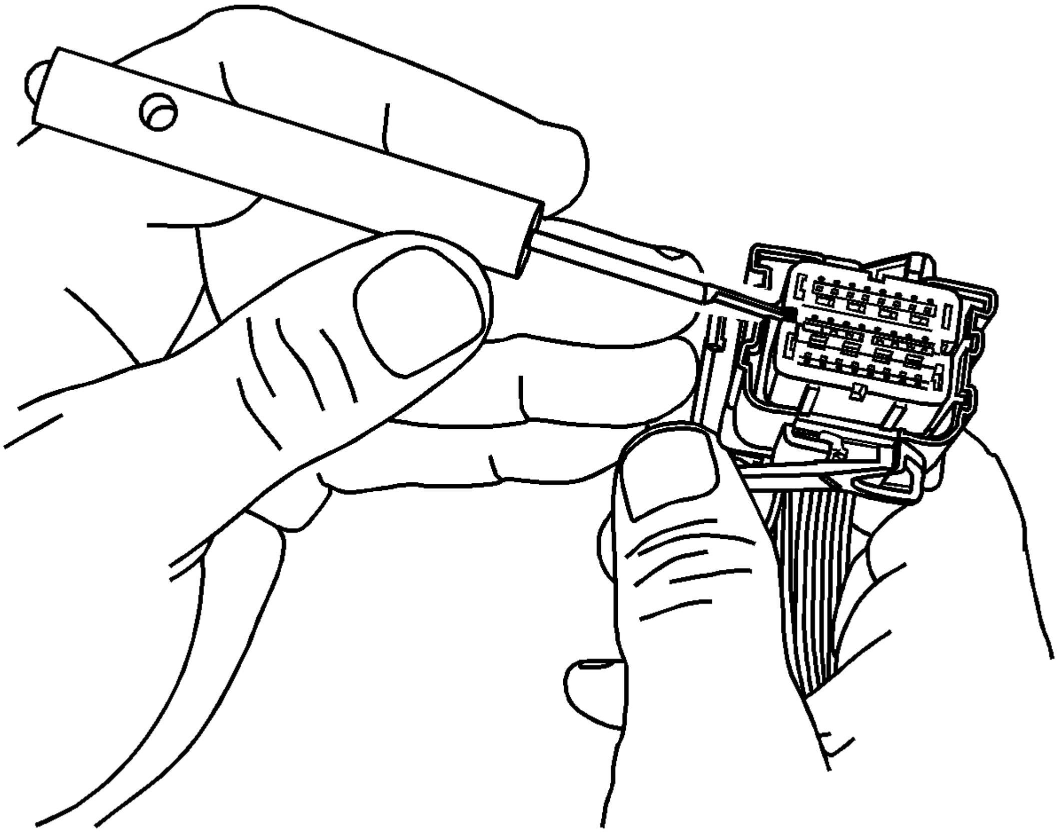

Fig. 191: Removing TPA
Courtesy of GENERAL MOTORS COMPANY

5. Using terminal tool J-38125-11A or equivalent, remove the TPA by lifting straight off the connector body.

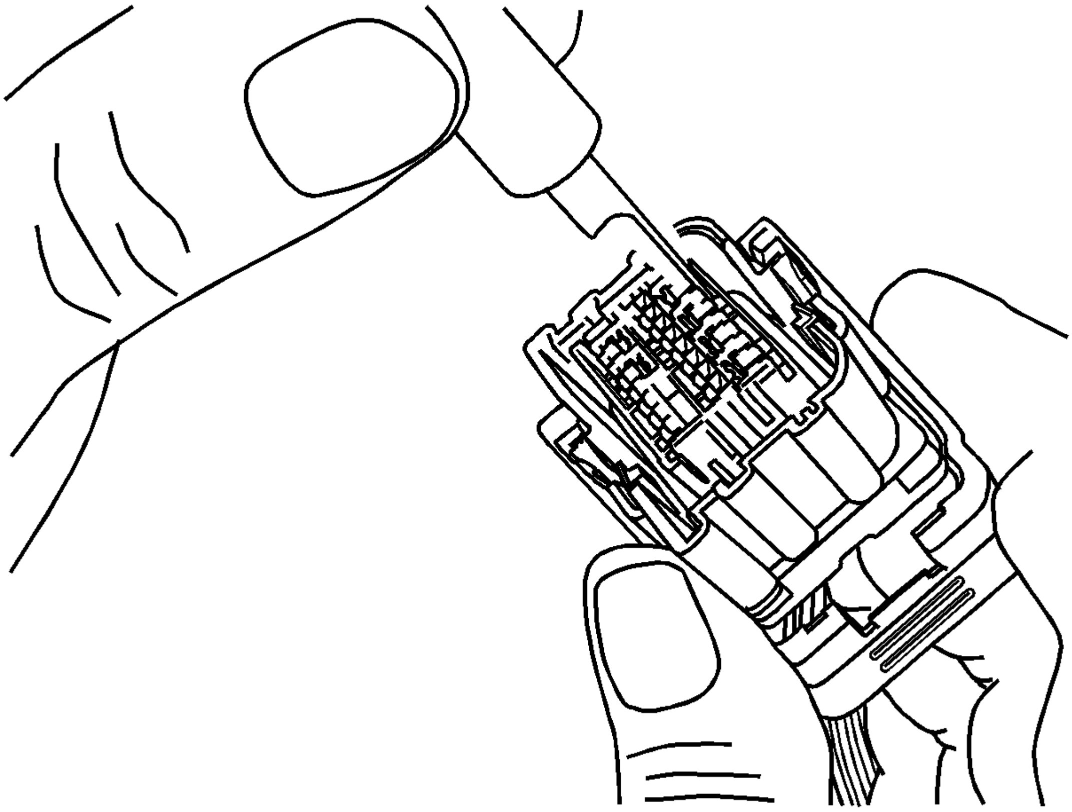

Fig. 192: View of Terminal Release Tool & Rear of Connector Body
Courtesy of GENERAL MOTORS COMPANY

6. Using terminal release tool J-38125-215A, place the tip of the tool on the outside edge next to the terminal and depress the lock tab and remove the rear of the connector body.

Terminal Repair Procedure

Use the appropriate terminal and crimper in order to replace the terminal.

YAZAKI CONNECTORS (2-WAY)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-553** Terminal Release Tool

For equivalent regional tools, refer to Special Tools .

Terminal Removal Procedure

1. Disconnect the connector from the component.

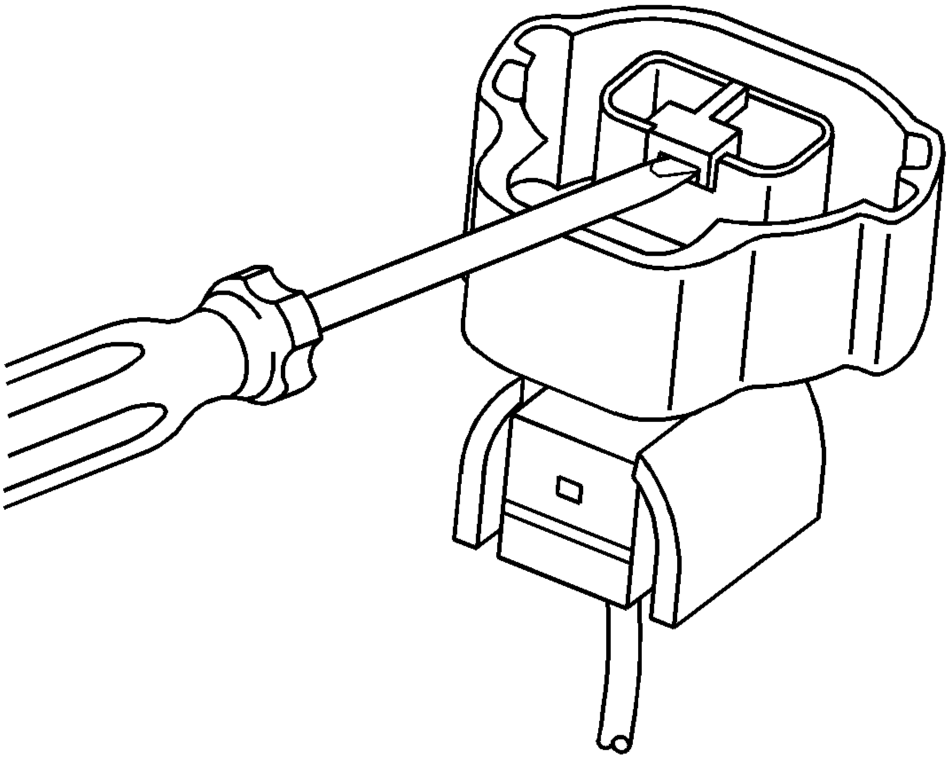

Fig. 193: Identifying Terminal Position Assurance
Courtesy of GENERAL MOTORS COMPANY

2. Insert a small flat-blade tool in the slot below the front loaded terminal position assurance (TPA) and pry up.
3. Remove the TPA by pulling it out of the connector.
4. Push the wire side of the terminal that is being removed toward the connector and hold it in position.

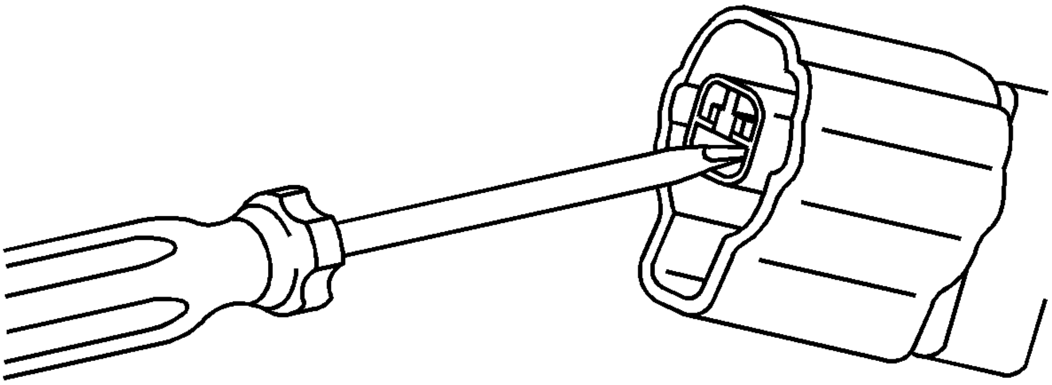

Fig. 194: Inserting Tool Into Terminal Cavity (Yazaki)
Courtesy of GENERAL MOTORS COMPANY

5. Insert the J-38125-553 on a slight upward angle into the cavity below the terminal to be removed. Ensure that the pointed on the end of the tool is facing the bottom of the terminal and it stays in contact with the terminal until it stops on the plastic terminal retainer.

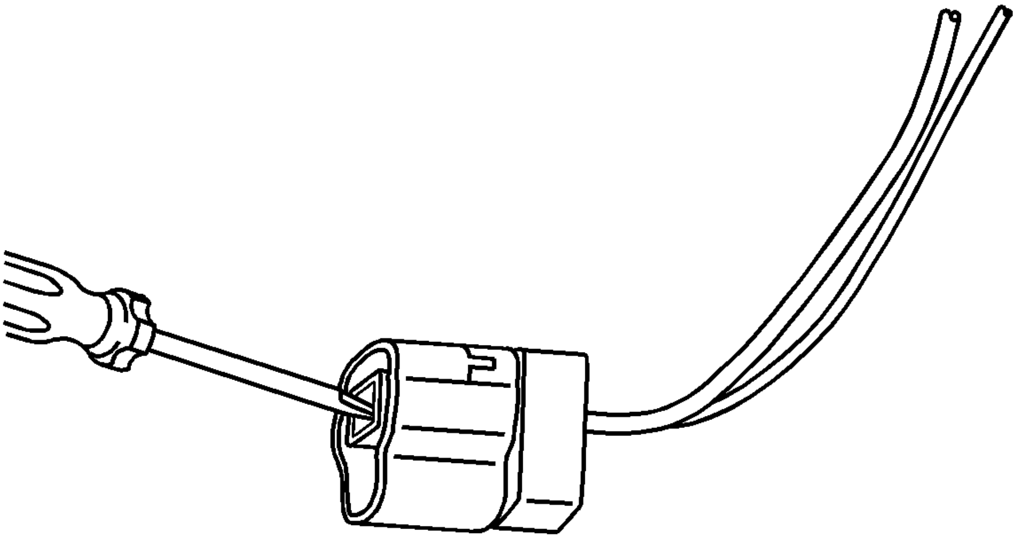

Fig. 195: Pulling Terminal Out Of Connector
Courtesy of GENERAL MOTORS COMPANY

6. Gently pry the plastic terminal retainer down and carefully pull the terminal out of the connector. Always remember never use force when pulling a terminal out of a connector. If the terminal is difficult to remove, repeat the entire procedure.
7. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
8. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

YAZAKI CONNECTORS (16-WAY)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-215** Terminal Release Tool

For equivalent regional tools, refer to **Special Tools** .

Terminal Removal Procedure

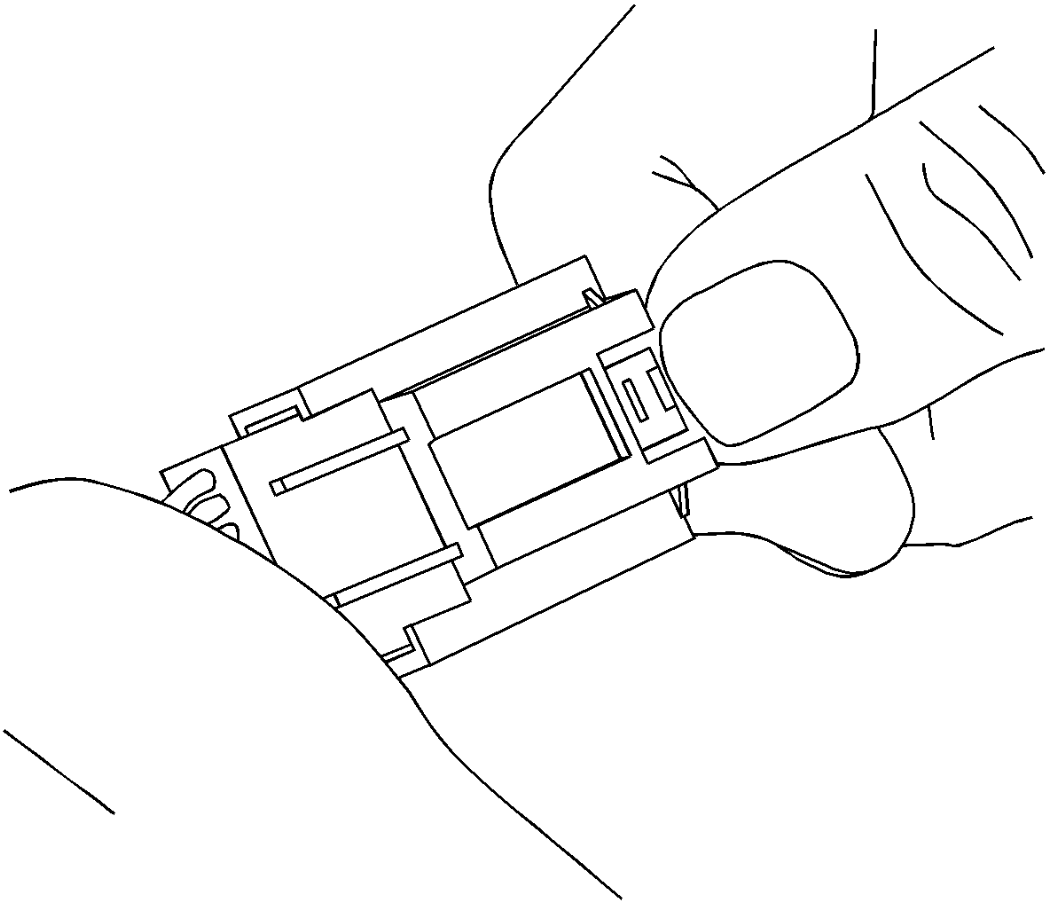

Fig. 196: Pulling Two Connector Halves Apart
Courtesy of GENERAL MOTORS COMPANY

1. While depressing the lock, pull the two connector halves apart.

NOTE: **The terminal position assurance (TPA) is fragile and may break if not done carefully.**

2. Use a small flat-blade tool to very carefully push the TPA towards the face of the connector on both sides of the connector.

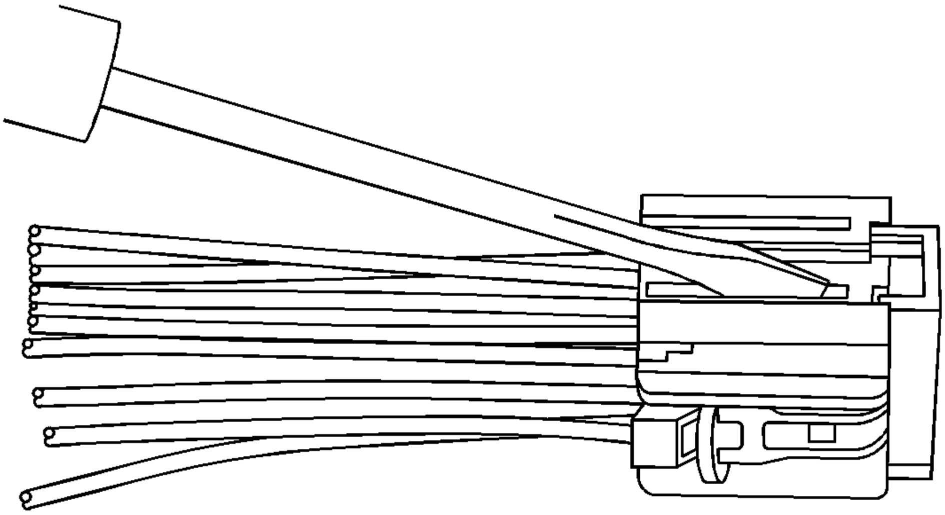

Fig. 197: View Of Male Connector Half & Female Terminals
Courtesy of GENERAL MOTORS COMPANY

3. View of the male half of the connector with female terminals.

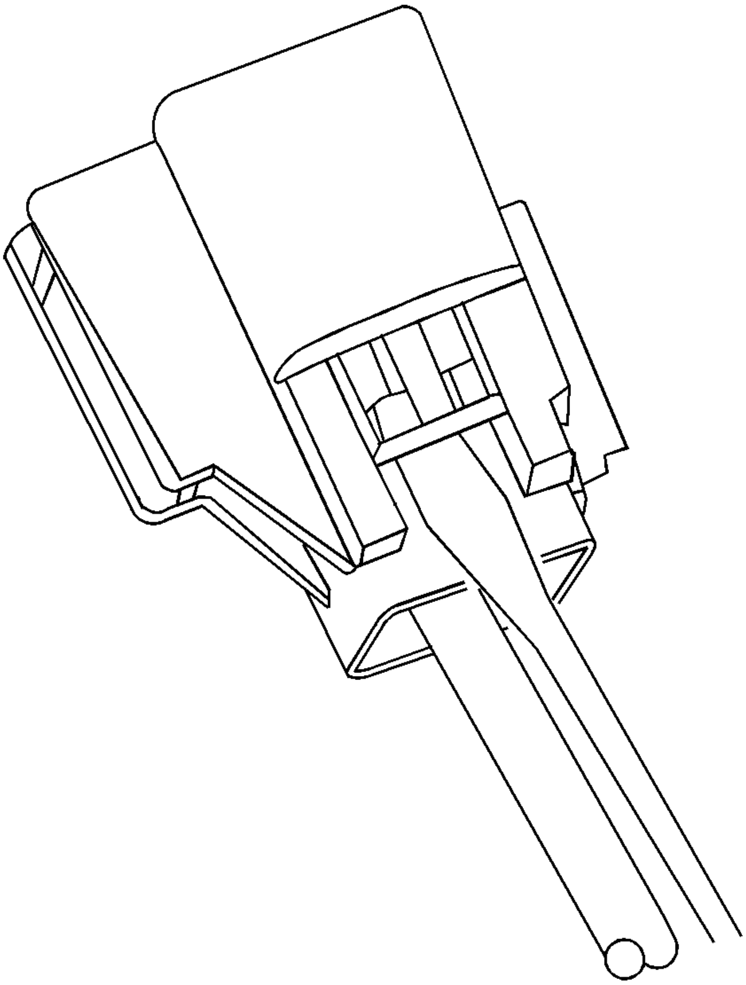

Fig. 198: View Of Female Half Of Connector With Male Terminals
Courtesy of GENERAL MOTORS COMPANY

4. View of the female half of the connector with male terminals.
5. Use the J-38125-215 tool to release the terminals by inserting the tool into the terminal release cavity.

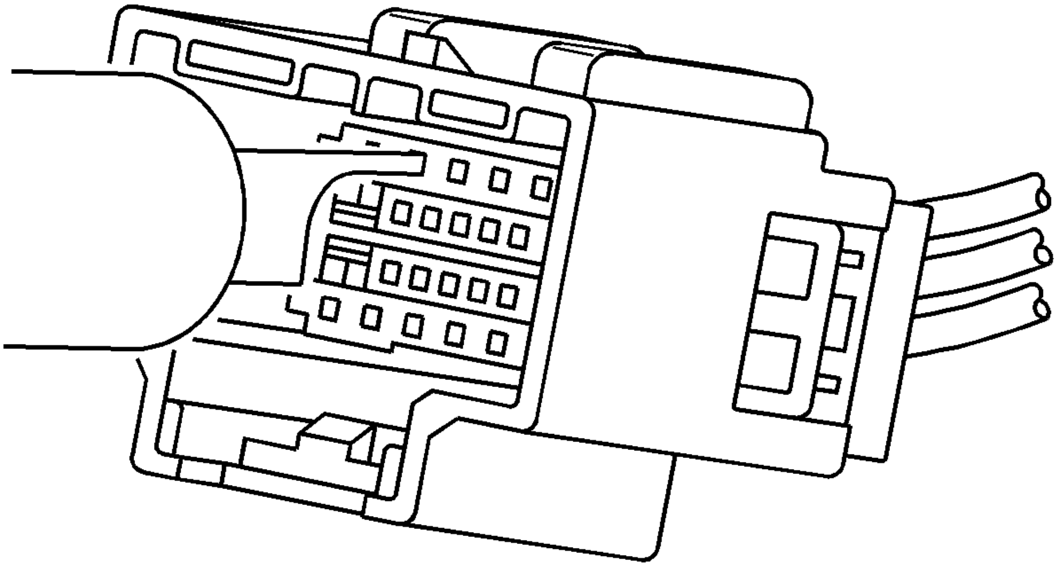

Fig. 199: Using Removal Tool On Female Half Of Connector
Courtesy of GENERAL MOTORS COMPANY

6. View of the female half of the connector with male terminals.

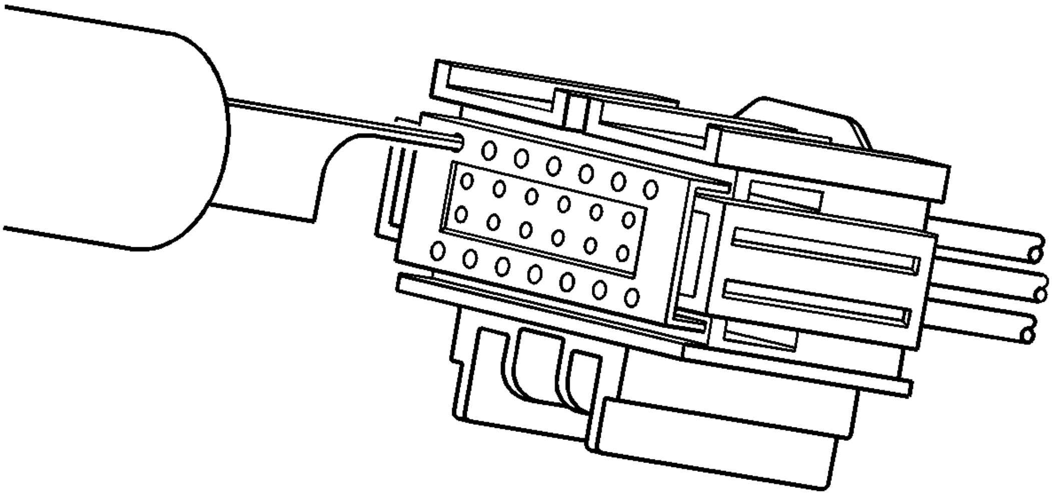

Fig. 200: Using Removal Tool On Male Half Of Connector
Courtesy of GENERAL MOTORS COMPANY

7. View of the male half of the connector with female terminals.
8. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
9. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
10. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

REPAIRING CONNECTOR TERMINALS (TERMINATED LEAD REPAIR)

Special Tools

EL-38125-10 Splice Sleeve Crimp Tool

For equivalent regional tools, refer to **Special Tools** .

NOTE: **All repairs near the engine manifold, turbo engine and all exhaust pipes should follow the High Temperature Wiring Repairs procedures.**

For high temperature wiring repairs, refer to **High Temperature Wiring Repairs**.

Terminated leads are terminals that are crimped onto wires. The terminated lead can be used throughout the vehicle since it is designed for temperatures up to 150Â°C. The length of the wire is 450 mm.

1. Use the connector end view to identify the correct terminated lead.
2. The terminated lead package should include a DuraSeal splice sleeve. If not, use the chart to in Splicing Copper Wire Using Splice Sleeves to identify the correct DuraSeal splice sleeve, refer to

Wire to Wire Repair.

REPAIRING CONNECTOR TERMINALS (TERMINAL REPAIR)

Special Tools

- **J-38125 - 580** Terminal Repair Kit
- **J-38125-6** Crimp Tool
- **J-38125-7** Crimp Tool
- **J-38125-8** Crimp Tool
- **J-38125-64** Crimp Tool
- **J-38125-101** Crimp Tool
- **J-38125-641** Crimp Tool
- **J-38125-642** Crimp Tool
- **J-38125-643** Crimp Tool

For equivalent regional tools, refer to Special Tools .

Use the following repair procedures to repair each type of terminal:

- For push to seat terminals, refer to Delphi Connectors (Weather Pack)Delphi Connectors (Push To Seat)Delphi Connectors (Pull To Seat)Delphi Connectors (Micro-Pack 100W)Delphi Connectors (Micro.64)Delphi Connectors (12-Way)Delphi Connectors (Steering Gear).
- For pull to seat terminals, refer to Delphi Connectors (Weather Pack)Delphi Connectors (Push To Seat)Delphi Connectors (Pull To Seat)Delphi Connectors (Micro-Pack 100W)Delphi Connectors (Micro.64)Delphi Connectors (12-Way)Delphi Connectors (Steering Gear).

NOTE: **The first step for all terminal repairs is to find the connector end view in SI.**

Cable Seal Terminals

1. Cut off the terminal between the core and the insulation crimp to minimize any wire loss.
2. Remove the old seal.
3. Apply the correct cable seal, per the wire gauge size, from the kit. Slide the seal back along the wire to enable removal of the insulation.
4. To minimize wire loss, remove only the insulation required.
5. Using the connector end view, determine the correct crimp tool and crimp jaw.
6. Align the seal with the end of the cable insulation.
7. Position the stripped wire and seal in the terminal.
8. Hand Crimp the core wings first.
9. Hand Crimp the insulation wings around the seal and the cable.

Unsealed Terminals

1. Cut off the terminal between the core and the insulation crimp to minimize any wire loss.
2. To minimize wire loss, remove only the insulation required.
3. Position the stripped wire in the terminal.
4. Hand Crimp the core wings first.
5. Hand Crimp the insulation wings around the cable.

Micro-Pack 100W Size Terminal

The Micro-Pack 100W connectors have small terminals that are difficult to handle and hold when crimping. In order to aid the technician when crimping these terminals, a new crimping tool was developed. The J 38125-101 (W jaw) crimping tool was developed to crimp Micro-Pack 100W terminals. The J 38125-101 (W jaw) crimping tool has a terminal holding block that will hold the terminal in place while the terminal is being crimped. After the terminal is removed from the connector perform the following procedure in order to repair Micro-Pack 100 terminals.

1. Cut the wire as close to the terminal as possible.

NOTE: **After cutting the damaged terminal from the wire, determine if the remaining wire is long enough to reach the connector without putting a strain on the wire. If the wire is not long enough, splice a small length of the same gauge wire to the existing wire, then crimp the new terminal on the added wire.**

2. Strip 5 mm (3/16 in) of insulation from the wire.

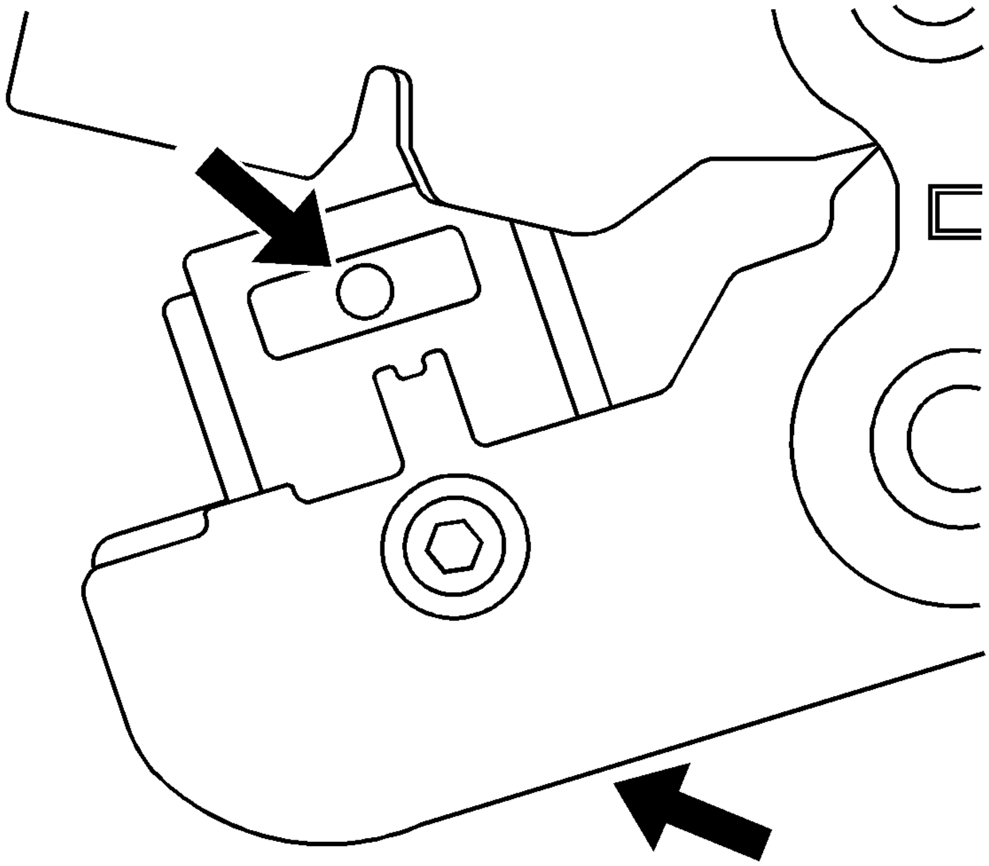

Fig. 201: Identifying Crimping Tool Spring Loaded Locator
Courtesy of GENERAL MOTORS COMPANY

3. Depress the spring loaded locator of the J 38125-101 (W jaw) crimping tool until the terminal holder is completely visible.

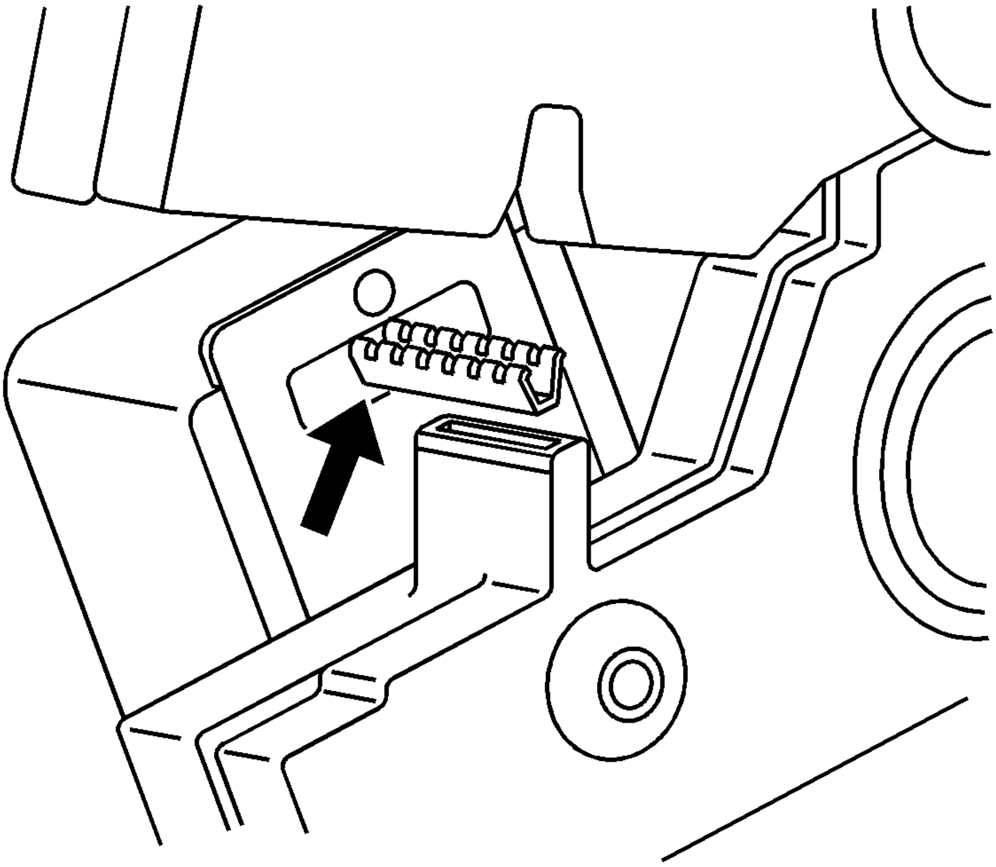

Fig. 202: Locating Terminal In Crimping Tool
Courtesy of GENERAL MOTORS COMPANY

4. Insert the terminal into the crimp tool until the core wings are flush with the anvil on the crimp tool. Be sure that the wings are pointed toward the crimp tool former and release the spring locator. The locator will hold the terminal in place. Inspect the alignment of the terminal wings with the crimp tool former. If the terminal wings are wider than the crimp tool former, remove the terminal and bend the terminal wings in slightly.
5. Place stripped wire into terminal.
6. Crimp the new terminal to the wire. If a jam occurs, press the emergency release to open applicator.

Micro 0.64 Size Terminal

The Micro 64 connectors have small terminals that are difficult to handle and hold when crimping. In order to aid the technician when crimping these terminals, a new crimping tool was developed. The J 38125-64 (M jaw) was developed to crimp Micro 64 terminals. The J-38125-64 crimping tool has a terminal holding block that will hold the terminal in place while the terminal is being crimped. The J-38125-64 crimping tool is also designed to crimp both the wire and the insulation at the same time.

After the terminal is removed from the connector perform the following procedure in order to repair Micro 64 terminals.

NOTE: **After cutting the damaged terminal from the wire, determine if the remaining wire is long enough to reach the connector without putting a strain on the wire. If the wire is not long enough, splice a small length of the same gauge wire to the existing wire, then crimp the new terminal on the added wire.**

1. Cut the wire as close to the damaged terminal as possible.
2. Strip 5 mm (3/16 in) of insulation from the wire.

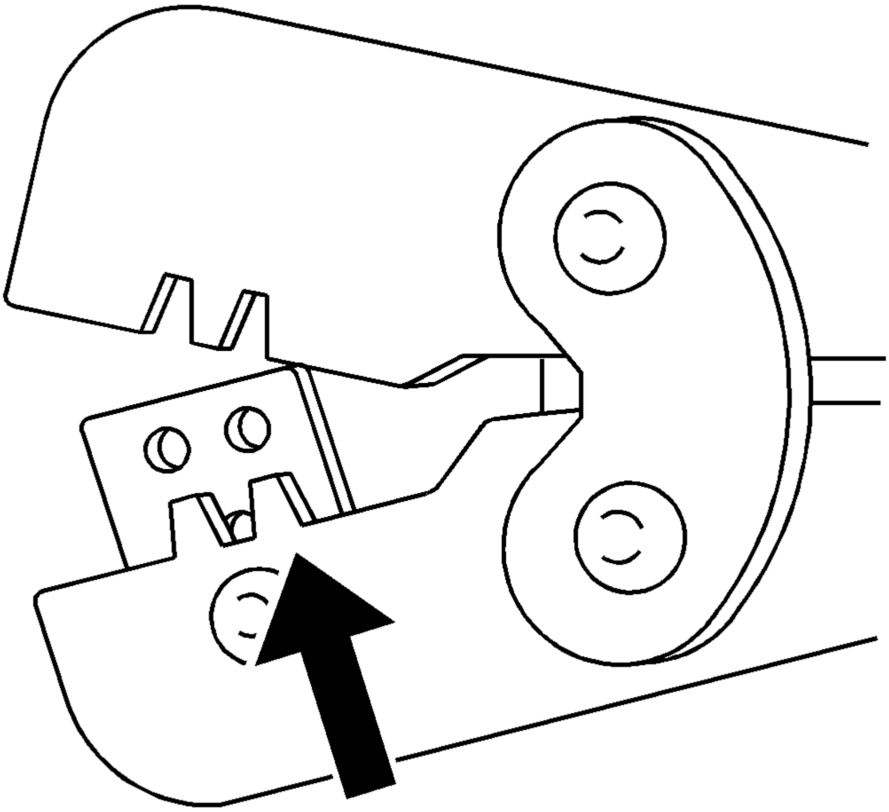

Fig. 203: Identifying Crimping Tool Spring Loaded Locator
Courtesy of GENERAL MOTORS COMPANY

3. Depress the spring loaded locator of the crimping tool until the terminal holder is completely visible.

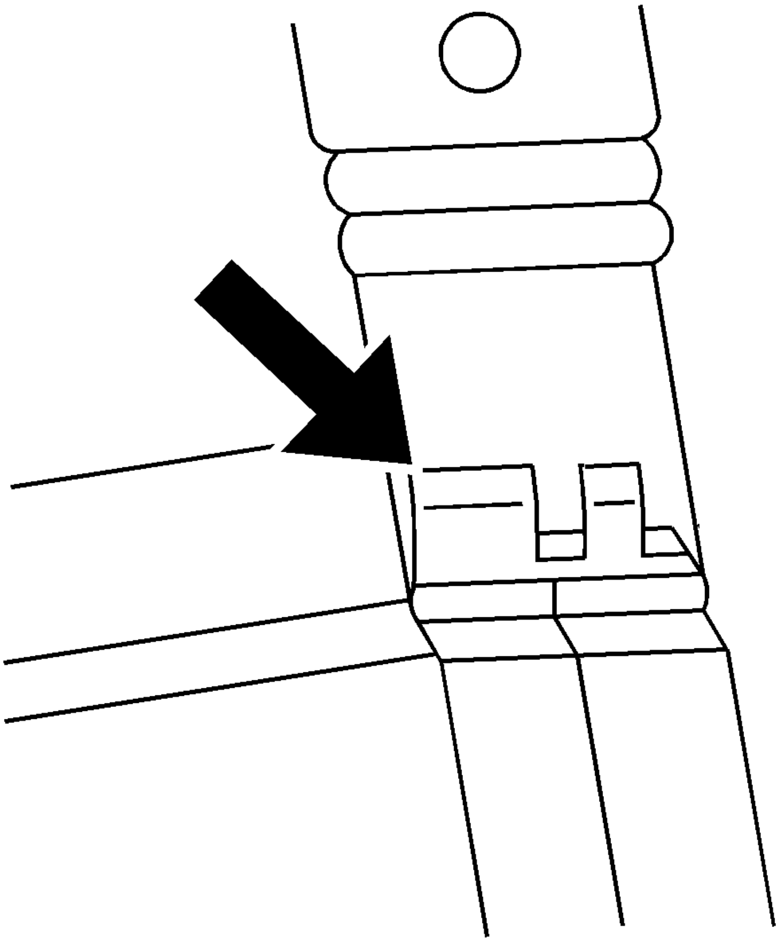

Fig. 204: Identifying Terminal Holder
Courtesy of GENERAL MOTORS COMPANY

4. Insert terminal into the appropriate terminal holder until it hits bottom and stops. The correct terminal holder is determined by the wire size. Also ensure that the terminals wings are pointing towards the former on the tool and the release locator.
5. Insert the stripped cable into the terminal. Insulation should be visible on both sides of the terminal insulation wings.
6. Compress the handles until the ratchet automatically releases.
7. Place the terminal into the appropriate cavity and assemble the connector.

TERMINAL REMOVAL

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **EL-35616** Terminal Test Probe Kit

For equivalent regional tools, refer to Special Tools .

NOTE: **All repairs near the engine manifold, turbo engine and all exhaust pipes should follow the High Temperature Wiring Repair procedures.**

1. Find the appropriate connector end view within the connector end view section. The connector end view has the following information:
    - Diagnostic probe tool
    - Terminal release tool
    - Terminal/terminated lead part numbers

NOTE: **Not using the proper test kit probe may cause damage to the terminal(s) that are probed.**

2. Determine if a terminal is damaged.
    1. Locate the diagnostic probe tool from the connector end view. The connector end view describes the color and part number to help the technician find and use the correct tool.
    2. Connect the probe tool to the Digital Multimeter.
    3. Insert the probe tool into the cavity and follow the procedures from the **Troubleshooting with a Digital Multimeter** .
3. Disconnect the connector body to perform the repair.
4. Use the following procedure to remove the terminal from the connector body.

NOTE: **Several procedures for specific connector bodies are called out in the Wiring Repairs section.**

1. The terminal position assurance (TPA) and connector position assurance (CPA) should be removed before releasing the terminal for the connector body.
2. Look at the connector end view to locate the cavity of the damaged terminal and find the proper terminal release tool from the terminal release tool kit.

NOTE: **Using the incorrect terminal release tool can damage the connector body.**

NOTE: **Some terminals have a lever that must be disengaged before the terminal can be released.**

3. Insert the terminal release tool into the cavity.

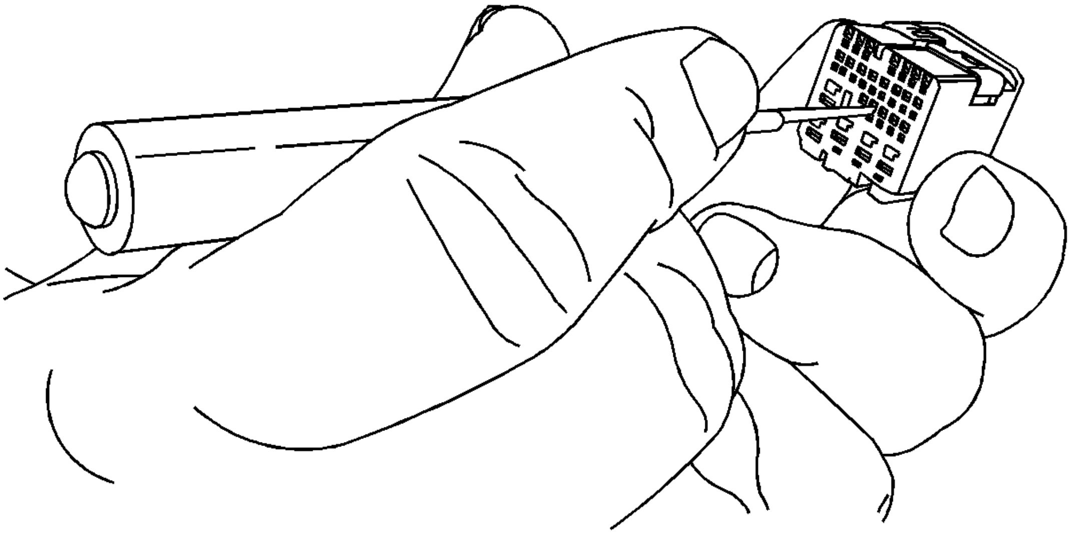

Fig. 205: Gently Pulling Wire Out Of Back Of Connector
Courtesy of GENERAL MOTORS COMPANY

5. Gently pull the wire out of the back of the connector.
6. Repair the terminal by following the Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair) procedure.
7. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

RELAY REPLACEMENT (ATTACHED TO WIRE HARNESS)

Removal Procedure

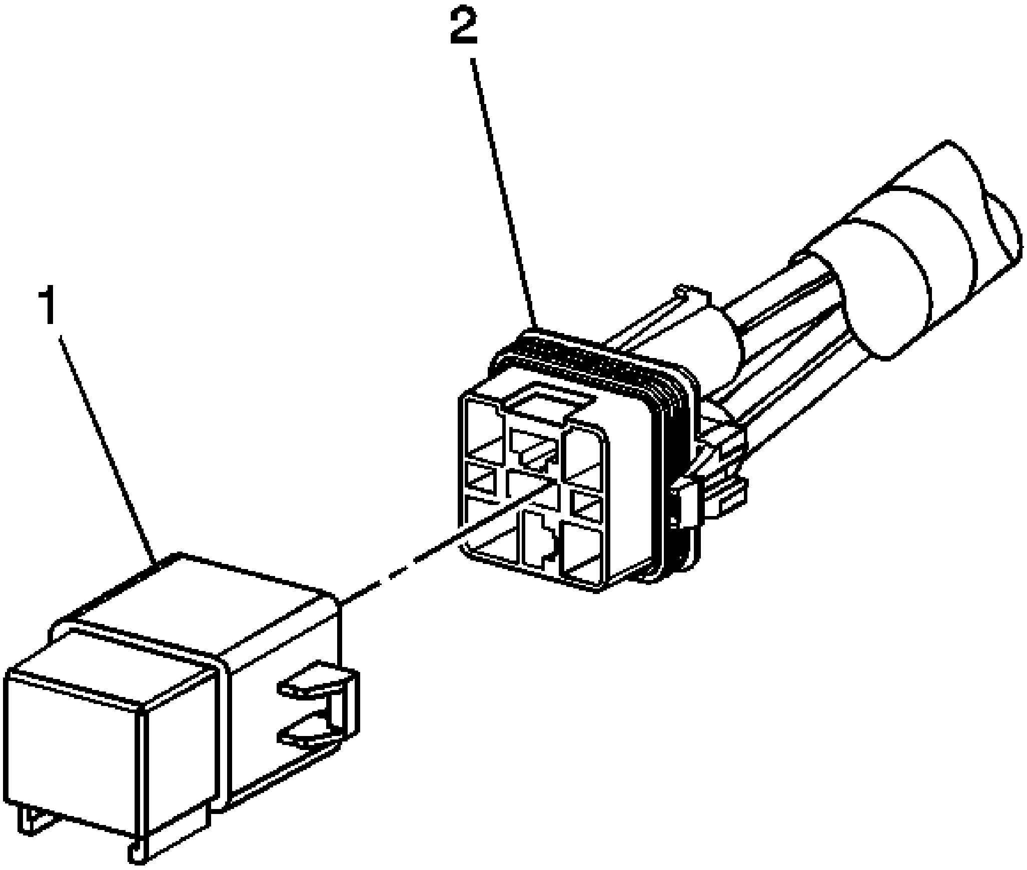

Fig. 206: Identifying Relay & Wire Harness Connector
Courtesy of GENERAL MOTORS COMPANY

1. Locate the relay. Refer to the Master Electrical Component List to locate the relay in the vehicle.
2. Remove any fasteners which hold the relay in place.
3. Remove any connector position assurance (CPA) devices or secondary locks.

NOTE: **Use care when removing a relay in a wiring harness when the relay is secured by fasteners or tape.**

4. Separate the relay (1) from the wire harness connector (2).

Installation Procedure

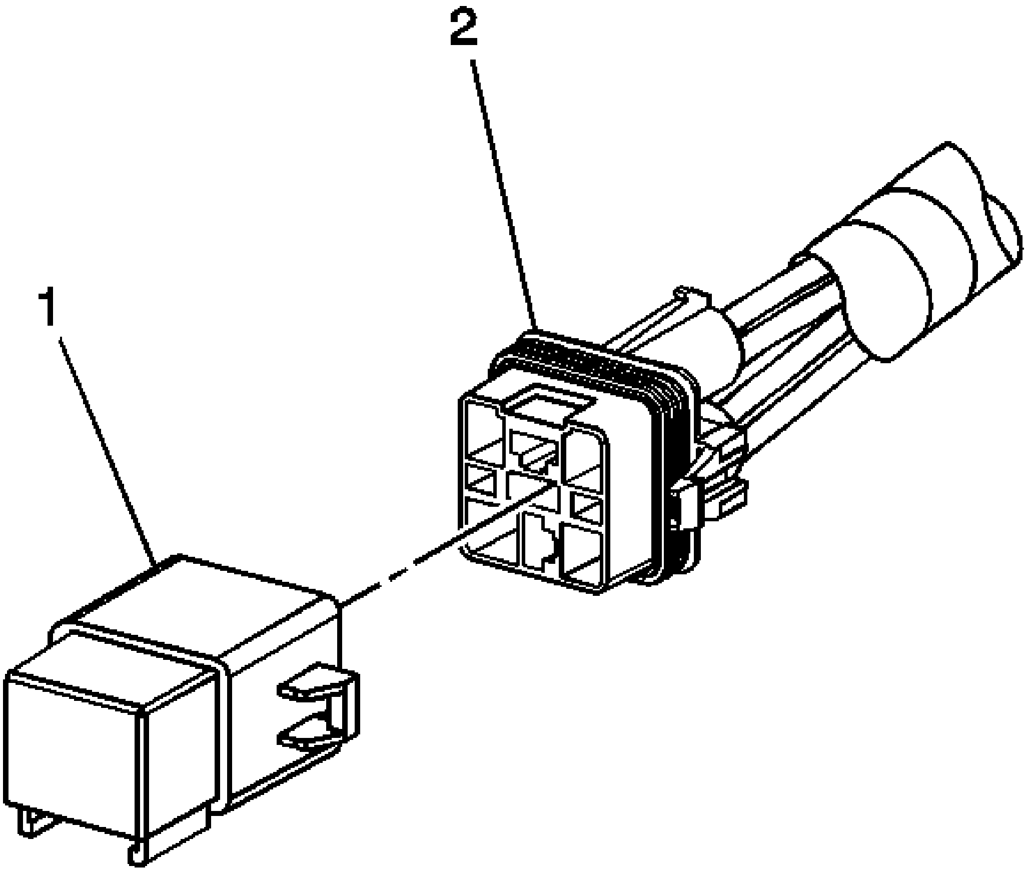

Fig. 207: Identifying Relay & Wire Harness Connector
Courtesy of GENERAL MOTORS COMPANY

1. Connect the relay (1) to the wire harness connector (2).
2. Install any connector position assurance (CPA) devices or secondary locks.
3. Install the relay using any fasteners or tape that originally held the relay in place.

RELAY REPLACEMENT (WITHIN AN ELECTRICAL CENTER)

Special Tools

EL-43244 Relay Puller Pliers

Removal Procedure

1. Remove the electrical center cover.

NOTE:

- **Always note the orientation of the relay.**
- **If equipped with a notch style relay; observe the location of the notch on the old relay to verify the new relay is installed with the notch in the same location.**
- **Ensure that the electrical center is secure, as not to put added stress on the wires or terminals.**

2. Locate the relay. Refer to Electrical Center Identification Views to locate the electrical center where the relay exists.

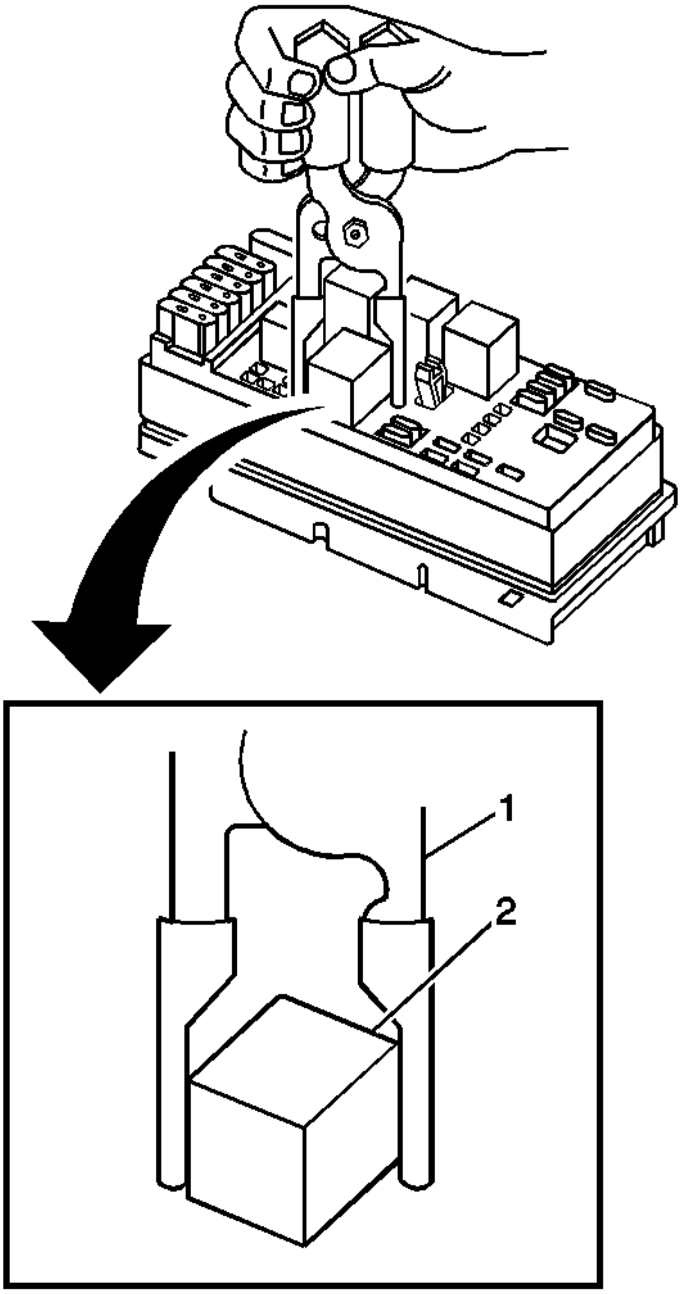

Fig. 208: Removing/Installing Relay
Courtesy of GENERAL MOTORS COMPANY

3. Using the EL-43244 (1) position the tool on opposing corners of the relay (2).

CAUTION: **Use EL-43244 to pull the relay straight out from the electrical center terminals. The use of pliers or a flat bladed tool could damage the electrical center.**

4. Remove the relay (2) from the electrical center.

Installation Procedure

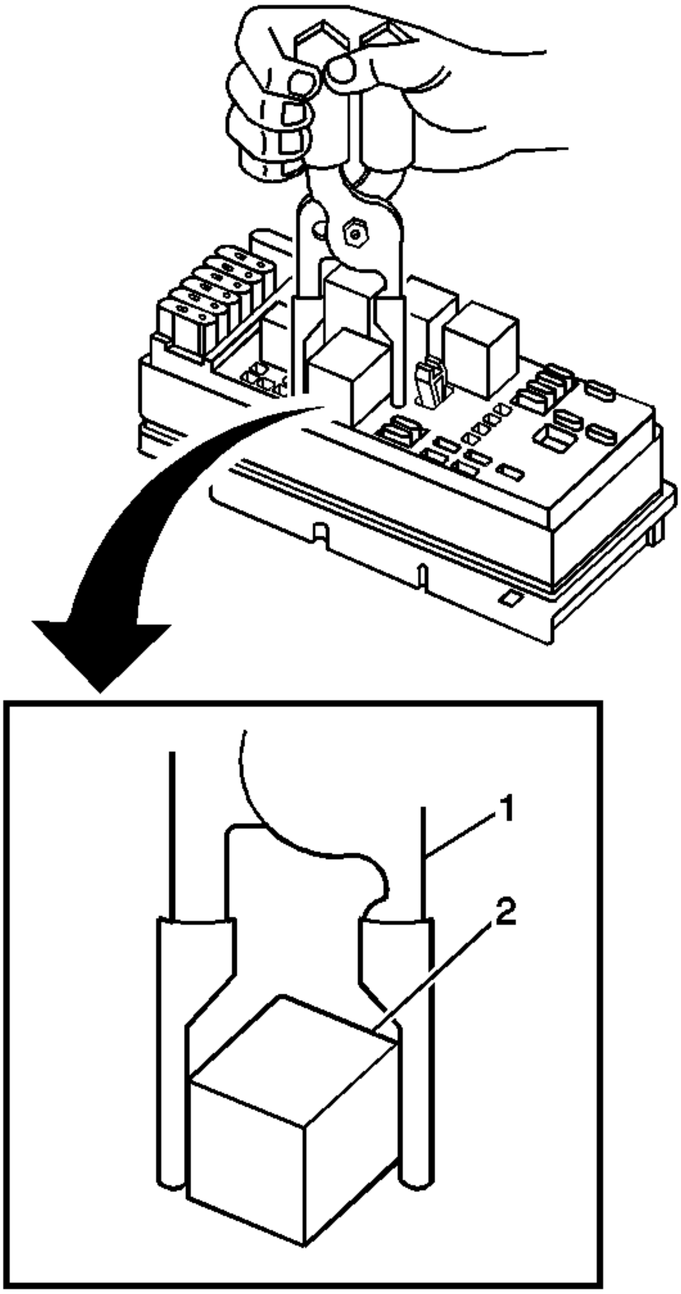

Fig. 209: Removing/Installing Relay
Courtesy of GENERAL MOTORS COMPANY

1. Install the relay (2) in the same position as removed.
2. Install the electrical center cover.

GROUND REPAIR

Electrical Grounds

Proper electrical system function relies on secure, positive, corrosion-free ground connections. Loose, stripped, or corroded connections increase the possibility of improper system function and loss of module communication. These conditions may also lead to unnecessary repairs and component replacements.

In general, electrical ground connections are accomplished using one, or a combination of, three attachment methods:

- Welded M6 stud and nut
- Welded M6 nut and bolt
- Welded M8 nut and bolt

CAUTION: Use GM approved replacement fasteners with conductive finish for electrical ground repair.

Determine which attachment method is used, and carry out the appropriate repair.

M6 Weld Stud Replacement

1. Select a location adjacent the damaged or missing M6 ground stud having 20 mm (0.79 in) clearance behind the panel surface and 20 mm (0.79 in) clearance surrounding the M6 rivet stud flange.
2. Using GM approved residue-free solvent or equivalent, remove any grease from the repair site and allow to dry.

   NOTE: Ensure 20 mm (0.79 in) clearance is maintained behind the panel to be drilled.

3. Drill a 10 mm (0.40 in) diameter hole through the panel.
4. Carefully remove paint and primer from the area surrounding the rivet stud flange until bare metal is visible.

   CAUTION: Use GM approved replacement fasteners with conductive finish for electrical ground repair.

5. Select a replacement conductive M6 rivet stud. Reference the GM parts catalog for the correct part number and application.
6. Using a rivet stud installer, install the replacement conductive M6 rivet stud.
7. Ensure the new rivet stud is securely fastened, with no detectable movement.

   NOTE: The rivet stud and surrounding panel area must be properly refinished prior to the installation of the ground terminal and nut to maintain positive electrical grounding.

8. Completely wrap the threads of the rivet stud with painters tape or equivalent.
9. Refinish the repair area using an anti-corrosion primer.
10. Allow the refinished repair area to cure sufficiently before removing the protective material applied to the rivet stud threads.
11. Remove the painters tape or equivalent from the rivet stud threads.
12. Using GM approved residue-free solvent or equivalent, thoroughly clean the rivet stud threads to remove any adhesive and allow to dry.
13. Carefully remove any corrosion from the electrical ground wire terminal. Testing for Intermittent Conditions and Poor Connections
14. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the new conductive M6 rivet stud threads.
15. Install the ground terminal to the new rivet stud.
16. Select a new, conductive M6 nut. Reference the GM parts catalog for the correct part number and application.

   CAUTION: Fastener Caution

17. Install the conductive M6 nut and tighten to 8 N.m (71 lb in).
18. Check for proper system operation.

M6 Weld Nut

CAUTION: **Use GM approved replacement fasteners with conductive finish for electrical ground repair.**

1. If the M6 weld nut at the electrical ground location is damaged or stripped, a new, conductive self-threading M7 bolt may be used to secure the ground terminal. Reference the GM parts catalog for the correct part number and application.
2. Using GM approved residue-free solvent or equivalent, remove any grease from the surface surrounding the weld nut and allow to dry.
3. Remove any loose metal particles from the damaged or stripped weld nut with a stiff brush.
4. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the new, conductive, self-threading M7 bolt threads.
5. Carefully remove any corrosion from the electrical ground terminal. Testing for Intermittent Conditions and Poor Connections
6. Install the electrical ground terminal to the new, conductive M7 bolt.

CAUTION: Fastener Caution

7. Install the conductive M7 bolt and tighten to 9 N.m (80 lb in).
8. Check for proper system operation.

M6 Weld Nut (Alternative Repair)

CAUTION: **Use GM approved replacement fasteners with conductive finish for electrical ground repair.**

1. If the electrical ground location is accessible from both sides of the panel, a conductive M6 bolt and a conductive M6 nut may be used to secure the electrical ground terminal. Reference the GM parts catalog for the correct part number and application.
2. Select a location adjacent the damaged M6 weld nut having 20 mm (0.79) clearance behind the panel surface and 20 mm (0.79 in) clearance surrounding the new electrical ground site.
3. Using GM approved residue-free solvent or equivalent, remove any grease from the surface surrounding the ground location and allow to dry.

NOTE: **Ensure 20 mm (0.79 in) clearance is maintained behind the panel to be drilled.**

4. Drill a 10 mm (0.40 in) diameter hole through the panel.
5. Carefully remove paint and primer from the area surrounding the new ground site until bare metal is visible.
6. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the new, conductive M6 bolt threads.
7. Carefully remove any corrosion from the electrical ground terminal. Testing for Intermittent Conditions and Poor Connections
8. Install the electrical ground terminal and new, conductive M6 bolt to the ground location.

CAUTION: Fastener Caution

9. Install the conductive M6 nut and tighten to 8 N.m (71 lb in).

NOTE: **The repair area must be properly refinished to maintain positive electrical grounding.**

10. Refinish the repair area using an anti-corrosion primer.
11. Check for proper system operation.

M8 Weld Nut

CAUTION: **Use GM approved replacement fasteners with conductive finish for**

electrical ground repair.

1. If the M8 weld nut electrical ground location is accessible from both sides of the panel, a conductive M8 bolt and a conductive M8 nut may be used to secure the ground terminal. Reference the GM parts catalog for the correct part number and application.
2. Select a location adjacent to M8 weld nut having 20 mm (0.79 in) clearance behind the panel surface and 20 mm (0.79 in) clearance surrounding the new electrical ground site.
3. Using GM approved residue-free solvent or equivalent, remove any grease from the surface surrounding the ground location and allow to dry.

NOTE: **Ensure 20 mm (0.79 in) clearance is maintained behind the panel to be drilled.**

4. Drill a 10 mm (0.40 in) diameter hole through the panel.
5. Carefully remove paint and primer from the area surrounding the new ground site until bare metal is visible.
6. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the new, conductive M8 bolt threads.
7. Carefully remove any corrosion from the electrical ground terminal. **Testing for Intermittent Conditions and Poor Connections**
8. Install the electrical ground terminal and new, conductive M8 bolt to the ground location.

CAUTION: **Fastener Caution**

9. Install the conductive M8 nut and tighten to 22 N.m (16 lb ft).

NOTE: **The repair area must be properly refinished to maintain positive electrical grounding.**

10. Refinish the repair area using an anti-corrosion primer.
11. Check for proper system operation.

M8 Weld Nut (Alternative Repair)

CAUTION: **Use GM approved replacement fasteners with conductive finish for electrical ground repair.**

1. If the M8 weld nut electrical ground location is not accessible from both sides of the panel, a conductive M6 rivet stud and a conductive M6 nut may be used to secure the ground terminal. Reference the GM parts catalog for the correct part number and application.
2. Select a location adjacent the damaged M8 weld nut having 20 mm (0.79 in) clearance behind the panel surface and 20 mm (0.79 in) clearance surrounding the new, conductive M6 rivet stud flange.
3. Using GM approved residue-free solvent or equivalent, remove any grease from the repair site and allow to dry.

NOTE: **Ensure 20 mm (0.79 in) clearance is maintained behind the panel to be drilled.**

4. Drill a 10 mm (0.40 in) diameter hole through the panel.
5. Carefully remove paint and primer from the area surrounding the rivet stud flange until bare metal is visible.
6. Using a rivet stud installer, install the replacement conductive M6 rivet stud.
7. Ensure the new rivet stud is securely fastened, with no detectable movement.

NOTE: **The rivet stud and surrounding panel area must be properly refinished prior to the installation of the ground terminal and nut to maintain positive electrical grounding.**

8. Completely wrap the threads of the rivet stud with painters tape or equivalent.
9. Refinish the repair area using an anti-corrosion primer.
10. Allow the refinished repair area to cure sufficiently before removing the protective material applied to the rivet stud threads.
11. Remove the painters tape or equivalent from the rivet stud threads.
12. Using GM approved residue-free solvent or equivalent, thoroughly clean the rivet stud threads to remove any adhesive and allow to dry.
13. Carefully remove any corrosion from the electrical ground wire terminal. **Testing for Intermittent Conditions and Poor Connections**
14. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the new conductive M6 rivet stud threads.
15. Install the ground terminal to the new, conductive M6 rivet stud.

    CAUTION: **Fastener Caution**

16. Install the conductive M6 nut and tighten to 8 N.m (71 lb in).
17. Check for proper system operation.

Securing Loose Electrical Ground Connections

If the electrical ground connection is loose and the ground attachments are not damaged, properly securing the loose electrical ground may be all that is necessary. Carry out the following procedure to secure loose electrical ground connections.

CAUTION: **Use GM approved replacement fasteners with conductive finish for electrical ground repair.**

1. Using GM approved residue-free solvent or equivalent, thoroughly clean the ground stud threads and allow to dry.
2. Carefully remove any corrosion from the electrical ground wire terminal. **Testing for Intermittent Conditions and Poor Connections**
3. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the ground stud threads.
4. Install the ground wire terminal to the ground stud.

   CAUTION: **Fastener Caution**

5. Install the appropriate conductive nut.
    - Conductive M6 nut: Tighten to 8 N.m (71 lb in)
    - Conductive M8 nut: Tighten to 22 N.m (16 lb ft)
    - Conductive M10 nut: Tighten to 45 N.m 33 lb ft)
6. Check for proper system operation.

ON/OFF VEHICLE SWITCH REPLACEMENT

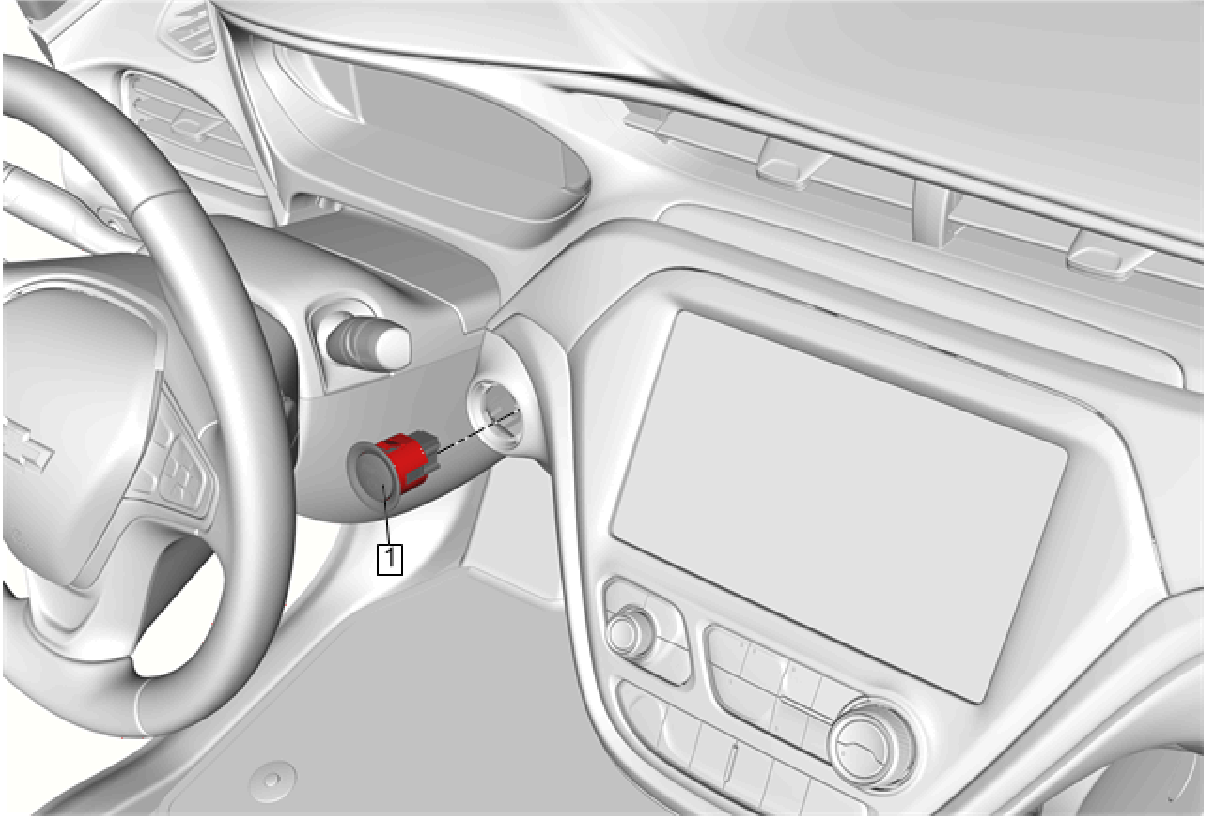

Fig. 210: On/Off Vehicle Switch

AUTOMATIC STOP/START DISABLE

General Motors

AUTO STOP/START DISABLE

NOTE: **General Motors calls this function, Auto Stop or Engine Stop-Start System.**

DISABLE CONDITIONS

On General Motors vehicles equipped with the auto stop/start feature, there may or may not be an auto stop/start off button. For vehicles without the button, any or some of the following conditions may prevent the engine from automatically stopping while parked:

- Transmission is in P position
- Engine compartment hood is open
- Driver's seat belt is unlatched
- Driver's door is open
- Windshield defroster is on
- A/C is set to Manual and is running at Max.

DISABLE BUTTON

Vehicles with the auto stop/start off button, press the button to switch the system off. The button may illuminate. Deactivation using the button lasts only one key cycle. Press the button again to restore auto stop/start function.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B2745: TRACTION CONTROL SWITCH CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B2745

Traction Control Switch Circuit

For symptom byte information refer to **Symptom Byte List**

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Traction Control Switch Signal	B2745 02	1	1	-
Traction Control Switch Ground	-	1	-	-
1. Traction Control Switch Malfunction.				

Circuit/System Description

The body control module monitors the electronic stability control switch. When the electronic stability control switch is pressed once, the body control module will request the electronic brake control module via serial data to disable the traction control. When the electronic stability control switch is pressed and held for five seconds, the body control module will request the electronic brake control module to disable the stability control. The Electronic Brake Control Module will request the Instrument Cluster to turn the Traction Control Off and Stability Control Off indicator ON to notify the driver of the deactivation.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

The body control module detects a short to ground on the signal circuit.

Action Taken When the DTC Sets

The body control module ignores the traction control switch signal input.

Conditions for Clearing the DTC

- When the condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Description and Operation

[ABS Description and Operation](#)

Electrical Information Reference

- [Circuit Testing](#)
- [Connector Repairs](#)
- [Testing for Intermittent Conditions and Poor Connections](#)
- [Wiring Repairs](#)

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the Instrument Cluster indicators listed below turn ON and OFF when commanding the All Indicators ON and OFF with a scan tool.
    - Traction Control Off indicator
    - Stability Control Off indicator
    - Traction/stability Control indicator
    - **If any indicator does not turn ON and OFF**

      Replace the P16 Instrument Cluster.
    - **If all indicators turn ON and OFF**
3. Verify the scan tool Body Control Module, Traction Control Switch parameter changes between Active and Inactive while pressing and releasing the S48C Multifunction Switch 1 - Instrument Panel.
    - **If the parameter does not change**

      Refer to Circuit/System Testing.
    - **If the parameter changes**
4. All OK.

Circuit/System Testing

NOTE: Circuit/System Verification must be performed before Circuit/System Testing.

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S48C Multifunction Switch 1 - Instrument Panel. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 10 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Ignition ON.
4. Verify the scan tool Body Control Module, Traction Control Switch parameter is Inactive.
    - **If Active**
    1. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the signal circuit terminal 14 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.

        - If infinite resistance, replace the K9 Body Control Module.
    - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 3 and ground.
6. Verify the scan tool Traction Control Switch parameter is Active.
    - **If Inactive**
    1. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V.
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If Active**
7. Test or replace the S48C Multifunction Switch 1 - Instrument Panel.

Component Testing

1. Ignition OFF, disconnect the harness connector at the S48C Multifunction Switch 1 - Instrument Panel.
2. Test for infinite resistance between the signal terminal 3 and the ground terminal 10 with the switch in the open position.
    - **If less than infinite resistance**

      Replace the S48C Multifunction Switch 1 - Instrument Panel.

    - **If infinite resistance**
3. Test for less than 2 Ω between the signal circuit terminal 3 and the ground terminal 10 with the switch in the closed position.
    - **If 2 Ω or greater**

      Replace the S48C Multifunction Switch 1 - Instrument Panel.

    - **If less than 2 Ω**
4. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Hazard Warning Switch Replacement
- Control Module References for Body Control Module or Instrument Cluster replacement, programming and setup.

Component	Condition	DTC Symptom Byte

Component	Condition	DTC Symptom Byte
Wheel Speed Sensor	• Physical damage • Debris on the wheel speed sensor or the encoder ring • Loose or worn wheel bearing • Loose or improperly mounted sensor • Air gap between the wheel speed sensor and the encoder ring too large • Water intrusion in the wiring harness • Incorrect part wheel speed sensor installed • Wheel speed sensor installed on incorrect side of same axle	08, 0F, 27, 29, 66, or 67

Circuit/System Description

Each wheel speed sensor receives ignition voltage through the signal high circuit from the electronic brake control module. Wheel speeds are detected by active wheel speed sensors and encoder rings. The magnetic encoder rings consists of multiple north and south pole pairs surrounding the outer circumference. When the encoder ring rotates and passes by the wheel speed sensor; it generates a sign wave in the wheel speed sensor. The sensor converts the signal to a digital square wave; the square wave values switch between 7mA (Low) and 14mA (High) DC current. As the wheel spins, the module uses the frequency of the square wave signal to calculate the wheel speed.

Conditions for Running the DTC

C0035 00 - C0050 00, C0035 18 - C0050 18, or C0035 27 - C0050 27

Ignition ON

C0035 0F - C0050 0F or C0035 5A - C0050 5A

Vehicle speed is greater than 60 km/h (37 MPH).

Conditions for Setting the DTC

C0035 00, C0040 00, C0045 00, or C0050 00

- A short to ground, or open/high resistance on the wheel speed sensor signal high circuit is detected for 0.2 sec.
- A short to voltage, short to ground, or open/high resistance on the wheel speed sensor signal low circuit is detected for 0.2 sec.

C0035 18, C0040 18, C0045 18, or C0050 18

- An erratic wheel speed sensor signal is detected.

C0035 0F, C0040 0F, C0045 0F, or C0050 0F

- Incorrectly mounted wheel speed sensor.
- Debris on the wheel speed sensor or the tone ring.
- Missing tooth or teeth on the wheel speed sensor tone ring.
- Air gap between the wheel speed sensor and the encoder ring.
- Electrical magnetic interference with the wheel speed sensor harness.

C0035 27, C0040 27, C0045 27, or C0050 27

- Debris on the wheel speed sensor tone ring.
- Missing tooth or teeth on the wheel speed sensor tone ring.
- Air gap between the wheel speed sensor and the encoder ring too large.

C0035 67, C0040 67, C0045 67, or C0050 67

- An incorrect part wheel speed sensor signal is detected.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The traction/stability control indicator turns ON.
- A driver information center message may be displayed.
- The electronic brake control module disables the ABS, the traction control, and the electronic stability program for the duration of the ignition cycle.

Conditions for Clearing the DTC

- When the condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Diagnostic Aids

- Do not use a magnet to clean the encoder ring.
- Inspect the wheel encoder ring for rust or corrosion.
- Inspect the wheel speed sensors and components for the correct parts.
- If two or more wheel speed sensors are inoperative, diagnose each wheel speed sensor individually.
- If symptom code 0F, 27, or 5A is set, refer to the Diagnostic Fault Information table for possible mechanical faults or conditions.
- If the customer comments that the ABS indicator is ON only during moist environmental conditions (rain, snow, vehicle wash, etc.), inspect the wheel speed sensor wiring for signs of water intrusion.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Drive the vehicle in a straight line at a speed greater than 40 km/h (25 MPH).
2. Verify all scan tool Wheel Speed Sensor parameters are within 1.6 km/h (1 MPH) of each other.
    - **If any parameter is not within 1.6 km/h (1 MPH) of each other.**

      Refer to Circuit/System Testing.

    - **If each parameter is within 1.6 km/h (1 MPH) of each other.**
3. All OK.

Circuit/System Testing

1. Inspect the appropriate B5 Wheel Speed Sensor and encoder ring for contamination, metallic particles, physical damage, incorrect installation and the correct component.
    - **If contamination, physical damage, incorrect installation, or the wrong component is diagnosed**

      Repair or replace the applicable component.

    - **If no contamination, physical damage, incorrect installation, or the wrong component is not diagnosed**
2. Ignition OFF and all vehicle systems OFF, disconnect the harness connectors at the appropriate B5 Wheel Speed Sensor and the harness connector at the K17 Electronic Brake Control Module, ignition ON.
3. Test for less than 1 V between the K17 Electronic Brake Control Module harness connector terminals listed below and ground:
    - B5LF Wheel Speed Sensor - Left Front - terminal 7 and terminal 24
    - B5LR Wheel Speed Sensor - Left Rear - terminal 23 and terminal 39
    - B5RF Wheel Speed Sensor - Right Front - terminal 26 and terminal 21
    - B5RR Wheel Speed Sensor - Right Rear - terminal 37 and terminal 22
    - **If 1 V or greater**

      Repair the short to voltage on the circuit.

    - **If less than 1 V**
4. Ignition OFF.
5. Test for infinite resistance between the K17 Electronic Brake Control Module harness connector terminals listed below and ground:
    - B5LF Wheel Speed Sensor - Left Front - terminal 7 and terminal 24
    - B5LR Wheel Speed Sensor - Left Rear - terminal 23 and terminal 39
    - B5RF Wheel Speed Sensor - Right Front - terminal 26 and terminal 21
    - B5RR Wheel Speed Sensor - Right Rear - terminal 37 and terminal 22
    - **If less than infinite resistance**

      Repair the short to ground on the circuit.

    - **If infinite resistance**
6. Test for less than 2 Ω between the B5 Wheel Speed Sensor harness connector terminal 1 and the K17 Electronic Brake Control Module harness connector terminal listed below:
    - B5LF Wheel Speed Sensor - Left Front - terminal 24
    - B5LR Wheel Speed Sensor - Left Rear - terminal 39
    - B5RF Wheel Speed Sensor - Right Front - terminal 21
    - B5RR Wheel Speed Sensor - Right Rear - terminal 22
    - **If 2 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 2 Ω**

7. Test for less than 2 Ω between the B5 Wheel Speed Sensor harness connector terminal 2 and the K17 Electronic Brake Control Module harness connector terminal listed below:
    - B5LF Wheel Speed Sensor - Left Front - terminal 7
    - B5LR Wheel Speed Sensor - Left Rear - terminal 23
    - B5RF Wheel Speed Sensor - Right Front - terminal 26
    - B5RR Wheel Speed Sensor - Right Rear - terminal 37
    - **If 2 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 2 Ω**
8. Replace the B5 Wheel Speed Sensor.
9. Verify the DTC does not set while operating the vehicle within Conditions for Running the DTC.
    - **If the DTC sets**

      Replace the K17 Electronic Brake Control Module.

    - **If the DTC does not set**
10. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Front Wheel Speed Sensor Replacement**
- **Rear Wheel Speed Sensor Replacement**
- **Control Module References** for control module replacement, programming and setup.

DTC C0055: REAR WHEEL SPEED SENSOR CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0055

Rear Wheel Speed Sensor Circuit

For symptom byte information refer to **Symptom Byte List**

Circuit/System Description

The wheel speeds are detected by active wheel speed sensors. Each wheel speed sensor receives a 12 V reference voltage from the electronic brake control module (EBCM) and provides an alternating current square wave signal to the EBCM. As the wheel spins, the EBCM uses the frequency of the square wave signal to calculate the wheel speed. The EBCM sends the wheel speed information as a high speed controller area network (CAN) serial data message.

Conditions for Running the DTC

Ignition ON

Conditions for Setting the DTC

A supervised periodic message that includes the wheel speed serial data has not been received.

Action Taken When the DTC Sets

Specific subsystems will not function or operate in degraded mode.

Conditions for Clearing the DTC

A current DTC clears when the diagnostic runs and passes.

Scan Tool Reference

Control Module References for scan tool information

Diagnostic Aids

This DTC can be set due to an incorrect part wheel speed sensor installed.

Circuit/System Verification

Ignition ON, observe the scan tool EBCM Wheel Speed Sensor parameters. The reading should be the same speed on all sensors when driving in a straight line at a speed greater than 20 km/h (13 MPH).

1. Drive the vehicle in a straight line at a speed greater than 40 km/h (25 MPH).
2. Verify all scan tool Wheel Speed Sensor parameters are within 1.6 km/h (1 MPH) of each other.
    - **If any parameter is not within 1.6 km/h (1 MPH) of each other.**

      Refer to Circuit/System Testing.

    - **If each parameter is within 1.6 km/h (1 MPH) of each other.**
3. All OK.

Circuit/System Testing

1. Ignition ON.
2. Verify that DTC C0035, C0040, C0045, or C0050 is not set in the EBCM.
    - **If any listed DTC is set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** to diagnose that DTC prior to this diagnostic.

    - **If any listed DTC is not set**
3. Replace the K17 Electronic Brake Control Module.
4. Verify the DTC does not set while operating the vehicle under the Conditions for Running the DTC.

- **If the DTC sets**

  Replace the module that set the DTC.

- **If the DTC does not set**

5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for control module replacement, programming and setup

DTC C005A: SIMULTANEOUS MALFUNCTION OF BOTH WHEEL SPEED SENSORS ON ONE AXLE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C005A

Simultaneous Malfunction of Both Wheel Speed Sensors on One Axle

For symptom byte information refer to **Symptom Byte List**

Circuit/System Description

The wheel speeds are detected by active wheel speed sensors and encoder rings. The encoder ring consists of permanent magnets. Each wheel speed sensor receives ignition voltage from the electronic brake control module and provides an alternating current square wave signal to the electronic brake control module. As the wheel spins, the module uses the frequency of the square wave signal to calculate the wheel speed.

Conditions for Running the DTC

- Vehicle in Service Mode or Vehicle ON
- Ignition voltage is greater than 10 V.
- Two wheel speeds are greater than 5 km/h (3 MPH).

Conditions for Setting the DTC

Simultaneous dropout of both wheel speed sensors on the same axle.

Actions Taken when the DTC Sets

- The ABS indicator turns ON.
- The red brake indicator turns ON.
- The traction control/stability control indicator turns ON.
- The Service Brake Assist and Service StabiliTrak messages are displayed on the driver information center.
- The electronic brake control module disables the antilock brake system, the dynamic rear proportioning, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

    - **If the DTC is not set**
3. All OK.

DTC C0110: PUMP MOTOR CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0110

Pump Motor Circuit

For symptom byte information refer to **Symptom Byte List**

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	C0110 03	C0110 00	C0110 07	C0110 39, C0110 59
Ground	-	C0110 00	-	-

Component	Condition	DTC

Component	Condition	DTC
Pump Motor	• Wear • Damage • Lock	C0110 61

Circuit/System Description

The pump motor is an integral part of the brake pressure modulator, while the pump motor relay is integral to the electronic brake control module. The pump motor relay is not engaged during normal system operation. When the ABS, the traction control or the electronic stability control operation is required, the module activates the pump motor relay and turns the pump motor on.

Conditions for Running the DTC

C0110 00

- Ignition ON
- The pump motor is commanded ON.

C0110 03, or C0110 07

- Ignition ON
- Vehicle speed is greater than 30 km/h (18.6 MPH) for 7 s.

C0110 39, C0110 59, or C0110 61

- Ignition ON
- Vehicle speed is greater than 60 km/h (37.3 MPH) for 5 s.

Conditions for Setting the DTC

C0110 00

An open/high resistance is detected on the pump motor switch circuit.

C0110 03

Low voltage is detected in the pump motor circuit.

C0110 07

A short to voltage is detected on the pump motor ground circuit.

C0110 39

A shorted circuit is detected in the pump motor circuit.

C0110 59

The pump motor is overheating.

C0110 61

- The pump motor is mechanically blocked.
- The pump motor is actuated but no generated motor voltage is detected.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The red brake indicator turns ON.
- The traction/stability control indicator turns ON.

- The driver information center may display a message.
- The electronic brake control module disables the ABS, the traction control and the stability control for the duration of the ignition cycle.

Conditions for Clearing the DTC

- When the condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the ABS pump motor turns On and Off when commanding the ABS Motor On and Off with a scan tool.
    - **If the pump motor does not turn On and Off**

      Refer to Circuit/System Testing.

    - **If the pump motor turns On and Off**
3. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the K17 Electronic Brake Control Module. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between ground circuit terminal 14 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
        - **If less than 10 Ω**
3. Ignition ON.
4. Verify that a test lamp illuminates between the B+ circuit terminal 1 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**
  1. Ignition OFF, remove the test lamp.
  2. Test for less than 2 Ω in the B+ circuit end to end.
     - If 2 Ω or greater, repair the open/high resistance the in the circuit.
     - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
- **If the test lamp does not illuminate and the circuit fuse is open**
  1. Ignition OFF, remove the test lamp.
  2. Test for infinite resistance between the B+ circuit and ground.
     - If less than infinite resistance, repair the short to ground on the circuit.
     - If infinite resistance, replace the Q5 Brake Pressure Modulator.
- **If the test lamp illuminates**

5. Replace the Q5 Brake Pressure Modulator.
6. Verify the DTC does not set while operating the vehicle within the Conditions for Running the DTC.
   - **If the DTC sets**

     Replace the K17 Electronic Brake Control Module.

   - **If the DTC does not set**
7. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Control Module replacement, programming and setup.

DTC C0115: PUMP MOTOR STUCK

DTC Descriptors

DTC C0116

Pump Motor Relay Circuit

For symptom byte information refer to **Symptom Byte List** .

Diagnostic Fault Information

Component	Condition	DTCs
Pump motor relay	- Wear - Damage - Lock	C0116

Circuit/System Description

The pump motor is an integral part of the brake pressure modulator valve assembly, while the pump motor relay is integral to the electronic brake control module. The pump motor relay is not engaged during normal system operation. When the ABS, traction control or stability control operation is required, the electronic brake control module activates the pump motor relay and turns the pump motor ON.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

- The pump motor relay has an internal failure
- The pump motor relay voltage is greater than threshold.

Action Taken When the DTC Sets

- The electronic brake control module disables the ABS, traction control, stability control and hill start assist for the duration of the ignition cycle.
- The ABS warning indicator turns ON.

- The traction control/stability control-active indicator turns ON.

Conditions for Clearing the DTC

- A current DTC clears when the diagnostic runs and passes.
- The electronic brake control module will turn OFF the indicators in the next ignition cycle.

DTC C0121: VALVE RELAY CIRCUIT MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0121

Valve Relay Circuit Malfunction

For symptom byte information refer to Symptom Byte List

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	C0121 00	C0121 00	-	-
Ground	-	C0121 00	-	-

Circuit/System Description

The valve relay is an integral part of the electronic brake control module (EBCM), while the solenoid valves are integral to the brake pressure modulator valve assembly. The valve relay is engaged during normal system operation and provides voltage to the solenoid valves. When the ABS control operation is required, the EBCM controls the solenoid valves by providing ground to the active solenoid valves.

Conditions for Running the DTC

- Vehicle speed is greater than 6 km/h (4 MPH) with the brake pedal not applied.

  OR

- Vehicle speed is greater than 15 km/h (9 MPH) and the brake pedal is not actuated.

Conditions for Setting the DTC

- The EBCM is requesting valve activation and the relay output voltage is low.
- The EBCM is not requesting valve activation and the relay output voltage is B+.
- The EBCM detects 3 or more solenoid valve circuits are open or shorted during the self-test.
- A malfunction exists within the EBCM.

Action Taken When the DTC Sets

- The EBCM disables the ABS for the duration of the ignition cycle.
- The ABS indicator turns ON.

Conditions for Clearing the DTC

- A current DTC clears when the diagnostic runs and passes.
- The EBCM will turn OFF the indicator and enable the system functions in the next ignition cycle.

DTC C0161: ANTILOCK BRAKING SYSTEM BRAKE SWITCH CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC C0161

Antilock Braking System Brake Switch Circuit

For symptom byte information, refer to Symptom Byte List

Circuit/System Description

When the brake pedal is applied, the body control module sends a serial data message to the electronic brake control module in reference to the brake pedal positions. The electronic brake control module compares the correlation between the brake pedal position and the amount of brake pressure it senses from the brake pressure sensor, which is internal to the brake pressure modulator. It uses this information to control the vehicle during an stability event.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

- The electronic brake control module detects four accelerations from standstill to a vehicle speed greater 40 km/h (26 MPH) without any brake pedal position signal changes.

- The electronic brake control module detects the vehicle speed is greater than 20 km/h (13 MPH), the brake pedal is applied for six minutes, and brake pressure is less than 15 bar (218 PSI).

Conditions for Clearing the DTC

A current DTC clears when the diagnostic runs and passes.

Action Taken When the DTC Sets

No actions are taken

Diagnostic Aids

This DTC may set if the brake pedal is applied while accelerating.

    - **If either DTC is set**

      Refer to **DTC C0277 or C0890** .

    - **If either DTC is not set**
3. Verify the brake pedal position sensor or the brake pedal is not binding causing residual brake pressure to be detected, while the brake lights operate properly.
    - **If a condition is found**

      Repair or replace the applicable component.

    - **If a condition is not found**
4. Verify the scan tool Electronic Brake Control Module Brake Pedal Applied parameter changes between Yes and No while applying and releasing the brake pedal.
    - **If the parameter does not change between Yes and No**

      Refer to **Symptoms - Lighting** .

    - **If the parameter changes between Yes and No**

5. Refer to Diagnostic Aids, All OK.

DTC C0179: BRAKE SYSTEM CALCULATED COMPONENT OVERHEAT PROTECTION TIME-OUT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0179 59

Brake System Calculated Component Overheat Protection Time-Out

Circuit/System Description

The electronic brake control module monitors how often the traction control or the stability control system activates in order to calculate an estimate of the front brake discs temperature. In most cases the high temperatures are caused by extended traction control activation. If the electronic brake control module calculates that the front brake components temperatures are too high, the electronic brake control module will temporarily suspend the traction control system function until the front brake discs cool down.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

The electronic brake control module detects the calculated temperature of the brake components is higher than 500Ã‚Â°C (932Ã‚Â°F).

Action Taken When the DTC Sets

- The traction/stability control indicator turns ON.
- The electronic brake control module disables the ABS, the traction control, the stability control and the electronic brake distribution for the duration of the ignition cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Diagnostic Aids

DTC C0179 does not indicate a malfunction has occurred. This DTC indicates there was excessive ABS, traction control or stability control activation that caused the high temperatures.

- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC C0186

Lateral Acceleration Sensor Signal (Electronic Brake Control Module)

DTC C018B

Lateral Acceleration Sensor Signal (Multi-axis Acceleration Sensor Module)

DTC C0196

Yaw Rate Signal (Electronic Brake Control Module)

DTC C019B

Yaw Rate Signal (Multi-axis Acceleration Sensor Module)

DTC C027E

Longitudinal Acceleration Sensor Signal (Multi-axis Acceleration Sensor Module)

DTC C0287

Longitudinal Acceleration Sensor Signal (Electronic Brake Control Module)

For symptom byte information refer to **Symptom Byte List**

Circuit/System Description

The yaw rate, lateral acceleration and longitudinal acceleration sensors are combined into one multi-axis acceleration sensor, internal to the inflatable restraint sensing and diagnostic module. The multi-axis acceleration sensor communicates with the electronic brake control module via serial data. The electronic brake control module activates the stability control function depending on the multi-axis acceleration sensor input. The inflatable restraint sensing and diagnostic module uses the multi-axis acceleration sensor to determine if the vehicle is in a roll over or near collision incident.

Conditions for Running the DTC

- Ignition ON begins the initialization of the brake system power-up self test.
- Drive the vehicle at speeds greater than 16 km/h (10 MPH) to complete the active brake system test.

Conditions for Setting the DTC

C0186 00 or C018B 5A

The lateral acceleration signal is out of the specified range.

C0186 5A

The lateral acceleration signal is not plausible with the yaw rate signal, steering angle signal and vehicle speed.

C0186 71

- The electronic brake control module received an invalid lateral acceleration signal.
- An open/high resistance is detected on the multi-axis acceleration ground circuit.
- A short to ground or open/high resistance is detected on the multi-axis acceleration ignition circuit.

C0196 00 or C019B 5A

The yaw rate signal is out of the specified range.

C0196 5A

- The yaw rate signal offset is out of the specified range.
- The yaw rate signal is not plausible with the lateral acceleration signal, the steering angle signal and the vehicle speed.

C0196 71

- A short to ground or open/high resistance is detected on the ignition circuit.
- The electronic brake control module received an invalid lateral acceleration signal.
- An open/high resistance is detected on the multi-axis acceleration ground circuit.

C027E 5A

The longitudinal acceleration signal is not plausible.

C0287 4B

The longitudinal acceleration sensor is not calibrated.

C0287 5A

The longitudinal acceleration signal is not plausible with the vehicle speed.

C0287 71

- An open/high resistance is detected on the multi-axis acceleration ground circuit.
- The electronic brake control module received an invalid longitudinal acceleration signal.
- A short to ground or open/high resistance is detected on the multi-axis acceleration ignition circuit.

Action Taken When the DTC Sets

- The traction control Off indicator turns ON.
- The traction/stability control indicator turns ON.
- A Traction Control Off message may be displayed.
- A Service Stabilitrak message may be displayed.
- The electronic brake control module disables the traction control and the stability control for the duration of the ignition cycle.

Conditions for Clearing the DTC

- The DTC clears when the diagnostic runs and passes.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal High - Left Front	C0035 00	C0035 00	C0245 00	-
Signal High - Right Front	C0040 00	C0040 00	C0245 00	-
Signal High - Left Rear	C0045 00	C0045 00	C0245 00	-
Signal High - Right Rear	C0050 00	C0050 00	C0245 00	-

Component	Condition	DTC Symptom Byte

Component	Condition	DTC Symptom Byte
Wheel Speed Sensor	• Wheel speed sensor incorrectly mounted	66

Circuit/System Description

Each wheel speed sensor receives ignition voltage through the signal high circuit from the electronic brake control module. Wheel speeds are detected by active wheel speed sensors and encoder rings. The magnetic encoder rings consists of multiple north and south pole pairs surrounding the outer circumference. When the encoder ring rotates and passes by the wheel speed sensor; it generates a sign wave in the wheel speed sensor. The sensor converts the signal to a digital square wave; the square wave values switch between 7mA (Low) and 14mA (High) DC current. As the wheel spins, the module uses the frequency of the square wave signal to calculate the wheel speed.

Conditions for Running the DTC

- DTC C0035, C0040, C0045, or C0050 is not present.
- Vehicle speed is between 20 km/h (13 MPH) and 50 km/h (31 MPH).
- While driving a curve with a yaw-rate of 3Ã‚Â° per second for greater than 9 s.

Conditions for Setting the DTC

- A short to voltage on any one of the wheel speed sensor ignition circuits.
- A electrical magnetic interference with the wheel speed sensor harness.
- Difference between the fastest and slowest wheel speed is greater than 6 km/h (4 MPH).
- If two or more wheel speed sensor faults are detected without the ABS warning lamp being turned ON.
- The electronic brake control module cannot determine a specific wheel speed sensor signal because of electrical interference.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The traction control Off indicator turns ON.
- The stability control Off indicator turns ON.
- The traction/stability control indicator turns ON.
- The driver information center displays the Service StabiliTrak message.
- The electronic brake control module disables the ABS, the traction control, and the stability control for the duration of the ignition cycle.

Conditions for Clearing the DTC

- When the condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Diagnostic Aids

- Do not use a magnet to clean the encoder ring.
- Check for electrical magnetic interference with the wheel speed sensor harness.
- If two or more wheel speed sensors are inoperative, diagnose each wheel speed sensor individually.
- If the customer comments that the ABS indicator is ON only during moist environmental conditions (rain, snow, vehicle wash, etc.), inspect the wheel speed sensor wiring for signs of water intrusion.

Circuit/System Verification

1. Verify that all tires have the proper air pressure.
    - **If not the proper air pressure**

      Adjust all tire air pressures to the stated cold air pressure as identified on the tire placard or specification.

    - **If the proper air pressure**
2. Verify that all tires are of uniform size and matching brand.
    - **If not of uniform size or matching brand**
    1. Replace the mis-sized or non-matching brand tire.
    2. Ignition ON.
    3. Verify the DTC does not set while operating the vehicle within the Conditions for Running the DTC.
        - If the DTC set, replace the K17 Electronic Brake Control Module.
        - If the DTC does not set
    4. All OK.
    - **If all tires are of uniform size and matching brand**
3. Refer to Circuit/System Testing.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the K17 Electronic Brake Control Module, ignition ON.
2. Test for less than 1 V between the K17 Electronic Brake Control Module harness connector terminals listed below and ground:
    - B5LF Left Front Wheel Speed Sensor - terminal 7
    - B5RF Right Front Wheel Speed Sensor - terminal 26
    - B5LR Left Rear Wheel Speed Sensor - terminal 23
    - B5RR Right Rear Wheel Speed Sensor - terminal 37
    - **If 1 V or greater**

      Repair the short to voltage on the circuit.

- **If less than 1 V**

3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC C0274: ISOLATION VALVE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC C0274

Isolation Valve

Circuit/System Description

The solenoid valves are integral parts of the brake pressure modulator. The brake pressure modulator contains an isolation solenoid valve and a dump solenoid valve for each wheel. A traction/stability control supply solenoid valve and a isolation solenoid valve for each brake circuit. The solenoid valves are not engaged during normal system operation. When the ABS, the traction control or the stability control operation is required the electronic brake control module turns the required solenoid ON.

Conditions for Running the DTC

Ignition ON

Conditions for Setting the DTC

The calculated solenoid valve temperature is greater than the threshold.

Action Taken When the DTC Sets

C0274 54

- The ABS indicator turns ON.
- The traction/stability control indicator turns ON.
- The electronic brake control module disables the ABS, the traction control, the stability control and the hill start assist for the duration of the ignition cycle.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Diagnostic Aids

DTCs may set due to extended operation of the ABS, the traction control or the stability control.

Circuit/System Verification

NOTE: **Since most occurrences of this DTC are caused by excessive ABS or traction control usage, review with the customer the conditions under which the DTC set.**

1. Ignition ON.
2. Verify that DTC C0186, C0187, C0196, C0287, or C0710 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If none of the DTCs are set**
3. Ignition OFF, allow the hydraulic brake pressure modulator to cool down to ambient temperature.
4. Ignition ON.
5. Verify that DTC C0274 54 is not set while driving the vehicle within normal braking conditions.
    - **If any of the DTCs are set**

      Replace the K17 Electronic Brake Control Module with Brake Pressure Modulator.

    - **If none of the DTCs are set**
6. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC C0280: STABILITY SYSTEM ACTIVE TOO LONG

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC C0280

Stability System Active Too Long

For symptom byte information, refer to **Symptom Byte List**

Circuit/System Description

The solenoid valves are integral parts of the brake pressure modulator valve. The brake pressure modulator valve contains an isolation solenoid valve and a dump solenoid valve for each wheel and a traction/ stability control supply solenoid valve and isolation solenoid valve for each brake circuit. The solenoid valves are not engaged during normal system operation. When the ABS, the traction control or the stability control operation is required the electronic brake control module turns the required solenoid valves ON.

Conditions for Running the DTC

- Ignition ON
- Vehicle speed is greater than 22 km/h (13.7 MPH).

Conditions for Setting the DTC

Calculated solenoid valve temperature is greater than threshold.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The traction/stability control indicator turns ON.
- A driver information center message may be displayed.
- The electronic brake control module disables the ABS, the traction control, the stability control, and the hill start assist for the duration of the ignition cycle.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Diagnostic Aids

This DTC may set due to extended operation of the ABS, the traction control or the stability control system.

- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC C0561

System Disabled Information Stored

Symptom Byte Information: Symptom Byte List

Circuit/System Description

For an overview of the component/system, refer to:**ABS Description and Operation**

Circuit	Description
B+ - Terminal 1	The output circuit is switched from ground to 12 V to activate the component.
Low Reference	Grounded through the control module.

Component	Description

Component	Description
K17 Electronic Brake Control Module	The control module K17 can increase and decrease the brake pressure on all 4 wheels individually in order to fulfill these functions: • Antilock Braking • Traction Control • Vehicle Stability Control The control module K17 can also influence the following control modules to limit the amount of produced torque: • K20 Engine Control Module • K71 Transmission Control Module

Conditions for Running the DTC

- Engine Running - Gasoline/Diesel
- Propulsion Active - Hybrid/EV

Conditions for Setting the DTC

K17 Electronic Brake Control Module=Invalid Data Received - More than 10 times.

Actions Taken When the DTC Sets

- ABS Indicator Control=ON
- Traction/Stability Control Indicator=ON
- The EBCM disables the ABS, traction control, stability control and hill start assist for the duration of the ignition cycle.

Conditions for Clearing the DTC

- The conditions for setting the DTC no longer exist.
- A history DTC will clear after 40 consecutive malfunction-free ignition cycles.

Diagnostic Aids

Diagnose other DTCs first.

   - **If any of the DTCs are set**
   1. Program the control module:K17 Electronic Brake Control Module
   2. Verify DTC C0561 is not set.
      - If the DTC sets - Replace the component:K17 Electronic Brake Control Module
      - If no DTC is set
   3. All OK.
   - **If the DTC is not set**
3. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: **Diagnostic Repair Verification**

For control module replacement, programming, and setup refer to: **Control Module References**

DTC C0569: SYSTEM CONFIGURATION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0569

System Configuration

Circuit/System Description

The electronic brake control module receives serial data messages from other modules. The electronic brake control module must be configured with the Vehicle Identification Number (VIN), configuration data and vehicle options. If not properly configured after installation, the electronic brake control module may set a DTC.

The internal fault detection is handled inside the control module. No external circuits are involved.

Conditions for Running the DTC

Ignition ON

Conditions for Setting the DTC

The electronic brake control module is not programmed.

Action Taken When the DTC Sets

- The traction/stability control indicator turns ON.
- The electronic brake control module disables the traction control, the stability control and the hill start assist for the duration of the ignition cycle.

Conditions for Clearing the DTC

- The DTC clears when the diagnostic runs and passes.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Diagnostic Aids

A newly replaced electronic brake control module can set one or more DTCs on its initial ignition ON cycle.

DTC C10EA: POWERTRAIN CONTROL MODULE INDICATED REQUESTED TORQUE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC C10EA

Powertrain Control Module Indicated Requested Torque

Circuit/System Description

The electronic brake control module and the engine control module simultaneously control the regenerative braking. When certain engine control module DTCs are set, the engine control module will not be able to perform the regenerative braking. A serial data message is sent to the electronic brake control module indicating that regenerative braking is not allowed.

Conditions for Running the DTC

- Vehicle in Service Mode.
- The ignition voltage is greater than 10 V.

Conditions for Setting the DTC

The engine control module diagnoses a condition preventing the engine control portion of the regenerative braking function and sends a serial data message to the electronic brake control module indicating that regenerative braking is not allowed.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The MIL indicator may be on or flashing.
- The traction control/stability control indicator turns ON.
- The Service StabiliTrak message is displayed on the driver information center.
- The electronic brake control module disables the ABS, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

DTC C10EB: ENGINE CONTROL MODULE INDICATED TRACTION CONTROL

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC C10EB

Engine Control Module Indicated Traction Control

Circuit/System Description

The electronic brake control module and the engine control module simultaneously control the traction control. The electronic brake control module sends a serial data message to the engine control module requesting torque reduction. When certain engine control module DTCs are set, the engine control module will not be able to perform the torque reduction for traction control. A serial data message is sent to the electronic brake control module indicating that traction control is not allowed.

Conditions for Running the DTC

- Vehicle in Service Mode.
- The ignition voltage is greater than 10 V.

Conditions for Setting the DTC

The engine control module diagnoses a condition preventing the engine control portion of the traction control function and sends a serial data message to the electronic brake control module indicating that torque reduction is not allowed.

Action Taken When the DTC Sets

- The ABS indicator turns ON.
- The MIL indicator may be on or flashing.
- The traction control/stability control indicator turns ON.
- The Service StabiliTrak message is displayed on the driver information center.
- The electronic brake control module disables the ABS, the traction control system and the electronic stability program for the duration of the drive cycle.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

DTC C1200: POWERTRAIN SENSED BRAKE PEDAL INFORMATION MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC C1200

Powertrain Sensed Brake Pedal Information Message Counter Incorrect

Circuit/System Description

The body control module monitors the brake pedal position sensor and sends a serial data message to the both the electronic brake control module and engine control modules when the brake pedal is applied. The engine control module compares the correlation between the brake pedal positions and the brake control brake pedal position sensor to sense the driver's application of the brake pedal.

Conditions for Running the DTC

- Vehicle ON
- The brake pedal is applied.
- The ignition voltage is greater than 10 V.
- The accelerator pedal position is greater than 20 %.

Conditions for Setting the DTC

The brake pedal position sensor signal is not applied while the brake control brake pedal position sensor indicates the brake pedal is applied.

Action Taken When the DTC Sets

A driver information center message and/or a warning indicator will not be displayed.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 40 consecutive fault-free drive cycles have occurred.

Diagnostic Aids

- DTC C1200 may set if the brake pedal is applied while accelerating.
- Check the Engine Control Module for any accelerator pedal DTCs and correct them first before diagnosing this DTC.

Lateral Acceleration Sensor Circuit High Voltage

DTC C1251

Lateral Acceleration Sensor Performance

DTC C1252

Longitudinal Acceleration Sensor Circuit Low Voltage

DTC C1253

Longitudinal Acceleration Sensor Circuit High Voltage

DTC C1254

Longitudinal Acceleration Sensor Performance

For symptom byte information refer to **Symptom Byte List** .

Circuit/System Description

The yaw rate, lateral acceleration and longitudinal acceleration sensors are combined into one multi-axis acceleration sensor, internal to the inflatable restraint sensing and diagnostic module. The multi-axis acceleration sensor communicates with the electronic brake control module and trans control module via serial data. The electronic brake control module activates the stability control function depending on the multi-axis acceleration sensor input. The inflatable restraint sensing and diagnostic module uses the multi-axis acceleration sensor to determine if the vehicle is in a roll over or near collision incident. The transmission control module sets these DTCs.

Conditions for Running the DTC

Vehicle speed is greater than 16 km/h (10 MPH).

Conditions for Setting the DTC

The transmission control module detects a fault that prevents it from performing a hill hold start assist function.

Action Taken When the DTC Sets

- The air bag indicator turns ON.
- The traction/stability control indicator turns ON.
- The electronic brake control module disables the stability control and the hill hold start assist for the duration of the ignition cycle.

Conditions for Clearing the DTC

- The DTC clears when the diagnostic runs and passes.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that no other DTCs are set except for C1287.
    - **If any other DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If no other DTCs are set**
3. Replace the K17 Electronic Brake Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Electronic Brake Control Module or Engine Control Module replacement, programming and setup

DTC P0856: TRACTION CONTROL TORQUE REQUEST CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis:**Strategy Based Diagnosis**

- An overview of each diagnostic category can be found here: Diagnostic Procedure Instructions

DTC Descriptor

DTC P0856

Traction Control Torque Request Circuit

Symptom Byte Information: Symptom Byte List

Circuit/System Description

For an overview of the component/system, refer to:ABS Description and Operation

Circuit	Description
B+ - Terminal 1	The output circuit is switched from ground to 12 V to activate the component.
Low Reference	Grounded through the control module.

Component	Description
K20 Engine Control Module	The control module contains a microprocessor used to process input data to control outputs. The control module controls a series of actuators to ensure optimal engine performance. The control module does this by reading values from a variety of sensors, interprets the data and adjusts the engine actuators accordingly.
K17 Electronic Brake Control Module	The control module K17 can increase and decrease the brake pressure on all 4 wheels individually in order to fulfill these functions: • Antilock Braking • Traction Control • Vehicle Stability Control The control module K17 can also influence the following control modules to limit the amount of produced torque: • K20 Engine Control Module • K71 Transmission Control Module

Conditions for Running the DTC

- Engine Running - Gasoline/Diesel
- Propulsion Active - Hybrid/EV

Conditions for Setting the DTC

When certain DTCs are set in the engine control module, it will not be able to perform torque reduction for traction control. A serial data message is sent to the electronic brake control module indicating that torque reduction is currently not allowed.

Actions Taken When the DTC Sets

- Traction/Stability Control Indicator=ON
- The EBCM disables the ABS, traction control, stability control and hill start assist for the duration of the ignition cycle.

Conditions for Clearing the DTC

- The conditions for setting the DTC no longer exist.

- A history DTC will clear after 40 consecutive malfunction-free ignition cycles.

Circuit/System Verification

1. Verify there are no other DTCs set, except for DTC P0856.
    - **If any of the DTCs are set**

      Refer to:**Diagnostic Trouble Code (DTC) List - Vehicle**

    - **If no other DTCs are set**
2. Replace the component:K20 Engine Control Module
3. Under normal operating conditions:Verify that no DTCs are set.
    - **If the DTC sets**

      Replace the component:K17 Electronic Brake Control Module

    - **If no DTC is set**
4. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: **Diagnostic Repair Verification**

For control module replacement, programming, and setup refer to: **Control Module References**

DTC P15F8: AUTOMATIC BRAKING ENGINE TORQUE REQUEST SIGNAL MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P15F8

Automatic Braking Engine Torque Request Signal Message Counter Incorrect

Circuit/System Description

The electronic brake control module and the engine control module simultaneously control the vehicle performance. During a automatic brake event the electronic brake control module sends a serial data message to the engine control module requesting torque reduction. If the engine control module receives corrupt data from the electronic brake control module, DTC P15F8 will set in the engine control module. The engine control module then sends a serial data message to the electronic brake control module that torque reduction is not allowed.

Conditions for Running the DTC

- The ignition is ON.
- Ignition voltage is greater than 8 V.

Conditions for Setting the DTC

The engine control module detects a corrupted data message from the electronic brake control module.

Action Taken When the DTC Sets

- The ABS remains functional.
- DTC P15F8 is a Type B DTC.
- The traction Off indicator turns ON.
- The traction/stability control indicator turns ON.
- The Service Stabilitrak message may be displayed on the driver information center.

Conditions for Clearing the DTC

DTC P15F8 is a Type B DTC.

Diagnostic Aids

Inspect the serial data circuits and connections at the engine control module and the electronic brake control module. They should be free from sources of electromagnetic interference and the connections should be clean and tight.

Circuit/System Testing

1. Verify that no other DTCs are set except for DTC P15F8.
    - **If any other DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If only DTC P15F8 is set**

2. Replace the K17 Electronic Brake Control Module.
3. Verify the DTC does not set while operating the vehicle within the Conditions for Running the DTC.
   - **If DTC sets**

     Replace the K20 Engine Control Module.

   - **If DTC does not set**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC P15FD: WHEEL SPEED SENSOR MESSAGE SEQUENCE INCORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P15FD

Wheel Speed Sensor Message Sequence Incorrect

Circuit/System Description

The wheel speeds are detected by active wheel speed sensors. Each wheel speed sensor receives a 12 V reference voltage from the electronic brake control module (EBCM) and provides an alternating current square wave signal to the EBCM. As the wheel spins, the EBCM uses the frequency of the square wave signal to calculate the wheel speed. The EBCM sends the wheel speed information as a high speed controller area network (CAN) serial data message.

Conditions for Running the DTC

Ignition ON

Conditions for Setting the DTC

A supervised periodic message that includes the wheel speed serial data has not been received.

Action Taken When the DTC Sets

Specific subsystems will not function or operate in degraded mode.

Conditions for Clearing the DTC

A current DTC clears when the diagnostic runs and passes.

Description and Operation

ABS Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Diagnostic Aids

- This DTC can be set due to an incorrect part wheel speed sensor installed.
- Inspect the wheel encoder ring for rust or corrosion.
- If the customer comments that the ABS indicator is ON only during moist environmental conditions (rain, snow, vehicle wash, etc.), inspect the wheel speed sensor wiring for signs of water intrusion.

Circuit/System Verification

Ignition ON, observe the scan tool EBCM Wheel Speed Sensor parameters. The reading should be the same speed on all sensors when driving in a straight line at a speed greater than 20 km/h (13 MPH).

Circuit/System Testing

1. Ignition ON.
2. Verify that DTC C0035, C0040, C0045, or C0050 is not set in the EBCM.
    - **If any listed DTC is set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** to diagnose that DTC prior to this diagnostic.

    - **If any listed DTC is not set**
3. Replace the K17 Electronic Brake Control Module.
4. Verify the DTC does not set while operating the vehicle under the Conditions for Running the DTC.
    - **If the DTC sets**

      Replace the module that set the DTC.

    - **If the DTC does not set**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for control module replacement, programming and setup

DTC P1B12: DRIVER INTENDED BRAKING TORQUE SIGNAL MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for a overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1B12

Driver Intended Braking Torque Signal Message Counter Incorrect

Circuit/System Description

The electronic brake control module provides brake pedal position information to the engine control module, via the serial data circuit. The engine control module monitors a series of 16 rolling counts, with each count assigned a value, when the engine control module determines that too many of the counts have an incorrect value, the engine control module sets DTC P1B12.

Conditions for Running the DTC

- The propulsion system is active.
- DTC P1B12 runs continuously when the above condition is met.

Conditions for Setting the DTC

The engine control module detects that 10 of the 16 rolling counts have an incorrect value.

Action Taken When the DTC Sets

DTC P1B12 is a Type C DTC.

Conditions for Clearing the DTC

DTC P1B12 is a Type C DTC.

Diagnostic Aids

- DTC P1B12 is an informational DTC.
- Verify the electronic brake control module and engine control module contain the latest calibrations.
- Diagnose all other engine control module DTCs prior to DTC P1B12.
- Find out from the customer the conditions under which the DTC was set. This information may help duplicate the concern like the specific number of brake pedal applies in a row prior to the fault set.

Circuit/System Verification

1. Verify that no other DTCs are set except for DTC P1B12 is set.
    - **If any other DTCs are set**

      Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

    - **If no other DTCs are set**
2. Replace the K17 Electronic Brake Control Module.
3. Verify the DTC P1B12 does not set while operating the vehicle within the Conditions for Running the DTC.
    - **If only DTC P1B12 is set**

      Replace the K20 Engine Control Module.

    - **If the DTC does not set**
4. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Control Module References for Electronic Brake Control Module and Engine Control Module replacement, programming and setup.

SYMPTOMS - ANTILOCK BRAKE SYSTEM

NOTE: **The following steps must be completed before using the symptom tables.**

1. Perform the Diagnostic System Check - Vehicle before using the symptom tables in order to verify that all of the following are true:
    - There are no DTCs set.
    - The control modules can communicate via the serial data link.
2. Review the system description and operation in order to familiarize yourself with the system functions. Refer to ABS Description and Operation.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the ABS. Refer to Checking Aftermarket Accessories .
- Inspect the easily accessible or visible system components, for obvious damage or conditions, which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- ABS Indicator Malfunction
- Traction Control/Stability Control Indicator Malfunction
- Brake Warning Indicator Malfunction

ABS INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Circuit/System Description

The instrument cluster turns the ABS indicator ON for 5 s after the ignition is turned ON, or when the electronic brake control module detects a fault it sends a serial data message to the instrument cluster commanding the indicator ON.

Circuit/System Verification

1. Ignition ON.
2. Verify that no DTCs are set.
    - **If any DTCs are set**

      Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

    - **If no DTCs are set**
3. Verify the Instrument Cluster ABS indicator turns ON and OFF when commanding the All Indicators ON and OFF with a scan tool.
    - **If ABS indicator does not turn ON and OFF**

      Replace the P16 Instrument Cluster.

    - **If the ABS indicator turns ON and OFF**
4. Verify the ABS indicator turns OFF 5 s after the ignition is turned ON.
    - **If the ABS indicator does not turn OFF**

Replace the K17 Electronic Brake Control Module.

- **If the ABS indicator turns OFF**

5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

TRACTION CONTROL/STABILITY CONTROL INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Traction Control Switch Signal	B2745 02	1	1	-
Traction Control Switch Ground	-	1	-	-
1. Traction Control Switch Malfunction.				

Circuit/System Description

The instrument cluster illuminates the traction/stability control indicator, traction control off indicator and stability control off indicator for five seconds after the ignition is turned ON. When the electronic brake control module detects a fault it sends a serial data message to the instrument cluster commanding the traction/stability control indicator ON.

The body control module monitors the electronic stability control switch. When the electronic stability control switch is pressed once, the body control module will request the electronic brake control module via serial data to disable the traction control. When the electronic stability control switch is pressed and held for five seconds, the body control module will request the electronic brake control module to disable the stability control. The Electronic Brake Control Module will request the Instrument Cluster to turn the Traction Control Off and Stability Control Off indicator ON to notify the driver of the deactivation.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the Instrument Cluster indicators listed below turn ON and OFF when commanding the All Indicators ON and OFF with a scan tool.
    - Traction Control Off indicator
    - Stability Control Off indicator
    - Traction/stability Control indicator
    - **If any indicator does not turn ON and OFF**

      Replace the P16 Instrument Cluster.
    - **If all indicators turn ON and OFF**
3. Verify the scan tool Body Control Module, Traction Control Switch parameter changes between Active and Inactive while pressing and releasing the S48C Multifunction Switch 1 - Instrument Panel.
    - **If the parameter does not change**

      Refer to Circuit/System Testing.
    - **If the parameter changes**
4. All OK.

Circuit/System Testing

NOTE: **Circuit/System Verification must be performed before Circuit/System Testing.**

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S48C Multifunction Switch 1 - Instrument Panel. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 10 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Ignition ON.
4. Verify the scan tool Body Control Module, Traction Control Switch parameter is Inactive.
    - **If Active**
    1. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the signal circuit terminal 14 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module.
    - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 3 and ground.
6. Verify the scan tool Traction Control Switch parameter is Active.

- **If Inactive**
  1. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module, ignition ON.
  2. Test for less than 1 V between the signal circuit and ground.
     - If 1 V or greater, repair the short to voltage on the circuit.
     - If less than 1 V.
  3. Test for less than 2 Ω in the signal circuit end to end.
     - If 2 Ω or greater, repair the open/high resistance in the circuit.
     - If less than 2 Ω, replace the K9 Body Control Module.
- **If Active**

7. Test or replace the S48C Multifunction Switch 1 - Instrument Panel.

Component Testing

1. Ignition OFF, disconnect the harness connector at the S48C Multifunction Switch 1 - Instrument Panel.
2. Test for infinite resistance between the signal terminal 3 and the ground terminal 10 with the switch in the open position.
   - **If less than infinite resistance**

     Replace the S48C Multifunction Switch 1 - Instrument Panel.

   - **If infinite resistance**
3. Test for less than 2 Ω between the signal circuit terminal 3 and the ground terminal 10 with the switch in the closed position.
   - **If 2 Ω or greater**

     Replace the S48C Multifunction Switch 1 - Instrument Panel.

   - **If less than 2 Ω**
4. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Hazard Warning Switch Replacement
- Control Module References for Body Control Module or Instrument Cluster replacement, programming and setup.

REPAIR INSTRUCTIONS

ANTILOCK BRAKE SYSTEM AUTOMATED BLEED

WARNING: **Refer to Brake Fluid Irritant Warning .**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

NOTE: **Before performing the ABS Automated Bleed Procedure, first perform a pressure bleed of the base brake system. Refer to Hydraulic Brake System Bleeding . The automated bleed procedure is recommended when one of the following conditions exist:**

- **Base brake system bleeding does not achieve the desired pedal height or feel**
- **Extreme loss of brake fluid has occurred**
- **Air ingestion is suspected in the secondary circuits of the brake modulator assembly**

The ABS Automated Bleed Procedure uses a scan tool to cycle the system solenoid valves and run the pump in order to purge any air from the secondary circuits. These circuits are normally closed off, and are only opened during system initialization at vehicle start up and during ABS operation. The automated bleed procedure opens these secondary circuits and allows any air trapped in these circuits to flow out toward the brake corners.

Performing the Automated Bleed Procedure

CAUTION: **The Auto Bleed Procedure may be terminated at any time during the process by pressing the EXIT button. No further Scan Tool prompts pertaining to the Auto Bleed procedure will be given. After exiting the bleed procedure, relieve bleed pressure and disconnect bleed equipment per manufacturers instructions. Failure to properly relieve pressure may result in spilled brake fluid causing damage to components and painted surfaces.**

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove all four tire and wheel assemblies. Refer to **Tire and Wheel Removal and Installation** .
3. Inspect the brake system for leaks and visual damage. Repair or replace components as needed.
4. Lower the vehicle.
5. Inspect the battery state of charge. Refer to **Battery Inspection/Test** .
6. Install a scan tool.
7. Place the Power button in Service Only Mode.
8. With the scan tool, establish communications with the ABS system. Select Control Functions. Select Automated Bleed from the Control Functions menu.
9. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
10. Following the directions given on the scan tool, pressure bleed the base brake system. Refer to **Hydraulic Brake System Bleeding** .
11. Follow the scan tool directions until the desired brake pedal height is achieved.
12. If the bleed procedure is aborted, a malfunction exists. Perform the following steps before resuming the bleed procedure:
    - If a DTC is detected, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** , and diagnose the appropriate DTC.
    - If the brake pedal feels spongy, perform the conventional brake bleed procedure again. Refer to **Hydraulic Brake System Bleeding** .
13. When the desired pedal height is achieved, press the brake pedal to inspect for firmness.
14. Install the tire and wheel assemblies. Refer to **Tire and Wheel Removal and Installation** .
15. Lower the vehicle.
16. Remove the scan tool.
17. Inspect the brake fluid level. Refer to **Master Cylinder Reservoir Filling** .
18. Road test the vehicle while inspecting that the pedal remains high and firm.

STEERING WHEEL ANGLE SENSOR CENTERING

The steering angle sensor does not require centering often. Centering of the steering angle sensor might be required after certain service procedures are performed. Some of these procedures are as follows:

- Wheel alignment
- Steering gear replacement
- Steering column replacement
- Collision or other physical damage
- Power steering control module replacement

The steering angle sensor centering procedure can be completed with a scan tool using the following steps:

1. Using the steering wheel, align and center the front wheels forward.
2. Apply the parking brake, or set the transmission in Park.
3. Install the scan tool to the data link connector.
4. Vehicle in Service Mode.
5. With the scan tool select the Power Steering Control Module.
6. Select the Steering Wheel Angle Sensor Centering under Configuration/Reset Functions list.
7. Follow the scan tool directions to complete the learn procedure.
8. With the scan tool select the Electronic Brake Control Module.
9. Select the Steering Wheel Angle Sensor Centering under Configuration/Reset Functions list.
10. Follow the scan tool directions to complete the learn procedure.
11. Clear any DTCs that may be set.
12. Vehicle OFF.

Removal Procedure

WARNING: Brake Fluid Irritant Warning

CAUTION: Brake Fluid Effects on Paint and Electrical Components Caution

CAUTION: **Always connect or disconnect the wiring harness connector from the EBCM/EBTCM with the ignition switch in the OFF position. Failure to observe this precaution could result in damage to the EBCM/EBTCM.**

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Disable the high voltage system. High Voltage Disabling
2. Remove the radiator surge tank bolts and reposition the heater surge tank from the heater surge tank bracket with the hoses connected. Heater Coolant Surge Tank Replacement

BRAKE PRESSURE MODULATOR VALVE PRESSURE SENSOR CALIBRATION

The brake pressure sensor does not require calibration often. Calibration of the brake pressure sensor might be required after certain service procedures are performed. Some of these procedures are as follows:

- Electronic brake control module (EBCM) replacement.
- Brake pressure modulator valve assembly replacement

The Brake Pressure Sensor Calibration procedure can be completed with a scan tool using the following steps:

1. Apply the parking brake, or set the transmission in the P position.
2. Release the brake pedal.
3. Install the scan tool to the data link connector.
4. Ignition ON/Vehicle in Service Mode
5. Select Brake Pressure Sensor Calibration in the EBCM Configuration/Reset Functions list.
6. Follow the scan tool directions to complete the calibration procedure.
7. Clear any DTCs that may be set.

VEHICLE YAW SENSOR LEARN

The yaw rate sensor does not require calibration often. Calibrating the yaw rate sensor might be required after certain service procedures are performed. Some of these procedures are as follows:

- Yaw Rate Sensor replacement
- Electronic Brake Control Module replacement
- Inflatable Restraint Sensing and Diagnostic Module replacement

The yaw rate sensor learn procedure can be completed with a scan tool using the following steps:

1. Place vehicle on a level surface
2. Apply the parking brake, or set the transmission in the Park position.
3. Install the scan tool to the data link connector.
4. Ignition ON/Vehicle in Service Mode.
5. Select Yaw Rate Sensor Learn in the Electronic Brake Control Module Configuration/Reset Functions list.
6. Follow the scan tool directions to complete the calibration procedure.
7. Clear any DTCs that may be set.

NOTE: **EBCM terminal pin locations may differ between different RPO option brake systems.**

This vehicle is equipped with a Bosch ABS 9.0 brake system. The electronic brake control module and the brake pressure modulator valve are serviced separately. The brake pressure modulator valve uses a four circuit configuration to control hydraulic pressure to each wheel independently. Vehicles built with option RPO FX3 will feature stability enhancement.

The following vehicle performance enhancement systems are provided.

- ABS
- Brake Assist
- Electronic Brake Distribution
- Electronic stability control
- Hill start assist
- Traction control system

The following components are involved in the operation of the above systems:

- Electronic Brake Control Module - The electronic brake control module controls the system functions and detects failures. It supplies voltage to the solenoid valves and pump motor.
- Brake pressure modulator valve - The brake pressure modulator valve contains the hydraulic valves and pump motor that are controlled electrically by the electronic brake control module. The brake pressure modulator uses a four circuit configuration with a diagonal split. The brake pressure modulator directs fluid from the reservoir of the master cylinder to the left front and right rear wheels and fluid from the other reservoir to the right front and left rear wheels. The diagonal circuits are hydraulically isolated so that a leak or malfunction in one circuit will allow continued braking ability on the other.

  The brake pressure modulator contains the following components:

  - Brake pressure sensor
  - Four inlet valves (one per wheel)
  - Four outlet valves (one per wheel)
  - Pump motor
  - Two traction/stability control supply valves
  - Two traction/stability control isolation valves
- Body control module monitors the brake pedal position sensor signal when the brake pedal is applied and sends a high speed serial data message to the electronic brake control module indicating the brake pedal position.

- Brake pressure sensor is used to sense the action of the driver application of the brake pedal. The sensor provides an voltage signal that will increase as the brake pedal is applied. The electronic brake control module monitors the brake pressure sensor which is integral to the brake pressure modulator.
- Instrument cluster - The instrument cluster displays the vehicle speed based on the information from the engine control module. The engine control module sends the vehicle speed information via a high speed serial data to the body control module. The body control module then sends the vehicle speed information via a low speed serial data to the instrument cluster in order to display the vehicle speed, either in kilometers or miles, based on the vehicle requirements.
- Multi-axis acceleration sensor - The yaw rate, lateral acceleration and longitudinal acceleration sensors are combined into one multi-axis acceleration sensor, internal to the inflatable restraint sensing and diagnostic module. The electronic brake control module receives serial data message inputs from the yaw rate, lateral acceleration and longitudinal acceleration sensor and activates stability control and hill hold start assist function depending on multi-axis acceleration sensor input.
- Multifunction switch - The traction control switch is a multifunction momentary switch. The body control module monitors the signal circuit from the traction control switch and sends a high speed serial data message to the electronic brake control module indicating the switch position. The traction control and stability control are manually disabled or enabled by pressing the traction control switch.
- Steering angle sensor - The electronic brake control module receives serial data message inputs from the steering angle sensor. The steering angle sensor signal is used to calculate the desired yaw rate.
- Transmission control module - The electronic brake control module receives high speed serial data message inputs from the transmission control module indicating the gear position of the transmission for hill start assist functions.
- Wheel speed sensors - This vehicle is equipped with unique directional wheel speed sensors that can detect wheel direction as well as zero wheel speed. The wheel speed sensors are Active sensors that receive a 12 V power supply voltage from the electronic brake control module and provides an output signal to the module. As the wheel spins, the wheel speed sensor sends the electronic brake control module a DC square wave signal. The electronic brake control module uses the frequency of the square wave signal to calculate the wheel speed.

Power-Up-Self Test

The electronic brake control module is able to detect many malfunctions whenever the ignition is ON. However, certain failures cannot be detected unless active diagnostic tests are performed on the components. Shorted solenoid coil or motor windings, for example, cannot be detected until the components are commanded ON by the electronic brake control module. Therefore, a power-up self-test is performed to verify correct operation of system components. The electronic brake control module performs the first phase of the power-up self-test when the ignition is first turned ON. This phase consists of internal self-testing of the electronic brake control module along with electrical checks of system sensors and circuits.

Initialization Sequence

The initialization sequence cycles each solenoid valve and the pump motor, as well as the necessary relays, for approximately forty milliseconds to check component operation. The active test is initiated by the electronic brake control module at the start of the ignition cycle and the speed of the fastest wheel exceeds 16 km/h (10 MPH). If a fault condition is detected the electronic brake control module sets a DTC.

ABS

When wheel slip is detected during a brake application, an ABS event occurs. During ABS braking, hydraulic pressure in the individual wheel circuits is controlled to prevent any wheel from slipping. A separate hydraulic line and specific solenoid valves are provided for each wheel. The ABS can decrease, hold, or increase hydraulic pressure to each wheel. The ABS does not, however, increase hydraulic pressure above the amount which is transmitted by the master cylinder during braking.

During ABS braking, a series of rapid pulsations is felt in the brake pedal. These pulsations are caused by the rapid changes in position of the individual solenoid valves as the electronic brake control module responds to wheel speed sensor inputs and attempts to prevent wheel slip. These pedal pulsations are present only during ABS braking and stop when normal braking is resumed or when the vehicle comes to a stop. A ticking or popping noise may also be heard as the solenoid valves cycle rapidly. During ABS braking on dry pavement, intermittent chirping noises may be heard as the tires approach slipping. These noises and pedal pulsations are considered normal during ABS operation.

Vehicles equipped with ABS may be stopped by applying normal force to the brake pedal. Brake pedal operation during normal braking is no different than that of previous non ABS systems. Maintaining a constant force on the brake pedal provides the shortest stopping distance while maintaining vehicle stability. The typical ABS activation sequence is as follows.

Pressure Hold

The electronic brake control module closes the inlet valve and keeps the outlet valve closed in order to isolate the system when wheel slip occurs. This holds the pressure steady on the brake so that the hydraulic pressure does not increase or decrease.

Pressure Decrease

The electronic brake control module decreases the pressure to individual wheels during a deceleration when wheel slip occurs. The inlet valve is closed and the outlet valve is opened. The excess fluid is stored in the accumulator until the return pump can return the fluid to the master cylinder.

Pressure Increase

The electronic brake control module increases the pressure to individual wheels during a deceleration in order to reduce the speed of the wheel. The inlet valve is opened and the outlet valve is closed. The increased pressure is delivered from the master cylinder.

Brake Assist

The brake assist function is designed to support the driver in emergency braking situations.

The electronic brake control module receives inputs from the brake pressure sensor. When the electronic brake control module senses an emergency braking situation, the electronic brake control module will actively increase the brake pressure to a specific maximum.

Electronic Brake Distribution

The electronic brake distribution function is designed to support the driver in emergency braking situations.

The electronic brake distribution is a control system that enhances the hydraulic proportioning function of the mechanical proportioning valve in the base brake system. The electronic brake distribution control system is part of the operation software in the electronic brake control module. The electronic brake distribution uses active control with existing ABS in order to regulate the vehicle's rear brake pressure.

Electronic Stability Control (RPO FX3)

The electronic stability control adds an additional level of vehicle control to the electronic brake control module.

Yaw rate is the rate of rotation about the vehicles vertical axis. The electronic stability control is activated when the electronic brake control module determines that the desired yaw rate does not match the actual yaw rate as measured by the yaw rate sensor.

The desired yaw rate is calculated from the following parameters:

- The speed of the vehicle
- The position of the steering wheel
- The lateral acceleration of the vehicle

The difference between the desired yaw rate and the actual yaw rate is the yaw rate error, which is a measurement of over steer or under steer. If the yaw error becomes too large, the electronic brake control module attempts to correct the vehicles yaw rate motion by applying differential braking to the appropriate wheel. The amount of differential braking applied to the left or right front wheel is based on both the yaw rate error and side slip rate error.

The electronic stability control activations generally occur during aggressive driving, in turns or on bumpy roads without much use of the accelerator pedal. When braking during electronic stability control activation, the pedal pulsations feel different than the ABS pedal pulsations. The brake pedal pulsates at a higher frequency during vehicle stability enhancement system activation.

Hill Start Assist

When stopped on a hill, the hill start assist feature prevents the vehicle from rolling before driving off, whether facing uphill or downhill by holding the brake pressure during the transition between when the driver releases the brake pedal and starts to accelerate. The electronic brake control module calculates the brake pressure, which is needed to hold the vehicle on an incline or grade greater than 5% and locks that pressure for up to two seconds by commanding the appropriate solenoid valves ON and OFF when the brake pedal is released. The stop lamps will stay illuminated during the hill start assist operation even though the brake pedal is released, this is considered normal operation.

The hill start assist feature is determined by the electronic brake control module using the following inputs:

- Accelerator pedal position
- Brake pedal position sensor
- Brake pressure
- Clutch switch, if equipped
- Engine torque
- Longitudinal acceleration
- Multi-axis acceleration sensor
- Transmission gear information
- Vehicle speed

Traction Control System

When drive wheel slip is noted while the brake is not applied, the electronic brake control module will enter traction control mode.

First, the electronic brake control module requests the engine control module to reduce the amount of torque to the drive wheels via the serial data. The engine control module reduces torque to the drive wheels by retarding spark timing and turning off fuel injectors. The engine control module reports the amount of torque delivered to the drive wheels via the serial data circuit.

- Pressure hold
- Pressure increase
- Pressure decrease

Driver Information Indicator

ABS Warning Indicator

The instrument cluster turns the ABS warning indicator ON when the following occurs:

- The instrument cluster performs the bulb check.
- The electronic brake control module detects a malfunction which disables the ABS and sends a serial data message to the instrument cluster requesting illumination.

Brake Warning Indicator

The instrument cluster turns the brake warning indicator ON when the following occurs:

- The instrument cluster performs the bulb check.
- The electronic brake control module detects a fault and sends a serial data message to the instrument cluster requesting illumination.
- The body control module detects that the park brake is engaged. The body control module sends a serial data message to the instrument cluster requesting illumination.

Traction/Stability Active Control Indicator

The instrument cluster turns the traction/stability active control system indicator ON when the following occurs:

- The instrument cluster performs the bulb check.
- The ABS system is in traction control or stability control mode.
- The electronic brake control module detects a traction control/stability control occurring and sends a serial data message to the instrument cluster requesting illumination.

Traction Control Off Indicator

The instrument cluster turns the traction control off indicator ON when the following occurs:

- The instrument cluster performs the bulb check.
- The driver manually disables the traction control by pressing the traction control switch. The electronic brake control module sends a serial data message to the instrument cluster requesting illumination.

Stability Control Off Indicator

The instrument cluster turns the stability control off indicator ON when the following occurs:

- The instrument cluster performs the bulb check.
- The driver manually disables the electronic stability control by pressing and holding the traction control switch for five seconds. The electronic brake control module sends a serial data message to the instrument cluster requesting illumination.

Traction/Stability Control Indicator

The instrument cluster turns the traction/stability control system indicator ON when the following occurs:

- The instrument cluster performs the bulb check.
- The electronic brake control module detects a malfunction which disables the traction control or the electronic stability control and sends a serial data message to the instrument cluster requesting illumination.

DIAGNOSTIC INFORMATION AND PROCEDURES

BRAKE ROTOR THICKNESS MEASUREMENT

Special Tools

CH-230-A Disc Gauge

Equivalent regional tools:Special Tools

WARNING: **Refer to Brake Dust Warning .**

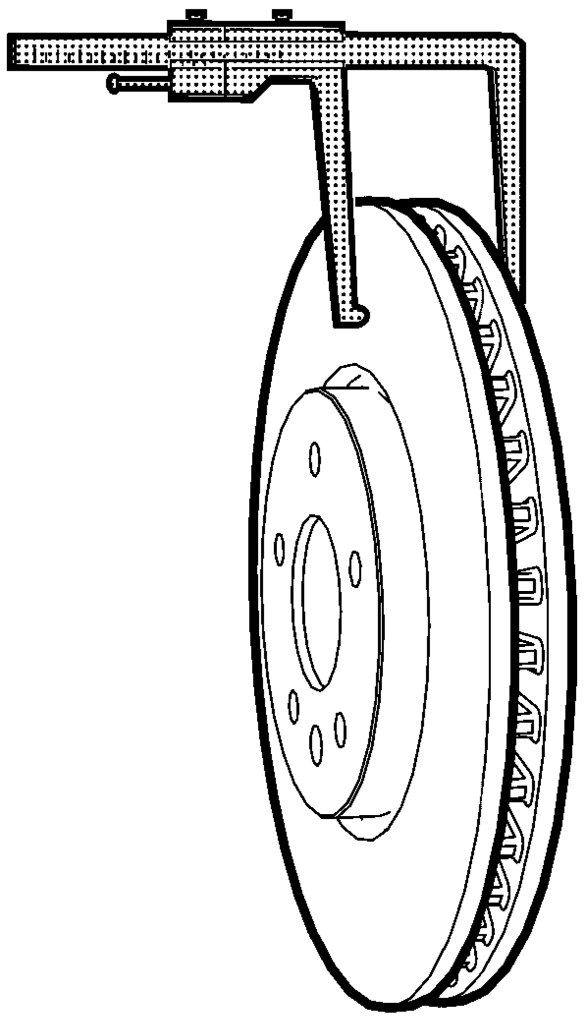

Fig. 1: Locating Disc Gauge
Courtesy of GENERAL MOTORS COMPANY

1. If the inboard friction surface of the brake rotor is not accessible, remove the brake pads. Refer to **Front Disc Brake Pads Replacement**, and/or **Rear Disc Brake Pads Replacement**, if equipped.
2. Clean the friction surfaces of the brake rotor with denatured alcohol, or an equivalent approved brake cleaner.

NOTE: Ensure the measurements are only taken within the friction surfaces.

3. Install the **CH-230-A** gauge for lateral runout measurement.
    1. Measure and record the thickness of the brake rotor at 4 or more points from the brake rotor inside to outside.
    2. Compare the lowest thickness measurement to the disc brake component specifications. Refer to **Disc Brake Component Specifications**.
4. If the lowest thickness measurement of the brake rotor is above the minimum allowable thickness after refinishing specification, the rotor may be able to be refinished, depending upon surface and wear conditions which may be present.
5. If the lowest thickness measurement of the brake rotor is at or below the minimum allowable thickness after refinishing specification, the rotor may not be refinished.
6. If the lowest thickness measurement of the brake rotor is at or below the discard thickness specification, the rotor requires replacement. Refer to **Front Brake Rotor Replacement**, and/or **Rear Brake Rotor Replacement**.

BRAKE ROTOR THICKNESS VARIATION MEASUREMENT

Special Tools

CH-45101 Hub and Wheel Runout Gauge

For equivalent regional tools, refer to **Special Tools**.

WARNING: **Refer to Brake Dust Warning .**

NOTE: Any disc brake rotor that exhibits thickness variation exceeding the maximum acceptable level must be refinished or replaced. Thickness variation exceeding the maximum acceptable level can cause brake pulsation.

1. If the inboard friction surface of the brake rotor is not accessible, remove the brake pads. Refer to **Front Disc Brake Pads Replacement**, and/or **Rear Disc Brake Pads Replacement**, if equipped.
2. Clean the friction surfaces of the brake rotor with denatured alcohol, or an equivalent approved brake cleaner.

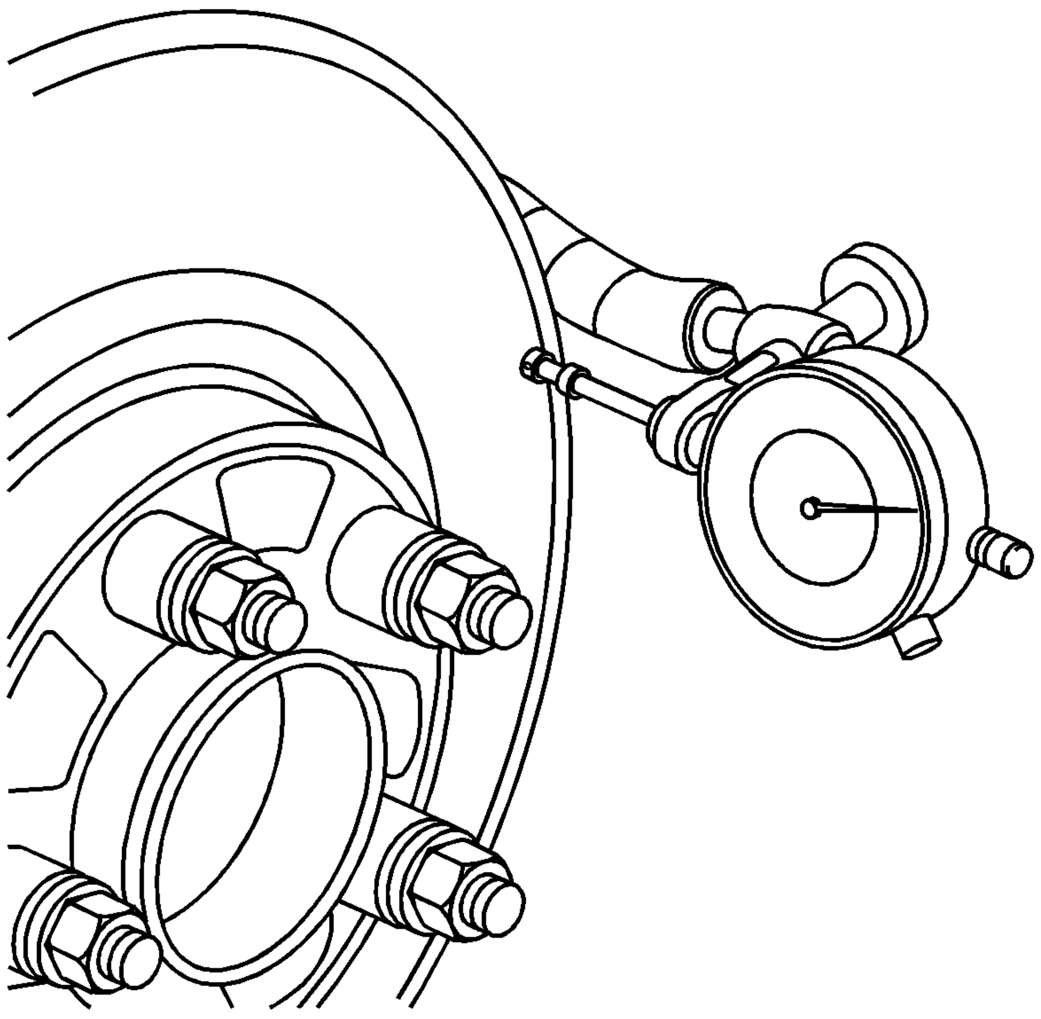

Fig. 2: Using Dial Indicator To Measure Lateral Runout
Courtesy of GENERAL MOTORS COMPANY

NOTE: Ensure the measurements are only taken within the friction surfaces.

3. Install the **CH-45101** runout gauge for lateral runout measurement and compare with the correct specifications. Refer to **Disc Brake Component Specifications**.

NOTE: Whenever a brake rotor is refinished or replaced, the assembled lateral runout (LRO) of the rotor must be measured to ensure optimum performance of the disc brakes.

4. If the brake rotor lateral runout measurement exceeds the specification, the rotor requires refinishing or replacement. Refer to **Front Brake Rotor Replacement**, **Rear Brake Rotor Replacement**, or **Brake Rotor Refinishing**.

BRAKE ROTOR SURFACE AND WEAR INSPECTION

WARNING: **Refer to Brake Dust Warning .**

1. If the inboard friction surface of the brake rotor is not accessible, remove the brake pads. Refer to **Front Disc Brake Pads Replacement**, or/and **Rear Disc Brake Pads Replacement**.
2. Clean the friction surfaces of the brake rotor with denatured alcohol, or an equivalent approved brake cleaner.
3. Inspect the friction surfaces of the brake rotor for the following Braking Surface Conditions:
    - Heavy rust and/or pitting.
    - Light surface rust can be removed with an abrasive disc. Heavy surface rust and/or pitting must be removed by refinishing the rotor. Refer to **Brake Rotor Refinishing**.
    - Cracks and/or heat spots.
    - Excessive bluing discoloration.
4. If the friction surfaces of the brake rotor exhibit one or more of the Braking Surface Conditions, the rotor requires refinishing or replacement. Refer to **Front Brake Rotor Replacement**, **Rear Brake Rotor Replacement**, or **Brake Rotor Refinishing**.

BRAKE ROTOR ASSEMBLED LATERAL RUNOUT MEASUREMENT

Special Tools

- **CH-41013** Rotor Resurfacing Kit
- **CH-42450-A** Wheel Hub Resurfacing Kit
- **CH-45101** Hub and Wheel Runout Gauge
- **CH-45101-100** Conical Brake Rotor Washers

For equivalent regional tool, refer to **Special Tools**.

WARNING: **Refer to Brake Dust Warning .**

NOTE:

- **Brake rotor assembled lateral runout (LRO) exceeding the maximum allowable specification can cause thickness variation to develop in the brake rotor over time, usually between 4800 and 11300 km (3000 and 7000 mi).**
- **Brake rotor thickness variation MUST be checked BEFORE checking for assembled lateral runout (LRO). Thickness variation exceeding the maximum acceptable level can cause brake pulsation. Refer to Brake Rotor Thickness Variation Measurement.**

NOTE: Whenever the brake rotor has been separated from the hub/axle flange, any rust or contaminants should be cleaned from the hub/axle flange and the brake rotor mating surfaces. Failure to do this may result in excessive assembled lateral runout (LRO) of the brake rotor, which could lead to brake pulsation.

1. Inspect the mating surface of the hub/axle flange and the brake rotor to ensure that there are no foreign particles, corrosion, rust, or debris remaining. If the wheel hub/axle flange and/or if the brake rotor mating surfaces exhibit these conditions, perform the following steps:
    1. Remove the brake rotor from the vehicle. Refer to **Front Brake Rotor Replacement**, and/or **Rear Brake Rotor Replacement**.
    2. Using the **CH-42450-A** resurfacing kit, thoroughly clean any rust or corrosion from the mating surface of the hub/axle flange.
    3. Using the **CH-41013** resurfacing kit, thoroughly clean any rust or corrosion from the mating surface of the brake rotor.

4. Clean the friction surfaces of the brake rotor with denatured alcohol, or an equivalent approved brake cleaner.
2. Install the rotor to the hub/axle flange.

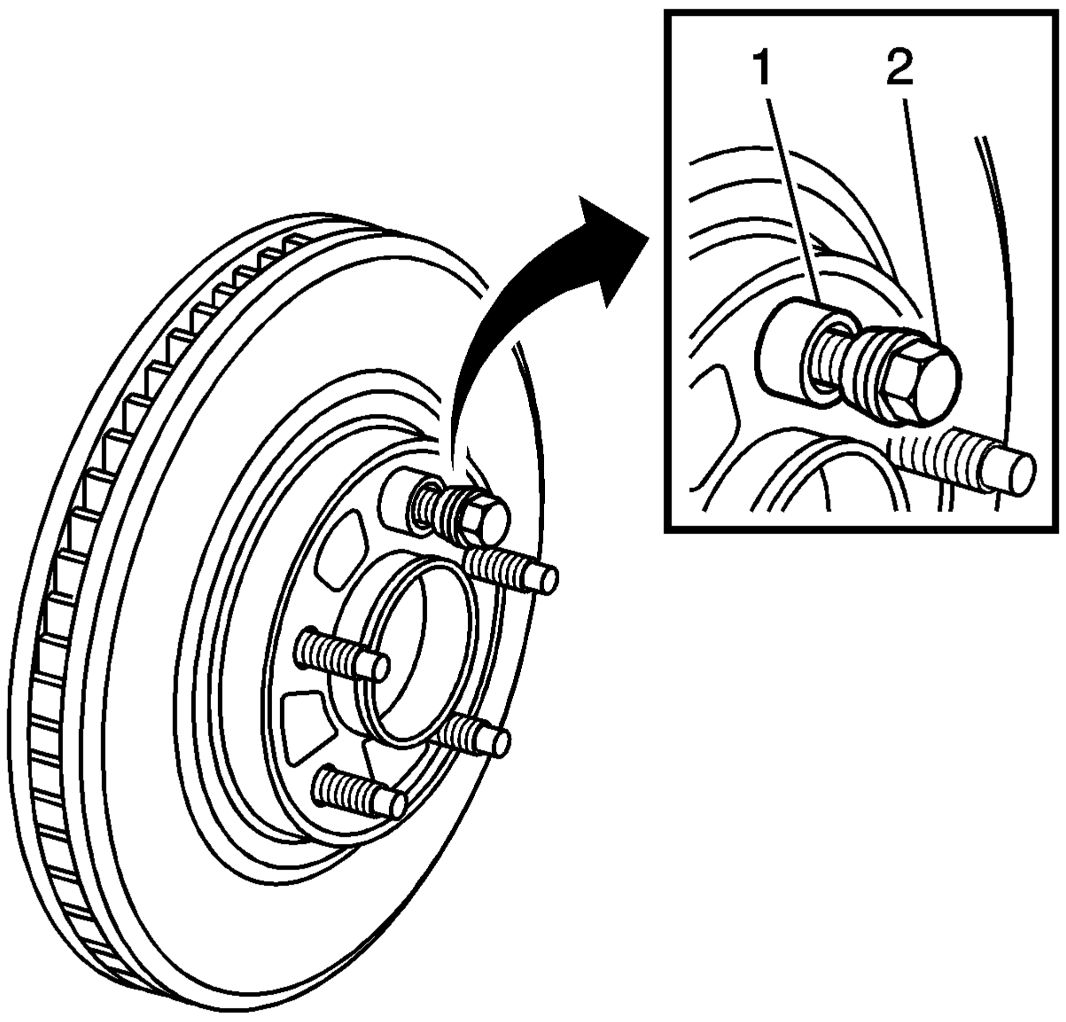

Fig. 3: Lug Nuts & Conical Washers
Courtesy of GENERAL MOTORS COMPANY

3. Hold the rotor firmly in place against the hub/axle flange and install one of the **CH-45101-100** washers (1), and one lug nut (2) onto the upper-most wheel stud.
4. Continue to hold the rotor secure and tighten the lug nut firmly by hand.

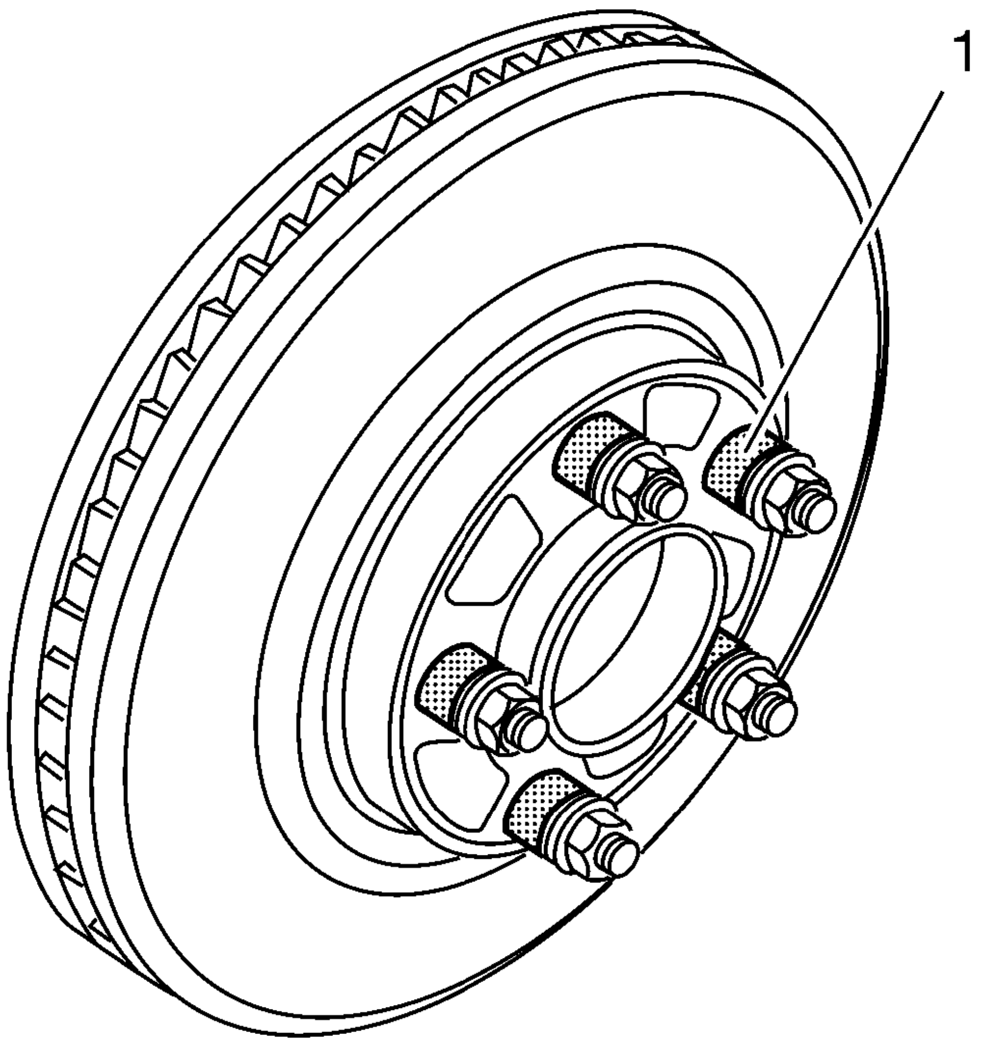

Fig. 4: Conical Washers & Lug Nuts
Courtesy of GENERAL MOTORS COMPANY

5. Install the remaining **CH-45101-100** washers (1) and lug nuts onto the wheel studs and tighten the nuts firmly by hand in a star-pattern.
6. Tighten the lug nuts in a star-pattern to specification, in order to properly secure the rotor. Refer to **Tire and Wheel Removal and Installation** .
7. If the brake rotor has been REFINISHED or REPLACED with a new rotor, proceed to step 13.
8. If the brake rotor meets the following criteria, proceed to step 9.
   - The rotor is within specifications and is being REUSED.
   - The rotor has NOT been refinished.
   - The rotor does NOT exhibit thickness variation exceeding the maximum allowable level.

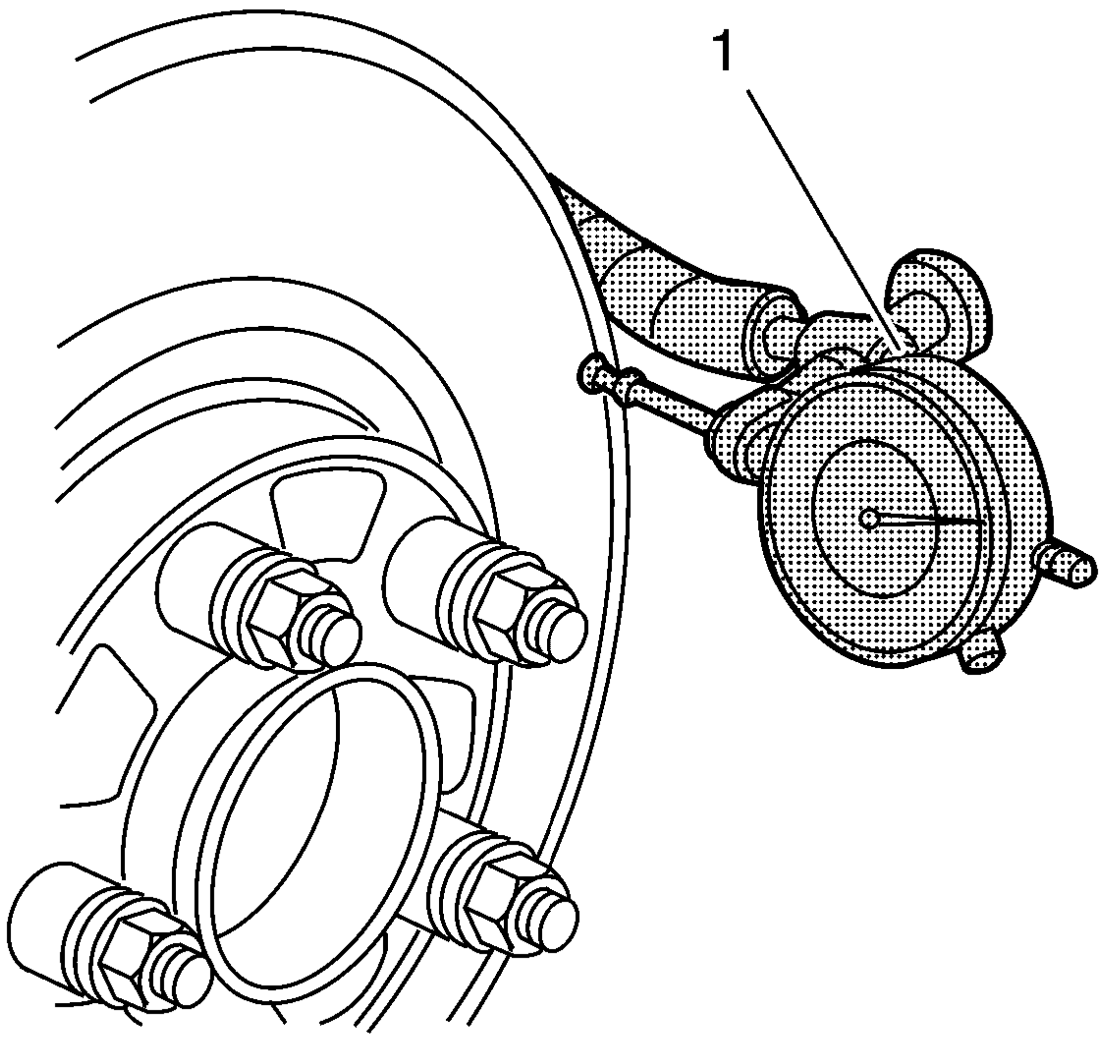

Fig. 5: Measuring Brake Rotor Lateral Runout
Courtesy of GENERAL MOTORS COMPANY

9. Mount the **CH-45101** gauge (1) or equivalent, to the strut and position the indicator button so it contacts the brake rotor friction surface at a 90 degree angle, approximately 13 mm (0.5 in) from the outer edge of the rotor.
10. Measure and record the assembled LRO of the brake rotor.
    1. Rotate the rotor until the lowest reading is displayed on the indicator dial, then set the dial to zero.
    2. Rotate the rotor until the highest reading is displayed on the dial.
    3. Mark the location of the high spot relative to the nearest wheel stud, or studs.
    4. Measure and record the amount of LRO.
11. Compare the brake rotor assembled LRO to the disc brake component specifications. Refer to **Disc Brake Component Specifications**
12. If the brake rotor assembled LRO is within specifications, proceed to step 17.

    If the brake rotor assembled LRO exceeds the specification, refinish the rotor to ensure true parallelism. Refer to **Brake Rotor Refinishing**. After refinishing the rotor, proceed to step 13.

13. Mount the **CH-45101** gauge (1) or equivalent, to the strut and position the indicator button so it contacts the brake rotor friction surface at a 90 degree angle, approximately 13 mm (0.5 in) from the outer edge of the rotor.
14. Measure and record the assembled LRO of the brake rotor.
    1. Rotate the rotor until the lowest reading is displayed on the indicator dial, then set the dial to zero.
    2. Rotate the rotor until the highest reading is displayed on the dial.
    3. Mark the location of the high spot relative to the nearest wheel stud, or studs.
    4. Measure and record the amount of LRO.
15. Compare the brake rotor assembled LRO to the disc brake component specifications.
16. If the brake rotor assembled LRO measurement exceeds the specification, replace the brake rotors. Refer to **Front Brake Rotor Replacement**, and/or **Rear Brake Rotor Replacement**.
17. If the brake rotor assembled LRO measurement is within specification, install the brake caliper and depress the brake pedal several times to secure the rotor in place before removing the **CH-45101-100** washers.

BRAKE PAD INSPECTION

Special Tools

CH-230-A Disc Gauge

For equivalent regional tools, refer to **Special Tools**.

WARNING: **Refer to Brake Dust Warning .**

1. Remove brake pads. Refer to **Front Disc Brake Pads Replacement**, and/or **Rear Disc Brake Pads Replacement**.

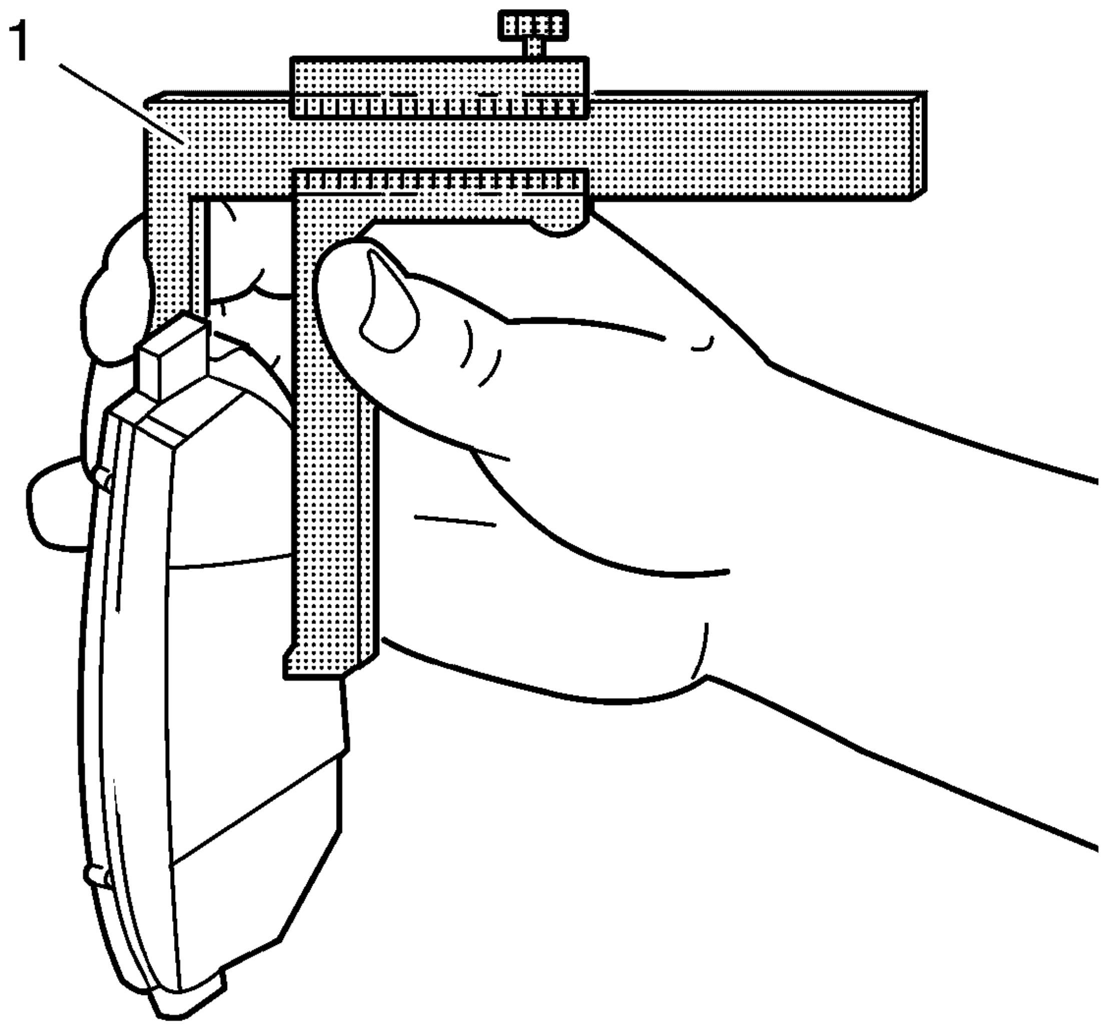

Fig. 6: Measuring Brake Pad Thickness
Courtesy of GENERAL MOTORS COMPANY

2. Measure remaining brake pad thickness at several points, using the **CH-230-A** disc gauge (1).
3. Compare brake pad thickness to disc brake component specifications.

BRAKE CALIPER INSPECTION

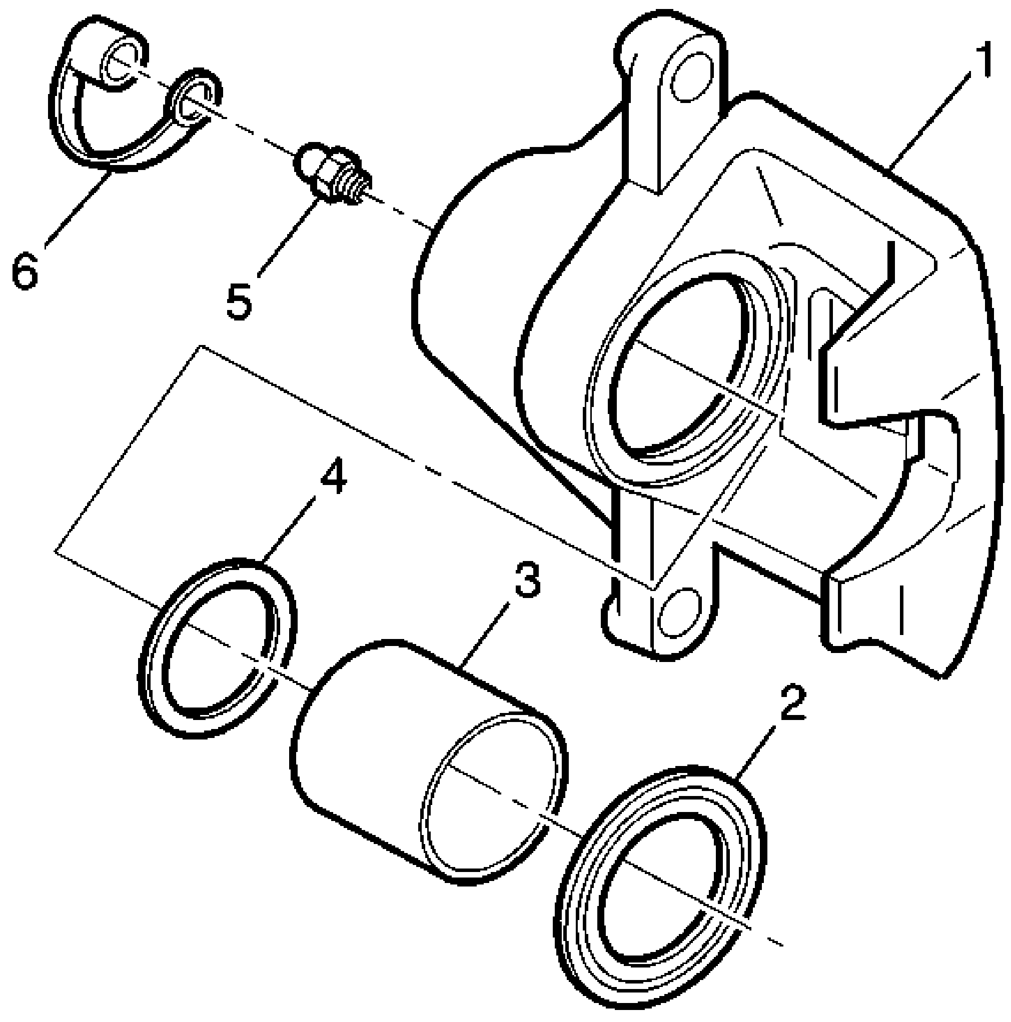

Fig. 7: Exploded View Of Brake Caliper
Courtesy of GENERAL MOTORS COMPANY

WARNING: **Refer to Brake Dust Warning .**

1. Inspect the brake caliper housing (1) for cracks, excess wear, and/or damage. If any of these conditions are present, the brake caliper requires replacement.
2. Inspect the caliper piston dust boot seal (2) for cracks, tears, cuts, deterioration and/or improper seating in the caliper body. If any of these conditions are present, the brake caliper requires overhaul or replacement.
3. Inspect for brake fluid leakage around the caliper piston dust boot seal (2) and on the disc brake pads. If there is any evidence of brake fluid leakage, the brake caliper requires overhaul or replacement.

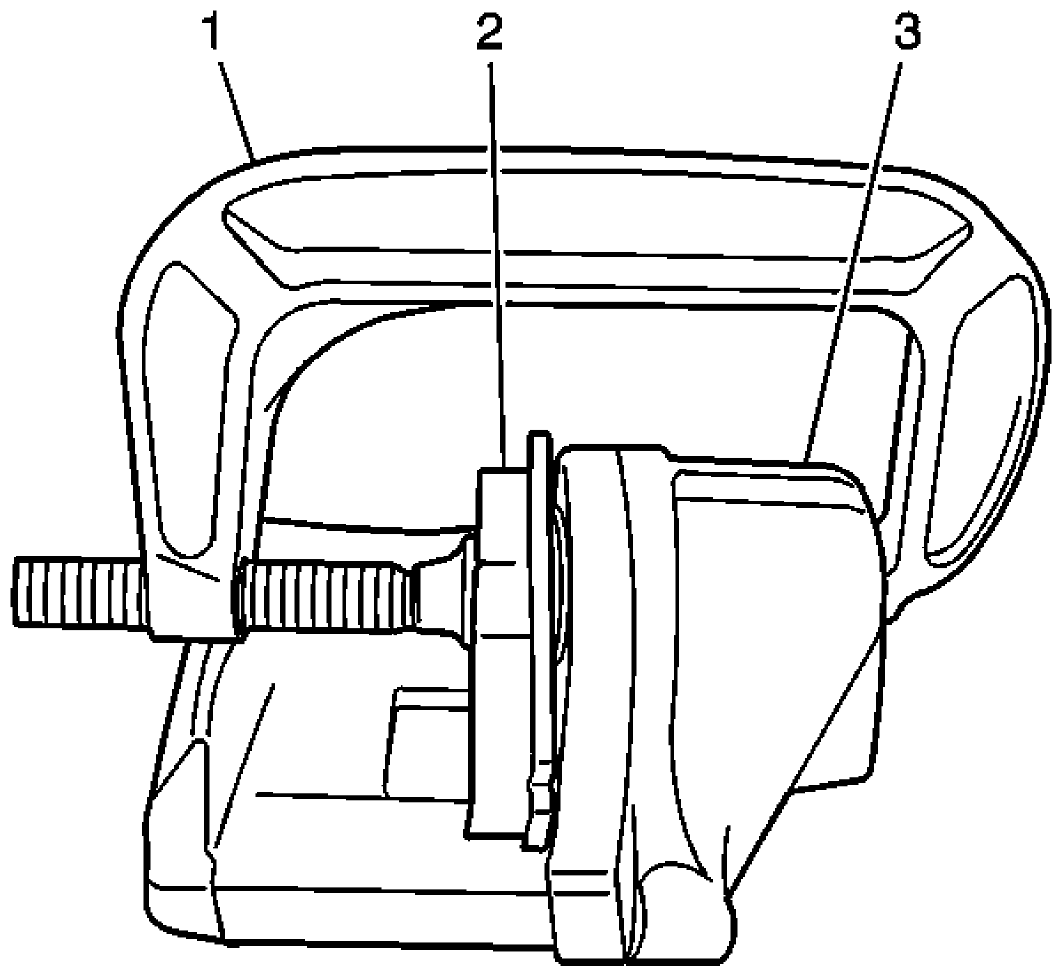

Fig. 8: Compressing Caliper Piston
Courtesy of GENERAL MOTORS COMPANY

4. Inspect for smooth and complete travel of the caliper pistons into the caliper bores:

   The movement of the caliper pistons into the caliper bores should be smooth and even. If the caliper piston is frozen or difficult to bottom, the caliper requires overhaul or replacement.

   - For single piston caliper applications, insert a discarded inner brake pad (2) or block of wood in front of the piston. Using a large C-clamp (1) installed over the body of the caliper (3) and against the brake pad or block of wood, slowly bottom the piston in the bore.
   - For dual piston caliper applications, insert a discarded inner brake pad (2) or block of wood in front of the pistons. Using 2 large C-clamps (1) installed over the body of the caliper (3) and against the brake pad or block of wood, slowly bottom the pistons evenly into the bores.

FRONT DISC BRAKE MOUNTING AND HARDWARE INSPECTION

WARNING: **Refer to Brake Dust Warning .**

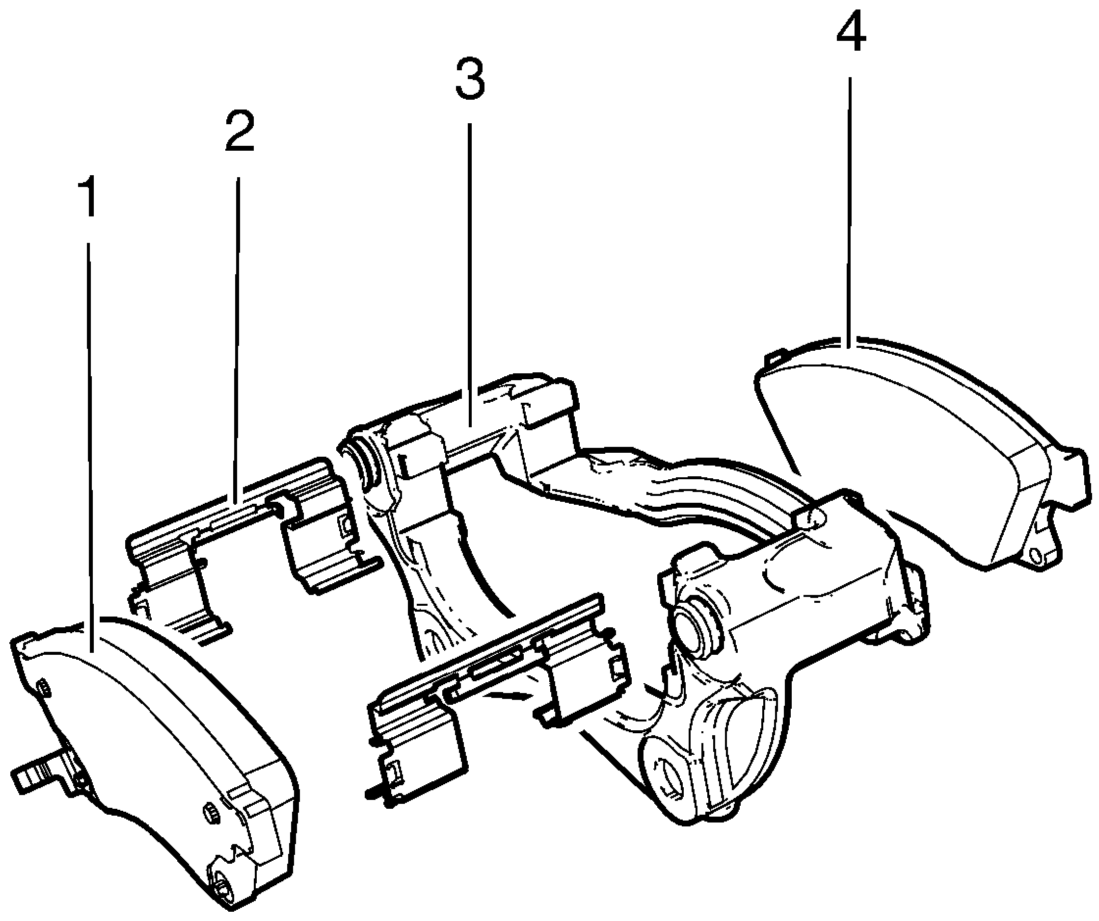

Fig. 9: Exploded View Of Brake Pads And Brake Caliper Mounting Bracket
Courtesy of GENERAL MOTORS COMPANY

1. Inspect the fluid level in the brake master cylinder reservoir.
2. If the brake fluid level is midway between the maximum-full point and the minimum allowable level then no brake fluid needs to be removed from the reservoir before proceeding.
3. If the brake fluid level is higher than midway between the maximum-full point and the minimum allowable level then remove brake fluid to the midway point before proceeding.
4. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
5. Remove the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
6. Grasp the brake caliper housing and try to move the brake caliper housing up/down and forward/reverse in relation to the brake caliper mounting bracket (3). If excessive looseness is observed the brake caliper bracket bushings and/or the brake caliper mounting bolts may need to be replaced. Compress the front caliper pistons
7. Compress the front caliper pistons.
   1. Install a large C-clamp over the top of the caliper housing and against the back of the outboard pad (1).
   2. Slowly tighten the C-clamp until the pistons are pushed completely into the caliper bores.
   3. Remove the C-clamp from the caliper.
8. With the pistons compressed into the caliper bores, grasp the brake caliper housing and slide it back and forth on the brake caliper mounting bolts. Check for smooth operation. If the brake caliper housing slide force is high or the brake caliper housing does not slide smoothly, inspect the brake caliper mounting bolts and/or the brake caliper mounting bracket bushings for wear or damage. If wear or damage conditions are found, replacement of the brake caliper mounting bolts and/or the brake caliper mounting bracket bushings is necessary.
9. Remove the brake caliper mounting bolts from the brake caliper mounting bracket and support the brake caliper using heavy mechanics wire. Do Not remove the hydraulic brake hose from the caliper. Refer to **Front Brake Caliper Replacement**.
10. Remove the disc brake pads (1, 2) from the brake caliper mounting bracket (3).
11. Inspect the disc brake pad mounting hardware for the following:
    - Missing mounting hardware.
    - Excessive corrosion.
    - Bent pad retainer spring (2).
    - Looseness at the brake caliper mounting bracket (3).
    - Looseness at the disc brake pads (1, 4).
    - Excessive contaminants in the brake caliper mounting bracket (3) surface and threads.
12. If any of the conditions listed are found, the disc brake pad mounting hardware requires replacement.
13. Ensure the disc brake pads are held firmly in place on the brake caliper mounting bracket, yet slide easily on the mounting hardware without binding.

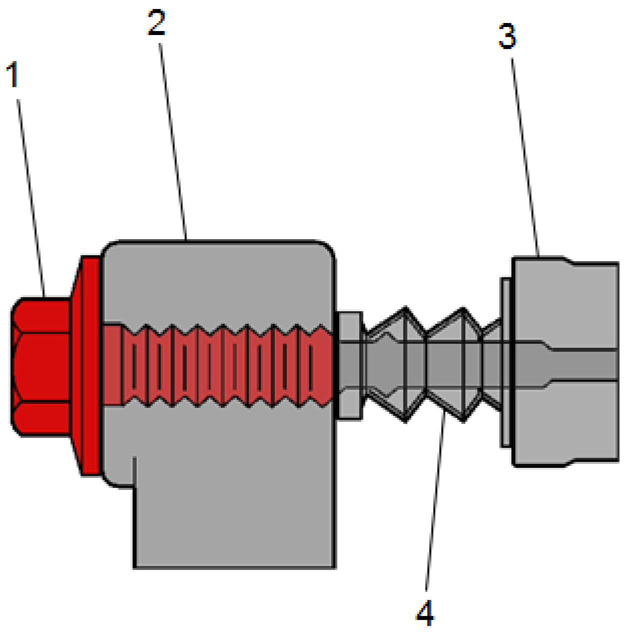

Fig. 10: View Of Caliper, Pin, Boots & Caliper Mounting Bracket
Courtesy of GENERAL MOTORS COMPANY

14. Inspect the brake caliper mounting hardware for the following:
    - Binding
    - Seizing
    - Looseness in the brake caliper mounting bracket (3).
    - Bent or damaged brake caliper mounting bolts (1).
    - Cracked or torn boots (4).
    - Missing boots.
    - Bent or damaged brake caliper mounting bracket (3).
    - Cracked or damaged brake caliper (2).
15. If any of the conditions listed are found then the brake caliper mounting hardware requires replacement.
16. Install the disc brake pads to the brake caliper mounting bracket.
17. Install the disc brake caliper to the brake caliper mounting bracket. Refer to **Front Brake Caliper Replacement**.

REAR DISC BRAKE MOUNTING AND HARDWARE INSPECTION

WARNING: **Brake Dust Warning**

1. Remove Rear Brake Caliper Bracket **Rear Brake Caliper Bracket Replacement**

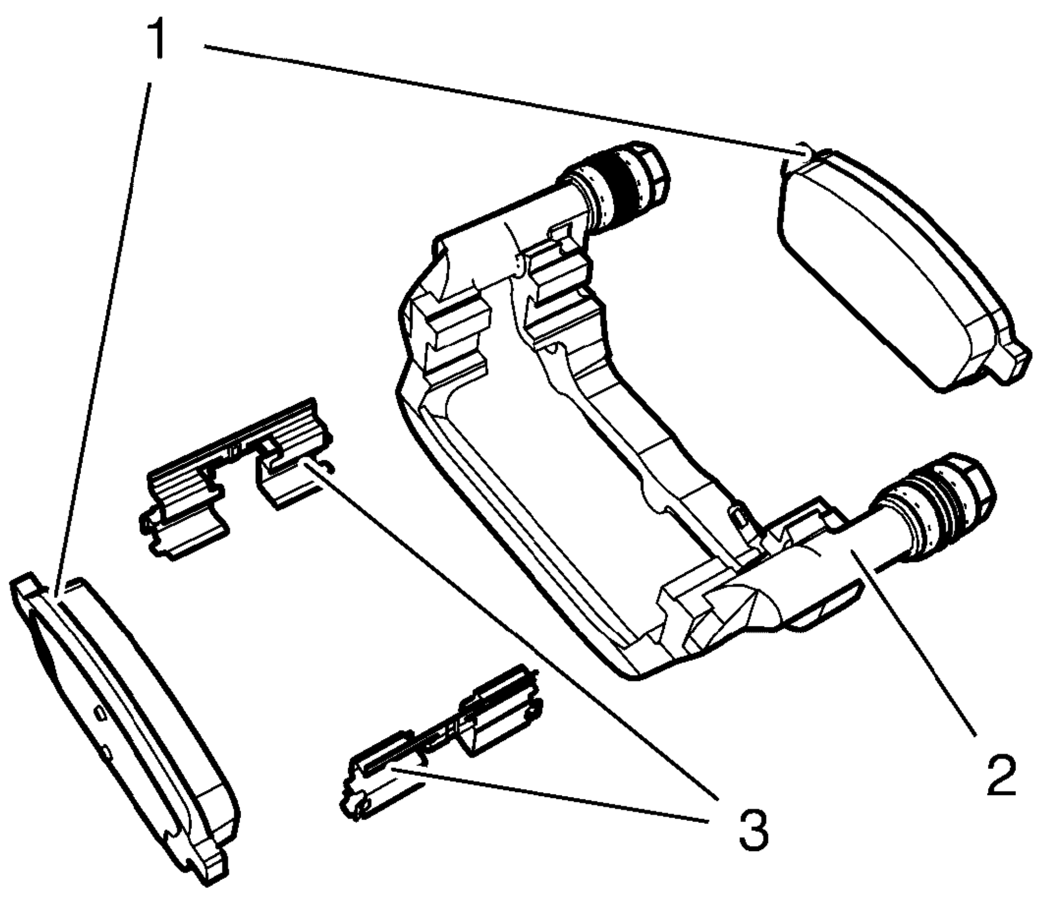

Fig. 11: Exploded View Of Brake Pads And Brake Caliper Mounting Bracket
Courtesy of GENERAL MOTORS COMPANY

2. Remove the disc brake caliper from the caliper mounting bracket (2).
3. Remove the disc brake pads (1) from the caliper mounting bracket (2).
4. Inspect the disc brake pad mounting hardware (3) (if installed) for the following:
    - Missing mounting hardware.
    - Excessive corrosion.
    - Brake pad fastener spring is bent.
    - Looseness at the brake caliper mounting bracket.
    - Looseness at the disc brake pads.
    - Excessive contaminants in the brake caliper mounting bracket surface and threads.
5. If any of the conditions listed are found, the disc brake pad mounting hardware requires replacement.
6. Ensure the disc brake pads are held firmly on the brake caliper mounting bracket, yet slide easily on the mounting hardware without binding.

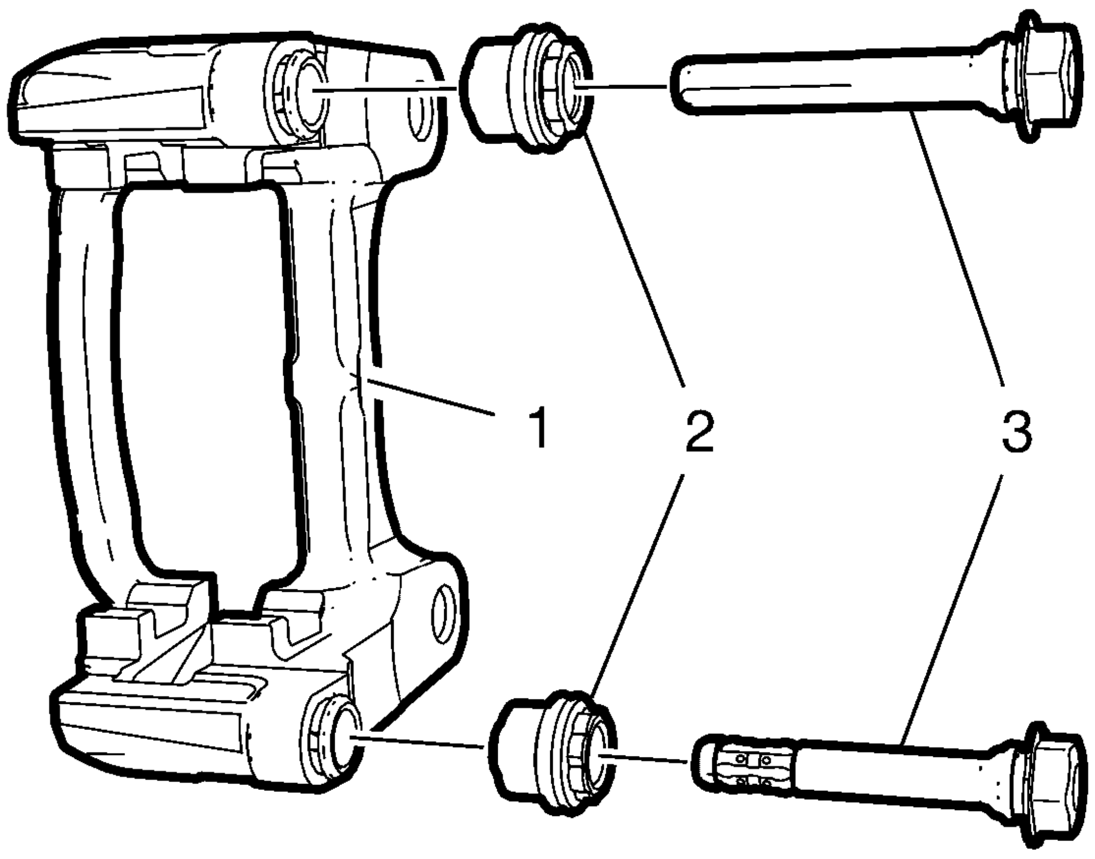

Fig. 12: Brake Caliper And Mounting Brackets
Courtesy of GENERAL MOTORS COMPANY

7. Inspect the brake caliper mounting hardware for the following:
    - Binding
    - Seizing
    - Looseness in the brake caliper mounting bracket (1)
    - Bent or damaged brake caliper mounting bolts
    - Cracked or torn boots (4)
    - Missing boots
    - Bent or damaged brake caliper mounting bracket (3)
    - Cracked or damaged brake caliper (2)
8. If any of the conditions listed are found then the brake caliper mounting hardware requires replacement.
9. Install the disc brake pads to the caliper mounting bracket.
10. Install the disc brake caliper to the mounting bracket.
11. Install Rear Brake Caliper Bracket **Rear Brake Caliper Bracket Replacement**

REPAIR INSTRUCTIONS

FRONT DISC BRAKE PADS REPLACEMENT

Removal Procedure

WARNING: **Brake Dust Warning**

WARNING: **Brake Fluid Irritant Warning**

CAUTION: **Brake Fluid Effects on Paint and Electrical Components Caution**

NOTE: **Always replace disc brake pads in axle sets.**

1. Inspect the fluid level in the brake master cylinder reservoir.
2. If the brake fluid level is midway between the maximum-full point and the minimum allowable level, no brake fluid needs to be removed before proceeding.
3. If the brake fluid level is higher than midway between the maximum-full point and the minimum allowable level, remove brake fluid to the midway point before proceeding.
4. Raise and support the vehicle. **Lifting and Jacking the Vehicle**
5. Remove the front tire and wheel assembly. **Tire and Wheel Removal and Installation**

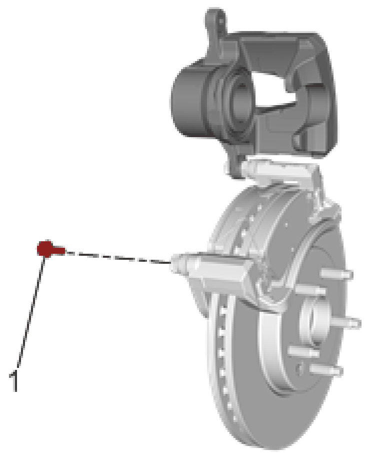

Fig. 13: Front Brake Caliper Guide Pin Bolt
Courtesy of GENERAL MOTORS COMPANY

NOTE:
- **Do NOT use any air tools to remove or install the brake caliper guide pin bolts. Use hand tools ONLY.**
- **Install an open end wrench to hold the caliper guide pin in line with the brake caliper while removing or installing the caliper guide pin bolt.Allowing the open end wrench to come in contact with the brake caliper will cause a pulsation when the brakes are applied.**

6. Remove Front Brake Caliper Guide Pin Bolt (1)

CAUTION: **Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.**

7. Pivot the brake caliper upward and secure with heavy mechanics wire, or equivalent.

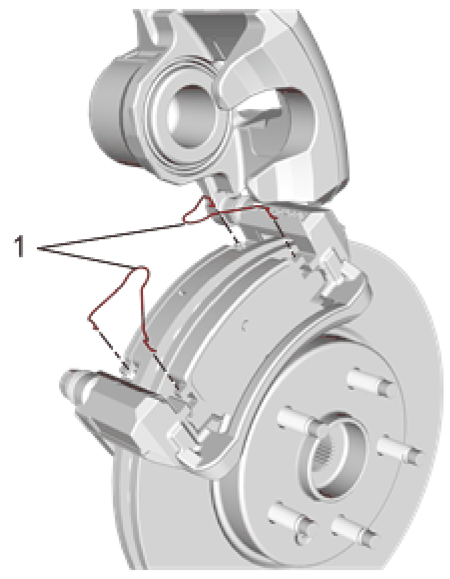

Fig. 14: Front Brake Caliper Spring
Courtesy of GENERAL MOTORS COMPANY

8. Remove Front Brake Caliper Spring (1) and DISCARD

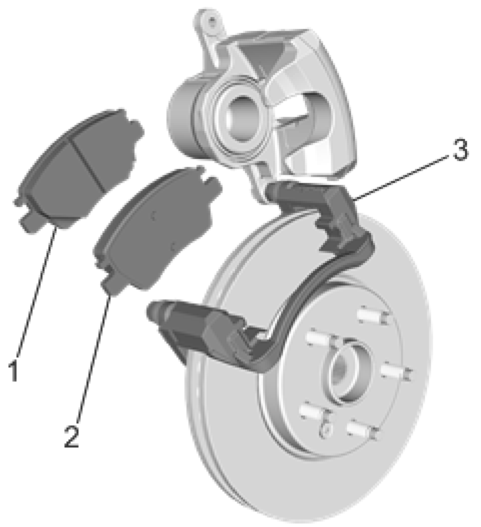

Fig. 15: Front Disc Brake Inner Pad
Courtesy of GENERAL MOTORS COMPANY

9. Remove Front Disc Brake Inner Pad (1) @Front Brake Caliper Bracket (3)
10. Remove Front Disc Brake Outer Pad (2) @Front Brake Caliper Bracket (3)

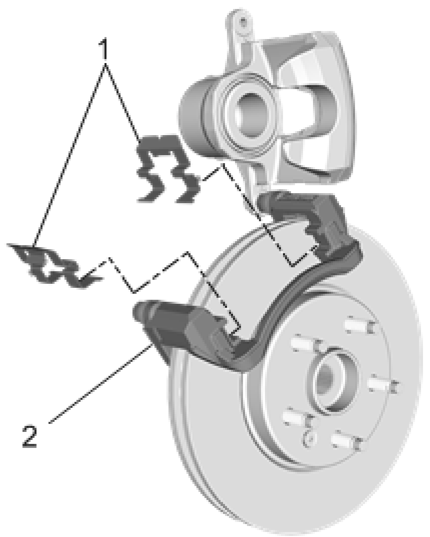

Fig. 16: Front Disc Brake Pad Retainer Spring
Courtesy of GENERAL MOTORS COMPANY

11. Remove Front Disc Brake Pad Retainer Spring (1) @Front Brake Caliper Bracket (2)
12. Inspect the front disc brake mounting and hardware. **Front Disc Brake Mounting and Hardware Inspection**

Installation Procedure

1. Using a commercial brake caliper piston retracting tool, carefully push back the brake caliper piston until it is compressed completely into the caliper bore.

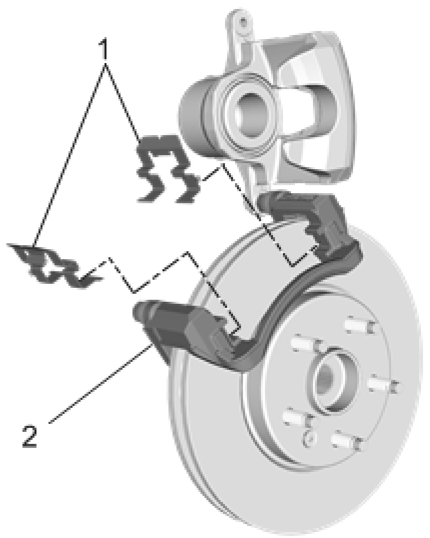

Fig. 17: Front Disc Brake Pad Retainer Spring
Courtesy of GENERAL MOTORS COMPANY

2. Install Front Disc Brake Pad Retainer Spring (1) @Front Brake Caliper Bracket (2)

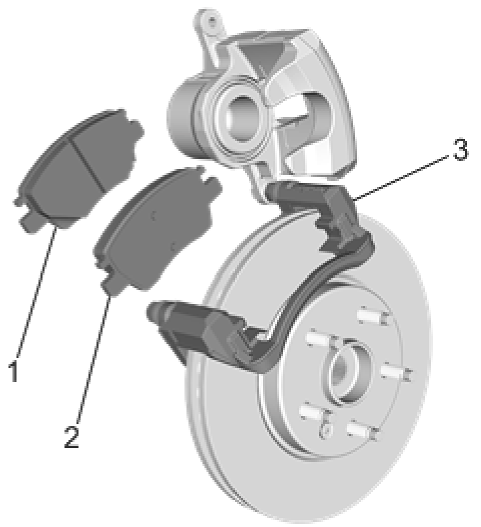

Fig. 18: Front Disc Brake Inner Pad
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The disc brake pad equipped with wear sensor has to be mounted in upper position on the inner side of the rotor.**

3. Front Disc Brake Outer Pad (2) @Front Brake Caliper Bracket (3)
4. Front Disc Brake Inner Pad (1) @Front Brake Caliper Bracket (3)

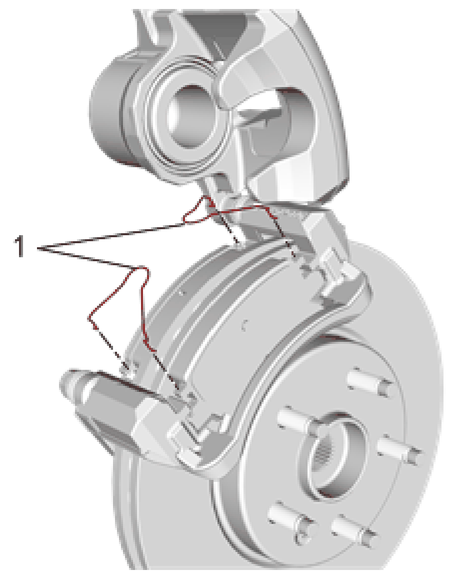

Fig. 19: Front Brake Caliper Spring
Courtesy of GENERAL MOTORS COMPANY

5. Install Front Brake Caliper Spring (1)

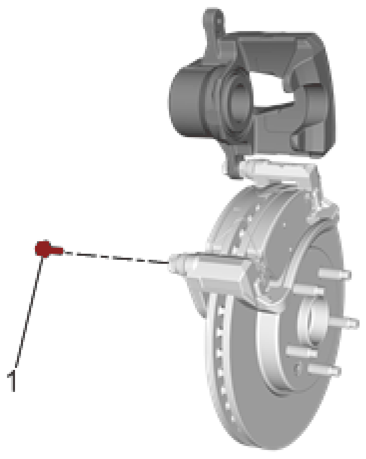

Fig. 20: Front Brake Caliper Guide Pin Bolt
Courtesy of GENERAL MOTORS COMPANY

6. Remove the support and rotate the front brake caliper into position over the disc brake pads and to the caliper mounting bracket.

CAUTION: Fastener Caution

NOTE: **Install an open end wrench to hold the caliper guide pin in line with the brake caliper while removing or installing the caliper guide pin bolt.**

7. Install Front Brake Caliper Guide Pin Bolt (1) and tighten 40 N.m (30 lb ft)
8. Install the front tire and wheel assembly. Tire and Wheel Removal and Installation
9. Lower the vehicle.
10. With the vehicle OFF, gradually apply the brake pedal to approximately 2/3 of its travel distance.
11. Slowly release the brake pedal.
12. Wait 15 seconds, then gradually apply the brake pedal approximately 2/3 of its travel distance again until a firm brake pedal apply is obtained. This will properly seat the brake caliper pistons and brake pads.
13. Inspect the fluid level in the brake master cylinder reservoir.
14. Fill the brake master cylinder reservoir to the maximum-full level with GM approved brake fluid from a clean, sealed brake fluid container. Master Cylinder Reservoir Filling
15. Burnish the brake pads and rotors. Brake Pad and Rotor Burnishing

REAR DISC BRAKE PADS REPLACEMENT

Removal Procedure

WARNING: Brake Dust Warning

WARNING: Brake Fluid Irritant Warning

CAUTION: Brake Fluid Effects on Paint and Electrical Components Caution

NOTE: **Always replace disc brake pads in axle sets.**

1. Inspect the fluid level in the brake master cylinder reservoir.
2. If the brake fluid level is midway between the maximum-full point and the minimum allowable level, no brake fluid needs to be removed before proceeding.
3. If the brake fluid level is higher than midway between the maximum-full point and the minimum allowable level, remove brake fluid to the midway point before proceeding.
4. Set the parking brake in service mode. Rear Parking Brake Service Mode Selection
5. Turn OFF the vehicle.
6. Raise and support the vehicle. Lifting and Jacking the Vehicle
7. Remove the rear tire and wheel assembly. Tire and Wheel Removal and Installation

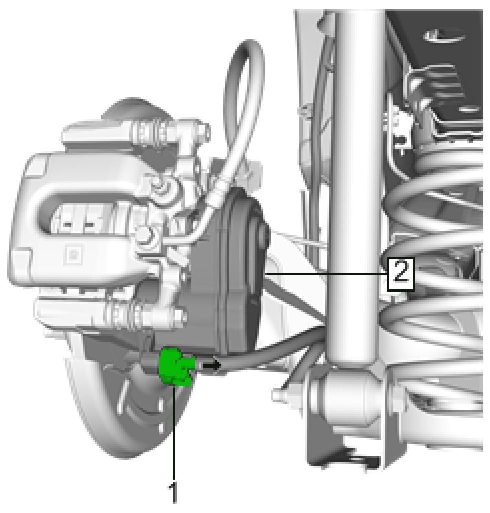

Fig. 21: Electrical Connector

13. Remove Rear Disc Brake Pad Retainer Spring (1) @Rear Brake Caliper Bracket (2)
14. Inspect the rear disc brake mounting and hardware. Rear Disc Brake Mounting and Hardware Inspection

Installation Procedure

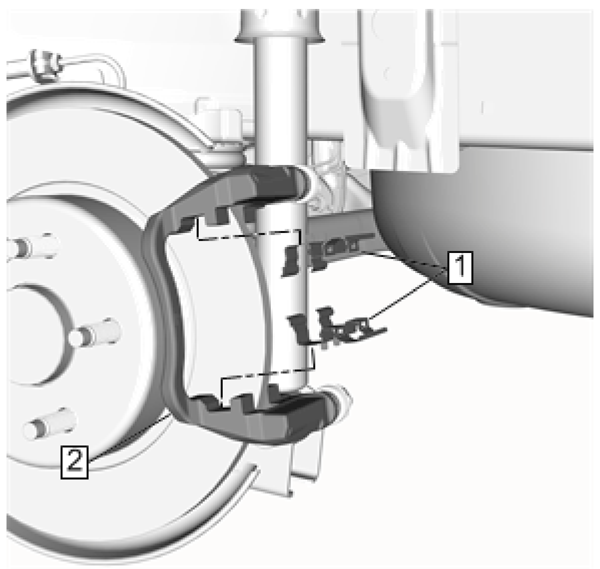

Fig. 25: Rear Disc Brake Pad Retainer Spring
Courtesy of GENERAL MOTORS COMPANY

1. Install Rear Disc Brake Pad Retainer Spring (1) @Rear Brake Caliper Bracket (2)

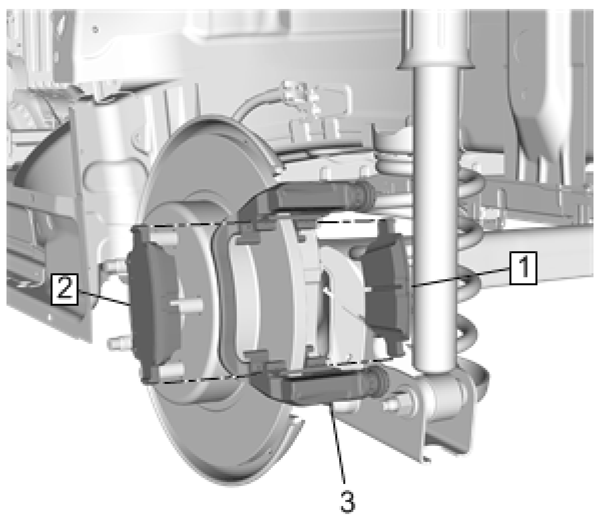

Fig. 26: Rear Disc Brake Inner Pad And Rear Brake Caliper Bracket
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The disc brake pad equipped with wear sensor has to be mounted in lower position on the inner side of the rotor.**

2. Install Rear Disc Brake Outer Pad (2) @Rear Brake Caliper Bracket (3)
3. Install Rear Disc Brake Inner Pad (1) @Rear Brake Caliper Bracket (3)

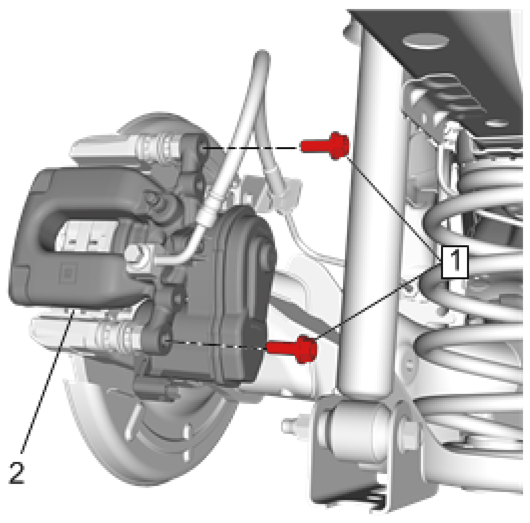

Fig. 27: Rear Brake Caliper Guide Pin Bolt
Courtesy of GENERAL MOTORS COMPANY

4. Remove the support and reposition the rear brake caliper (2) over the brake pads and to the rear brake caliper bracket.

CAUTION: Fastener Caution

NOTE: **Install an open end wrench to hold the caliper guide pin in line with the brake caliper while removing or installing the caliper guide pin bolt.**

5. Install Rear Brake Caliper Guide Pin Bolt (1) and tighten 35 N.m (26 lb ft)

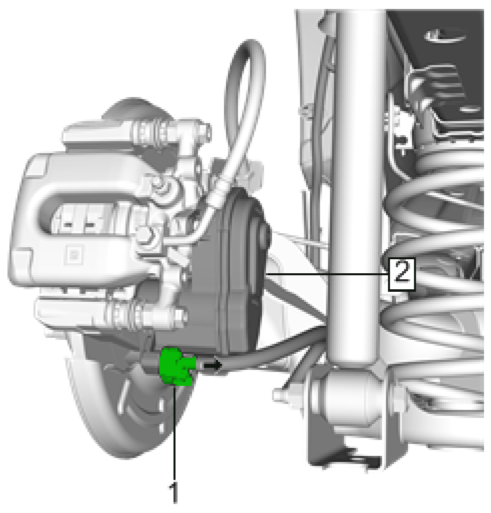

Fig. 28: Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

6. Connect Electrical Connector (1) @Rear Park Brake Actuator (2)
7. Install the rear tire and wheel assembly. Tire and Wheel Removal and Installation
8. Lower the vehicle.
9. With the vehicle OFF, gradually apply the brake pedal approximately 2/3 of its travel distance.
10. Slowly release the brake pedal.
11. Wait 15 seconds, then gradually apply the brake pedal approximately 2/3 of its travel distance again until a firm brake pedal apply is obtained. This will properly seat the brake caliper pistons and brake pads.
12. Inspect the fluid level in the brake master cylinder reservoir.
13. Fill the brake master cylinder reservoir to the maximum-full level with GM approved brake fluid from a clean, sealed brake fluid container. Master Cylinder Reservoir Filling
14. Calibrate the park brake. Park Brake Calibration
15. Burnish the brake pads and rotors. Brake Pad and Rotor Burnishing

BRAKE PAD AND ROTOR BURNISHING

WARNING: **Road test a vehicle under safe conditions and while obeying all traffic laws. Do not attempt any maneuvers that could jeopardize vehicle control. Failure to adhere to these precautions could lead to serious personal injury and vehicle damage.**

Burnishing the brake pads and brake rotors is necessary in order to ensure that the braking surfaces are properly prepared after service has been performed on the disc brake system.

This procedure should be performed whenever the disc brake rotors have been refinished or replaced, and/or whenever the disc brake pads have been replaced.

1. Select a smooth road with little or no traffic.
2. Accelerate the vehicle to 48 km/h (30 mph).

NOTE: **Use care to avoid overheating the brakes while performing this step.**

3. Using moderate to firm pressure, apply the brakes to bring the vehicle to a stop. Do not allow the brakes to lock.
4. Repeat steps 2 and 3 until approximately 20 stops have been completed. Allow sufficient cooling periods between stops in order to properly burnish the brake pads and rotors.

FRONT BRAKE CALIPER REPLACEMENT

Removal Procedure

WARNING: Brake Dust Warning

WARNING: Brake Fluid Irritant Warning

CAUTION: Brake Fluid Effects on Paint and Electrical Components Caution

1. Raise and support the vehicle. Lifting and Jacking the Vehicle .
2. Remove the front tire and wheel assembly. Tire and Wheel Removal and Installation

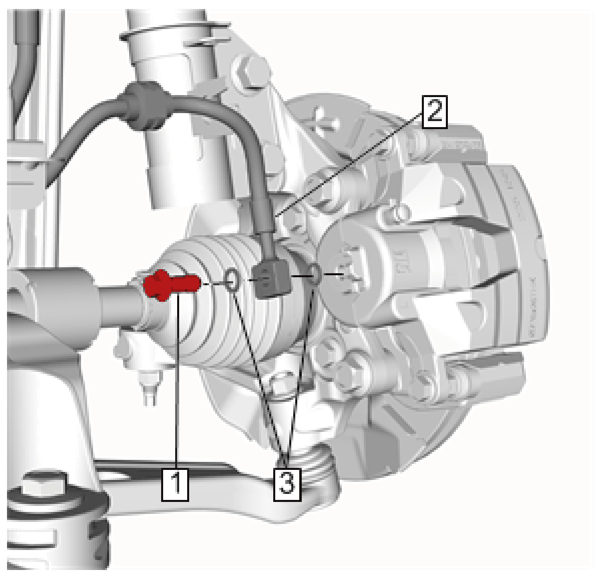

Fig. 29: Front Brake Hose, Fitting Bolt And Washer
Courtesy of GENERAL MOTORS COMPANY

3. Remove Front Brake Hose Fitting Bolt (1) @Front Brake Caliper
4. Remove Front Brake Hose (2) @Front Brake Caliper
5. Remove Front Brake Hose Washer (3) and DISCARD

NOTE: **These washers may be stuck to the brake caliper and/or the brake hose end.**

6. Cap the opening in the brake caliper and the brake hose to prevent fluid loss and contamination.

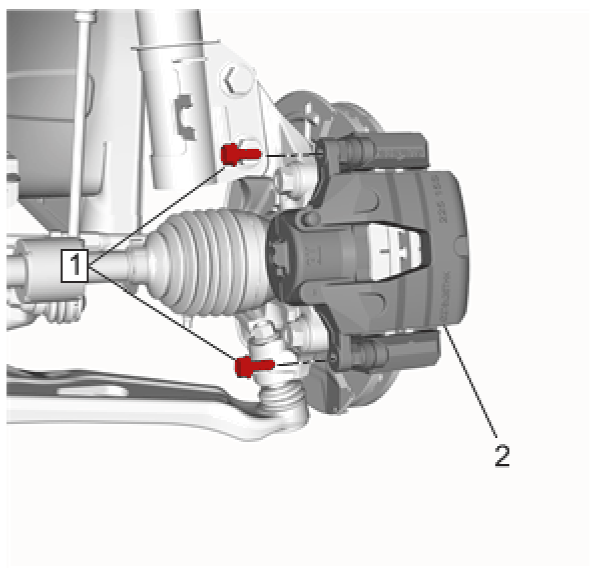

Fig. 30: Front Brake Caliper Guide Pin Bolt
Courtesy of GENERAL MOTORS COMPANY

NOTE:
- **Do NOT use any air tools to remove or install the brake caliper guide pin bolts. Use hand tools ONLY.**
- **Install an open end wrench to hold the caliper guide pin in line with the brake caliper while removing or installing the caliper guide pin bolt.Allowing the open end wrench to come in contact with the brake caliper will cause a pulsation when the brakes are applied.**

7. Remove Front Brake Caliper Guide Pin Bolt (1)
8. Remove Front Brake Caliper (2) @Front Brake Caliper Bracket
9. Inspect the brake caliper guide pins for freedom of movement, and inspect the condition of the guide pin boots. Move the guide pins inboard and outboard within the bracket bores, without disengaging the slides from the boots, and observe for the following:
   - Restricted caliper guide pin movement
   - Looseness in the brake caliper mounting bracket
   - Seized or binding caliper guide pins
   - Split or torn boots
10. If any of the conditions listed are found, the brake caliper guide pins and/or boots require replacement.

Installation Procedure

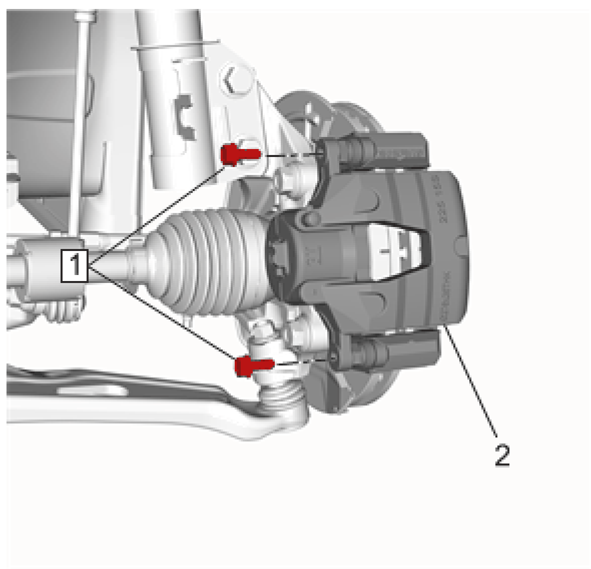

Fig. 31: Front Brake Caliper Guide Pin Bolt
Courtesy of GENERAL MOTORS COMPANY

1. Install Front Brake Caliper (1) @Front Brake Caliper Bracket

CAUTION: **Fastener Caution**

NOTE: **Install an open end wrench to hold the caliper guide pin in line with the brake caliper while removing or installing the caliper guide pin bolt.**

2. Install Front Brake Caliper Guide Pin Bolt (1) and tighten 40 N.m (30 lb ft)

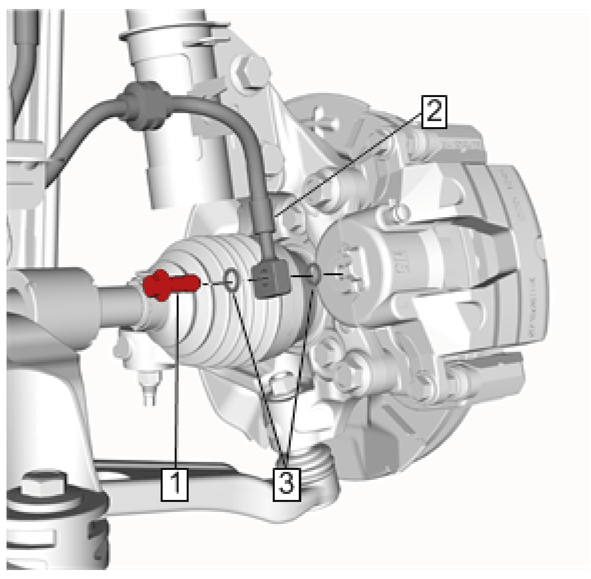

Fig. 32: Front Brake Hose, Fitting Bolt And Washer
Courtesy of GENERAL MOTORS COMPANY

3. Remove the caps from the brake caliper and the brake hose.

NOTE: **Do not reuse the copper brake hose washers.**

4. Install Front Brake Hose Washer (3)
5. Install Front Brake Hose (2) @Front Brake Caliper
6. Install Front Brake Hose Fitting Bolt (1) @Front Brake Caliper and tighten 40 N.m (30 lb ft)
7. Bleed the brake system. **Hydraulic Brake System Bleeding**
8. Install the front tire and wheel assembly. **Tire and Wheel Removal and Installation**
9. Lower the vehicle.
10. With the vehicle OFF, gradually apply the brake pedal to approximately 2/3 of its travel distance.
11. Slowly release the brake pedal.
12. Wait 15 seconds, then gradually apply the brake pedal approximately 2/3 of its travel distance again until a firm brake pedal apply is obtained. This will properly seat the brake caliper pistons and brake pads.

9. Bleed the brake system. **Hydraulic Brake System Bleeding**
10. Install the rear tire and wheel assembly. **Tire and Wheel Removal and Installation**
11. Lower the vehicle.
12. With the vehicle OFF, gradually apply the brake pedal approximately 2/3 of its travel distance.
13. Slowly release the brake pedal.
14. Wait 15 seconds, then gradually apply the brake pedal approximately 2/3 of its travel distance again until a firm brake pedal apply is obtained. This will properly seat the brake caliper pistons and brake pads.
15. Calibrate the park brake. **Park Brake Calibration**

FRONT BRAKE CALIPER OVERHAUL

WARNING: **Refer to Brake Fluid Irritant Warning .**

WARNING: **Refer to Brake Dust Warning .**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

Disassembly Procedure

WARNING: **Do not place fingers in front of the caliper piston(s) in an attempt to catch or protect it when applying compressed air. The piston(s) can fly out with force and could result in serious bodily injury.**

NOTE:

- **Replace all the components included in the repair kits used to service this brake caliper.**
- **Lubricate the rubber parts with GM approved brake fluid from a clean, sealed brake fluid container to make assembly easier.**
- **If any hydraulic component is removed or disconnected, it may be necessary to bleed all or part of the brake system.**
- **The torque values specified are for dry, non-lubricated fasteners.**
- **Perform the service operations on a clean bench, free from all mineral oil materials.**

1. Remove the brake caliper from the vehicle. **Front Brake Caliper Replacement**
2. Drain the brake fluid from the brake caliper.

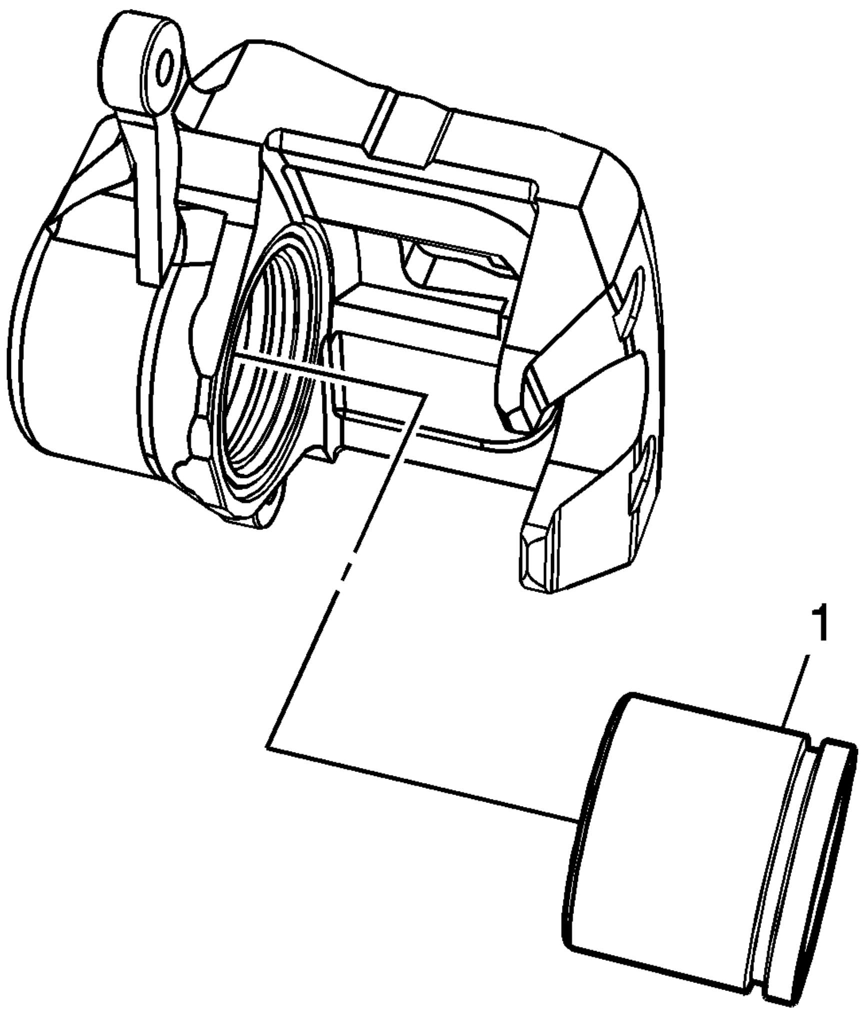

Fig. 39: Brake Caliper Piston
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **Use clean cloths to pad interior of caliper housing during piston removal. Use just enough air to ease the pistons out of the bores. If the pistons are blown out, even with the padding provided, it may be damaged.**

3. Place a 25 mm (1 in) block of wood between the caliper housing and the piston.
4. Place clean shop cloths between the caliper piston and the block of wood.
5. Carefully remove the brake caliper piston (1) by directing low pressure compressed air into the brake caliper inlet hole.
6. Remove the shop cloths and the block of wood from the caliper.

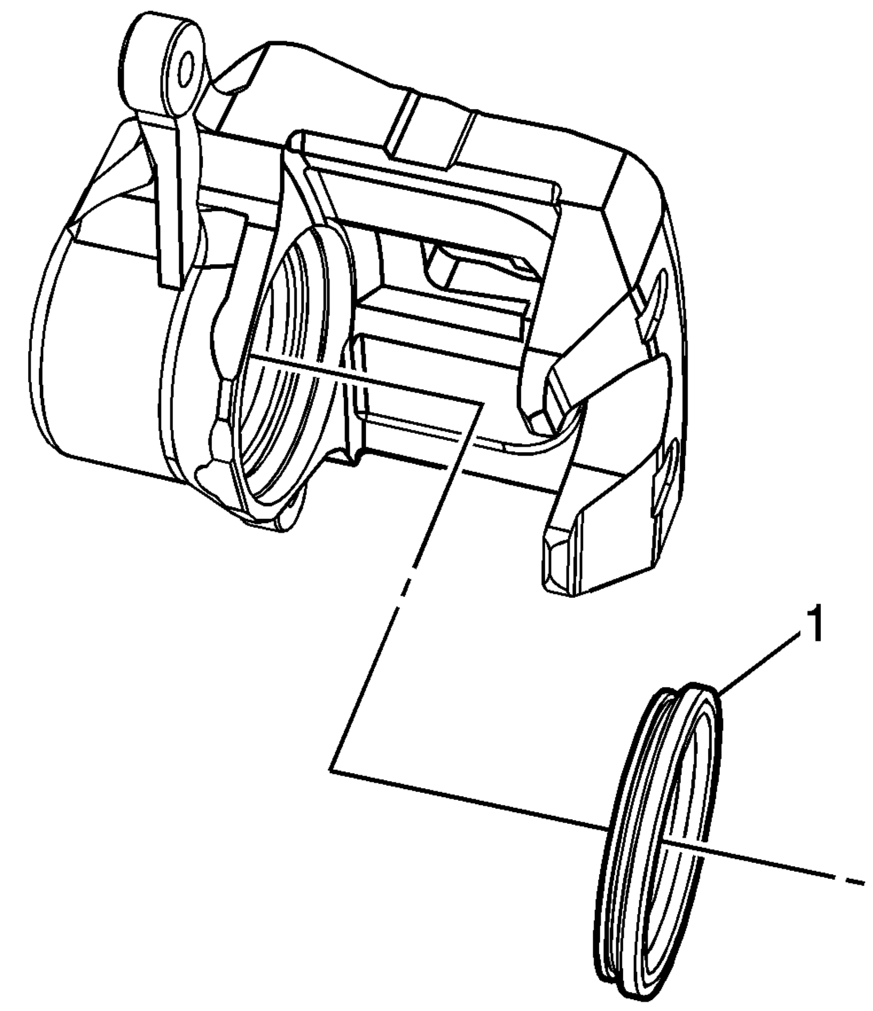

Fig. 40: Piston Dust Boot Seal
Courtesy of GENERAL MOTORS COMPANY

7. Remove the piston dust boot seal (1) from the seal counterbore in the brake caliper and discard the dust boot seal.

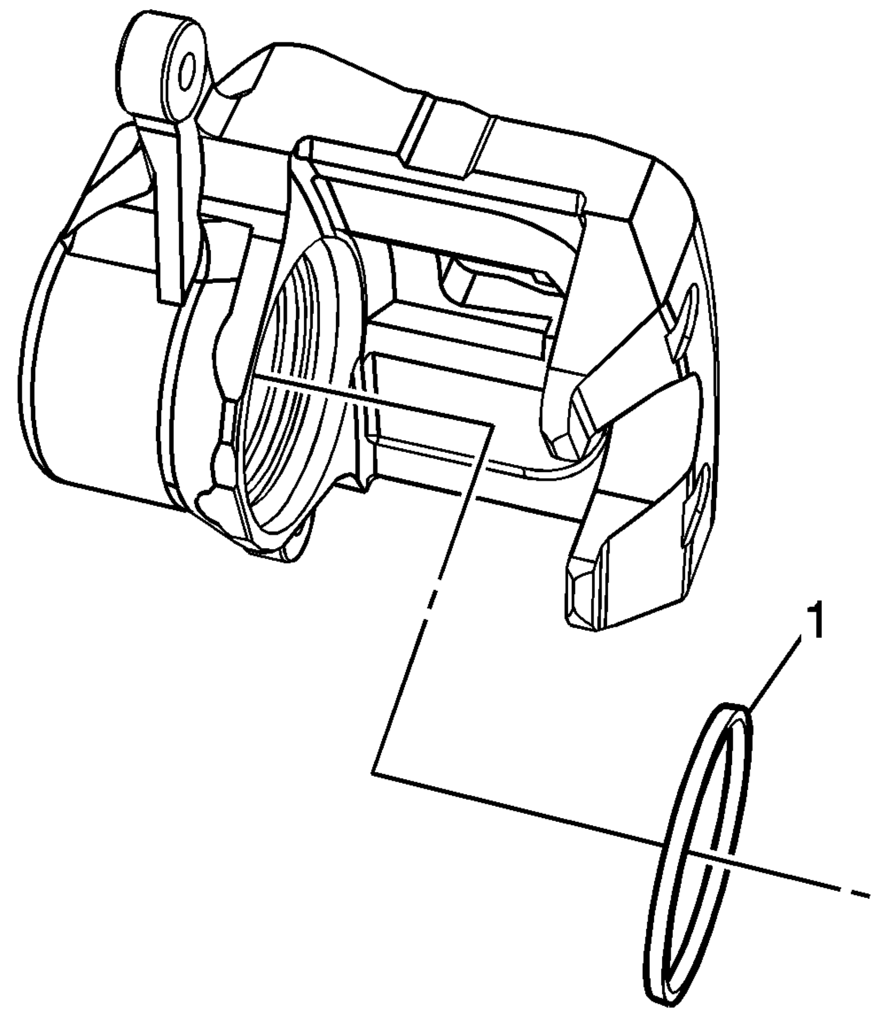

Fig. 41: Piston Seal
Courtesy of GENERAL MOTORS COMPANY

8. Using a small wooden or plastic tool, remove the piston seal (1) from the brake caliper bore and discard the piston seal.

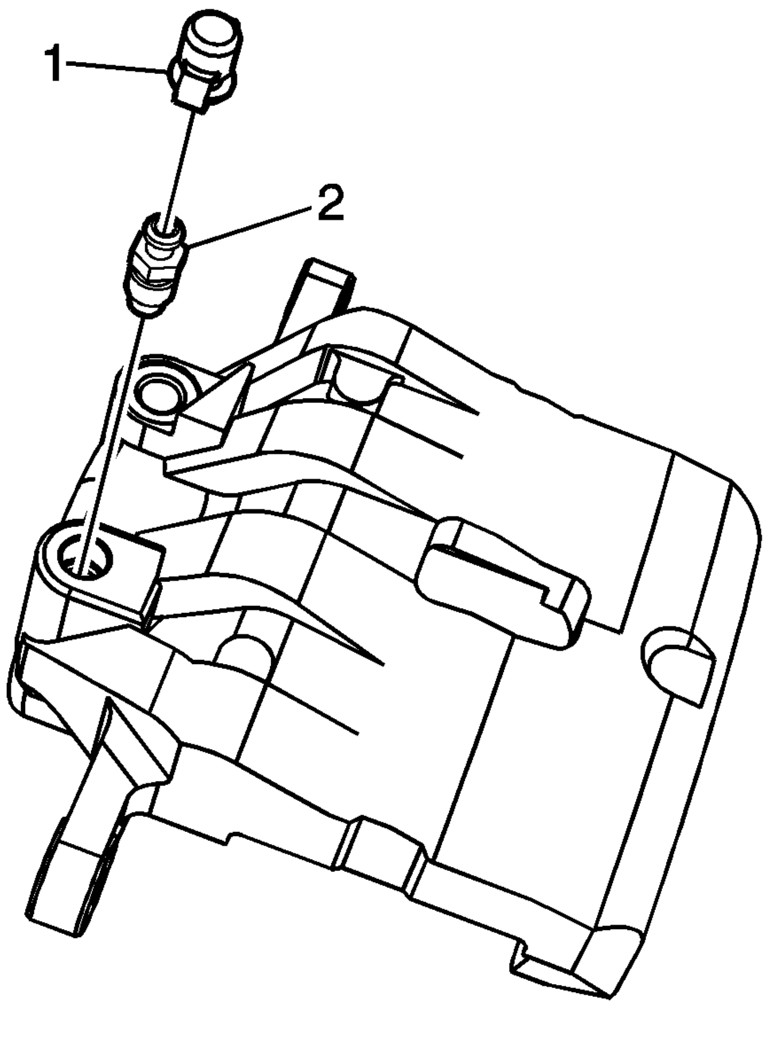

Fig. 42: Brake Caliper Bleeder Valve & Cap
Courtesy of GENERAL MOTORS COMPANY

9. Remove the brake caliper bleeder valve cap (1) and bleeder valve (2).

NOTE: **Do not use abrasives to clean the brake caliper pistons.**

10. Inspect the brake caliper mounting bracket guide surfaces for corrosion and wear. Remove and replace the brake caliper mounting bracket if damaged or worn.
11. Clean the brake caliper piston bores and seal counterbore with denatured alcohol, or equivalent.
12. Clean the brake caliper piston with denatured alcohol, or equivalent.
13. Dry the caliper piston bore and counterbore with non-lubricated, filtered air.

14. Dry the brake caliper piston with non-lubricated, filtered air.
15. Inspect the caliper bore for cracks, scoring, pitting, excessive corrosion.
16. If light corrosion is present in the caliper bore, attempt to remove the imperfection with a fine emery paper. If the imperfection cannot be removed, replace the caliper assembly.
17. If cracks, scoring, pitting, and excessive corrosion are present in the caliper bore, replace the caliper assembly.
18. Inspect the caliper piston for cracks, scoring, and/or damage. Replace the caliper piston if any of these conditions exist.

Assembly Procedure

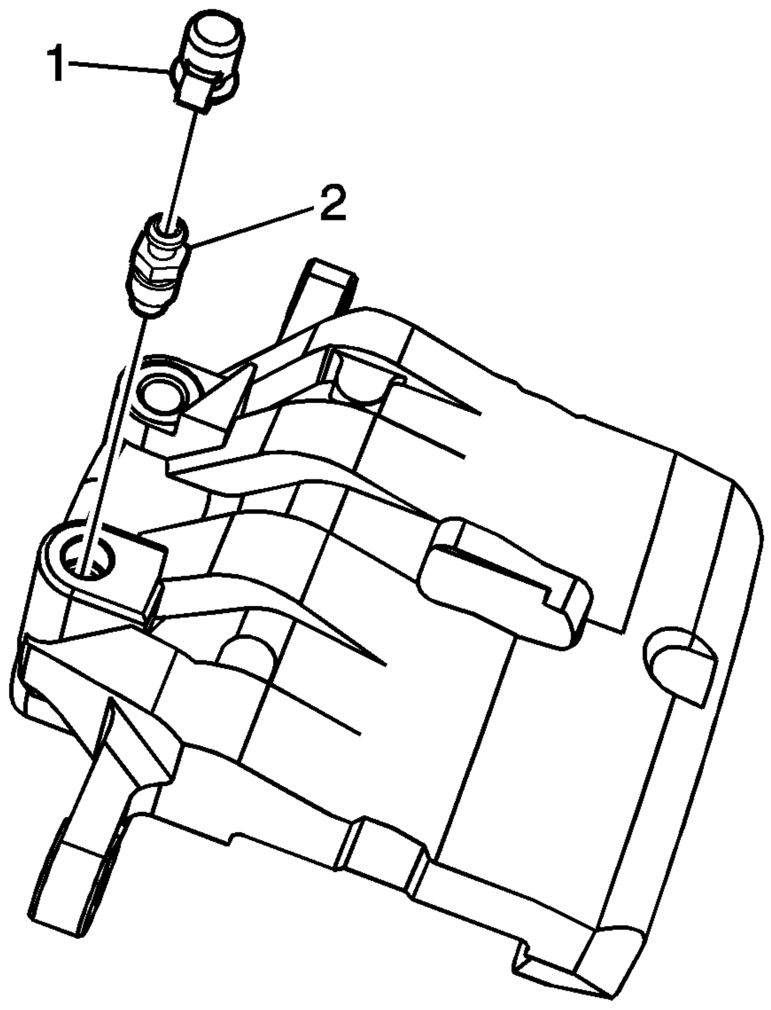

Fig. 43: Brake Caliper Bleeder Valve & Cap
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

1. Install the brake caliper bleeder valve (2) and tighten to 10 N.m (89 lb in).
2. Install the brake caliper bleeder valve cap (1).

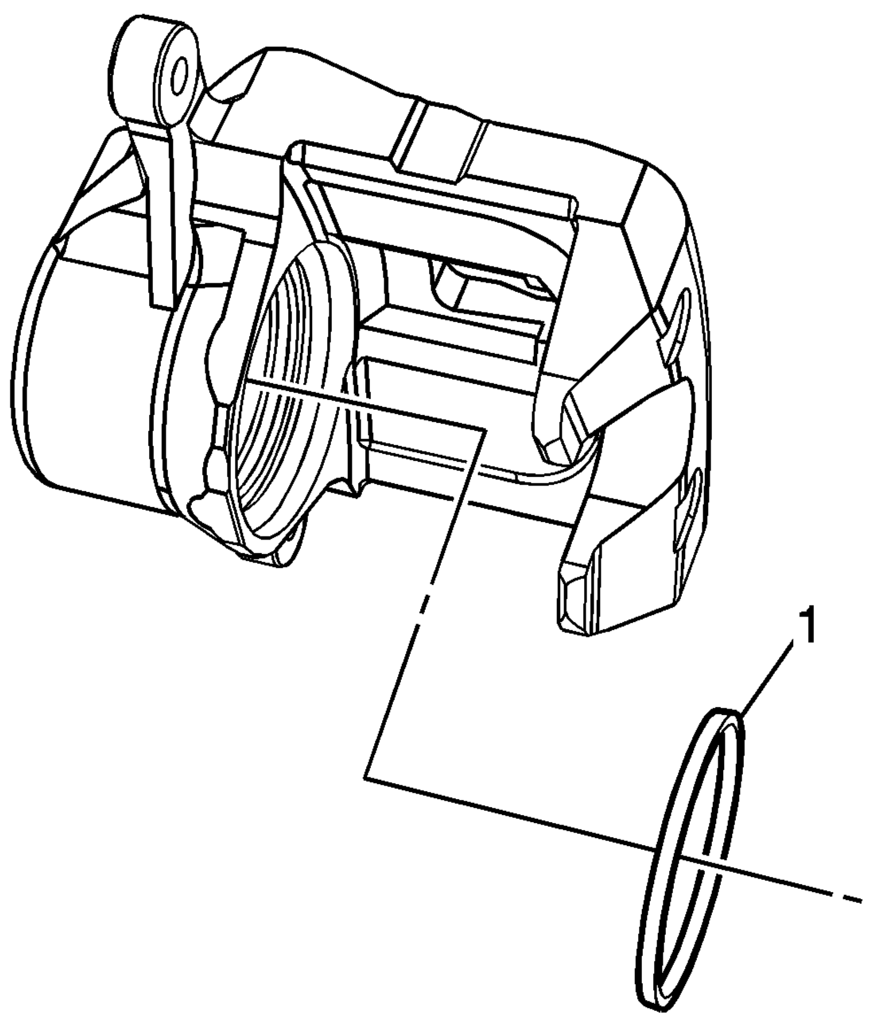

Fig. 44: Piston Seal
Courtesy of GENERAL MOTORS COMPANY

3. Lubricate the new piston seal (1) with GM approved brake fluid from a clean, sealed brake fluid container.
4. Install lubricated piston seal into the brake caliper bore seal groove.

   Ensure the seal is not twisted.

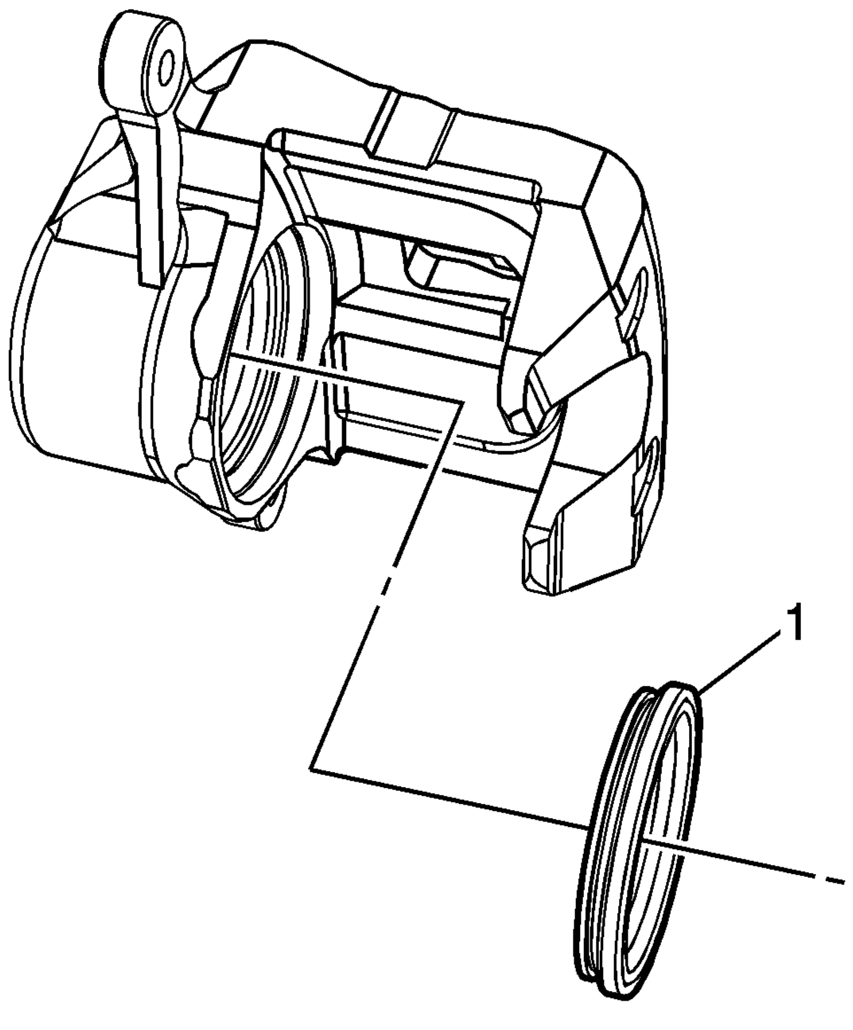

Fig. 45: Piston Dust Boot Seal
Courtesy of GENERAL MOTORS COMPANY

5. Install the piston dust boot seal (1) to the caliper.

   Ensure the seal is seated evenly and completely into the groove in the caliper housing.

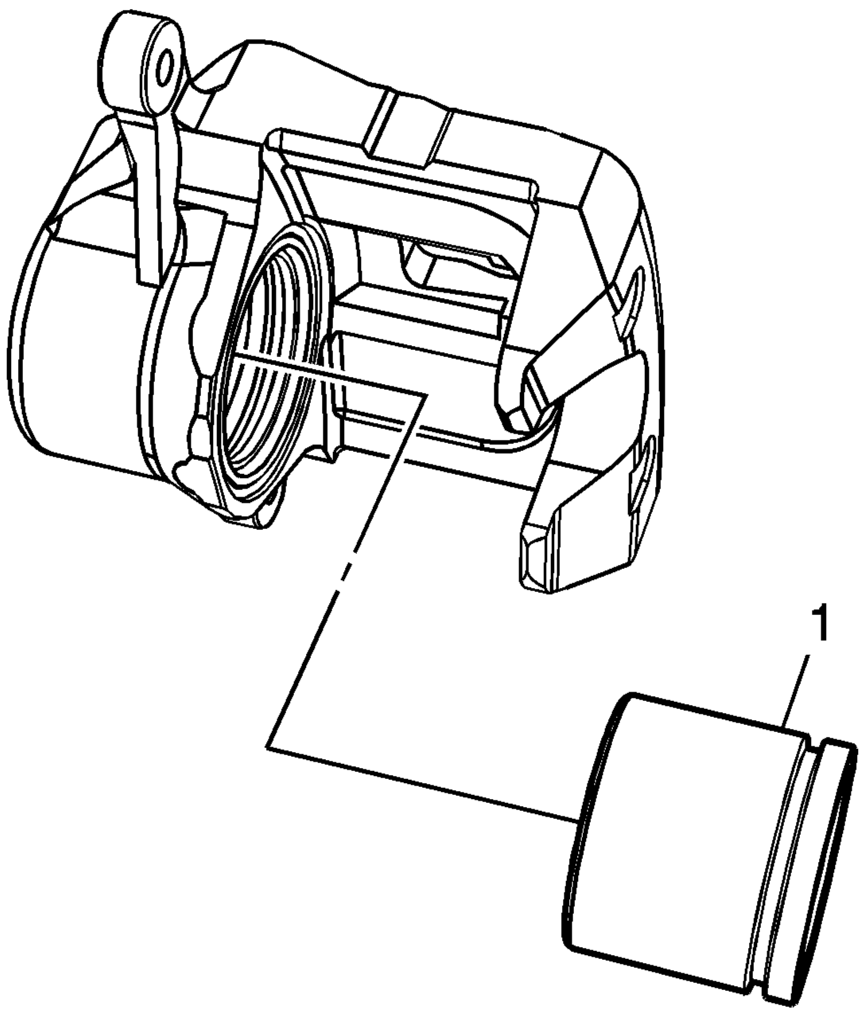

Fig. 46: Brake Caliper Piston
Courtesy of GENERAL MOTORS COMPANY

6. Place the caliper piston into the caliper housing by carefully lifting the edge of the dust boot seal.
7. Carefully push the piston (1) squarely into the brake caliper bore.
8. Ensure the caliper dust boot is properly seated into the piston groove and into the groove in the brake caliper bore.
9. Install the brake caliper to the vehicle. **Front Brake Caliper Replacement**

FRONT BRAKE CALIPER BRACKET REPLACEMENT

Removal Procedure

WARNING: **Refer to Brake Dust Warning .**

1. Raise and support the vehicle. **Lifting and Jacking the Vehicle**
2. Remove the front tire and wheel assembly. **Tire and Wheel Removal and Installation**

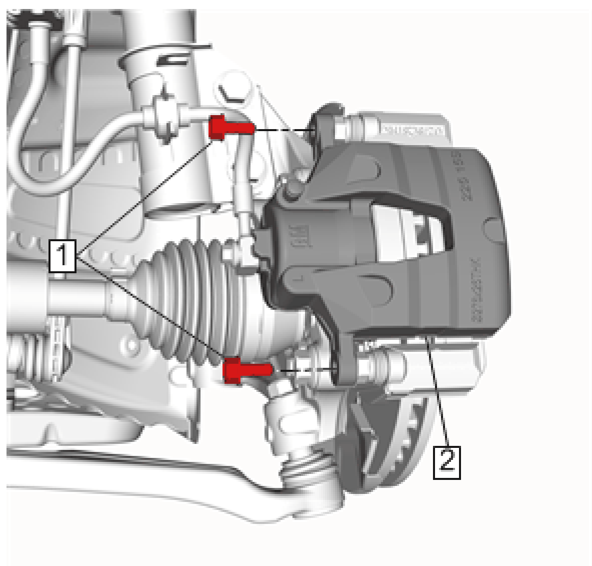

Fig. 47: Front Brake Caliper Guide Pin Bolt
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- **Do NOT use any air tools to remove or install the brake caliper guide pin bolts. Use hand tools ONLY.**
- **Install an open end wrench to hold the caliper guide pin in line with the brake caliper while removing or installing the caliper guide pin bolt.Allowing the open end wrench to come in contact with the brake caliper will cause a pulsation when the brakes are applied.**

3. Remove Front Brake Caliper Guide Pin Bolt (1)

CAUTION: Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

4. Remove the front brake caliper (2) from the front brake caliper bracket and support the front brake caliper (2) with heavy mechanic's wire, or equivalent. Do NOT disconnect the hydraulic brake flexible hose from the caliper.

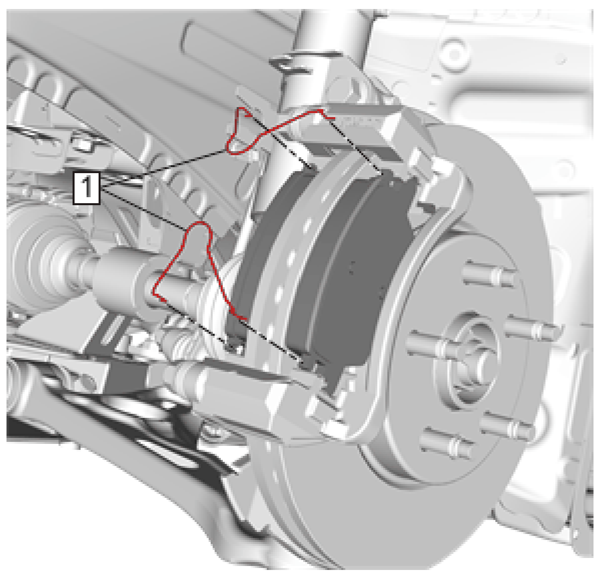

Fig. 48: Front Brake Caliper Spring
Courtesy of GENERAL MOTORS COMPANY

3. Install Front Disc Brake Pad Retainer Spring (2) @Front Brake Caliper Bracket

NOTE: **The disc brake pad equipped with wear sensor has to be mounted in upper position on the inner side of the rotor.**

4. Install Front Disc Brake Pad (1) @Front Brake Caliper Bracket

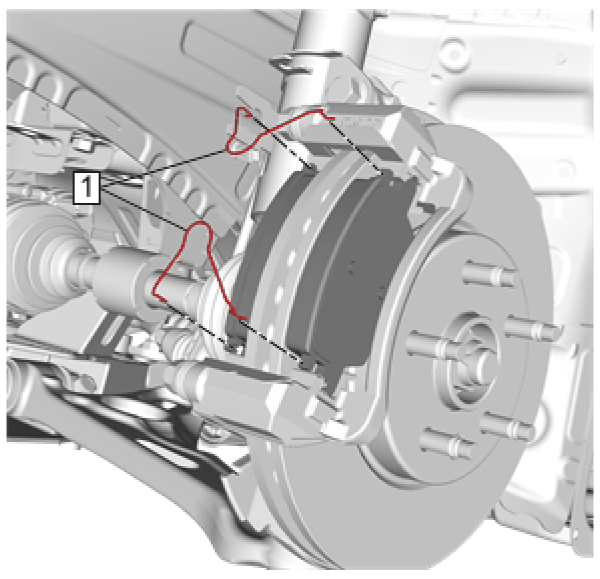

Fig. 53: Front Brake Caliper Spring
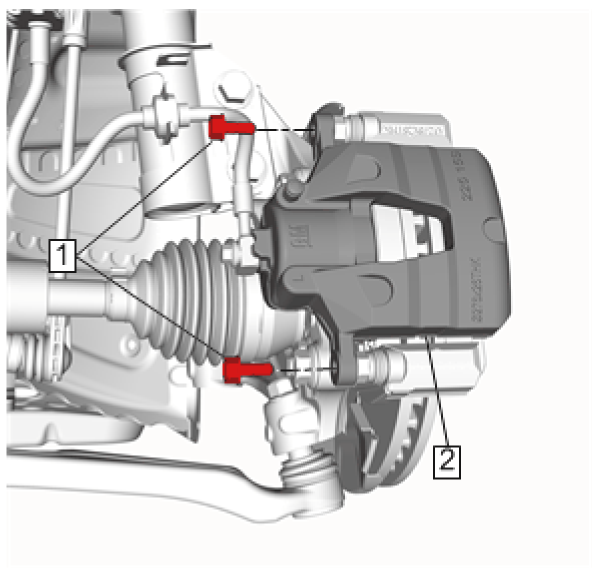
Courtesy of GENERAL MOTORS COMPANY

5. Install Front Brake Caliper Spring (1)



[Fig. 54: Front Brake Caliper Guide Pin Bolt]

Courtesy of GENERAL MOTORS COMPANY

6. Remove the support and reposition the front brake caliper (2) over the brake pads and to the front brake caliper bracket.

NOTE: **Install an open end wrench to hold the caliper guide pin in line with the brake caliper while removing or installing the caliper guide pin bolt.**

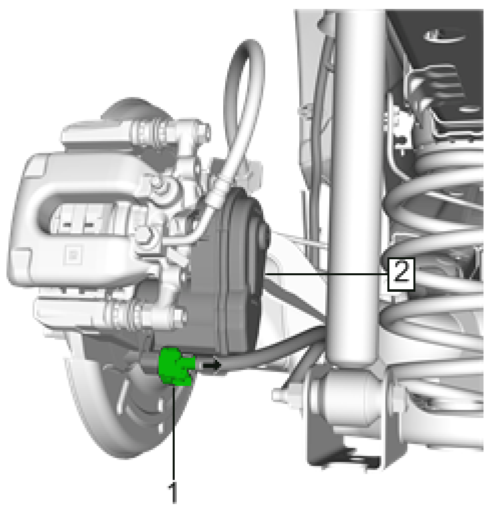
7. Install Front Brake Caliper Guide Pin Bolt (1) and tighten 40 N.m (30 lb ft)
8. Install the front tire and wheel assembly. **Tire and Wheel Removal and Installation**
9. Lower the vehicle.

REAR BRAKE CALIPER BRACKET REPLACEMENT

Removal Procedure

WARNING: **Refer to Brake Dust Warning .**

1. Set the parking brake in service mode. **Rear Parking Brake Service Mode Selection**
2. Turn OFF the vehicle.
3. Raise and support the vehicle. **Lifting and Jacking the Vehicle**
4. Remove the rear tire and wheel assembly. **Tire and Wheel Removal and Installation**



[Fig. 55: Electrical Connector]

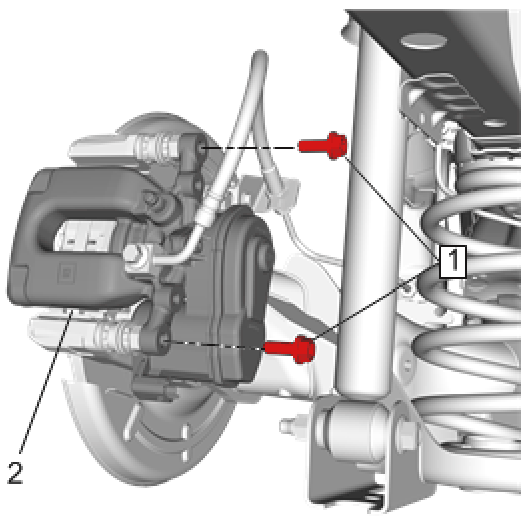
5. Disconnect Electrical Connector (1) @Rear Park Brake Actuator (2)



[Fig. 56: Rear Brake Caliper Guide Pin Bolt]

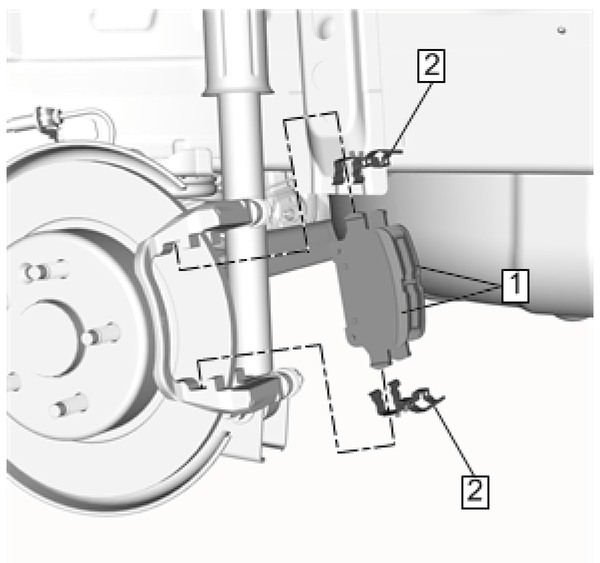
Courtesy of GENERAL MOTORS COMPANY

NOTE:
- **Do NOT use any air tools to remove or install the brake caliper guide pin bolts. Use hand tools ONLY.**
- **Install an open end wrench to hold the caliper guide pin in line with the brake caliper while removing or installing the caliper guide pin bolt.Allowing the open end wrench to come in contact with the brake caliper will cause a pulsation when the brakes are applied.**

6. Remove Rear Brake Caliper Guide Pin Bolt (1)

CAUTION: **Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.**

7. Remove the rear brake caliper (2) from the brake caliper bracket and support the rear brake caliper (2) with heavy mechanic's wire, or equivalent. Do NOT disconnect the hydraulic brake flexible hose from the caliper.



[Fig. 57: Rear Disc Brake Pad]

Courtesy of GENERAL MOTORS COMPANY

8. Remove Rear Disc Brake Pad (1) @Rear Brake Caliper Bracket
9. Remove Rear Disc Brake Pad Retainer Spring (2) @Rear Brake Caliper Bracket

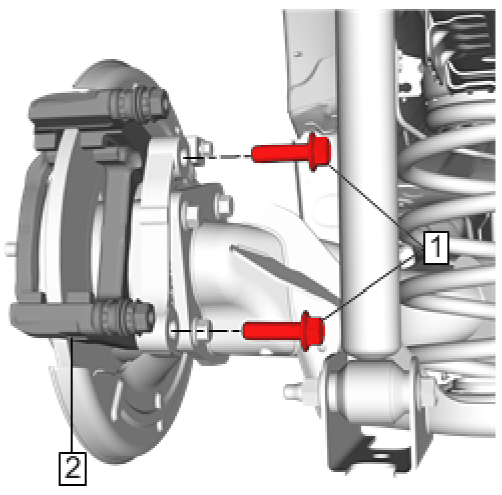


Fig. 58: Brake Caliper Bracket And Bolt
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The brake caliper mounting bracket bolts must not be used. Replace the bolts with new bolts whenever the bolts are removed or become loose.**

10. Remove Rear Brake Caliper Bracket Bolt (1) and DISCARD
11. Remove Rear Brake Caliper Bracket (2) @Vehicle

Installation Procedure

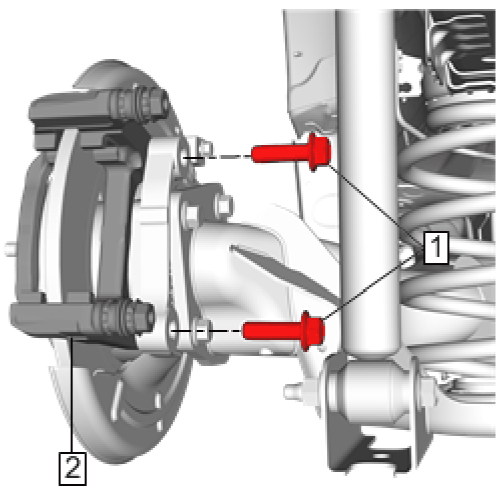

Fig. 59: Brake Caliper Bracket And Bolt
Courtesy of GENERAL MOTORS COMPANY

1. Install Rear Brake Caliper Bracket (2)@Vehicle

CAUTION: **Refer to Fastener Caution .**

2. Install Rear Brake Caliper Bracket Bolt (1) and tighten 100 N.m (74 lb ft)

   Install NEW bolts. Do NOT reuse old bolts.

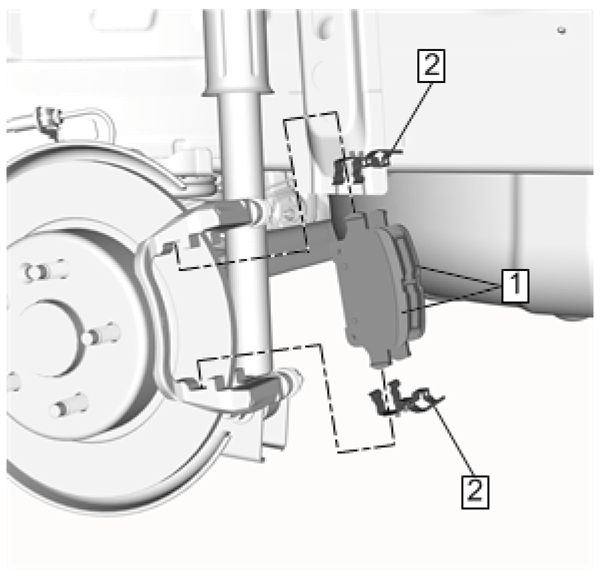

Fig. 60: Rear Disc Brake Pad
Courtesy of GENERAL MOTORS COMPANY

3. Install Rear Disc Brake Pad Retainer Spring (2) @Rear Brake Caliper Bracket

NOTE: **The disc brake pad equipped with wear sensor has to be mounted in lower position on the inner side of the rotor.**

4. Install Rear Disc Brake Pad (1) @Rear Brake Caliper Bracket

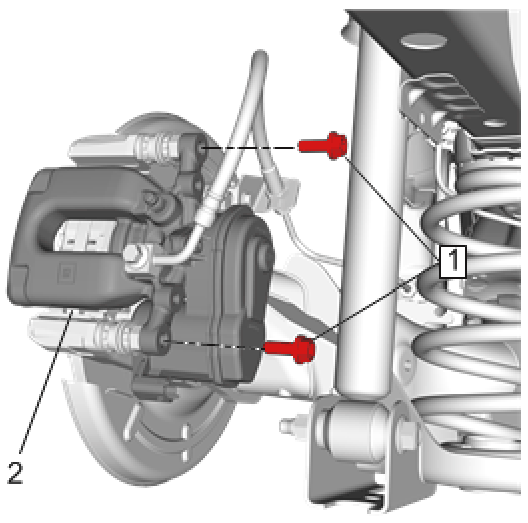

Fig. 61: Rear Brake Caliper Guide Pin Bolt
Courtesy of GENERAL MOTORS COMPANY

5. Remove the support and reposition the rear brake caliper (2) over the brake pads and to the rear brake caliper bracket.

NOTE: **Install an open end wrench to hold the caliper guide pin in line with the brake caliper while removing or installing the caliper guide pin bolt.**

6. Install Rear Brake Caliper Guide Pin Bolt (1) and tighten 35 N.m (26 lb ft)

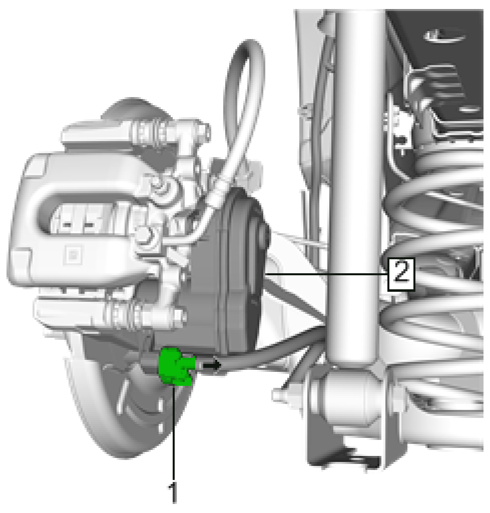

Fig. 62: Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

7. Connect Electrical Connector (1) @Rear Park Brake Actuator (2)
8. Install the rear tire and wheel assembly. **Tire and Wheel Removal and Installation**
9. Lower the vehicle.
10. With the vehicle OFF, gradually apply the brake pedal approximately 2/3 of its travel distance.
11. Slowly release the brake pedal.
12. Wait 15 seconds, then gradually apply the brake pedal approximately 2/3 of its travel distance again until a firm brake pedal apply is obtained. This will properly seat the brake caliper pistons and brake pads.
13. Calibrate the park brake. **Park Brake Calibration**

FRONT BRAKE ROTOR REPLACEMENT

Special Tools

- **CH-41013** Rotor Resurfacing Kit
- **CH-42450-A** Wheel Hub Resurfacing Kit

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

WARNING: **Refer to Brake Dust Warning .**

1. Raise and support the vehicle. **Lifting and Jacking the Vehicle**
2. Remove the front tire and wheel assembly. **Tire and Wheel Removal and Installation**

CAUTION: **Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.**

3. Remove the front brake caliper from the front brake caliper bracket and support the front brake caliper with heavy mechanic's wire, or equivalent. Do NOT disconnect the hydraulic brake flexible hose from the caliper. **Front Brake Caliper Replacement**
4. Remove Front Brake Caliper Bracket@Steering Knuckle **Front Brake Caliper Bracket Replacement**

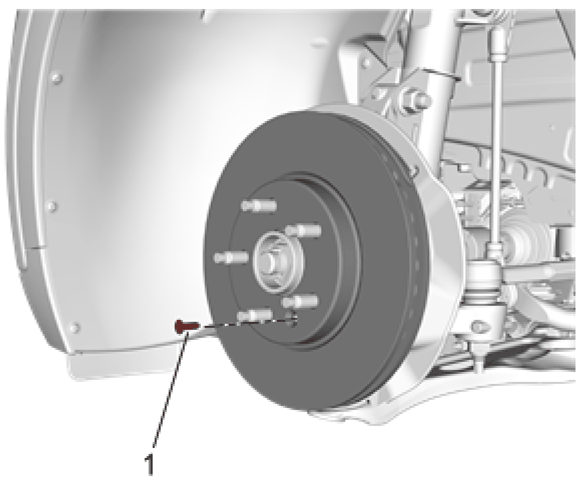

Fig. 63: Front Brake Rotor Bolt

BRAKE ROTOR ASSEMBLED LATERAL RUNOUT CORRECTION

NOTE:

- **Brake rotor thickness variation MUST be checked BEFORE checking for assembled lateral runout (LRO). Thickness variation exceeding the maximum acceptable level can cause brake pulsation. Brake Rotor Thickness Variation Measurement**
- **Brake rotor assembled lateral runout (LRO) exceeding the maximum allowable specification can cause thickness variation to develop in the brake rotor over time, usually between 4 800 - 11 300 km (3, 000 - 7, 000 mi). Brake Rotor Assembled Lateral Runout Measurement**

Review the following acceptable methods for bringing the brake rotor assembled LRO to within specifications. Determine which method to use for the specific vehicle being repaired.

- The indexing method of correcting assembled LRO is most effective when the LRO specification is only exceeded by a relatively small amount: 0.025 - 0.127 mm (0.001 - 0.005 in). Indexing is used to achieve the best possible match of high spots to low spots between related components. **Brake Rotor Assembled Lateral Runout Correction - Indexing**
- The on-vehicle brake lathe method is used to bring the LRO to within specifications through compensating for LRO while refinishing the brake rotor. **Brake Rotor Assembled Lateral Runout Correction - On Vehicle Lathe**

If the assembled LRO cannot be corrected using these methods, then other components must be suspected as causing and/or contributing to the LRO concern.

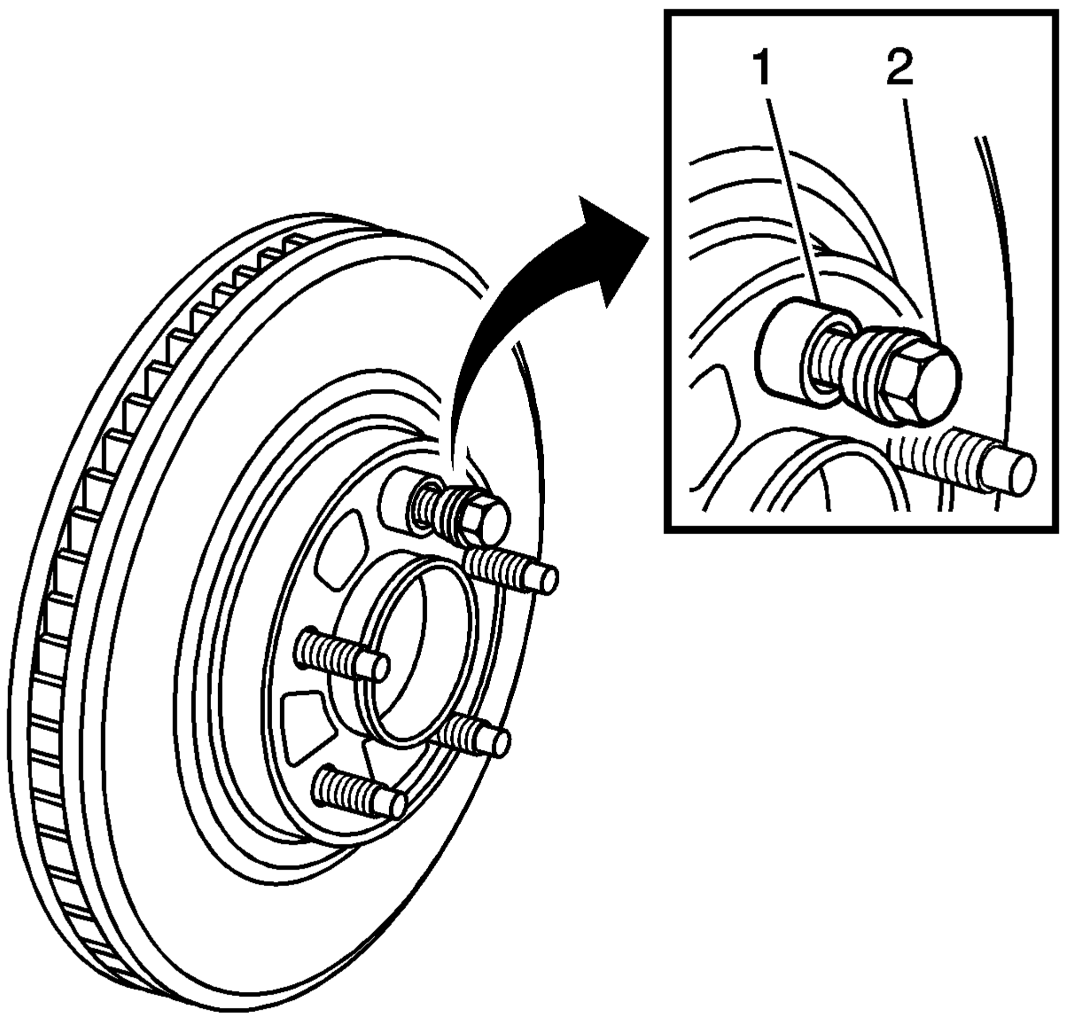
BRAKE ROTOR ASSEMBLED LATERAL RUNOUT CORRECTION - INDEXING

NOTE: **This Procedure is not used in Europe**

Special Tools

CH-45101-100 Conical Brake Rotor Washers

For equivalent regional tools, refer to **Special Tools**.



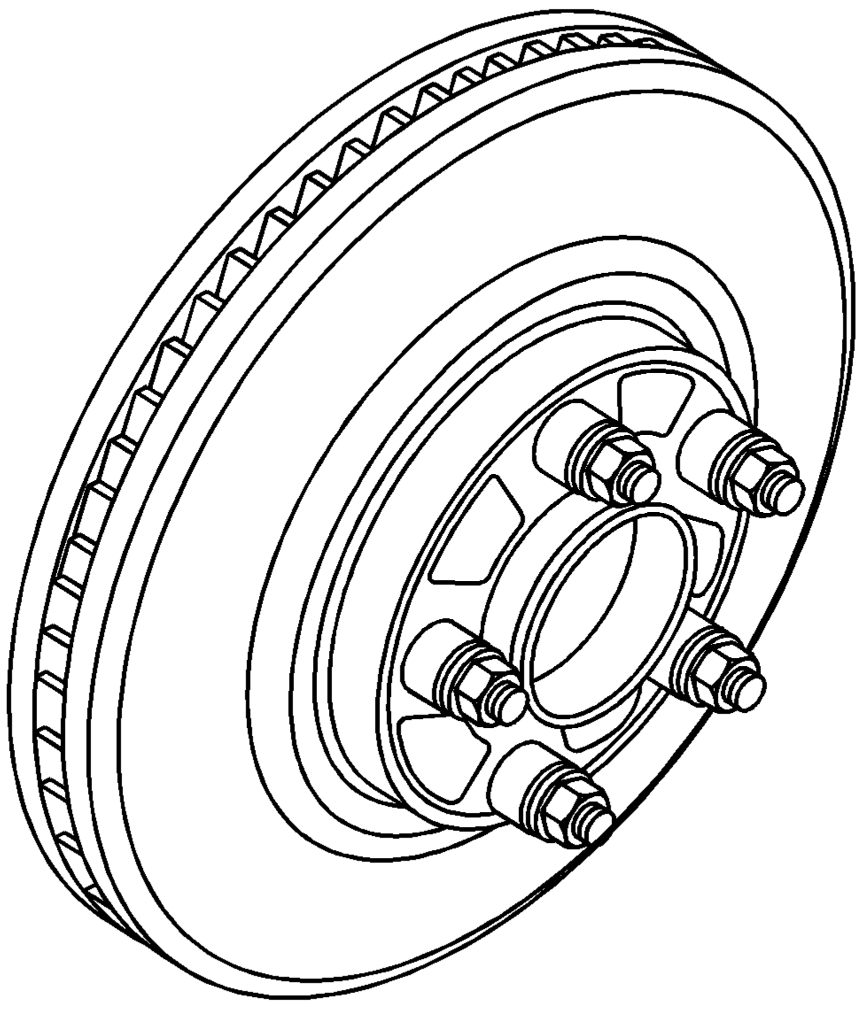
[Fig. 75: Lug Nuts & Conical Washers](#)
Courtesy of GENERAL MOTORS COMPANY

WARNING: **Refer to [Brake Dust Warning](#) .**

NOTE:

- **Brake rotor thickness variation MUST be checked BEFORE checking for assembled lateral runout (LRO). Thickness variation exceeding the maximum acceptable level can cause brake pulsation. Brake Rotor Thickness Variation Measurement**
- **Brake rotor assembled LRO exceeding the maximum allowable specification can cause thickness variation to develop in the brake rotor over time, usually between 4, 800 - 11, 300 km (3, 000 - 7, 000 mi). Brake Rotor Assembled Lateral Runout Measurement**

1. Remove the **CH-45101-100** Conical Brake Rotor Washers and the lug nuts that were installed during the assembled LRO measurement procedure.
2. Inspect the mating surface of the hub/axle flange and the brake rotor to ensure that there are no foreign particles or debris remaining.
3. Index the brake rotor in a different orientation to the hub/axle flange.
4. Hold the rotor firmly in place against the hub/axle flange and install one of the **CH-45101-100** Conical Brake Rotor Washers (1) and one lug nut (2) onto the upper-most wheel stud.
5. Continue to hold the rotor secure and tighten the lug nut firmly by hand.



[Fig. 76: Lug Nuts & Conical Washers](#)
Courtesy of GENERAL MOTORS COMPANY

6. Install the remaining **CH-45101-100** Conical Brake Rotor Washers and lug nuts onto the wheel studs and tighten the nuts firmly by hand in a star-pattern.
7. Tighten the lug nuts in a star-pattern to specification, in order to properly secure the rotor. **Tire and Wheel Removal and Installation**
8. Measure the assembled LRO of the brake rotor. **Brake Rotor Assembled Lateral Runout Measurement**
9. Compare the amount of change between this measurement and the original measurement.
10. If this measurement is within specifications, proceed to step 14.
11. If this measurement still exceeds specifications, repeat steps 1 - 9 until the best assembled LRO measurement is obtained.
12. Matchmark the final location of the rotor to the wheel studs if the orientation is different than it was originally.
13. If the brake rotor assembled LRO measurement still exceeds the maximum allowable specification, refer to **Brake Rotor Assembled Lateral Runout Correction**.
14. If the brake rotor assembled LRO is within specification, install the brake caliper and depress the brake pedal several times to secure the rotor in place before removing the **CH-45101-100** Conical Brake Rotor Washers and the lug nuts.

BRAKE ROTOR ASSEMBLED LATERAL RUNOUT CORRECTION - CORRECTION PLATES

NOTE: **This procedure not used in Europe**

Special Tools

CH-45101-100 Conical Brake Rotor Washers

For equivalent regional tools, refer to [Special Tools](#).

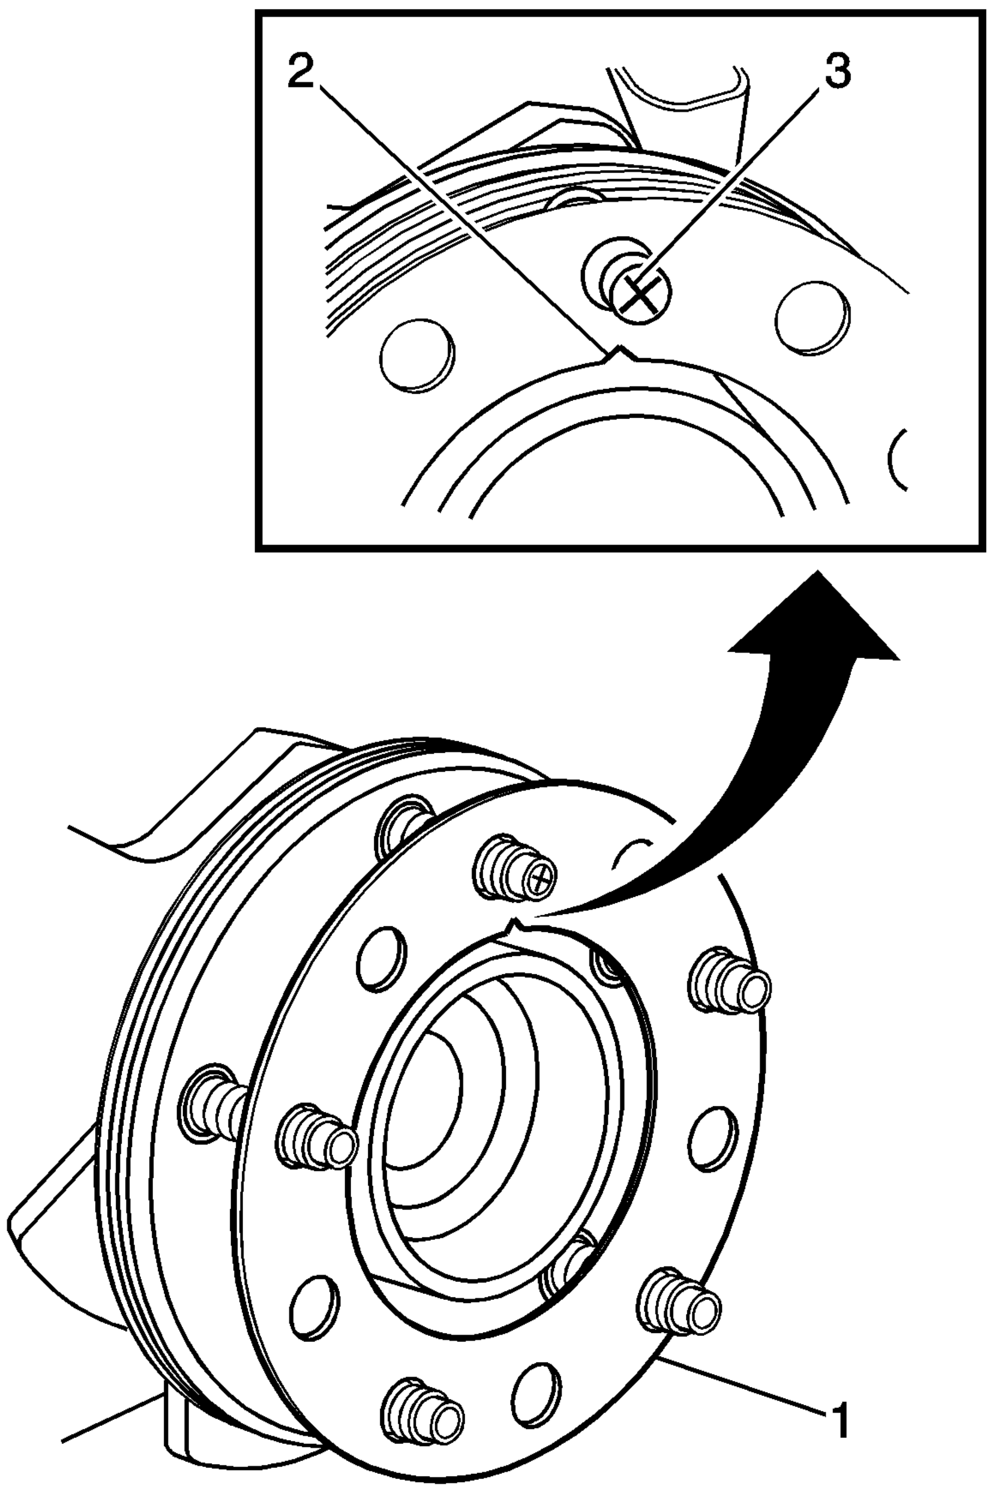


Fig. 77: Identifying Correction Plate, High Spot Mark & V-Shaped Notch
Courtesy of GENERAL MOTORS COMPANY

WARNING: **Refer to Brake Dust Warning .**

NOTE:

- **Brake rotor thickness variation MUST be checked BEFORE checking for assembled lateral runout (LRO). Thickness variation exceeding the maximum acceptable level can cause brake pulsation.** **Brake Rotor Thickness Variation Measurement**
- **Brake rotor assembled LRO exceeding the maximum allowable specification can cause thickness variation to develop in the brake rotor over time, usually between 4, 800 - 11, 300 km (3, 000 - 7, 000 mi).** **Brake Rotor Assembled Lateral Runout Measurement**

1. Rotate the brake rotor to position the high spot, identified and marked during the brake rotor assembled LRO measurement procedure, to face upward.
2. Remove the **CH-45101-100** Conical Brake Rotor Washers and the lug nuts that were installed during the assembled LRO measurement procedure and/or the indexing correction procedure.
3. Inspect the mounting surface of the hub/axle flange and the brake rotor to ensure that there are no foreign particles or debris remaining.
4. Select the correction plate, following the manufacturer's instructions, which has a specification closest to the assembled LRO measurement.

   For example: If the assembled LRO measurement was 0.076 mm (0.003 in), the 0.076 mm (0.003 in) correction plate would be used. If the measurement was 0.127 mm (0.005 in), the 0.152 mm (0.006 in) correction plate would be used.

5. Determine the positioning for the correction plate (1) using the high spot mark (3) made during the brake rotor assembled LRO measurement procedure.

NOTE:

- **Do NOT install used correction plates in an attempt to correct brake rotor assembled LRO.**
- **Do NOT stack up, or install more than one correction plate onto one hub/axle flange location, in an attempt to correct brake rotor assembled LRO.**

6. Install the correction plate (1) onto the hub/axle flange, with the V-shaped notch (2) orientated to align with the high spot mark (3), that was positioned to face upward.

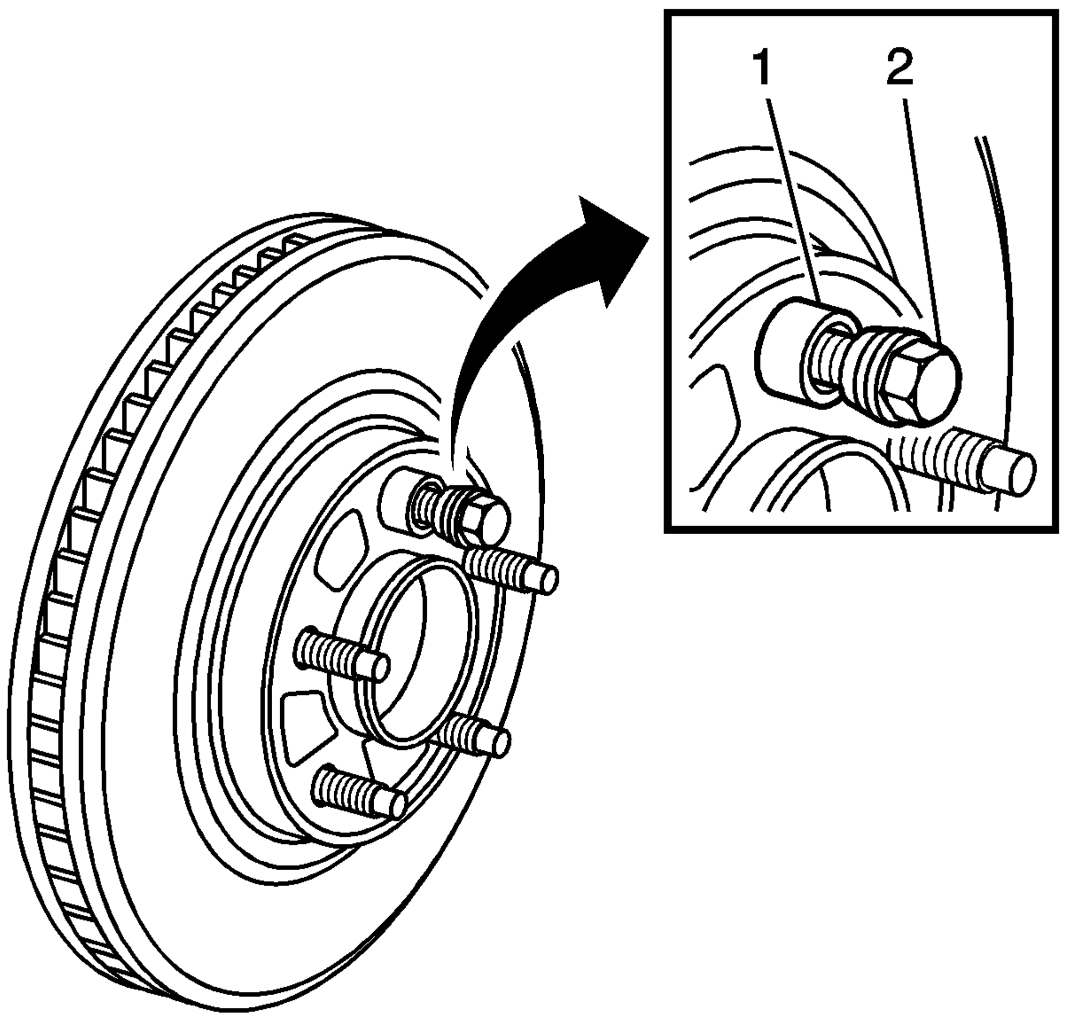

Fig. 78: Lug Nuts & Conical Washers
Courtesy of GENERAL MOTORS COMPANY

7. Install the brake rotor to the hub/axle flange. Use the matchmark made prior to removal for proper orientation to the flange.
8. Hold the rotor firmly in place against the hub/axle flange and install one of the **CH-45101-100** Conical Brake Rotor Washers (1) and one lug nut (2) onto the upper-most wheel stud.
9. Continue to hold the rotor secure and tighten the lug nut firmly by hand.

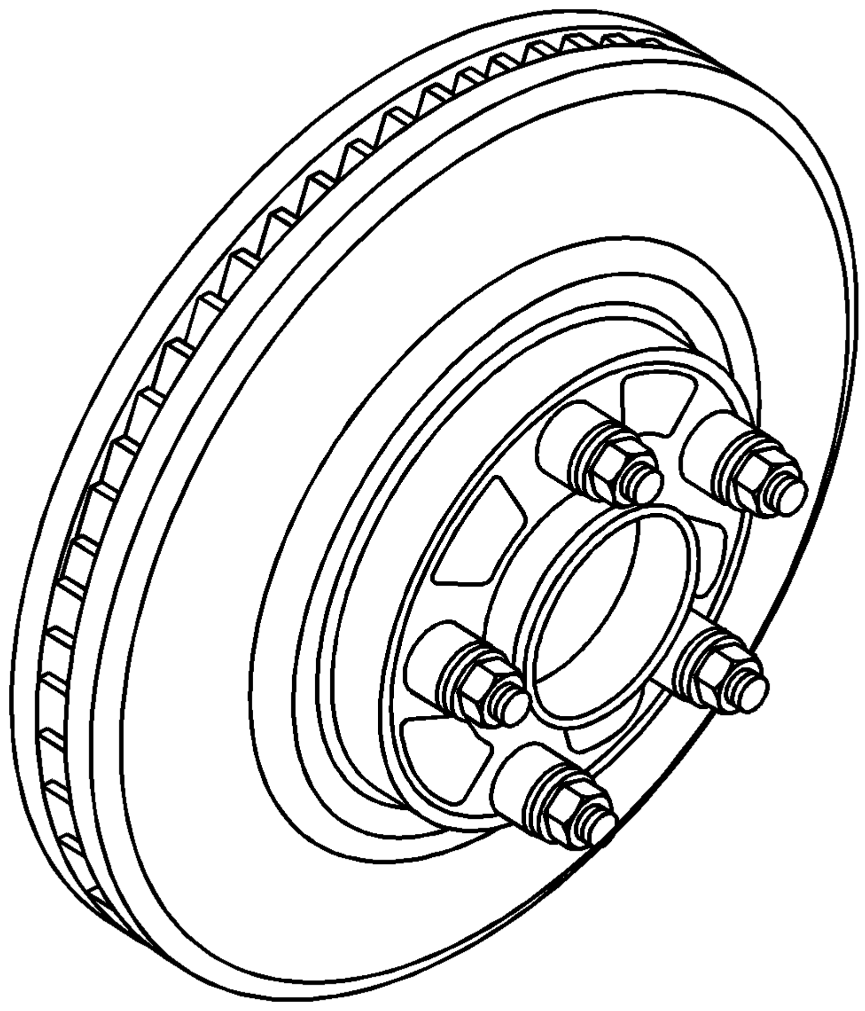

Fig. 79: Lug Nuts & Conical Washers
Courtesy of GENERAL MOTORS COMPANY

10. Install the remaining **CH-45101-100** Conical Brake Rotor Washers and lug nuts onto the wheel studs and tighten the nuts firmly by hand in a star-pattern.
11. Tighten the lug nuts in a star-pattern to specification, in order to properly secure the rotor. **Tire and Wheel Removal and Installation**
12. Measure the assembled LRO of the brake rotor. **Brake Rotor Assembled Lateral Runout Measurement**
13. If the brake rotor assembled LRO measurement still exceeds the maximum allowable specification, refer to **Brake Rotor Assembled Lateral Runout Correction**.
14. If the brake rotor assembled LRO measurement is within specification, install the brake caliper and depress the brake pedal several times to secure the rotor in place before removing the **CH-45101-100** Conical Brake Rotor Washers and the lug nuts.

BRAKE ROTOR ASSEMBLED LATERAL RUNOUT CORRECTION - ON VEHICLE LATHE

NOTE: **This procedure is not used in Europe.**

Special Tools

CH-45101-100 Conical Brake Rotor Washers

For equivalent regional tools, refer to **Special Tools**.

WARNING: **Refer to Brake Dust Warning .**

NOTE:

- **Brake rotor thickness variation MUST be checked BEFORE checking for assembled lateral runout (LRO). Thickness variation exceeding the maximum acceptable level can cause brake pulsation. Brake Rotor Thickness Variation Measurement**
- **Brake rotor assembled LRO exceeding the maximum allowable specification can cause thickness variation to develop in the brake rotor over time, usually between 4 800 - 11 300 km (3, 000 - 7, 000 mi). Brake Rotor Assembled Lateral Runout Measurement**

1. Ensure that the caliper and caliper bracket that are already being supported, are clear from contacting any rotating components, such as the brake rotor.
2. Remove the **CH-45101-100** Conical Brake Rotor Washers and the lug nuts that were installed during the assembled LRO measurement procedure and/or the indexing correction procedure.
3. Inspect the mounting surface of the hub/axle flange and the brake rotor to ensure that there are no foreign particles or debris remaining.
4. Set up the lathe, following the manufacturer's instructions.
5. Refinish the brake rotor, following the brake lathe manufacturer's instructions.
6. After each successive cut, inspect the brake rotor thickness. **Brake Rotor Thickness Measurement**
7. If at any time the brake rotor exceeds the minimum allowable thickness after refinish specification, the brake rotor must be replaced. After replacing the rotor, proceed to step 10.
8. After refinishing the brake rotor, use the following procedure in order to obtain the desired non-directional finish:
    1. Follow the brake lathe manufacturer's recommended speed setting for applying a non-directional finish.
    2. Using moderate pressure, apply the non-directional finish:
        - If the lathe is equipped with a non-directional finishing tool, apply the finish with 120-grit aluminum oxide sandpaper.
        - If the lathe is not equipped with a non-directional finishing tool, apply the finish with a sanding block and 150-grit aluminum oxide sandpaper.
    3. After applying a non-directional finish, clean each friction surface of the brake rotor with denatured alcohol, or an equivalent approved brake cleaner.
9. Remove the lathe from the vehicle.
10. Measure the assembled LRO of the brake rotor. **Brake Rotor Assembled Lateral Runout Measurement**
11. If the brake rotor assembled LRO measurement still exceeds the maximum allowable specification, refer to **Brake Rotor Assembled Lateral Runout Correction**.
12. If the brake rotor assembled LRO is within specification, install the brake caliper and depress the brake pedal several times to secure the rotor in place before removing the **CH-45101-100** Conical Brake Rotor Washers and the lug nuts.

BRAKE ROTOR REFINISHING

Special Tools

- **CH-41013** Rotor Resurfacing Kit
- **CH-42450-A** Wheel Hub Resurfacing Kit

For equivalent regional tools, refer to **Special Tools**.

WARNING: **Refer to Brake Dust Warning .**

NOTE:

- **The disc brake rotors do not require refinishing as part of routine brake system service. New disc brake rotors do not require refinishing.**

  Do not refinish disc brake rotors in an attempt to correct the following conditions:

    - **Brake system noise - squeal, growl, groan**
    - **Uneven and/or premature disc brake pad wear**
    - **Superficial or cosmetic corrosion/rust of the disc brake rotor friction surface**
    - **Scoring of the disc brake rotor friction surface less than the maximum allowable specification**
- **Before refinishing a brake rotor, the rotor MUST first be checked for adequate thickness to allow the rotor to be refinished and remain above the minimum allowable thickness after refinish specification. Brake Rotor Thickness Measurement**

  Disc brake rotors should only be refinished if they have adequate thickness to be refinished and if one or more of the following conditions exist:

    - **Thickness variation in excess of the maximum allowable specification**
    - **Excessive corrosion/rust and/or pitting**
    - **Cracks and/or heat spots**
    - **Excessive blueing discoloration**
    - **Scoring of the disc brake rotor surface in excess of the maximum allowable specification**
- **Disc brake rotors may need to be refinished as part of the process for correcting brake rotor assembled lateral runout (LRO) that exceeds the maximum allowable specification.**

NOTE: **If the vehicle is equipped with cross-drilled rotors, use a lathe with positive rake tooling. This setup requires less cutting pressure, which will result in less vibration, and a better surface finish. Also, use a vibration dampener when cutting. Otherwise, refinish according to the following instructions.**

NOTE: **Whenever the brake rotor has been separated from the hub/axle flange, clean any rust or contaminants from the hub/axle flange and the brake rotor mating surfaces. Failure to do this may result in increased assembled lateral runout (LRO) of the brake rotor, which could lead to brake pulsation.**

1. Using the **CH-42450-A** Wheel Hub Resurfacing Kit, thoroughly clean any rust or corrosion from the mating surface of the hub/axle flange.
2. Using the **CH-41013** Rotor Resurfacing Kit, thoroughly clean any rust or corrosion from the mating surface and mounting surface of the brake rotor.
3. Inspect the mating surfaces of the hub/axle flange and the rotor to ensure that there are no foreign particles or debris remaining.
4. Mount the brake rotor to the brake lathe according to the lathe manufacturer's instructions, ensuring that all mounting attachments and adapters are clean and free of debris.
5. Ensure that any vibration dampening attachments are securely in place.
6. With the brake lathe running, slowly bring in the cutting tools until they just contact the brake rotor friction surfaces.
7. Observe the witness mark on the brake rotor. If the witness mark extends approximately three-quarters or more of the way around the brake rotor friction surface on each side, the brake rotor is properly mounted to the lathe.
8. If the witness mark does not extend three-quarters or more of the way around the brake rotor, re-mount the rotor to the lathe.
9. Following the brake lathe manufacturer's instructions, refinish the brake rotor.
10. After each successive cut, inspect the brake rotor thickness. **Brake Rotor Thickness Measurement**
11. If at any time the brake rotor exceeds the minimum allowable thickness after refinish specification, the brake rotor must be replaced.
12. After refinishing the brake rotor, use the following procedure in order to obtain the desired non-directional finish:
    1. Follow the brake lathe manufacturer's recommended speed setting for applying a non-directional finish.
    2. Using moderate pressure, apply the non-directional finish:
        - If the lathe is equipped with a non-directional finishing tool, apply the finish with 120-grit aluminum oxide sandpaper.
        - If the lathe is not equipped with a non-directional finishing tool, apply the finish with a sanding block and 150-grit aluminum oxide sandpaper.

    NOTE: **Thoroughly cleaning the brake rotor will prevent the possible transfer of finite metal dust left as a by-product of machining to the brake pad material during the burnishing process, thereby reducing the possibility for brake squeal or other brake noises to occur.**

    3. After applying a non-directional finish, clean each friction surface of the brake rotor with a solution of mild dish washing detergent and water, or a GM approved brake cleaner and a clean shop towel to remove metal particles remaining from machining. Repeat the cleaning process if necessary to remove all metal particles.
13. Remove the brake rotor from the brake lathe.
14. Measure the assembled LRO of the brake rotor to ensure optimum performance of the disc brakes. **Brake Rotor Assembled Lateral Runout Measurement**
15. If the brake rotor assembled LRO measurement exceeds the specification, bring the LRO to within specifications. **Brake Rotor Assembled Lateral Runout Correction**

DESCRIPTION AND OPERATION

DISC BRAKE SYSTEM DESCRIPTION AND OPERATION

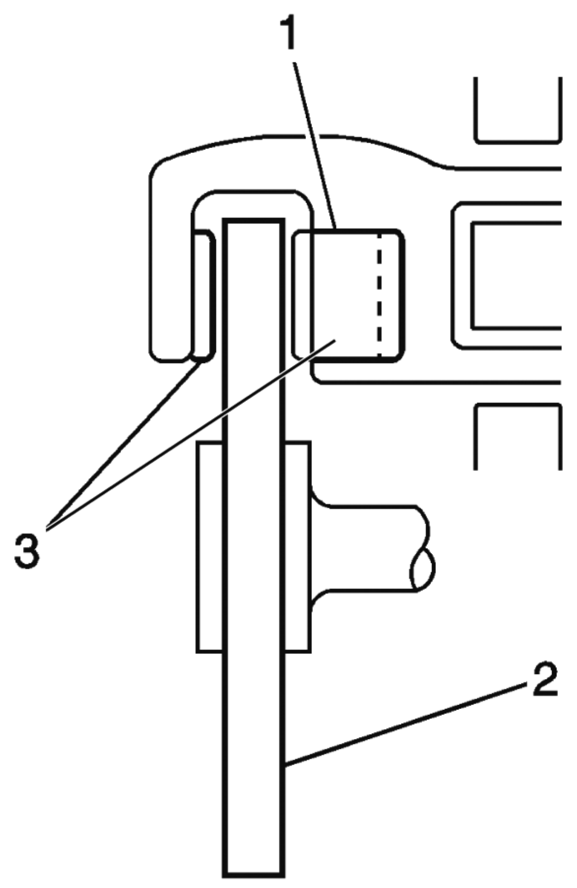

Fig. 80: Brake Caliper Piston, Rotor And Brake Pads
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **Refer to Brake Caliper Caution .**

The brake caliper is single piston type; and is installed on knuckle by two mounting bolts. Brake caliper transforms hydraulic pressure generated by depressing brake pedal into braking force. The braking force evenly acts on the piston (1) and the bottom of brake caliper cylinder bore, and then move the piston outward and slide brake caliper inward so that there generates a clamping effect on brake rotor (2). The clamping effect forces brake pad (3) to attach to brake rotor, and the resulting friction will make vehicles stop.

When maintaining the brake caliper, replace all parts included in repair sets.

- Lubricate the rubber parts with clean brake fluid to make assembly easier.
- Do not apply compressed air to brake parts with workshop with lubricant, otherwise the rubber parts may be damaged.
- If any hydraulic component is removed or disconnected, it may be necessary to bleed all or part of the brake system.
- Replace whole brake pad (3) according to service parts in the maintenance package.
- The torque values are specified for dry, nonlubricated fasteners.
- Perform the service operations on a clean bench, free from all mineral oil materials.

Gap Calibration

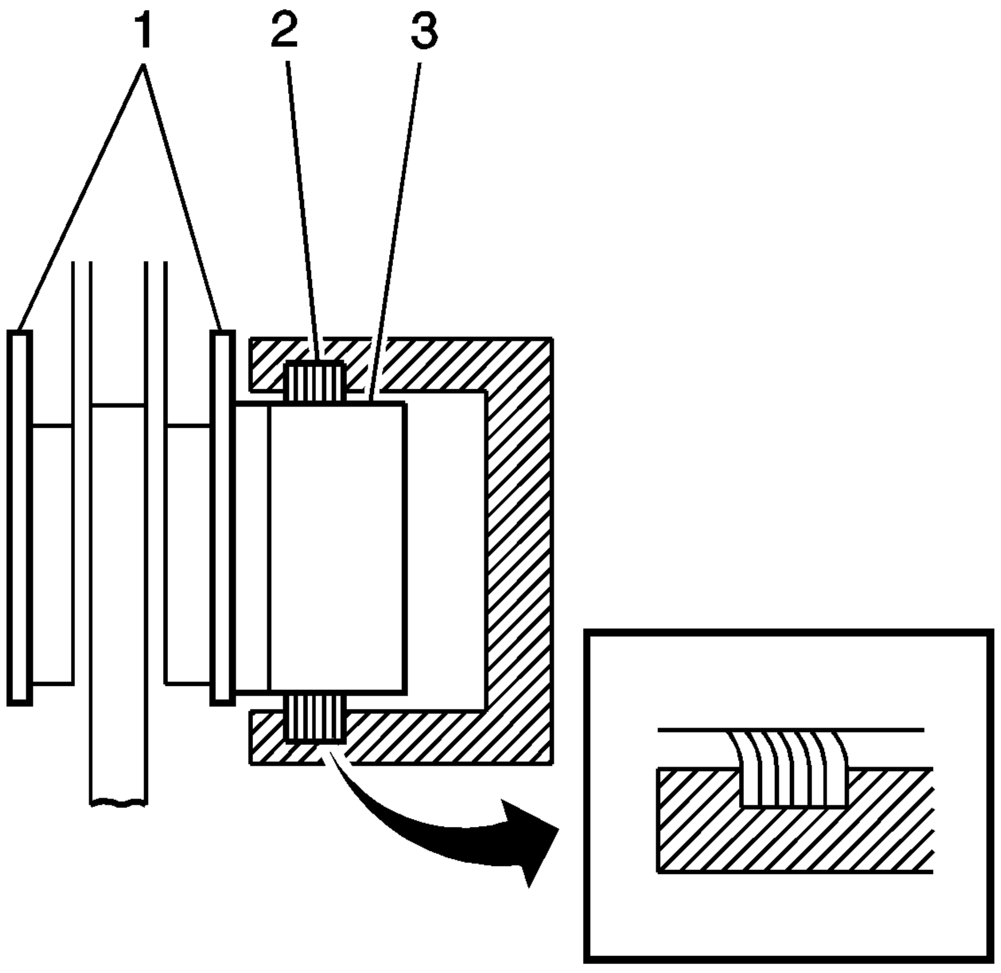

Fig. 81: Sectional View of Pads, Piston Seal, and Piston
Courtesy of GENERAL MOTORS COMPANY

When the hydraulic pressure acts on the piston (3), the piston moves left. The piston seals (2) exert pressure on the piston and move together with the cylinder. However, parts of the piston seals are fixed in the grooves of the cylinder. As shown, the shape of seals deforms toward the direction of piston.

When the pressure on the brake pedal is removed and the hydraulic pressure on the piston is released, there generates recovery elasticity on the seals. The force pushes the piston to the right side and return to its original position.

When the brake pad (1) exhibits wear, and the gap between the brake rotor and brake pad gets much larger, the piston moves farther.

Seals may further deform. Because the end of seals is fixed in the groove of the cylinder, the deformation is limited in the above-mentioned scope. Pistons further move to fill the gap. When the piston returns to the same position, the rubber seals resume original shape, and the gap between brake rotor and brake pad keeps the original level.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC C0075: BRAKE PEDAL POSITION SENSOR PERFORMANCE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC C0075

Brake Pedal Position Sensor Performance

Symptom Byte Information: Symptom Byte List

Circuit/System Description

For an overview of the component/system, refer to: **Hydraulic Brake System Description and Operation**

Conditions for Running the DTC

Ignition - On/Vehicle - In Service Mode

Conditions for Setting the DTC

Brake Pedal Position Sensor = Out Of Range

Actions Taken When the DTC Sets

Boost/Blending = Not Available

Conditions for Clearing the DTC

The conditions for setting the DTC no longer exist.

Reference Information

Schematic Reference

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition - On/Vehicle - In Service Mode
2. Verify DTC C0075 is not set.
    - **If the DTC is set**

      Replace the component: K177 Brake Booster Control Module

    - **If the DTC is not set**
3. All OK.

Circuit/System Verification

1. Ignition - On/Vehicle - In Service Mode
2. Verify DTC C0075 is not set.
    - **If the DTC is set**

        1. Perform all necessary programming and setup procedures for the control module: K177 Brake Booster Control Module
        2. Verify the DTC does not set.
            - If the DTC sets - Replace the component: K177 Brake Booster Control Module
            - If the DTC is not set
        3. All OK.
    - **If the DTC is not set**
3. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: **Diagnostic Repair Verification**

For control module replacement, programming, and setup refer to: **Control Module References**

DTC C0126: BRAKE FLUID LEVEL SENSOR CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC C0126

Brake Fluid Level Sensor Circuit

For symptom byte information refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	C0267 00	C0126 05	C0126 05	-
Ground	-	C0126 05	-	-

Circuit/System Description

The brake fluid level switch monitors the level of the brake fluid in the brake fluid reservoir. When the brake fluid level switch input closed, the electronic brake control module will set the DTC.

Conditions for Running the DTC

Ignition ON/Vehicle in Service Mode/Vehicle in Service Mode.

Conditions for Setting the DTC

- Low brake fluid level is detected for 5 s.
- An open is detected on the ground circuit.
- An open or short to voltage is detected on the signal circuit.

Action Taken When the DTC Sets

- The electronic brake control module disables the traction control and stability control for the duration of the ignition cycle.
- The traction control/stability control-active indicator turns ON.
- The brake warning indicator turns ON.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Control Module References for scan tool information

Circuit/System Verification

1. Verify that the brake fluid level is above the minimum level.
    - **If low**

      Refer to **Brake Fluid Loss**.

    - **If above minimum level**
2. Refer to Circuit/System Testing.

Circuit/System Testing

1. Ignition OFF/Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B20 Brake Fluid Level Switch. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 2 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF/Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Ignition ON/Vehicle in Service Mode.
4. Verify the scan tool Brake Fluid Level Sensor parameter is OK.
    - **If the parameter is not OK**
    1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K17 Electronic Brake Control Module.
    2. Test for infinite resistance between the signal circuit terminal 1 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K17 Electronic Brake Control Module.
    - **If the parameter is OK**
5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and ground.

6. Verify the scan tool Brake Fluid Level Sensor parameter is Low.
    - **If the parameter is not Low**
    1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K17 Electronic Brake Control Module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V.
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K17 Electronic Brake Control Module.
    - **If the parameter is Low**
7. Test or replace the B20 Brake Fluid Level Switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Brake Fluid Level Indicator Switch Replacement**
- Refer to **Control Module References** for electronic brake control module replacement, programming and setup.

DTC C0267: LOW BRAKE FLUID INDICATED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC C0267

Low Brake Fluid Indicated

For symptom byte information refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	C0267 00	C0126 05	C0126 05	-
Ground	-	C0126 05	-	-

Circuit/System Description

The brake fluid level switch monitors the level of the brake fluid in the brake fluid reservoir. When the brake fluid level switch input closed, the electronic brake control module will set the DTC.

Conditions for Running the DTC

Ignition ON/Vehicle in Service Mode.

Conditions for Setting the DTC

Low brake fluid level is detected for 8 s.

Action Taken When the DTC Sets

- The electronic brake control module disables the traction control and stability control for the duration of the ignition cycle.

- The traction control/stability control-active indicator turns ON.
- The brake warning indicator turns ON.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

    1. Ignition OFF/Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Ignition ON/Vehicle in Service Mode.
4. Verify the scan tool Brake Fluid Level Sensor parameter is OK.
    - **If the parameter is not OK**
    1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K17 Electronic Brake Control Module.
    2. Test for infinite resistance between the signal circuit terminal 1 and ground.

        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K17 Electronic Brake Control Module.
    - **If the parameter is OK**
5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and ground.
6. Verify the scan tool Brake Fluid Level Sensor parameter is Low.
    - **If the parameter is not Low**
    1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K17 Electronic Brake Control Module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V.
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K17 Electronic Brake Control Module.
    - **If the parameter is Low**
7. Test or replace the B20 Brake Fluid Level Switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Brake Fluid Level Indicator Switch Replacement**
- Refer to **Control Module References** for electronic brake control module replacement, programming and setup.

DTC C029F: BRAKE BOOSTER SYSTEM PERFORMANCE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC C029F

Brake Booster System Performance

For symptom byte information refer to **Symptom Byte List** .

Circuit/System Description

The brake booster system consists of a motor, electronic control unit (ECU), pedal travel sensor, and a master cylinder. If the electronic brake control module (EBCM) detects a brake booster system condition a DTC will be set.

Conditions for Running the DTC

Vehicle ON.

Conditions for Setting the DTC

The device has detected an internal malfunction

Action Taken When the DTC Sets

- No boost or blending available
- Red brake light and MIL are illuminated

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Low Reference	-	P057C, P05DE	-	-

Circuit/System Description

The brake booster system consists of a motor, electronic control unit (ECU), pedal travel sensor, and a master cylinder. The pedal travel sensor is connected to the brake pedal and measures the amount of brake pedal input to control the amount of boost needed. The pedal travel sensor consists of two travel sensors in one assembly, consisting of a shared 5 volt reference, shared low reference, and two signal circuits.

Conditions for Running the DTC

P057B, P057C, P057D, P057E, P05DC, P05DD, P05DE, P05DF, or P05E0

- Ignition ON/Vehicle in Service Mode.

Conditions for Setting the DTC

P057B

The brake pedal position sensor 1 upper and lower and lower range has been exceeded

P057E

Brake pedal position sensor 1 erratic signal

P057C

Brake pedal position sensor 1 signal shorted to ground

P057D

Brake pedal position sensor 1 signal shorted to voltage

P05DC

The brake pedal position sensor 2 upper and lower and lower range has been exceeded

P05DD

Brake pedal position sensor 2 signal shorted to ground

P05DE

Brake pedal position sensor 2 signal shorted to voltage

P05DF

Brake pedal position sensor 2 erratic signal

P05E0

The deviation between Brake pedal position sensor 1 and 2 is too large

Action Taken When the DTC Sets

P057B, P057C, P057D, P057E, P05DC, P05DD, P05DE, P05DF, or P05E0

- No boost or blending is available
- Red brake light and MIL are illuminated

Conditions for Clearing the DTC

P057B, P057C, P057D, P057E, P05DC, P05DD, P05DE, P05DF, or P05E0

The condition for setting the DTC is no longer present.

Diagnostic Aids

DTC P050E may set if the brake pedal is applied for 60 seconds or more while also applying the accelerator pedal.

Circuit/System Testing

1. Ignition OFF/Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B201 Brake Control Brake Pedal Position Sensor. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 3 and ground.
    - **If 10 Ω or greater**
    1. Disconnect the harness connector at the K177 Brake Booster Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K177 Brake Booster Control Module.
    - **If less than 10 Ω**
3. Ignition ON/Vehicle in Service Mode.
4. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 1 and ground.
    - **If less than 4.8 V**
    1. Ignition OFF/Ignition OFF/Vehicle OFF, disconnect the harness connector at the K177 Brake Booster Control Module.
    2. Test for infinite resistance between the 5 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the 5 V reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K177 Brake Booster Control Module.
    - **If greater than 5.2 V**

    1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K177 Brake Booster Control Module, Ignition ON/Vehicle in Service Mode.
    2. Test for less than 1 V between the 5 V reference circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K177 Brake Booster Control Module.
   - **If between 4.8 - 5.2 V**
5. Test for less than 1 V between the B201 Brake Control Brake Pedal Position Sensor signal circuit terminal 2 and ground.
   - **If greater than 1 V**
     1. Ignition OFF/Ignition OFF/Vehicle OFF, disconnect the harness connector at the K177 Brake Booster Control Module, ignition ON.
     2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K177 Brake Booster Control Module.
   - **If less than 1 V**
6. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K177 Brake Booster Control Module.
7. Test for infinite resistance between the B201 Brake Control Brake Pedal Position Sensor signal circuit terminal 2 and ground.
   - **If less than infinite resistance**

     Repair the short to ground on the circuit.

   - **If infinite resistance**
8. Test for less than 2 Ω in the B201 Brake Control Brake Pedal Position Sensor signal circuit end to end.
   - **If 2 Ω or greater**

     Repair the open/high resistance in the circuit.

   - **If less than 2 Ω**
9. Test for less than 1 V between the B201 Brake Control Brake Pedal Position Sensor signal circuit terminal 4 and ground.
   - **If greater than 1 V**
     1. Ignition OFF/Ignition OFF/Vehicle OFF, disconnect the harness connector at the K177 Brake Booster Control Module, ignition ON.
     2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K177 Brake Booster Control Module.
   - **If less than 1 V**
10. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K177 Brake Booster Control Module.
11. Test for infinite resistance between the B201 Brake Control Brake Pedal Position Sensor signal circuit terminal 4 and ground.
    - **If less than infinite resistance**

      Repair the short to ground on the circuit.

    - **If infinite resistance**
12. Test for less than 2 Ω in the B201 Brake Control Brake Pedal Position Sensor signal circuit end to end.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the circuit.

- **If less than 2 Ω**

13. Replace the K177 Brake Booster Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Control Module References** for control module replacement, programming and setup

DTC P0601, P0603, P0604, P0606, P060B, OR P062F: CONTROL MODULE

Diagnostic Instructions

Circuit/System Verification

1. Ignition - On/Vehicle - In Service Mode
2. Verify DTC P25C6, P25C7 is not set.
    - **If the DTC is set**
    1. Perform all necessary programming and setup procedures for the control module: K177 Brake Booster Control Module
    2. Verify the DTC does not set.
        - If the DTC sets - Replace the component: K177 Brake Booster Control Module
        - If the DTC is not set
    3. All OK.
    - **If the DTC is not set**
3. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: **Diagnostic Repair Verification**

For control module replacement, programming, and setup refer to: **Control Module References**

SYMPTOMS - HYDRAULIC BRAKES

IMPORTANT: The following steps must be completed before using the symptom tables.

1. Perform **Diagnostic System Check - Vehicle** before using the brake indicator symptom tables in order to verify that all of the following are true:

    - There are no DTCs set.
    - The control module(s) can communicate via the serial data link.
2. Perform the **Brake System Vehicle Road Test** before using the hydraulic brake symptom tables in order to duplicate the customer's concern.
3. Review the system operation in order to familiarize yourself with the system functions.
    - **Power Brake Booster Description and Operation**
    - **Brake Warning System Description and Operation**
    - **Hydraulic Brake System Description and Operation**
    - **Disc Brake System Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the brake warning system. Refer to **Checking Aftermarket Accessories**
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections**

Symptom List

Perform a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Brake Warning Indicator Malfunction**
- **Brake Pulsation**
- **Brake System Noise**
- **Braking Action Uneven - Pulls to One Side**
- **Braking Action Uneven - Front to Rear**
- **Brake Pedal Excessive Travel**
- **Brake Pedal Excessive Effort**
- **Brakes Drag**
- **Brake System Slow Release**
- **Brake Fluid Loss**

BRAKE WARNING INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	C0267 00	C0267 05	C0267 05	-
Ground	-	C0267 05	-	-

Circuit/System Description

The electronic brake control module monitors the brake fluid level in the brake fluid reservoir. When the fluid within the brake fluid reservoir is below the MIN level, contacts within the brake fluid level switch closes causing the voltage within the signal circuit to drop. The electronic brake control module will detect the voltage drop and will send a serial data message to the instrument cluster commanding the brake warning indicator to illuminate.

Description and Operation

Brake Warning System Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Verify that the brake fluid level is above the minimum level.
    - **If low**

      Refer to **Brake Fluid Loss**.

    - **If above minimum level**
2. Ignition ON.
3. Verify the scan tool Brake Fluid Level Sensor parameter is OK.
    - **If the parameter is Low**

      Refer to Circuit/System Testing

    - **If the parameter is Ok**
4. Verify the brake warning indicator turns ON and OFF when commanding the Instrument Cluster All Indicators On and Off with a scan tool.
    - **If the brake warning indicator does not turn ON and OFF**

      Replace the P16 Instrument Cluster.

    - **If the brake warning indicator turns ON and OFF**
5. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B20 Brake Fluid Level Switch. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 2 (or B) and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.

        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**

3. Ignition ON.
4. Verify the scan tool Brake Fluid Level Sensor parameter is OK.
    - **If the parameter is not OK**
    1. Ignition OFF, disconnect the harness connector at the K17 Electronic Brake Control Module.
    2. Test for infinite resistance between the signal circuit terminal 1 (or A) and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K17 Electronic Brake Control Module.
    - **If the parameter is OK**
5. Install a 3 A fused jumper wire between the signal circuit terminal 1 (or A) and ground.
6. Verify the scan tool Brake Fluid Level Sensor parameter is Low.
    - **If the parameter is OK**
    1. Ignition OFF, disconnect the harness connector at the K17 Electronic Brake Control Module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V.
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K17 Electronic Brake Control Module.
    - **If the parameter is Low**
7. Test or replace the B20 Brake Fluid Level Switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Brake Fluid Level Indicator Switch Replacement**
- Refer to **Control Module References** for electronic brake control module and Instrument Cluster replacement, programming and setup.

BRAKE PULSATION

<table>
<tr><th>Step</th><th>Action</th><th>Yes</th><th>No</th></tr>
<tr><td colspan="4">DEFINITION: Fluctuation or pulsation is felt through the brake pedal, steering wheel, seat, floor, and/or in the vehicle ONLY when braking.</td></tr>
<tr><td>1</td><td>Were you sent here from the Hydraulic Brake Symptom table?</td><td>Go to Step 2</td><td>Go to Symptoms - Hydraulic Brakes</td></tr>
</table>

Step	Action	Yes	No
2	1. Inspect the disc brake system for the following conditions. • Excessive thickness variation of rotor friction surfaces • Excessive assembled lateral runout (LRO) of rotor friction surfaces • Hard spots, heat checks, bluing discoloration of rotor friction surfaces; possibly due to brake drag • Excessive corrosion of rotor friction surfaces; including red, gray or black oxidation • Loose, damaged or missing caliper or lining hardware • Bent or damaged caliper or mounting component • Excessive LRO of wheel hub/axle flange; due to damage and/or loose or excessively worn bearings 2. Perform the disc brake system diagnostic procedure. Refer to **Disc Brake System Diagnosis** 3. Adjust, repair or replace components as necessary. Did you find and correct a condition?	Go to **Step 3**	Go to **Symptoms - Hydraulic Brakes**
3	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Refer to **Brake System Vehicle Road Test** Is the condition still present?	Go to **Step 2**	System OK

BRAKE SYSTEM NOISE

Step	Action	Yes	No
DEFINITION: Vehicle exhibits abnormal noise when braking; vehicle may exhibit abnormal noise during motion just after brake pedal release.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to **Step 2**	Go to **Diagnostic Starting Point - Vehicle**

Step	Action	Yes	No
2	1. Inspect the disc brake system for the following conditions. - Lining wear indicator contact with rotor - Debris trapped between rotor and splash shield or backing plate; and/or debris trapped between rotor and linings - Contaminated linings - Aftermarket linings - Glazed linings - Distorted, cracked or damaged linings - Excessively worn linings - Damaged or excessively worn caliper hardware and/or lining hardware - Incorrectly installed, loose or missing caliper hardware and/or lining hardware - Lack of lubrication or excessive corrosion on metal to metal contact surfaces - Bent or damaged splash shield or backing plate - Hard spots, heat checks, blueing discoloration of rotor friction surfaces - Glazed rotor friction surfaces - Bent or damaged caliper or mounting component 2. Adjust, repair or replace components as necessary. Refer to **Disc Brake System Diagnosis** Did you find and correct a condition?	Go to **Step 6**	Go to **Step 3**
3	1. Inspect the brake apply system for the following conditions. - Lack of lubrication or excessively worn pushrod or pedal pivots or pivot bushings - Bent or damaged pedal pushrod, pedal, or pedal bracket 2. Adjust, repair or replace components as necessary. Refer to **Hydraulic Brake System Diagnosis** Did you find and correct a condition?	Go to **Step 6**	Go to **Step 4**

Step	Action	Yes	No
4	1. Inspect the hydraulic brake system for the following conditions. • Improper operation of caliper pistons • Contaminated brake fluid 2. Adjust, repair or replace components as necessary. Refer to **Hydraulic Brake System Diagnosis** Did you find and correct a condition?	Go to **Step 6**	Go to **Step 5**
5	Inspect the park brake system for proper operation. Refer to **Park Brake System Diagnosis** Did you find and correct a condition?	Go to **Step 6**	Go to **Diagnostic Starting Point - Vehicle**
6	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Refer to **Brake System Vehicle Road Test** Is the condition still present?	Go to **Step 2**	System OK

BRAKING ACTION UNEVEN - PULLS TO ONE SIDE

Test Description

The numbers below refer to the step numbers on the diagnostic table.

4

Suspension components that are not operating properly may cause a disturbance to the vehicle during application of the brake system.

5

Steering components that are not operating properly may cause a disturbance to the vehicle during application of the brake system.

Step	Action	Yes	No
DEFINITION: Vehicle pulls to one side only when braking.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to **Step 2**	Go to **Diagnostic Starting Point - Vehicle**
2	1. Inspect the hydraulic brake system for the following conditions. • Kinked, pinched or damaged brake pipe or flexible brake hose • Sticking or improperly operating caliper piston • Brake fluid leak 2. Adjust, repair or replace components as necessary. Refer to **Hydraulic Brake System Diagnosis** Did you find and correct a condition?	Go to **Step 6**	Go to **Step 3**

Step	Action	Yes	No
3	1. Inspect the disc brake system for the following conditions. • Contaminated linings • Glazed linings • Distorted, cracked or damaged linings on one side • Loose, damaged or missing caliper hardware and/or lining hardware • Incorrect linings on one side • Hard spots, heat checks, blueing discoloration of rotor friction surfaces; possibly due to brake drag • Glazed rotor friction surfaces • Bent or damaged caliper or mounting component 2. Adjust, repair or replace components as necessary. Refer to **Disc Brake System Diagnosis** Did you find and correct a condition?	Go to **Step 6**	Go to **Step 4**
4	1. Inspect the suspension system for the following conditions. • Incorrect tire pressures • Loose suspension component connections • Excessively worn or damaged suspension components 2. Adjust, repair or replace components as necessary. Refer to **Diagnostic Starting Point - Vehicle** Did you find and correct a condition?	Go to **Step 6**	Go to **Step 5**
5	1. Inspect the steering system for the following conditions. • Loose steering component connections • Excessively worn or damaged steering components 2. Adjust, repair or replace components as necessary. Refer to **Diagnostic Starting Point - Vehicle** Did you find and correct a condition?	Go to **Step 6**	Go to **Diagnostic Starting Point - Vehicle**
6	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Refer to **Brake System Vehicle Road Test** Is the condition still present?	Go to **Step 2**	System OK

BRAKING ACTION UNEVEN - FRONT TO REAR

Test Descriptions

The number below refers to the step number on the diagnostic table.

4

Suspension components that are not operating properly may cause a disturbance to the vehicle during application of the brake system.

Step	Action	Yes	No
DEFINITION: Braking action or stopping force sensitive or grabbing and/or more pronounced at the front or at the rear axle. Sensitive or grabbing brakes: Excessive brake jump-in force relative to brake pedal input.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to **Step 2**	Go to **Diagnostic Starting Point - Vehicle**
2	1. Inspect the hydraulic brake system for the following conditions: • Improper operation of caliper pistons • Kinked, pinched or damaged brake pipe or flexible brake hose • Brake fluid leak • Improper operation of dynamic rear proportion (DRP) system 2. Adjust, repair or replace components as necessary. Refer to **Hydraulic Brake System Diagnosis** Did you find and correct a condition?	Go to **Step 6**	Go to **Step 3**
3	1. Inspect the disc brake system for the following conditions: • Contaminated linings • Glazed linings • Distorted, cracked or damaged linings • Excessively worn linings • Aftermarket linings • Damaged or excessively worn caliper hardware and/or lining hardware • Hard spots, heat checks, blueing discoloration of rotor friction surfaces • Glazed rotor friction surfaces 2. Adjust, repair or replace components as necessary. Refer to **Disc Brake System Diagnosis** Did you find and correct a condition?	Go to **Step 6**	Go to **Step 4**

Step	Action	Yes	No
4	1. Inspect the suspension system for the following conditions: • Loose suspension component connections • Excessively worn or damaged suspension components 2. Adjust, repair or replace components as necessary. Refer to **Diagnostic Starting Point - Vehicle** Did you find and correct a condition?	Go to **Step 6**	Go to **Step 5**
5	1. Inspect the brake apply system for the following conditions: • Binding, bent or damaged pedal pushrod, pedal, or pedal bracket • Binding, bent or damaged brake pedal • Binding, bent or damaged brake pedal bracket 2. Adjust, repair or replace components as necessary. Refer to **Hydraulic Brake System Diagnosis** Did you find and correct a condition?	Go to **Step 6**	Go to **Diagnostic Starting Point - Vehicle**
6	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Refer to **Brake System Vehicle Road Test** Is the condition still present?	Go to **Step 2**	System OK

BRAKE PEDAL EXCESSIVE TRAVEL

Step	Action	Yes	No
DEFINITION: Brake pedal travels further than expected to obtain firm pedal and/or firm pedal cannot be obtained, pedal fades away, or pedal is spongy.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to **Step 2**	Go to **Symptoms - Hydraulic Brakes**
2	Inspect the travel and feel of brake pedal applies. Perform the following: 1. Place the Power button in the Service Only mode. 2. Remove one of the Electric Brake Boost fuses from the Engine Compartment Fuse Block. 3. Apply the brake pedal with light, steady pressure and hold for 15 seconds. Observe pedal travel and feel. Did you complete the brake pedal travel and feel inspections?	Go to **Step 3**	-

Step	Action	Yes	No
3	1. Inspect the hydraulic brake system for the conditions listed, based on the following symptoms observed during the pedal travel and feel inspections: • Pedal feel was spongy • Air in hydraulic system • External brake fluid leaks • Soft, weak or damaged hydraulic hoses; expanding under pressure • Pedal fell away and/or traveled to or almost to floor • External brake fluid leaks • Poor brake fluid quality; low boiling point • Internal brake fluid leaks; improperly functioning master cylinder • Pedal was somewhat firm then dropped slightly, or pedal rose with successive applies, or pedal travel was different between slow and quick applies • Internal brake fluid leaks; improperly functioning master cylinder • Poor brake fluid quality; low boiling point • Pedal returned to rest slowly after any of the applies • Internally damaged flexible brake hoses; hindering fluid return • Binding caliper pistons • Internal brake fluid leaks; improperly functioning master cylinder 2. Repair or replace components as necessary. Refer to **Hydraulic Brake System Diagnosis** 3. Re-inspect brake pedal apply travel and feel. Did you find and correct a condition?	Go to **Step 9**	Go to **Step 4**

Step	Action	Yes	No
4	1. Inspect the disc brake system for the following conditions: - Cracked, excessively worn or damaged linings - Cracked, excessively worn or damaged rotors - Improperly operating, binding or damaged caliper hardware and/or lining hardware - Loose or missing caliper hardware and/or lining hardware - Excessive assembled lateral runout (LRO) of rotor friction surfaces - Bent or damaged caliper or mounting component 2. Adjust, repair or replace components as necessary. Refer to **Disc Brake System Diagnosis** 3. Re-inspect brake pedal apply travel and feel. Did you find and correct a condition?	Go to **Step 9**	Go to **Step 5**
5	Inspect for proper brake pedal travel. Refer to **Brake Pedal Travel Measurement and Inspection** Is the brake pedal travel distance within the acceptable limits?	Go to **Step 8**	Go to **Step 6**
6	1. Inspect for worn, missing, misaligned, bent or damaged brake pedal system components. - Perform the brake pedal pushrod component inspection. Refer to **Brake Pedal Pushrod Inspection**. - Inspect the brake pedal bushings for binding, excessive wear and/or damage and inspect the brake pedal for a misaligned, bent, and/or damaged condition. 2. Replace the brake pedal system components that are worn, missing, misaligned, bent or damaged. Did you find and replace any worn, missing, misaligned, bent or damaged brake pedal system components?	Go to **Step 9**	Go to **Step 7**
7	1. Replace the brake master cylinder assembly. 2. Inspect the brake pedal travel. Refer to **Brake Pedal Travel Measurement and Inspection** Did you find and correct a condition?	Go to **Step 9**	Go to **Step 8**

Step	Action	Yes	No
8	1. Inspect the brake assist system for the following conditions: - Internal fluid leaks and/or restrictions within the brake modulator assembly - Damaged or improperly operating brake modulator assembly 2. Adjust, repair or replace components as necessary. Refer to **Hydraulic Brake System Diagnosis** Did you find and correct a condition?	Go to **Step 9**	Go to **Symptoms - Hydraulic Brakes**
9	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Refer to **Brake System Vehicle Road Test** Is the condition still present?	Go to **Step 2**	System OK

BRAKE PEDAL EXCESSIVE EFFORT

Step	Action	Yes	No
DEFINITION: Brake pedal requires an increased amount of input from the driver to obtain good braking action and/or stopping distance is increased.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to **Step 2**	Go to **Diagnostic Starting Point - Vehicle**
2	1. Inspect the brake assist system for the following conditions: - Lack of lubrication, binding or excessively worn pushrod or pedal pivots or pivot bushings - Bent or damaged pedal pushrod, pedal, or pedal bracket 2. Adjust, repair or replace components as necessary. Refer to **Hydraulic Brake System Diagnosis** Did you find and correct a condition?	Go to **Step 5**	Go to **Step 3**

Step	Action	Yes	No
3	1. Inspect the hydraulic brake system for the following conditions: • Binding caliper pistons • Internally damaged flexible brake hoses; hindering fluid flow • External brake fluid leaks • Kinked or damaged flexible brake hoses and/or pipes • Internal brake fluid leaks; improperly operating master cylinder • Poor brake fluid quality; low boiling point 2. Adjust, repair or replace components as necessary. Refer to **Hydraulic Brake System Diagnosis** Did you find and correct a condition?	Go to **Step 5**	Go to **Step 4**
4	1. Inspect the disc brake system for the following conditions: • Excessively worn linings • Glazed linings • Cracked, distorted or damaged linings • Contaminated linings • Binding, damaged or excessively worn caliper hardware and/or lining hardware • Lack of lubrication or excessive corrosion on metal to metal contact surfaces • Excessively worn or corroded rotor friction surfaces • Glazed rotor friction surfaces • Hard spots, heat checks, blueing discoloration of rotor friction surfaces 2. Adjust, repair or replace components as necessary. Refer to **Disc Brake System Diagnosis** Did you find and correct a condition?	Go to **Step 5**	Go to **Diagnostic Starting Point - Vehicle**
5	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Refer to **Brake System Vehicle Road Test** Is the condition still present?	Go to **Step 2**	System OK

BRAKES DRAG

Step	Action	Yes	No
DEFINITION: Brake system does not fully release or has delayed release; vehicle motion may be hindered by brake system without applying brakes.			

Step	Action	Yes	No
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to **Step 2**	Go to **Diagnostic Starting Point - Vehicle**
2	Is the vehicle equipped with an adjustable stop lamp switch and/or an adjustable cruise control release switch?	Go to **Step 3**	Go to **Step 4**
3	1. Inspect the stop lamp switch for proper adjustment to ensure that the brake pedal is fully releasing. 2. Inspect the cruise control release switch, if equipped, for proper adjustment to ensure that the brake pedal is fully releasing. Did you find and correct a condition?	Go to **Step 14**	Go to **Step 4**
4	Is the vehicle equipped with a drum-in-rotor type of park brake system?	Go to **Step 5**	Go to **Step 7**
5	Ensure the park brake shoes are not adjusted too tightly, possibly causing drag under certain conditions. Are the park brake shoes adjusted too tightly?	Go to **Step 6**	Go to **Step 7**
6	1. Clean and inspect the park brake shoes for excessive wear and/or damage. 2. Inspect the drum portion of the rotors for excessive wear, blueing discoloration and heat spots. 3. If any of these conditions are present, replace the affected components. 4. Adjust the park brake system. Did you find and correct a condition?	Go to **Step 14**	Go to **Step 7**
7	Inspect the park brake system for proper operation. Refer to **Park Brake System Diagnosis** Did you find and correct a condition?	Go to **Step 14**	Go to **Step 8**
8	1. Inspect the disc brake system for the following conditions: • Binding, incorrectly installed or missing caliper hardware and/or lining hardware - Ensure free movement of linings and of caliper, if equipped with sliding type caliper • Lack of lubrication or excessive corrosion on metal to metal contact surfaces • Distorted or damaged linings • Damaged or excessively worn caliper hardware and/or lining hardware • Bent or damaged caliper or mounting component 2. Adjust, repair or replace components as necessary. Refer to **Disc Brake System Diagnosis** Did you find and correct a condition?	Go to **Step 14**	Go to **Step 9**

Step	Action	Yes	No
9	1. Separate the brake booster pushrod from the brake pedal. 2. Inspect the brake corners to determine if the brake drag condition is still present. Do the brake corners still exhibit the brake drag condition?	Go to **Step 11**	Go to **Step 10**
10	1. Inspect the pushrod for improper positioning and/or damage. Correctly position or replace the pushrod if necessary. 2. Inspect the brake pedal assembly for damage and replace if necessary. Did you complete the repair or replacement?	Go to **Step 14**	-
11	1. For vacuum boost systems, disconnect the vacuum check valve from the booster to relieve vacuum reserve. 2. Separate the master cylinder from the brake booster. Do not disconnect any brake pipes. 3. Inspect the brake corners to determine if the brake drag condition is still present. Do the brake corners still exhibit the brake drag condition?	Go to **Step 13**	Go to **Step 12**
12	Replace the brake booster assembly. Did you complete the replacement?	Go to **Step 14**	-
13	1. Inspect the hydraulic brake system for the following conditions. • Improper operation of caliper pistons • Contaminated brake fluid • Internally damaged flexible brake hoses; hindering brake release • Damaged or improperly operating master cylinder 2. Adjust, repair or replace components as necessary. Refer to **Hydraulic Brake System Diagnosis** Did you find and correct a condition?	Go to **Step 14**	Go to **Diagnostic Starting Point - Vehicle**
14	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Refer to **Brake System Vehicle Road Test** Is the condition still present?	Go to **Step 2**	System OK

BRAKE SYSTEM SLOW RELEASE

Step	Action	Yes	No
DEFINITION: Brake system releases and returns to rest slowly; vehicle motion is hindered by brake system briefly after release of brake pedal.			

Step	Action	Yes	No
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to **Step 2**	Go to **Symptoms - Hydraulic Brakes**
2	1. Inspect the hydraulic brake and assist system for the following conditions: - Improper operation of caliper pistons - Internally damaged flexible brake hoses; hindering brake release - Contaminated brake fluid - Damaged or improperly operating master cylinder - Damaged or improperly operating hydraulic booster, if equipped - Binding, bent or damaged pedal pushrod, pedal, or pedal bracket 2. Adjust, repair or replace components as necessary. Refer to **Hydraulic Brake System Diagnosis** Did you find and correct a condition?	Go to **Step 4**	Go to **Step 3**
3	1. Inspect the disc brake system for the following conditions: - Damaged or excessively worn caliper hardware and/or lining hardware - Distorted or damaged linings - Lack of lubrication or excessive corrosion on metal to metal contact surfaces - Bent or damaged caliper or mounting component 2. Adjust, repair or replace components as necessary. Refer to **Disc Brake System Diagnosis** Did you find and correct a condition?	Go to **Step 4**	Go to **Symptoms - Hydraulic Brakes**
4	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Refer to **Brake System Vehicle Road Test** Is the condition still present?	Go to **Step 2**	System OK

BRAKE FLUID LOSS

Step	Action	Yes	No
DEFINITION: Brake fluid level is low not related to lining wear.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to **Step 2**	Go to **Diagnostic Starting Point - Vehicle**

Step	Action	Yes	No
2	1. Inspect the following hydraulic brake system components for brake fluid leaks: • Flexible brake hose connections; threaded and bolted • Flexible brake hose crimp joints • Brake pipe fittings • Caliper piston seals • Wheel cylinder piston seals, if equipped • Master cylinder reservoir • Master cylinder reservoir low pressure hose, if equipped • Brake pressure modulator valve (BPMV) assembly, if equipped 2. Repair or replace components as necessary. Refer to **Hydraulic Brake System Diagnosis** Did you find and correct a condition?	Go to **Step 8**	Go to **Step 3**
3	Is the vehicle equipped with a vacuum brake booster?	Go to **Step 4**	Go to **Step 6**
4	1. Disconnect the vacuum check valve from the booster to relieve vacuum reserve. 2. Separate the master cylinder from the vacuum brake booster. Do not disconnect any brake pipes. 3. Inspect the rear of the master cylinder for a brake fluid leak. 4. Inspect for brake fluid in the vacuum brake booster. Did you find a brake fluid leak?	Go to **Step 5**	Go to **Diagnostic Starting Point - Vehicle**
5	Replace the brake master cylinder and the vacuum brake booster. Did you complete the replacement?	Go to **Step 8**	-
6	1. Wipe clean the external surface of the master cylinder to hydraulic brake booster area, if equipped. 2. Separate the master cylinder from the hydraulic brake booster, if equipped. Do not disconnect any brake pipes. 3. Inspect the rear of the master cylinder for a brake fluid leak. Did you find a brake fluid leak?	Go to **Step 7**	Go to **Diagnostic Starting Point - Vehicle**
7	Replace the brake master cylinder. Did you complete the replacement?	Go to **Step 8**	-

Step	Action	Yes	No
8	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle to confirm proper operation. Refer to **Brake System Vehicle Road Test** Is the condition still present?	Go to **Step 2**	System OK

DISC BRAKE SYSTEM DIAGNOSIS

Test Description

The numbers below refer to the step numbers on the diagnostic table:

9

Lubricant leaks from non-brake system components may come in contact with and contaminate brake system components.

10

Lubricant leaks from non-brake system components may come in contact with and contaminate brake system components.

12

Disc brake rotor shields/backing plates that come in contact with disc brake rotors may cause brake system noise.

15

Disc brake rotor thickness variation that exceeds the maximum acceptable level can cause brake pulsation.

19

Disc brake rotor thickness variation that exceeds the maximum acceptable level can cause brake pulsation.

22

Disc brake rotor assembled lateral runout (LRO) that exceeds the maximum acceptable level can lead to thickness variation.

Step	Action	Yes	No
DEFINITION: This diagnostic table is designed to diagnose ONLY the components of the DISC brake system in order to determine if the DISC brake system is operating properly. You will be directed by the appropriate Symptom table to go to other brake system diagnostic tables as appropriate.			
1	Were you sent here from a Brake Symptom table?	Go to **Step 2**	Go to **Diagnostic Starting Point - Vehicle**

Step	Action	Yes	No
2	Visually inspect the disc brake pads for the following conditions: **Brake Pad Inspection** - Lining thickness below specifications - Uneven and/or abnormal wear - edge-to-edge and/or side-to-side - Looseness or damage - including pad hardware - Evidence of contamination from an external substance Did you find any conditions to indicate a concern with any of the front and/or rear disc brake pads?	Go to **Step 3**	Go to **Step 12**
3	Are any of the front and/or rear disc brake pads contaminated?	Go to **Step 8**	Go to **Step 4**
4	Are any of the front and/or rear disc brake pads worn unevenly?	Go to **Step 7**	Go to **Step 5**
5	Are any of the front and/or rear disc brake pads and/or pad hardware loose or damaged?	Go to **Step 7**	Go to **Step 6**
6	1. Remove and inspect the worn disc brake pads for glazing, looseness, heat spots or damage. 2. Replace the worn disc brake pads as a complete axle set. Refer to **Front Disc Brake Pads Replacement** , and/or **Rear Disc Brake Pads Replacement** Did you complete the inspection and replacement?	Go to **Step 12**	-

Step	Action	Yes	No
7	**CAUTION:** **Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.** **NOTE:** **Do NOT disconnect the hydraulic brake flex hoses from the calipers.** 1. Remove the front and/or rear disc brake calipers, as appropriate, from the mounting brackets or from the suspension knuckles and support the calipers. Refer to **Front Brake Caliper Replacement** , and/or **Rear Brake Caliper Replacement** 2. Inspect the disc brake caliper mounting bracket and the mounting/sliding hardware for the following conditions: **Front Disc Brake Mounting and Hardware Inspection** , and/or **Rear Disc Brake Mounting and Hardware Inspection** • Binding or seized hardware • Worn, damaged or missing hardware components • Loose, bent, cracked, or damaged caliper mounting bracket 3. Replace components as required. Refer to the following procedures, as required: • **Front Brake Caliper Bracket Replacement** • **Rear Brake Caliper Bracket Replacement** 4. Replace the unevenly-worn, loose or damaged disc brake pads as a complete axle set. Refer to **Front Disc Brake Pads Replacement** , and/or **Rear Disc Brake Pads Replacement** Did you complete the inspection and replacement?	Go to **Step 12**	-

Step	Action	Yes	No
8	1. Inspect the disc brake calipers, brake hoses and brake pipes for evidence of an external brake fluid leak. 2. Replace any components found to be leaking brake fluid. Refer to the following procedures as required: - **Front Brake Caliper Replacement** - **Rear Brake Caliper Replacement** - **Front Brake Hose Replacement** - **Rear Brake Hose Replacement** - **Brake Pipe Replacement** Did you find and correct the source of the leak causing contamination of the pads?	Go to **Step 11**	Go to **Step 9**
9	1. Inspect the wheel drive shaft outer seals for damage and evidence of a grease leak. 2. Replace any wheel drive shaft seal that is found to be leaking grease which may be the source of the contamination to the pads. Did you find and correct the source of the leak causing contamination of the pads?	Go to **Step 11**	Go to **Step 10**
10	1. Inspect the automatic transmission cooling system lines, if equipped, for damage and evidence of an external fluid leak which may be the source of the contamination to the pads. 2. Inspect the power steering system hoses for damage and evidence of an external fluid leak which may be the source of the contamination to the pads. 3. Replace any components found to be leaking fluid which may be the source of the contamination to the pads. Did you find and correct the source of the leak causing contamination of the pads?	Go to **Step 11**	-

Step	Action	Yes	No
11	1. Clean the remaining disc brake system components to remove any traces of the contaminant. **CAUTION:** **Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.** **NOTE:** **Do NOT disconnect the hydraulic brake flex hoses from the calipers.** 2. Remove the front and/or rear disc brake calipers, as appropriate, from the mounting brackets and support the calipers. Refer to **Front Brake Caliper Replacement** , and/or **Rear Brake Caliper Replacement** 3. Inspect the disc brake caliper mounting/sliding hardware for the following conditions: **Front Disc Brake Mounting and Hardware Inspection** , and/or **Rear Disc Brake Mounting and Hardware Inspection** - Binding or seized hardware - Distorted, worn, damaged or missing hardware components 4. Replace the caliper mounting/sliding hardware components as required. 5. Replace the contaminated disc brake pads as a complete axle set. Refer to **Front Disc Brake Pads Replacement** , and/or **Rear Disc Brake Pads Replacement** Did you complete the cleaning, inspection and replacement?	Go to **Step 12**	-
12	Visually inspect each of the rear disc brake rotor shields/backing plates, if equipped, for evidence of contact with the brake rotors. Are any of the brake rotor shields/backing plates contacting the brake rotors?	Go to **Step 13**	Go to **Step 14**
13	Repair or replace the disc brake rotor shields/backing plates as required. Refer to **Front Brake Shield Replacement** , or **Rear Brake Shield Replacement** Did you complete the repair or replacement?	Go to **Step 14**	-

Step	Action	Yes	No
14	1. Check the thickness of each of the disc brake rotors. **NOTE:** **Make the following determination AND ANSWER the question INDIVIDUALLY for EACH rotor.** 2. Make a determination for each brake rotor if the rotor can be REFINISHED and REMAIN ABOVE the minimum requirements. Refer to **Brake Rotor Thickness Measurement** Does the disc brake rotor meet the minimum requirements for REFINISHING?	Go to **Step 15**	Go to **Step 18**
15	**NOTE:** **Perform the following inspection AND ANSWER the question INDIVIDUALLY for EACH rotor.** Inspect each of the disc brake rotors for thickness variation that exceeds the maximum acceptable level. Refer to **Brake Rotor Thickness Variation Measurement** Does the brake rotor exhibit thickness variation that exceeds the maximum acceptable level?	Go to **Step 17**	Go to **Step 16**
16	1. Inspect each of the disc brake rotors for the following surface and wear conditions: **Brake Rotor Surface and Wear Inspection** - Heavy rust and/or pitting - Cracks and/or heat spots - Excessive blueing discoloration - Deep or excessive scoring beyond maximum acceptable level **NOTE:** **Make the following determination AND ANSWER the question INDIVIDUALLY for EACH rotor.** 2. Make a determination for each brake rotor if the rotor requires refinishing based upon the results of the inspection. If the brake rotor exhibits any of the conditions listed previously, it requires refinishing. Does the brake rotor require REFINISHING?	Go to **Step 17**	Go to **Step 22**

Step	Action	Yes	No
17	1. Refinish the brake rotor. Refer to **Brake Rotor Refinishing** 2. Inspect the brake rotor thickness. Refer to **Brake Rotor Thickness Measurement** Were you able to REFINISH the brake rotor within the minimum requirements?	Go to **Step 22**	Go to **Step 21**
18	Is the brake rotor at or below the DISCARD requirements?	Go to **Step 21**	Go to **Step 19**
19	**NOTE:** **Perform the following inspection AND ANSWER the question INDIVIDUALLY for EACH rotor.** Inspect each of the disc brake rotors for thickness variation that exceeds the maximum acceptable level. Refer to **Brake Rotor Thickness Variation Measurement** Does the brake rotor exhibit thickness variation that exceeds the maximum acceptable level?	Go to **Step 21**	Go to **Step 20**
20	1. Inspect each of the disc brake rotors for the following surface and wear conditions: **Brake Rotor Surface and Wear Inspection** - Heavy rust and/or pitting - Cracks and/or heat spots - Excessive blueing discoloration - Deep or excessive scoring beyond maximum acceptable level **NOTE:** **Make the following determination AND ANSWER the question INDIVIDUALLY for EACH rotor.** 2. Make a determination for each brake rotor if the rotor requires replacement based upon the results of the inspection. If the brake rotor exhibits any of the conditions listed previously, it requires replacement. Does the brake rotor require REPLACEMENT?	Go to **Step 21**	Go to **Step 22**
21	**NOTE:** **Whenever a brake rotor is replaced, the assembled lateral runout (LRO) of the rotor must be measured to ensure optimum performance of the disc brakes.** Replace the brake rotor. Refer to **Front Brake Rotor Replacement** , or **Rear Brake Rotor Replacement** Did you complete the replacement?	Go to **Step 24**	-

Step	Action	Yes	No
22	**NOTE:** **Perform the following inspection AND ANSWER the question INDIVIDUALLY for EACH rotor.** Inspect each of the disc brake rotors for assembled LRO that exceeds the maximum acceptable level. Refer to **Brake Rotor Assembled Lateral Runout Measurement** Does the brake rotor exhibit assembled LRO that exceeds the maximum acceptable level?	Go to **Step 23**	Go to **Step 24**
23	Correct the LRO for each brake rotor that was determined to have LRO exceeding the maximum acceptable level. Refer to **Brake Rotor Assembled Lateral Runout Measurement** Did you complete the operation?	Go to **Step 24**	-
24	Install or connect components that were removed or disconnected during diagnosis. Did you complete the operation?	Disc Brake System OK Return to Symptom Table	-

HYDRAULIC BRAKE SYSTEM DIAGNOSIS

Step	Action	Yes	No
DEFINITION: This diagnostic table is designed to diagnose ONLY the components of the HYDRAULIC brake system in order to determine if the HYDRAULIC brake system is operating properly. You will be directed by the appropriate Symptom table to go to other brake system diagnostic tables as appropriate.			
1	Were you sent here from a Brake Symptom table?	Go to **Step 2**	Go to **Symptoms - Hydraulic Brakes**
2	Inspect and adjust the brake fluid level in the brake master cylinder. Refer to **Master Cylinder Reservoir Filling** Was the brake fluid level low?	Go to **Step 3**	Go to **Step 4**
3	1. Inspect the brake fluid for the following conditions, indicating brake fluid contamination: • Fluid separation, indicating two types of fluid are present • Swirled appearance - oil-based substance • Layered appearance - silicone-based substance • Fluid discoloration • Cloudy appearance - moisture • Dark appearance/suspended particles in fluid - dirt, rust, corrosion, brake dust 2. Inspect the master cylinder reservoir cap diaphragm and the reservoir-to-master cylinder grommets for swelling, indicating fluid contamination. Do any of the above conditions exist?	Go to **Step 5**	Go to **Step 6**

Step	Action	Yes	No

4	1. Inspect the brake fluid for the following conditions, indicating brake fluid contamination:
	• Fluid separation, indicating two types of fluid are present
	  • Swirled appearance - oil-based substance
	  • Layered appearance - silicone-based substance
	• Fluid discoloration
	  • Cloudy appearance - moisture
	  • Dark appearance/suspended particles in fluid - dirt, rust, corrosion, brake dust
	2. Inspect the master cylinder reservoir cap diaphragm and the reservoir-to-master cylinder grommets for swelling, indicating fluid contamination.
	Do any of the above conditions exist?
		Go to **Step 5**	Go to **Step 12**

Step	Action	Yes	No

5	1. Flush the hydraulic brake system. Refer to **Hydraulic Brake System Flushing**
	2. If the brake fluid WAS contaminated with an oil-based or a silicone-based fluid, indicated by fluid separation and/or a swollen master cylinder reservoir cap diaphragm and/or swollen reservoir-to-master cylinder grommets, perform the following steps. Refer to the procedures indicated.
	  1. Remove ALL of the following components listed. Each component contains internal rubber seals/linings which have been contaminated.
	  2. Clean out the hydraulic brake pipes using denatured alcohol, or equivalent.
	  3. Dry the brake pipes using non-lubricated, filtered air.
	  4. Repair or replace ALL of the following components listed. Each component contains internal rubber seals/linings which have been contaminated.
	    - Replace the brake master cylinder reservoir cap diaphragm.
	    - **Master Cylinder Replacement**
	    - Brake master cylinder reservoir: Clean the brake master cylinder reservoir using denatured alcohol, or equivalent, then dry the reservoir using non-lubricated, filtered air, or if necessary, replace the brake master cylinder reservoir.
	    - **Front Brake Hose Replacement**
	    - **Rear Brake Hose Replacement**
	    - **Front Brake Caliper Overhaul** , **Front Brake Caliper Replacement**
	    - **Rear Brake Caliper Replacement**
	    - **Electronic Brake Control Module with Brake Pressure Modulator Valve Replacement**
	3. If the brake fluid was NOT contaminated with an oil-based fluid, but WAS contaminated with water or dirt, rust, corrosion, and/or brake dust, replace the brake master cylinder reservoir cap diaphragm which may have allowed moisture or dirt to enter the system.
	4. Refill and bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding**
	Did you complete the operation and any required repairs and/or replacements?
		Go to **Step 9**	-

Step	Action	Yes	No
6	1. Inspect the following hydraulic brake system components for external fluid leaks. Repair or replace any of the components found to be leaking brake fluid. Refer to the appropriate procedures: - Brake master cylinder reservoir cap diaphragm - Refer to **Master Cylinder Replacement** - Refer to **Front Brake Hose Replacement** - Refer to **Rear Brake Hose Replacement** - Refer to **Brake Pipe Replacement** - Refer to **Front Brake Caliper Overhaul** , **Front Brake Caliper Replacement** - Refer to **Rear Brake Caliper Replacement** - Refer to **Electronic Brake Control Module with Brake Pressure Modulator Valve Replacement** 2. If you repaired or replaced any of the brake system components listed, bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding** While bleeding the hydraulic brake system, observe for the following conditions: - The presence of air in the system at a bleeder valve location other than at the repair location, except if the brake master cylinder, and/or the proportioning valve assembly, was replaced - An unrestricted and even flow of brake fluid per axle during the bleeding procedure Did you find and correct a condition?	Go to **Step 7**	Go to **Step 12**
7	Was there air in the system at a bleeder valve location other than at the repair location, except if the brake master cylinder, and/or the proportioning valve assembly, was replaced?	Go to **Step 19**	Go to **Step 8**
8	Was the flow of brake fluid unrestricted and even per axle during the bleeding procedure?	Go to **Step 9**	Go to **Step 10**
9	Inspect the hydraulic function of the brake calipers and/or wheel cylinders, if equipped for proper operation. Refer to **Hydraulic Brake Component Operation Visual Inspection** Was the hydraulic function of the brake calipers/wheel cylinders operating properly?	Go to **Step 21**	Go to **Step 14**
10	Was the flow of brake fluid restricted or uneven through front axle hydraulic components during the bleeding procedure?	Go to **Step 13**	Go to **Step 11**
11	Was the flow of brake fluid restricted or uneven through rear axle hydraulic components during the bleeding procedure?	Go to **Step 17**	-
12	Inspect the hydraulic function of the brake calipers/wheel cylinders for proper operation. Refer to **Hydraulic Brake Component Operation Visual Inspection** Was the hydraulic function of the brake calipers/wheel cylinders operating properly?	Go to **Step 15**	Go to **Step 13**

Step	Action	Yes	No
13	Determine if the brake caliper is restricting the flow of brake fluid and/or not operating properly: 1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** 2. Remove the tire and wheel assemblies. Refer to **Tire and Wheel Removal and Installation** 3. Open the suspected caliper bleeder valve. 4. Using a large C-clamp, compress the caliper piston and observe for an unrestricted flow of brake fluid and for free movement of the caliper piston. 5. Close the caliper bleeder valve. Was the flow of brake fluid unrestricted and did the caliper piston move freely?	Go to **Step 17**	Go to **Step 14**
14	Repair or replace any brake caliper/wheel cylinder that was not operating properly. - Refer to **Front Brake Caliper Overhaul** , **Front Brake Caliper Replacement** - Refer to **Rear Brake Caliper Replacement** Did you complete the repair and/or replacement?	Go to **Step 21**	-
15	Bleed the hydraulic brake system to observe for the presence of air in the system and to observe for an unrestricted and even flow of brake fluid per axle during the bleeding procedure. Refer to **Hydraulic Brake System Bleeding** Was there air in the system?	Go to **Step 19**	Go to **Step 16**
16	Was the flow of brake fluid unrestricted and even per axle during the bleeding procedure?	Go to **Step 21**	Go to **Step 17**
17	1. Inspect the hydraulic brake pipes and flexible brake hoses for signs of a fluid restriction; such as being bent, kinked, pinched or damaged. Refer to **Brake Pipe and Hose Inspection** 2. Replace any of the hydraulic brake pipes and/or flexible brake hoses found to be bent, kinked, pinched, or damaged. - Refer to **Front Brake Hose Replacement** - Refer to **Rear Brake Hose Replacement** - Refer to **Brake Pipe Replacement** 3. If none of the hydraulic brake pipes or flexible brake hoses were visibly bent, kinked, pinched, or damaged, replace the hydraulic brake flex hose at the restricted location. Did you find and correct a condition?	Go to **Step 21**	Go to **Step 18**
18	Replace the brake modulator assembly, in order to correct the hydraulic brake dynamic rear proportioning mechanical operation. Refer to **Electronic Brake Control Module with Brake Pressure Modulator Valve Replacement** Did you complete the replacement?	Go to **Step 21**	-

Step	Action	Yes	No
19	1. Inspect the hydraulic brake system components for brake fluid seepage at a seal and/or fitting location, which may have drawn air into the system. 2. Inspect the hydraulic brake system components for evidence of a recent repair, which may have introduced air into the system. 3. Repair or replace any of the components found to be installed incorrectly or seeping brake fluid. Did you find and correct a condition?	Go to **Step 21**	Go to **Step 20**
20	1. Inspect the brake master cylinder for internal fluid leaks. Refer to **Brake System Internal Leak Test** 2. Repair or replace the brake master cylinder if it is found to be leaking brake fluid internally. Refer to **Master Cylinder Replacement** Did you find and correct a condition?	Go to **Step 21**	Return to Symptom Table
21	Install or connect components that were removed or disconnected during diagnosis. Did you complete the operation?	Hydraulic Brake System OK Return to Symptom Table	-

BRAKE SYSTEM VEHICLE ROAD TEST

Preliminary Inspections

1. Visually inspect easily accessible brake system components for obvious damage and/or leaks which may indicate that the vehicle should not be driven until further inspections have been completed.
2. Inspect the brake master cylinder reservoir fluid level and adjust only if necessary for brake system road testing. Refer to **Master Cylinder Reservoir Filling**
3. Inspect the tire inflation pressures and adjust as necessary.
4. Inspect the tire tread patterns to ensure that they are the same or very similar, especially per axle.
5. Ensure that the vehicle is not loaded unevenly prior to brake system road testing.

Road Testing Procedure

WARNING: **Road test a vehicle under safe conditions and while obeying all traffic laws. Do not attempt any maneuvers that could jeopardize vehicle control. Failure to adhere to these precautions could lead to serious personal injury and vehicle damage.**

1. Start the engine and allow it to idle.
2. Check to see if the brake system warning lamp remains illuminated.
3. If the brake system warning lamp remains illuminated, DO NOT proceed to test drive the vehicle until it is diagnosed and repaired. Refer to **Symptoms - Hydraulic Brakes**
4. Select a smooth, dry, clean and level road or large lot that is as free of traffic and obstacles as possible for brake system low speed road testing.
5. With the transmission in PARK, lightly apply the brake pedal. Observe both the pedal feel and the pedal travel.
6. If the brake pedal apply felt spongy, or the pedal travel was excessive, DO NOT drive the vehicle until it is repaired.
7. If the brake pedal apply did not feel spongy and the pedal travel was not excessive, proceed to step 8.

8. Release and apply the brakes.
9. While continuing to apply the brakes, shift the transmission into DRIVE, release the brakes and allow the engine to idle the vehicle away from the stopped position. Observe for a slow release of the brake system.
10. With the aid of an assistant to observe the vehicle's performance from outside of the vehicle, drive the vehicle at a low speed and lightly apply the brakes while driving past the assistant. Have the assistant observe for brake system noise from the side of the vehicle closest to them, while you observe both the pedal effort and the pedal travel.
11. If the brake pedal apply effort was excessive, or the pedal travel was excessive, DO NOT continue to test drive the vehicle until it is repaired.
12. If the brake pedal apply effort was not excessive and the pedal travel was not excessive, proceed to step 13.
13. Drive the vehicle in the opposite direction, at the same low speed and lightly apply the brakes while driving past the assistant. Have the assistant observe for brake system noise from the side of the vehicle closest to him.
14. Drive the vehicle at a low speed and shift the transmission into NEUTRAL without applying the brakes. Observe for a rapid deceleration in vehicle speed, indicating possible brake drag.
15. Select a smooth, dry, clean and level road that is as free of heavy traffic as possible for brake system moderate speed road testing.
16. Drive the vehicle at a moderate speed. Observe for a pull and/or incorrect tracking of the vehicle without the brakes applied.
17. While continuing to drive the vehicle at a moderate speed, perform several light applies of the brakes. Observe the pedal effort and the pedal travel, observe for brake system noise, pulsation and/or brake drag.
18. If the brake pedal apply effort was excessive, or the pedal travel was excessive, DO NOT continue to test drive the vehicle until it is repaired.
19. If the brake pedal apply effort was not excessive and the pedal travel was not excessive, proceed to step 20.
20. While continuing to drive the vehicle at a moderate speed, perform several moderate applies of the brakes. Observe the pedal effort and the pedal travel, observe for brake system pulsation and/or uneven braking action - either side to side, or front to rear.

    A small amount of vehicle front end dip is expected during a moderate apply of the brakes.

21. If the brake pedal apply effort was excessive, or the pedal travel was excessive, DO NOT continue to test drive the vehicle until it is repaired.

BRAKE PEDAL TRAVEL MEASUREMENT AND INSPECTION

NOTE: **The brake corners must be cool to obtain the most accurate measurement.**

1. Install a scan tool to the vehicle.
2. Place the power button in the Service Only Mode without applying the brake pedal.
3. Using the scan tool, perform the following steps:
    1. Select Diagnostics
    2. Enter the VIN
    3. Select Electronic Brake Control Module (EBCM)
    4. Select Data Display
    5. Scroll through the Data List, select Brake Pressure
4. While observing the master cylinder pressure on the scan tool data display, using moderate speed and moderate effort, apply the brake pedal to a force of 5000 kPa (725 psi) and maintain this pedal force.
5. Select Brake Boost Control Module.
6. Select Data Display.
7. Scroll through the Data List, select Output Rod Position.

8. Record the distance displayed on the scan tool that the brake pedal has travelled at a pedal apply force of 5000 kPa (725 psi).
9. Release the brake pedal.

   Specification

   Maximum brake pedal travel: 18 mm (0.71 in)

BRAKE SYSTEM EXTERNAL LEAK INSPECTION

WARNING: **Refer to Brake Fluid Irritant Warning .**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

1. In order to inspect for external brake fluid leaks, first check the fluid level in the master cylinder.

   While a slight brake fluid level drop can be considered a normal condition due to brake lining wear, a very low level may indicate a brake fluid leak in the hydraulic system.

   If the fluid level is abnormally low, adjust the brake fluid level. Refer to **Master Cylinder Reservoir Filling**

2. Start the engine and allow it to idle.
3. Apply constant, moderate foot pressure to the brake pedal.

   If the brake pedal gradually falls away while under foot pressure, there may be a brake fluid leak.

4. Turn OFF the ignition.
5. Visually inspect the following brake system components for brake fluid leaks, excessive corrosion, and damage. Give particular attention to all brake pipe and flexible hose connections to ensure that there are not any slight brake fluid leaks - even though the brake pedal may feel firm and hold steady:
   - Master cylinder brake pipe fittings
   - All brake pipe connections
   - Brake pipes
   - Brake hoses and connections
   - Brake calipers and/or wheel cylinders, if equipped
6. While slight dampness around the master cylinder reservoir can be considered acceptable, brake fluid leaking from any of the brake system components requires immediate attention. If any of these components exhibit signs of brake fluid leakage, repair or replace those components. After the repair or replacement, reinspect the hydraulic brake system to assure proper function.

BRAKE SYSTEM INTERNAL LEAK TEST

WARNING: **Refer to Brake Fluid Irritant Warning .**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

1. Ensure is ignition is OFF for at least 60 seconds to allow the system to depressurize and deplete the power reserve.
2. Apply the brake pedal several times to verify the power reserve is fully depleted.
3. Apply light, steady pressure to the brake pedal. Observe both the brake pedal feel and travel.
4. Release the brake pedal.
5. If the brake pedal apply felt spongy, but the brake pedal travel was not excessive, perform the following steps:
   1. Inspect the brake system for external leaks. Refer to **Brake System External Leak Inspection**

2. Pressure bleed the brake system in order to purge any air that may be trapped in the system. Refer to **Hydraulic Brake System Bleeding**

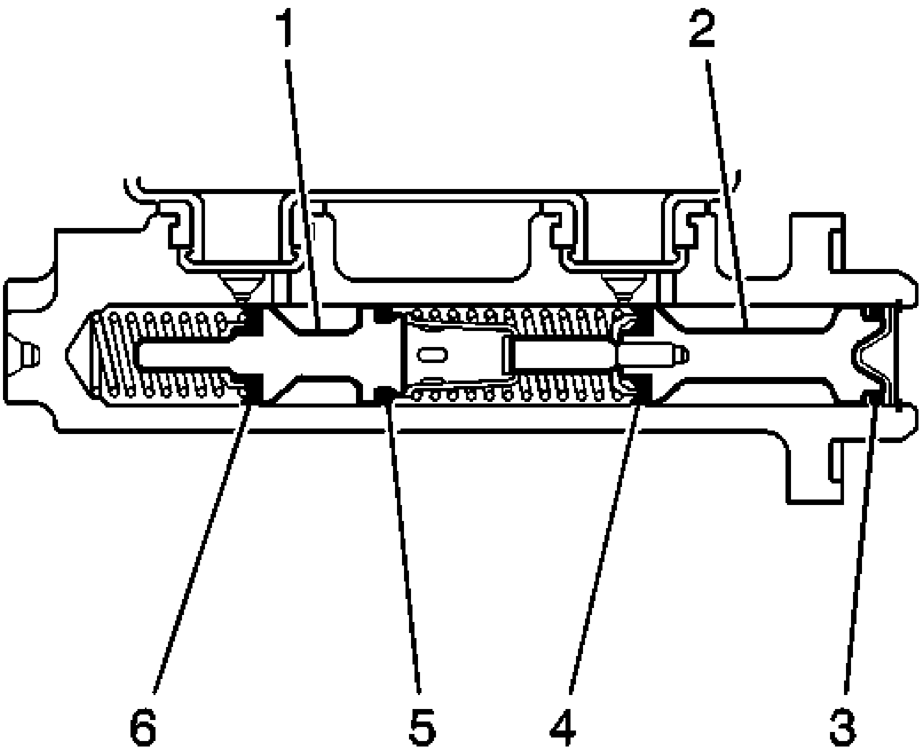

Fig. 2: Cross Sectional View Of Brake Master Cylinder And Components
Courtesy of GENERAL MOTORS COMPANY

6. If the brake pedal apply did not feel spongy, but the brake pedal travel was excessive, perform the following steps:
    1. Loosen the master cylinder-to-adapter mounting nuts.
    2. Carefully pull the master cylinder away from the adapter just enough to inspect the mounting surface of the master cylinder.
    3. Inspect the master cylinder mounting surface at the primary piston (2) for brake fluid leaks.
7. If the master cylinder exhibits any leakage around the primary piston (2), then the primary piston primary seal (4) and/or secondary seal (3) is leaking and the master cylinder requires replacement.
8. If the master cylinder primary piston (2) does not exhibit any leakage, install the master cylinder to the adapter and pressure bleed the brake system. Refer to **Hydraulic Brake System Bleeding**
9. If the brake pedal apply did not feel spongy, and the brake pedal travel was initially steady and not excessive, but then gradually fell, then the master cylinder requires replacement due to an internal leak past a piston seal.
10. If the brake pedal apply did not feel spongy, and the brake pedal travel was initially steady and not excessive, then fell slightly, then became steady again, then the brake pressure modulator valve (BPMV) may be leaking internally, and may require replacement.

HYDRAULIC BRAKE COMPONENT OPERATION VISUAL INSPECTION

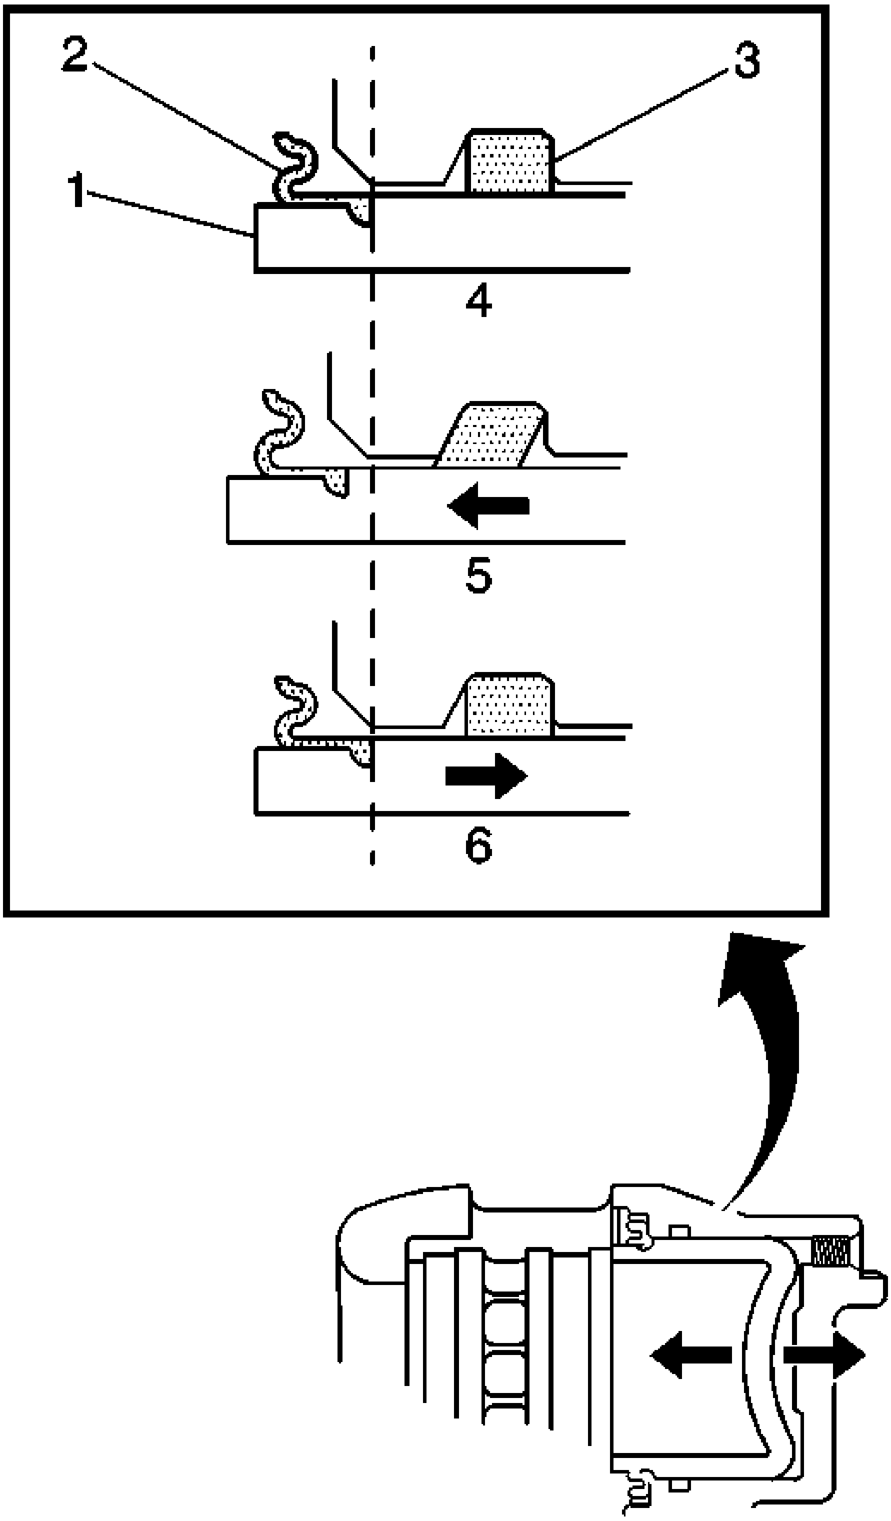

Fig. 3: Brake Caliper/Pad Inspection Areas
Courtesy of GENERAL MOTORS COMPANY

WARNING: **Refer to Brake Fluid Irritant Warning .**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

1. With the tire and wheel assemblies removed and the brake rotors retained by wheel lug nuts, visually inspect the caliper piston dust boot (2) sealing area to ensure that there are no brake fluid leaks.
2. If any evidence of a brake fluid leak is present, the brake caliper requires overhaul or replacement.
3. While the brake system is at rest (4), observe the position of the caliper piston (1) in relation to the caliper housing.

4. Have an assistant apply and release the brake pedal several times while you observe the operation of the hydraulic brake caliper.
    1. Observe the caliper piston (1) for unrestricted and even movement during each apply of the brake system (5).
    2. Observe the caliper piston (1) for an unrestricted and even return motion during each release of the brake system (6).
5. If the caliper piston (1) did not exhibit unrestricted and even movement during brake system apply and/or release, the piston square seal (3) may be worn or damaged and the caliper may require overhaul or replacement.

BRAKE PIPE AND HOSE INSPECTION

WARNING: **Refer to Brake Fluid Irritant Warning .**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

1. Visually inspect all of the brake pipes for the following conditions:
    - Kinks, improper routing, missing or damaged retainers, Leaking fittings, excessive corrosion
2. If any of the brake pipes exhibited any of the conditions listed, then the identified pipe, or pipes, require replacement.
3. Ensure that the vehicle axles are properly supported at ride height in order to maintain the proper relationship of the flexible brake hoses to the chassis.

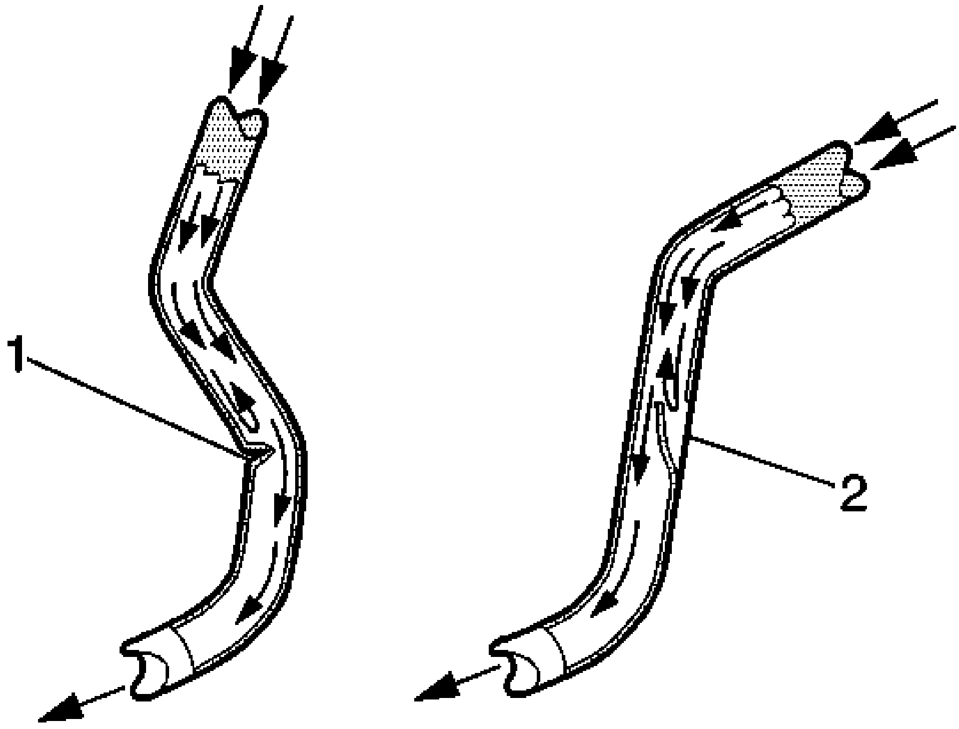

Fig. 4: Flexible Brake Hose Failure Conditions
Courtesy of GENERAL MOTORS COMPANY

4. Visually inspect all of the flexible brake hoses for the following conditions:
    - Kinks (1), improper routing, twists, chafing, missing or damaged retainers

- Leaking connections, cracking, dry-rot, blisters, bulges

5. If any of the flexible brake hoses exhibited any of the conditions listed, then the identified flexible brake hose, or hoses require replacement.
6. Tightly press the flexible brake hose with fingers to check whether there are any spongy spots (2) (which indicates the existence of interior blocking). Inspect the entire length of each hose.
7. If any of the flexible brake hoses were found to have soft spots (2), then the identified flexible brake hose, or hoses require replacement.

BRAKE PEDAL PUSHROD INSPECTION

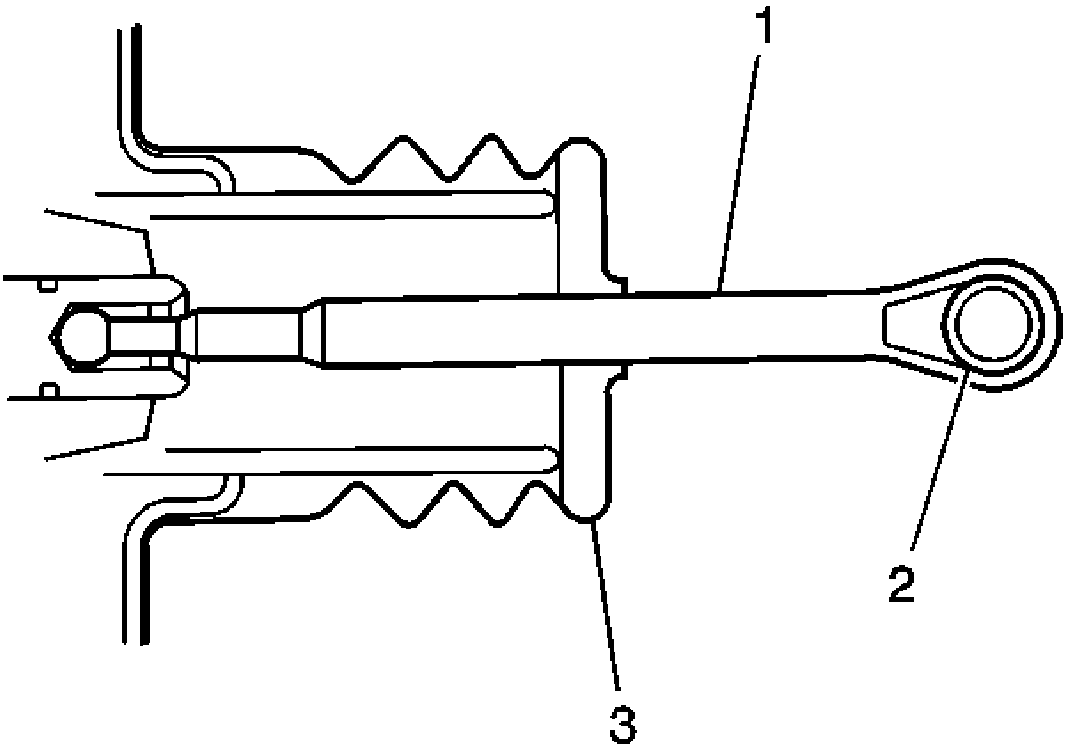

Fig. 5: Brake Pedal Pushrod, Eyelet Bushing And Boot
Courtesy of GENERAL MOTORS COMPANY

1. Disconnect the brake pedal pushrod (1) from the brake pedal.
2. Inspect the brake pedal pushrod eyelet bushing (2), if equipped, for cracks and/or excessive wear.
3. Reposition the pedal pushrod boot (3) toward the front of the vehicle to expose as much of the pedal pushrod (1) as possible.
4. Inspect the brake pedal pushrod (1) for straightness.
5. If the brake pedal pushrod eyelet bushing (2) exhibited cracks and/or excessive wear, then the bushing requires replacement.
6. If the brake pedal pushrod (1) is not straight, then the pushrod requires replacement.
7. Return the pedal pushrod boot (3) to its original position on the pedal pushrod (1).
8. Connect the brake pedal pushrod (1) to the brake pedal.

REPAIR INSTRUCTIONS

HYDRAULIC BRAKE FLUID REPLACEMENT

WARNING: **Refer to Brake Fluid Irritant Warning**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution**

CAUTION: **Only use products that comply with GM specifications and check manufacturer information respectively. We recommend the use of GM genuine products. Instructions must be followed at all times. The use of any type of fluid other than the recommended type of brake fluid, may cause contamination which could result in damage to the internal rubber seals and/or rubber linings of hydraulic brake system components.**

1. With the engine OFF, apply and release the brake pedal several times until the pedal effort becomes firm to deplete the brake booster power reserve.
2. Clean the outer surface of the master cylinder brake fluid reservoir, on and around the reservoir cap, prior to removing the cap and diaphragm. Refer to **Master Cylinder Reservoir Filling**
3. Fill the master cylinder brake fluid reservoir to the maximum-fill level with GM approved brake fluid from a clean, sealed brake fluid container. Refer to **Adhesives, Fluids, Lubricants, and Sealers**
4. Maintain the brake fluid level in the master cylinder brake fluid reservoir to between the minimum and maximum-fill level during the brake fluid replacement procedure.
5. Following the hydraulic brake system bleeding procedure, bleed each of the hydraulic brake wheel circuits until clean, clear brake fluid is observed coming from each bleeder valve. Refer to **Hydraulic Brake System Bleeding**
6. Fill the master cylinder brake fluid reservoir to the maximum-fill level with GM approved brake fluid from a clean, sealed brake fluid container. Refer to **Master Cylinder Reservoir Filling**
7. Securely install the master cylinder brake fluid reservoir diaphragm and cap.
8. Slowly apply and release the brake pedal, observing the brake pedal feel.
9. If the brake pedal feels spongy, perform the following:
    1. Visually inspect the hydraulic brake system for external leaks. Refer to **Brake System External Leak Inspection**
    2. Using a scan tool, perform the antilock brake system automated bleed procedure to remove any air that may have become trapped in the brake pressure modulator valve (BPMV). Refer to **Antilock Brake System Automated Bleed**

MASTER CYLINDER RESERVOIR FILLING

WARNING: **Refer to Brake Fluid Irritant Warning .**

CAUTION: **Only use products that comply with GM specifications and check manufacturer information respectively. We recommend the use of GM genuine products. Instructions must be followed at all times. The use of any type of fluid other than the recommended type of brake fluid, may cause contamination which could result in damage to the internal rubber seals and/or rubber linings of hydraulic brake system components.**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

1. Visually inspect the brake fluid level through the brake master cylinder reservoir.
2. If the brake fluid level is at or below the half-full point during routine fluid checks, the brake system should be inspected for wear and possible brake fluid leaks.
3. If the brake fluid level is at or below the half-full point during routine fluid checks, and an inspection of the brake system did not reveal wear or brake fluid leaks, the brake fluid may be topped-off up to the maximum-fill level.
4. If brake system service was just completed, the brake fluid may be topped-off up to the maximum-fill level.
5. If the brake fluid level is above the half-full point, adding brake fluid is not recommended under normal conditions.

6. If brake fluid is to be added to the master cylinder reservoir, clean the outside of the reservoir on and around the reservoir cap prior to removing the cap and diaphragm.
7. Use only GM approved brake fluid from a clean, sealed brake fluid container. Refer to Adhesives, Fluids, Lubricants, and Sealers.

MASTER CYLINDER RESERVOIR REPLACEMENT

Removal Procedure

WARNING: **Refer to Brake Fluid Irritant Warning .**

WARNING: **Use of eye goggles is necessary to prevent personal injury.**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

1. Using an appropriate siphon device, remove as much brake fluid from the reservoir as possible.
2. Place absorbent towels beneath the reservoir to catch any residual fluid.
3. Remove Engine Control Module @ Vehicle. Refer to Engine Control Module Replacement

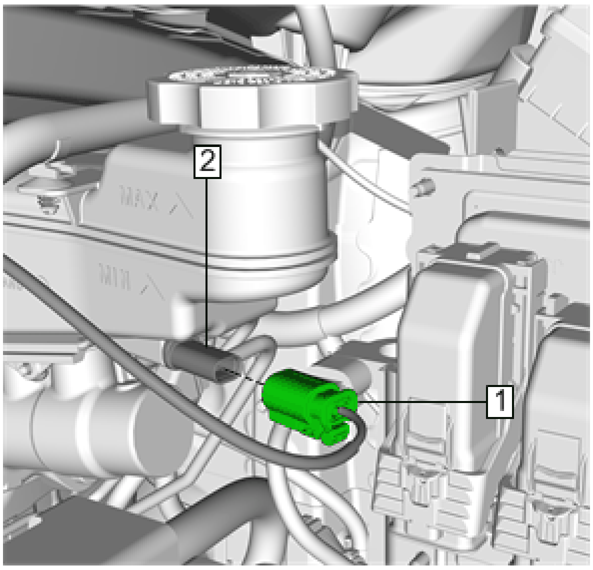

Fig. 6: Brake Fluid Level Indicator Switch And Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

4. Disconnect Electrical Connector (1) @ Brake Fluid Level Indicator Switch (2)

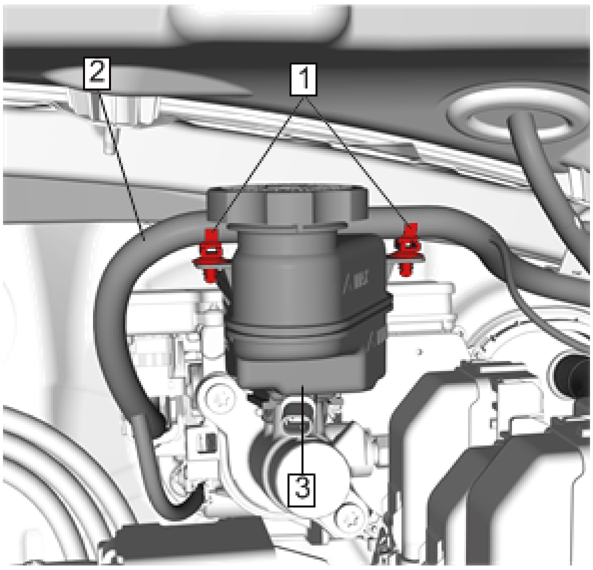

Fig. 7: Brake Master Cylinder Reservoir, Wiring Harness And Clips
Courtesy of GENERAL MOTORS COMPANY

5. Unclip Clips (1) (Qty: 2) @ Brake Master Cylinder Reservoir (3)

6. Reposition Body Wiring Harness (2) @ Brake Master Cylinder Reservoir (3)

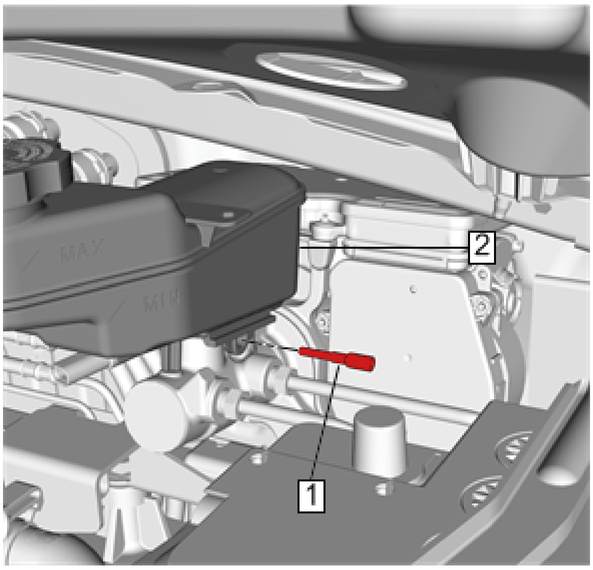

Fig. 8: Brake Master Cylinder Reservoir And Pin
Courtesy of GENERAL MOTORS COMPANY

7. Remove Brake Master Cylinder Reservoir Pin (1) @ Brake Master Cylinder Reservoir (3)

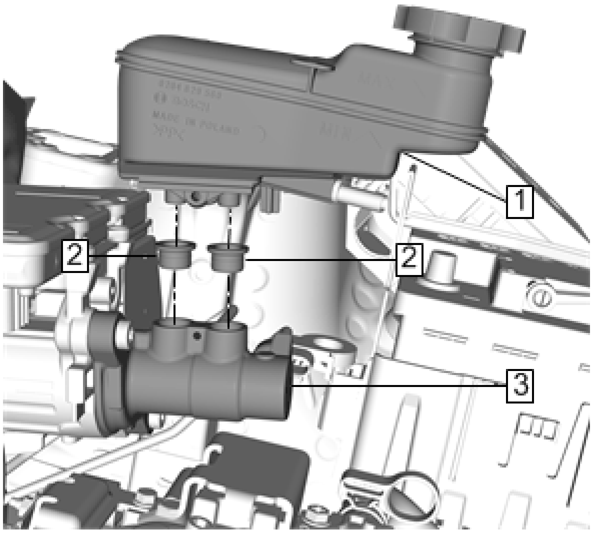

Fig. 9: Brake Master Cylinder, Reservoir And Seals
Courtesy of GENERAL MOTORS COMPANY

8. Remove Brake Master Cylinder Reservoir (1)@ Brake Master Cylinder (3)
9. Remove and DISCARD Brake Master Cylinder Reservoir Seals (2) (Qty: 2) @ Brake Master Cylinder (3)
10. Remove Brake Fluid Level Indicator Switch @ Brake Master Cylinder Reservoir. Refer to **Brake Fluid Level Indicator Switch Replacement**

Installation Procedure

1. Install Brake Fluid Level Indicator Switch @ Brake Master Cylinder Reservoir. Refer to **Brake Fluid Level Indicator Switch Replacement**

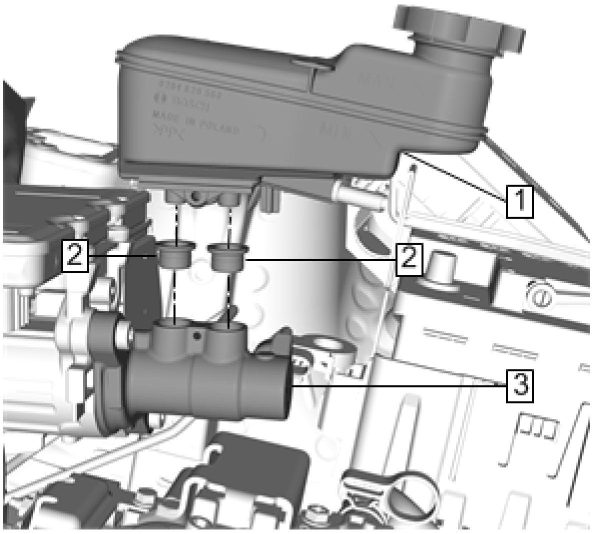

Fig. 10: Brake Master Cylinder, Reservoir And Seals
Courtesy of GENERAL MOTORS COMPANY

2. Lubricate the brake master cylinder reservoir seals with GM approved brake fluid from a clean, sealed, brake fluid container.
3. Install NEW Brake Master Cylinder Reservoir Seals (2) (Qty: 2) @ Brake Master Cylinder (3)
4. Install Brake Master Cylinder Reservoir (1) @ Brake Master Cylinder (3)

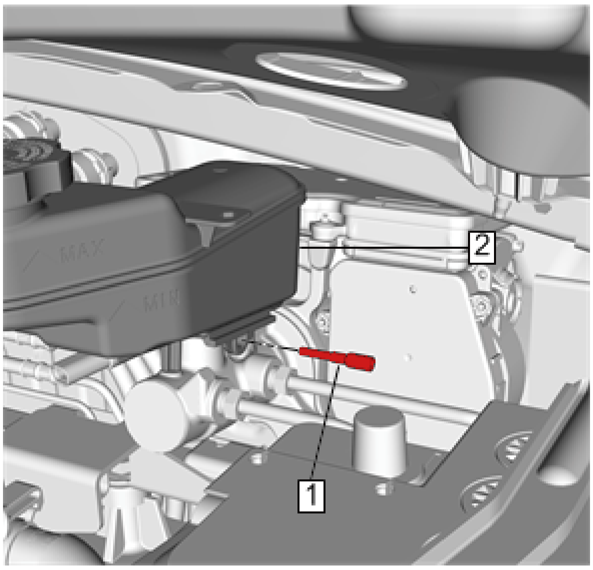

Fig. 11: Brake Master Cylinder Reservoir And Pin
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **Refer to Fastener Caution .**

5. Install and tighten Brake Master Cylinder Reservoir Pin (1) @ Brake Master Cylinder Reservoir (3) to 7 N.m (62 lb in)

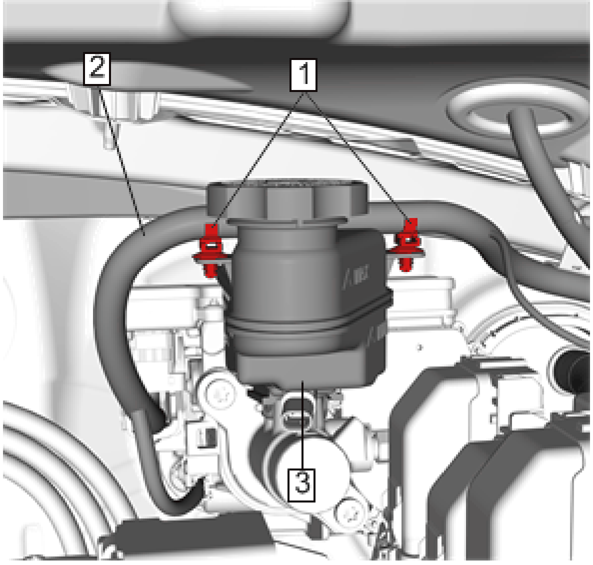

Fig. 12: Brake Master Cylinder Reservoir, Wiring Harness And Clips
Courtesy of GENERAL MOTORS COMPANY

6. Install Body Wiring Harness (2) @ Brake Master Cylinder Reservoir (3)
7. Install Clips (1) (Qty: 2) @ Brake Master Cylinder Reservoir (3)

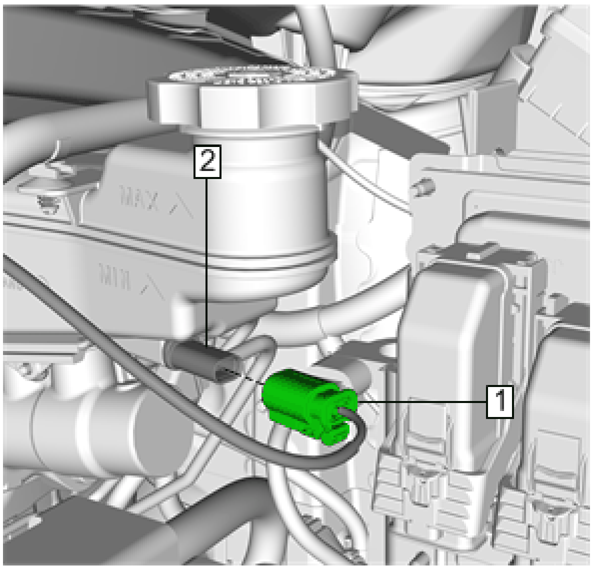

Fig. 13: Brake Fluid Level Indicator Switch And Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

8. Connect Electrical Connector (1) @ Brake Fluid Level Indicator Switch (2)
9. Install Engine Control Module @ Vehicle. Refer to **Engine Control Module Replacement**
10. Bleed the brake system. Refer to **Hydraulic Brake System Bleeding**

MASTER CYLINDER REPLACEMENT

Removal Procedure

WARNING: **Refer to Brake Fluid Irritant Warning .**

WARNING: **Use of eye goggles is necessary to prevent personal injury.**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

1. Remove Engine Control Module @ Vehicle. Refer to **Engine Control Module Replacement**

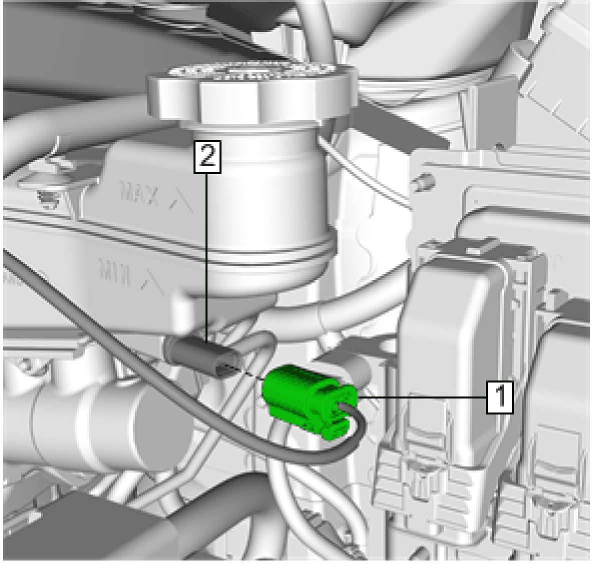

Fig. 14: Brake Fluid Level Indicator Switch And Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect Electrical Connector (1) @ Brake Fluid Level Indicator Switch (2)

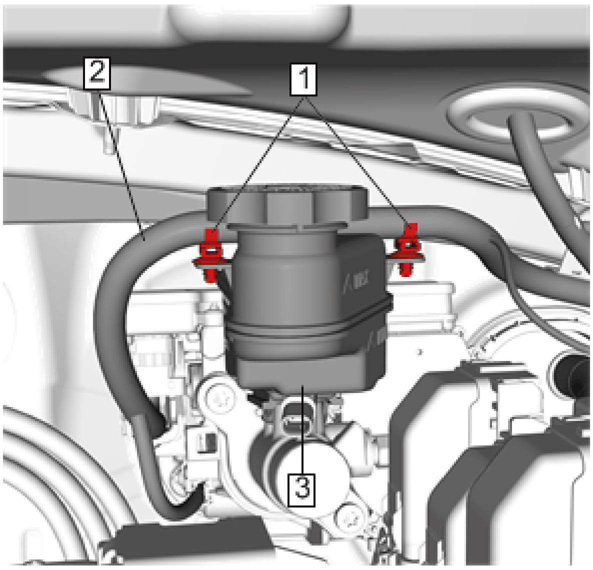

Fig. 15: Brake Master Cylinder Reservoir, Wiring Harness And Clips
Courtesy of GENERAL MOTORS COMPANY

3. Unclip Clips (1) (Qty: 2) @ Brake Master Cylinder Reservoir (3)
4. Reposition Body Wiring Harness (2) @ Brake Master Cylinder Reservoir (3)

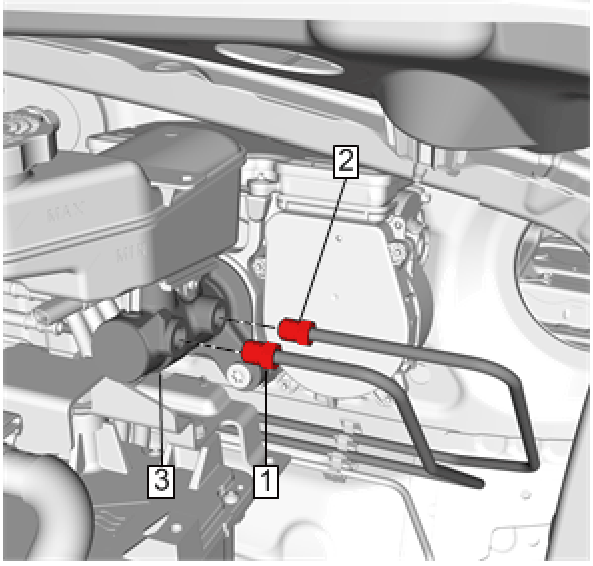

Fig. 16: BPMV Front And Rear Pipe Fittings At Brake Master Cylinder
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Cap the brake pipe fittings to prevent brake fluid loss and contamination.**

5. Remove Brake Pressure Modulator Valve Front Pipe Fitting (1) @ Brake Master Cylinder (3)
6. Remove Brake Pressure Modulator Valve Rear Pipe Fitting (2) @ Brake Master Cylinder (3)

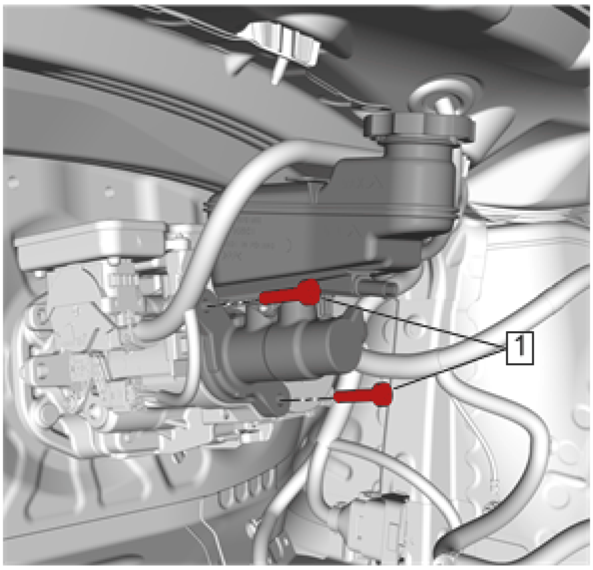

Fig. 17: Brake Master Cylinder Bolts
Courtesy of GENERAL MOTORS COMPANY

7. Remove Brake Master Cylinder Bolts (1) (Qty: 2)

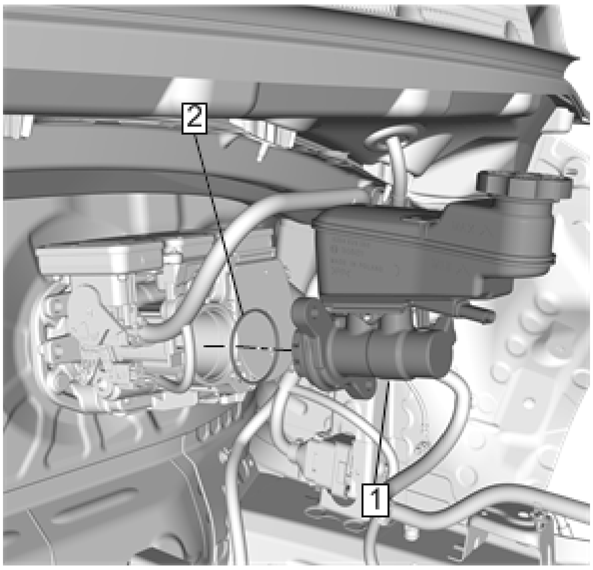

Fig. 18: Brake Master Cylinder And Seal
Courtesy of GENERAL MOTORS COMPANY

8. Remove Brake Master Cylinder (1)
9. Remove Brake Master Cylinder Seal (2)
10. Remove Brake Master Cylinder Reservoir @ Brake Master Cylinder. Refer to Master Cylinder Reservoir Replacement

Installation Procedure

1. Install Brake Master Cylinder Reservoir @ Brake Master Cylinder. Refer to Master Cylinder Reservoir Replacement

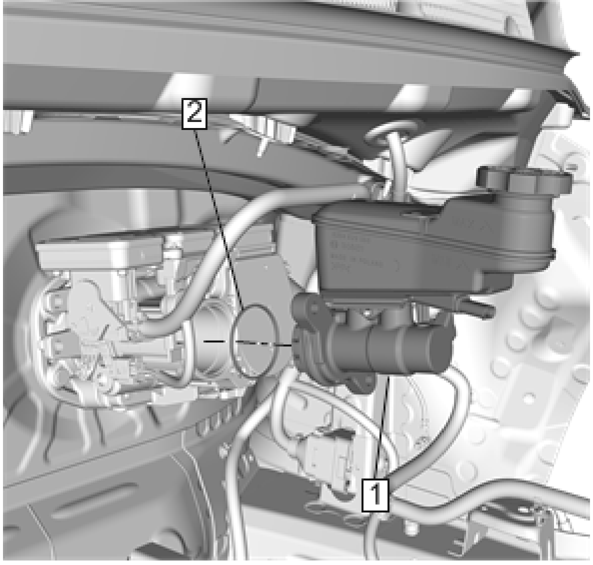

Fig. 19: Brake Master Cylinder And Seal
Courtesy of GENERAL MOTORS COMPANY

2. Install Brake Master Cylinder Seal (2)
3. Install Brake Master Cylinder (1)

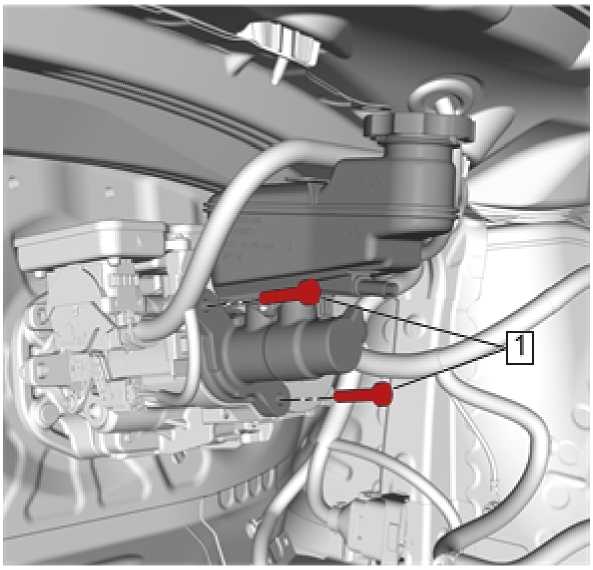

Fig. 20: Brake Master Cylinder Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **Refer to Fastener Caution .**

4. Install and tighten Brake Master Cylinder Bolts (1) (Qty: 2) to 22 N.m (16 lb ft)

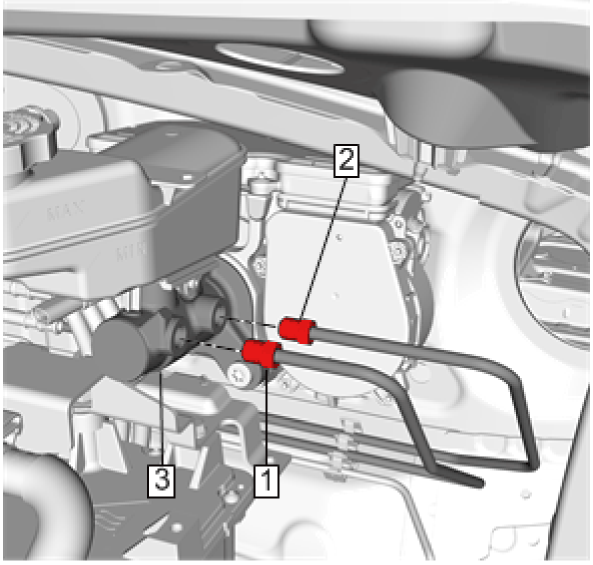

Fig. 21: BPMV Front And Rear Pipe Fittings At Brake Master Cylinder
Courtesy of GENERAL MOTORS COMPANY

5. Install and tighten Brake Pressure Modulator Valve Rear Pipe Fitting (2) @ Brake Master Cylinder (3) to 25 N.m (18 lb ft)
6. Install and tighten Brake Pressure Modulator Valve Front Pipe Fitting (1) @ Brake Master Cylinder (3) to 25 N.m (18 lb ft)

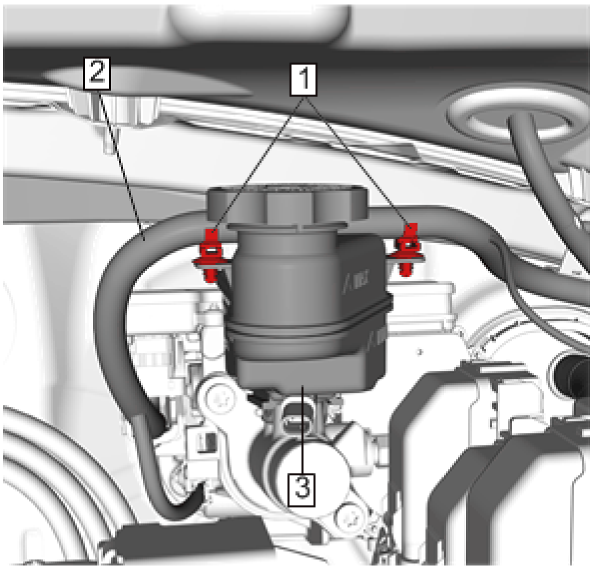

Fig. 22: Brake Master Cylinder Reservoir, Wiring Harness And Clips
Courtesy of GENERAL MOTORS COMPANY

7. Install Body Wiring Harness (2) @ Brake Master Cylinder Reservoir (3)
8. Install Clips (1) (Qty: 2) @ Brake Master Cylinder Reservoir (3)

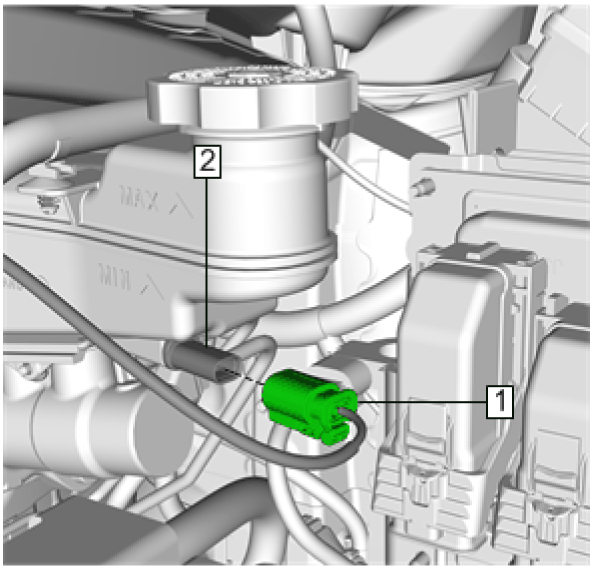

Fig. 23: Brake Fluid Level Indicator Switch And Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

9. Connect Electrical Connector (1) @ Brake Fluid Level Indicator Switch (2)
10. Install Engine Control Module @ Vehicle. Refer to **Engine Control Module Replacement**
11. Bleed the brake system. Refer to **Hydraulic Brake System Bleeding**

BRAKE FLUID LEVEL INDICATOR SWITCH REPLACEMENT

Removal Procedure

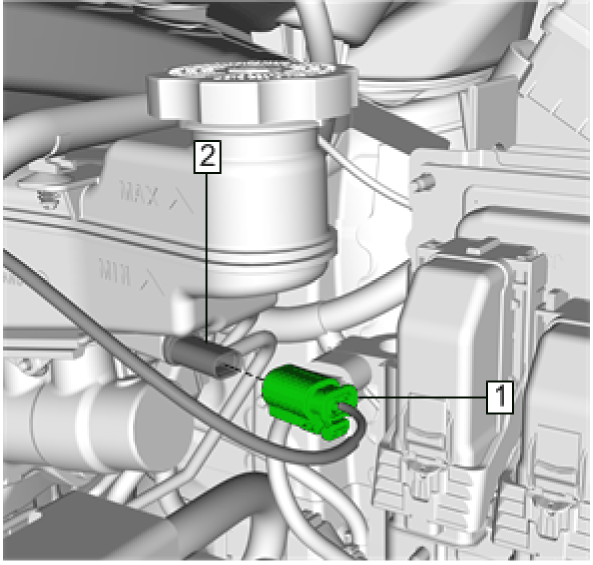

Fig. 24: Brake Fluid Level Indicator Switch And Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

1. Disconnect Electrical Connector (1) @ Brake Fluid Level Indicator Switch (2)

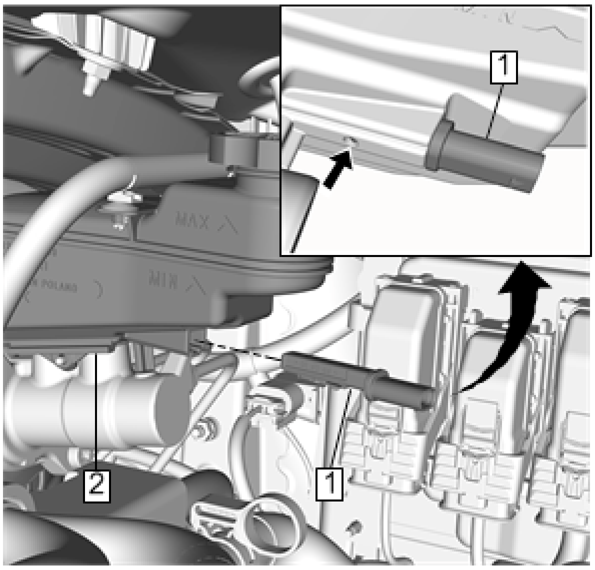

Fig. 25: Brake Fluid Level Indicator Switch And Brake Master Cylinder Reservoir
Courtesy of GENERAL MOTORS COMPANY

2. Using an appropriate tool, lift upward to release the brake fluid level indicator switch locking tab.
3. Remove Brake Fluid Level Indicator Switch (1) @ Brake Master Cylinder Reservoir (2)

Installation Procedure

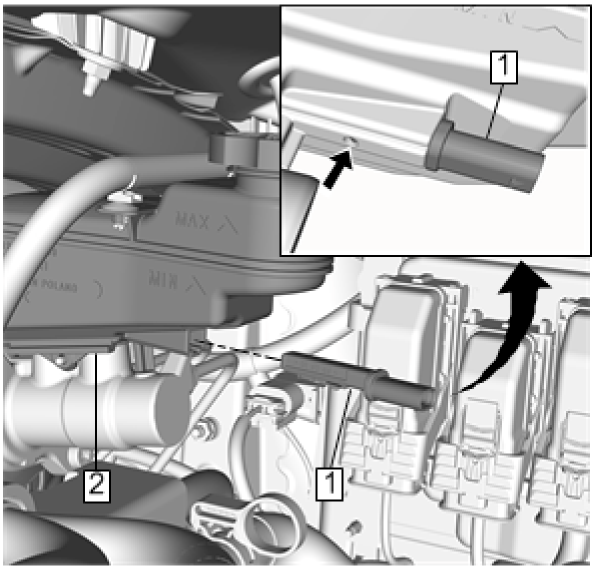

Fig. 26: Brake Fluid Level Indicator Switch And Brake Master Cylinder Reservoir
Courtesy of GENERAL MOTORS COMPANY

1. Install Brake Fluid Level Indicator Switch (1) @ Brake Master Cylinder Reservoir (2)
2. Ensure the brake fluid level indicator switch locking tab is fully engaged.

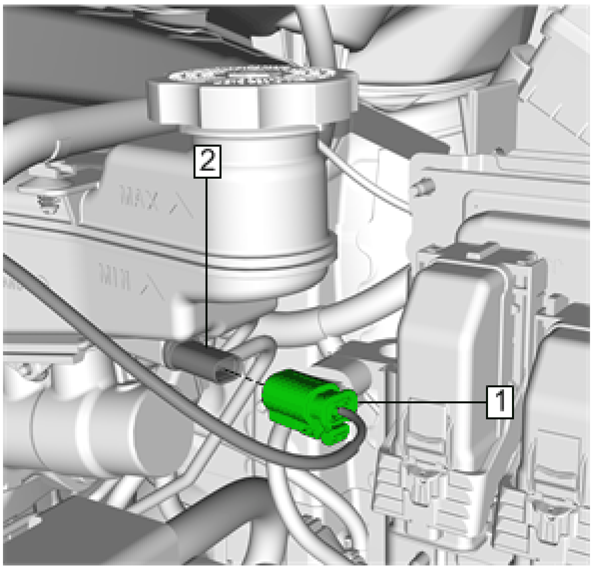

Fig. 27: Brake Fluid Level Indicator Switch And Electrical Connector

BRAKE PRESSURE MODULATOR VALVE FRONT PIPE REPLACEMENT

Removal Procedure

WARNING: **Refer to Brake Fluid Irritant Warning .**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

1. Disable the high voltage system. Refer to High Voltage Disabling
2. Remove Engine Control Module @ Vehicle. Refer to Engine Control Module Replacement
3. Clean all dirt and foreign material from the brake pipe fitting.

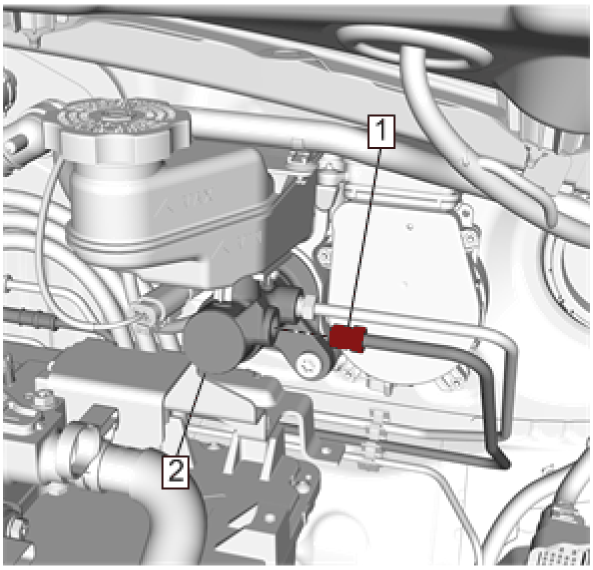

Fig. 42: Brake Pressure Modulator Valve Front Pipe Fitting And Brake Master Cylinder
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Cap the brake pipe fitting and plug the brake master cylinder outlet port to prevent brake fluid loss and contamination.**

4. Remove Brake Pressure Modulator Valve Front Pipe Fitting (1) @ Brake Master Cylinder (2)

   Drain the brake fluid out of the master cylinder.

5. Remove the radiator surge tank bolts and reposition the heater surge tank from the heater surge tank bracket with the hoses connected. Refer to Heater Coolant Surge Tank Replacement

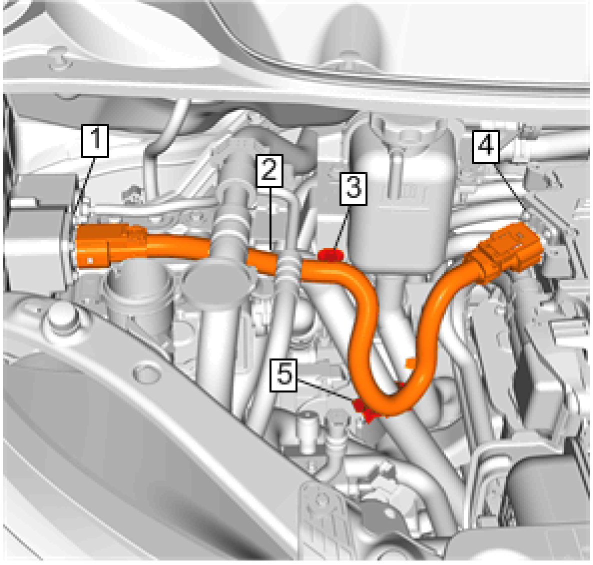

Fig. 43: Drive Motor Battery Positive and Negative Cable
Courtesy of GENERAL MOTORS COMPANY

6. Remove Drive Motor Battery Positive and Negative Cable (1). Refer to **Drive Motor Battery Positive and Negative Cable Replacement**

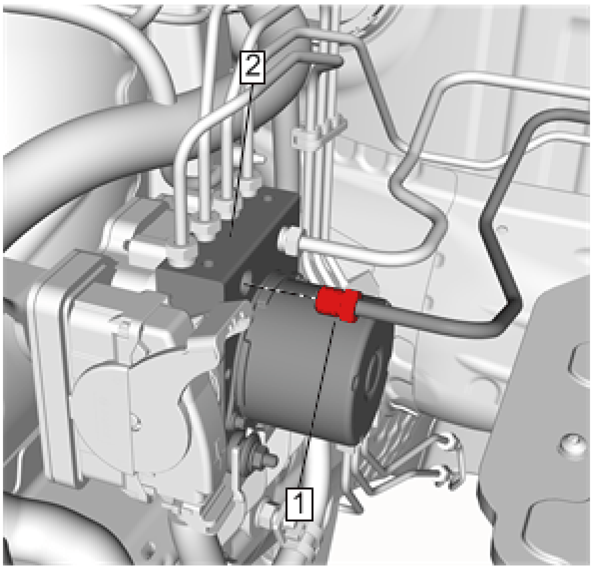

Fig. 44: Brake Pressure Modulator Valve Front Pipe Fitting And Brake Pressure Modulator Valve

CAUTION: **Refer to Fastener Caution .**

3. Install and tighten Brake Pressure Modulator Valve Front Pipe Fitting (1) @ Brake Pressure Modulator Valve (2) to 25 N.m (18 lb ft)

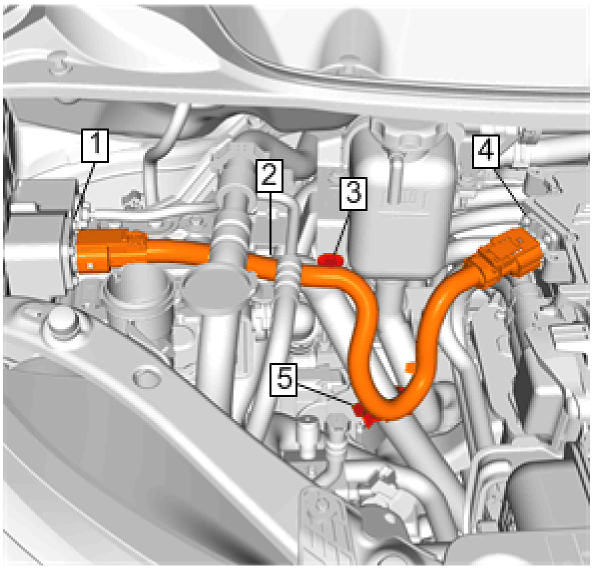

Fig. 48: Drive Motor Battery Positive and Negative Cable
Courtesy of GENERAL MOTORS COMPANY

4. Install Drive Motor Battery Positive and Negative Cable (1). Refer to Drive Motor Battery Positive and Negative Cable Replacement
5. Install the heater surge tank to the heater surge tank bracket. Refer to Heater Coolant Surge Tank Replacement

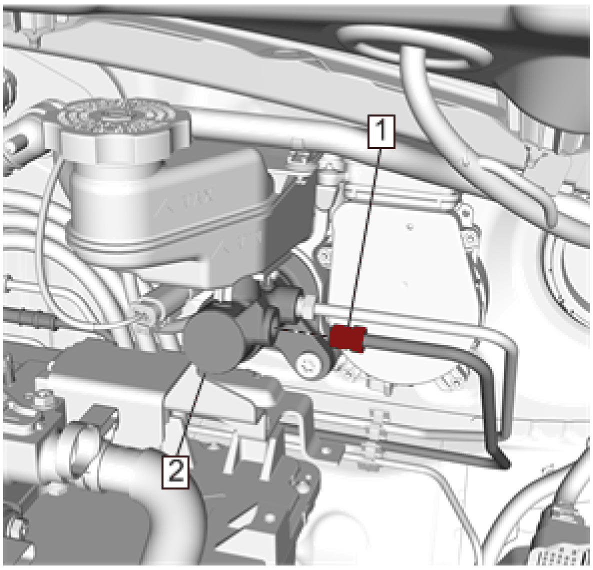

Fig. 49: Brake Pressure Modulator Valve Front Pipe Fitting And Brake Master Cylinder
Courtesy of GENERAL MOTORS COMPANY

6. Install and tighten Brake Pressure Modulator Valve Front Pipe Fitting (1) @ Brake Master Cylinder (2) to 25 N.m (18 lb ft)
7. Install Engine Control Module @ Vehicle. Refer to Engine Control Module Replacement
8. Enable the high voltage system. Refer to High Voltage Enabling
9. Bleed the brake system. Refer to Hydraulic Brake System Bleeding

BRAKE PRESSURE MODULATOR VALVE REAR PIPE REPLACEMENT

Removal Procedure

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

1. Disable the high voltage system. Refer to High Voltage Disabling
2. Remove Engine Control Module @ Vehicle. Refer to Engine Control Module Replacement
3. Clean all dirt and foreign material from the brake pipe fitting.

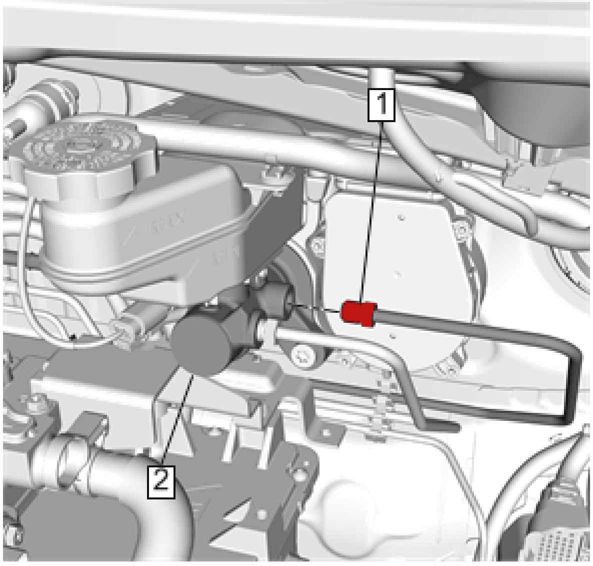

Fig. 50: Brake Pressure Modulator Valve Rear Pipe Fitting And Brake Master Cylinder
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Cap the brake pipe fitting and plug the brake master cylinder outlet port to prevent brake fluid loss and contamination.**

4. Remove Brake Pressure Modulator Valve Rear Pipe Fitting (1) @ Brake Master Cylinder (2)

   Drain the brake fluid out of the master cylinder.

5. Remove the radiator surge tank bolts and reposition the heater surge tank from the heater surge tank bracket with the hoses connected. Refer to Heater Coolant Surge Tank Replacement

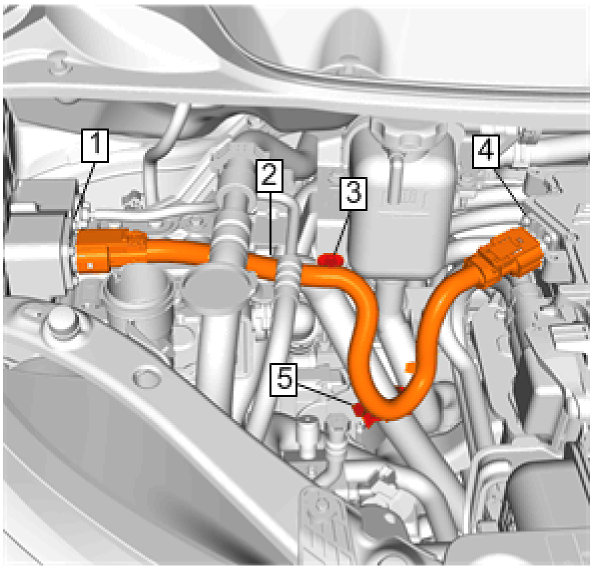

Fig. 51: Drive Motor Battery Positive and Negative Cable
Courtesy of GENERAL MOTORS COMPANY

6. Remove Drive Motor Battery Positive and Negative Cable (1). Refer to Drive Motor Battery Positive and Negative Cable Replacement

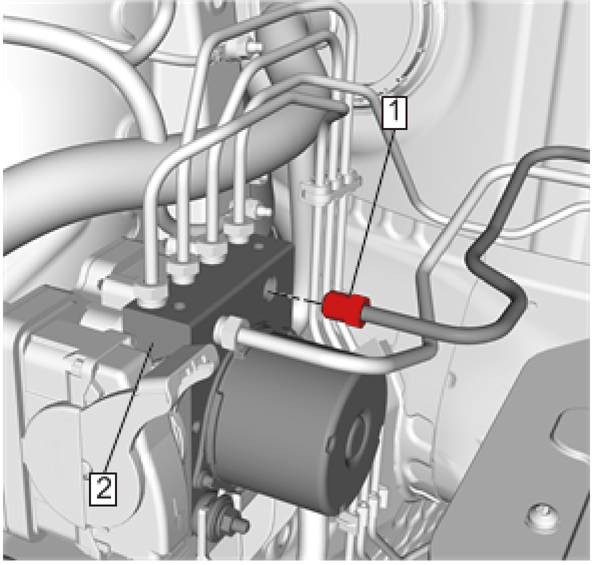

Fig. 52: Brake Pressure Modulator Valve Rear Pipe Fitting And Brake Pressure Modulator Valve

NOTE: **Cap the brake pipe fitting and plug the brake pressure modulator valve inlet port to prevent brake fluid loss and contamination.**

7.
8. Remove Brake Pressure Modulator Valve Rear Pipe Fitting (1) @ Brake Pressure Modulator Valve (2)

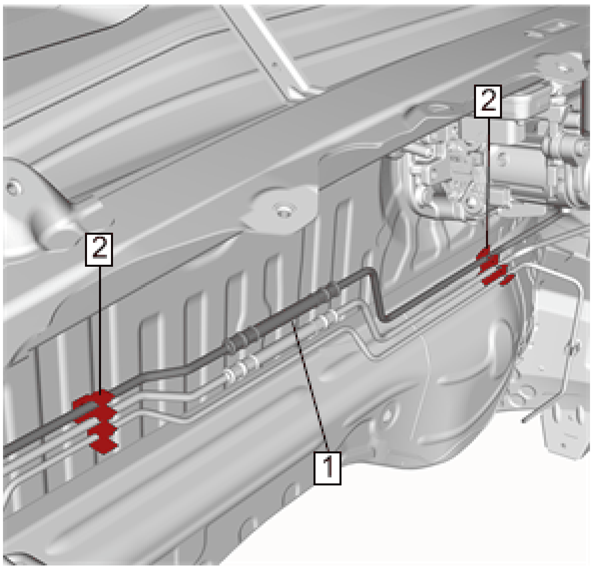

Fig. 53: Brake Pressure Modulator Valve Rear Pipe And Brake Pipe Clips
Courtesy of GENERAL MOTORS COMPANY

9. Unclip Brake Pressure Modulator Valve Rear Pipe (1) @ Brake Pipe Clips (2) (Qty: 2)
10. Remove Brake Pressure Modulator Valve Rear Pipe (1) @ Vehicle

Installation Procedure

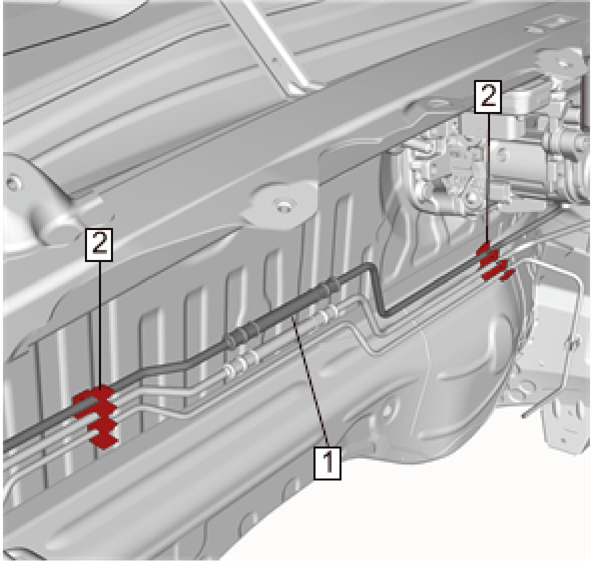

Fig. 54: Brake Pressure Modulator Valve Rear Pipe And Brake Pipe Clips
Courtesy of GENERAL MOTORS COMPANY

1. Install Brake Pressure Modulator Valve Rear Pipe (1) @ Vehicle
2. Install Brake Pressure Modulator Valve Rear Pipe (1) @ Brake Pipe Clips (2) (Qty: 2)

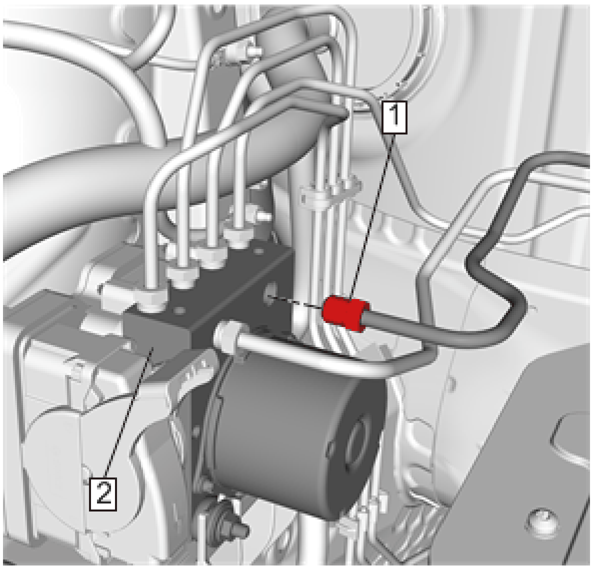

Fig. 55: Brake Pressure Modulator Valve Rear Pipe Fitting And Brake Pressure Modulator Valve
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **Refer to Fastener Caution .**

3. Install and tighten Brake Pressure Modulator Valve Rear Pipe Fitting (1) @ Brake Pressure Modulator Valve (2) to 25 N.m (18 lb ft)

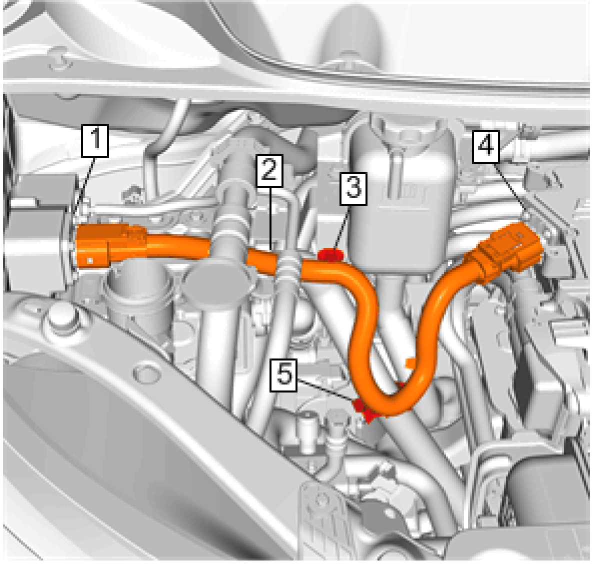

Fig. 56: Drive Motor Battery Positive and Negative Cable
Courtesy of GENERAL MOTORS COMPANY

4. Install Drive Motor Battery Positive and Negative Cable (1). Refer to **Drive Motor Battery Positive and Negative Cable Replacement**
5. Install the heater surge tank to the heater surge tank bracket. Refer to **Heater Coolant Surge Tank Replacement**

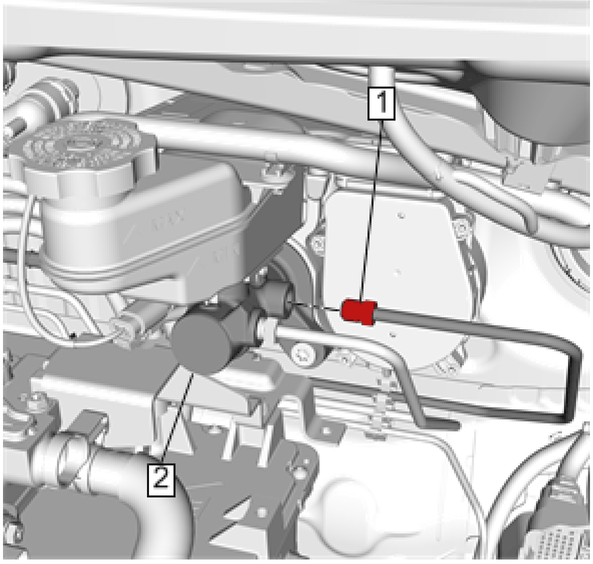

Fig. 57: Brake Pressure Modulator Valve Rear Pipe Fitting And Brake Master Cylinder
Courtesy of GENERAL MOTORS COMPANY

6. Install and tighten Brake Pressure Modulator Valve Rear Pipe Fitting (1) @ Brake Master Cylinder (2) to 25 N.m (18 lb ft)
7. Install Engine Control Module @ Vehicle. Refer to **Engine Control Module Replacement**
8. Enable the high voltage system. Refer to **High Voltage Enabling**
9. Bleed the brake system. Refer to **Hydraulic Brake System Bleeding**

BRAKE PIPE REPLACEMENT

Special Tools

CH-45405 Brake Pipe Flaring Kit

For equivalent regional tools, refer to **Special Tools**.

WARNING: **Refer to Brake Fluid Irritant Warning .**

WARNING: **Always use double walled steel brake pipe when replacing brake pipes.**

The use of any other pipe is not recommended and may cause brake system failure. Carefully route and retain replacement brake pipes. Always use the correct fasteners and the original location for replacement brake pipes. Failure to properly route and retain brake pipes may cause damage to the brake pipes and cause brake system failure.

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

NOTE: **When servicing the brake pipes, note the following:**

- **If sectioning the brake pipe, use replacement pipe of the same type and outside diameter.**
- **Use fittings of the appropriate size and type.**
- **Only create flares of the same type or design as originally equipped on the vehicle.**

1. Inspect the area of brake pipe to be repaired or replaced.
2. Remove components as necessary to gain access to the brake pipe to be repaired or replaced.
3. Release the brake pipe to be replaced from the retainers, as required.
4. Select an appropriate location to section the brake pipe, if necessary.
    - Allow adequate clearance in order to maneuver the **CH-45405** Brake Pipe Flaring Kit.
    - Avoid sectioning the brake pipe at bends or mounting points.
5. Using a string or wire, measure the length of the pipe to be replaced including all pipe bends.
6. Add to the measurement taken the appropriate additional length required for each flare to be created.

    Specification

    - 6.35 mm (0.250 in) for 4.76 mm (3/16 in) diameter pipe
    - 9.50 mm (0.374 in) for 6.35 mm (1/4 in) diameter pipe
    - 12.67 mm (0.499 in) for 7.94 mm (5/16 in) diameter pipe

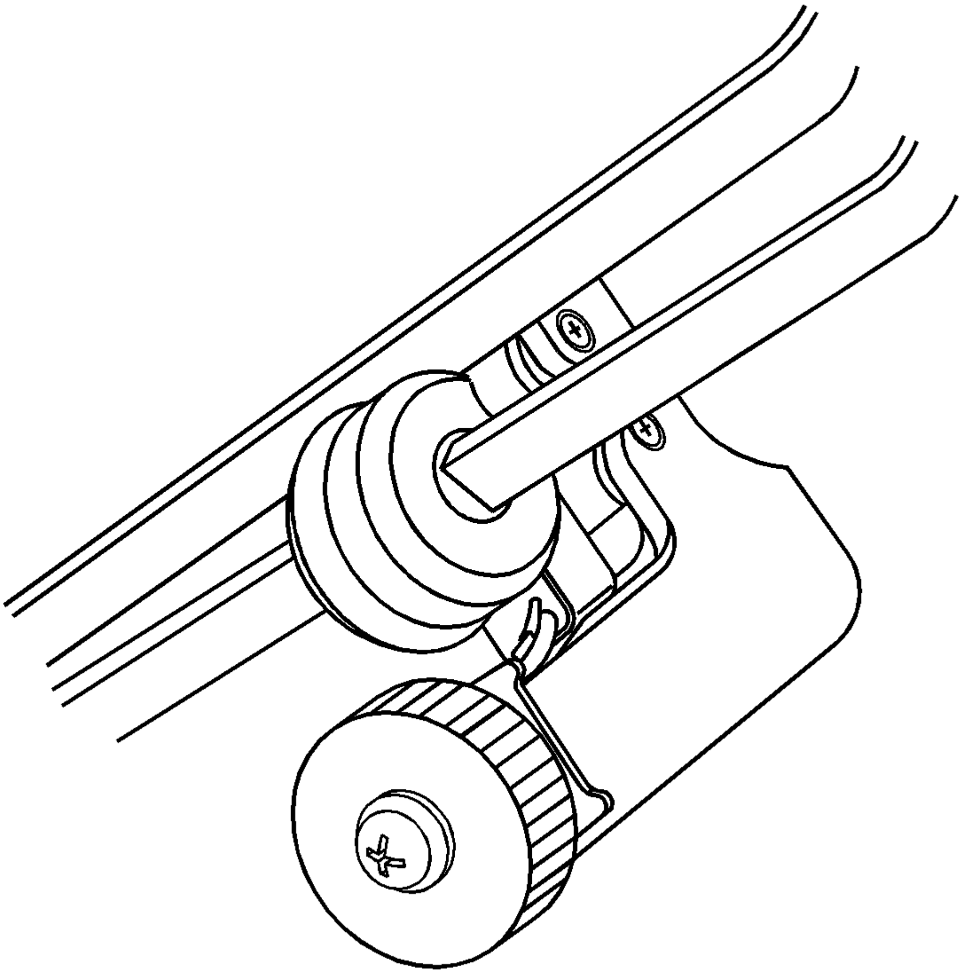

Fig. 58: Brake Pipe And Pipe Cutter
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Ensure that the brake pipe end to be flared is cut at a square, 90 degree angle to the pipe length.**

7. Using the pipe cutter included in the **CH-45405** Brake Pipe Flaring Kit, carefully cut the brake pipe squarely to the measured length.
8. Remove the sectioned brake pipe from the vehicle.
9. Select the appropriate size of brake pipe and tube nuts, as necessary. The brake pipe outside diameter determines brake pipe size.

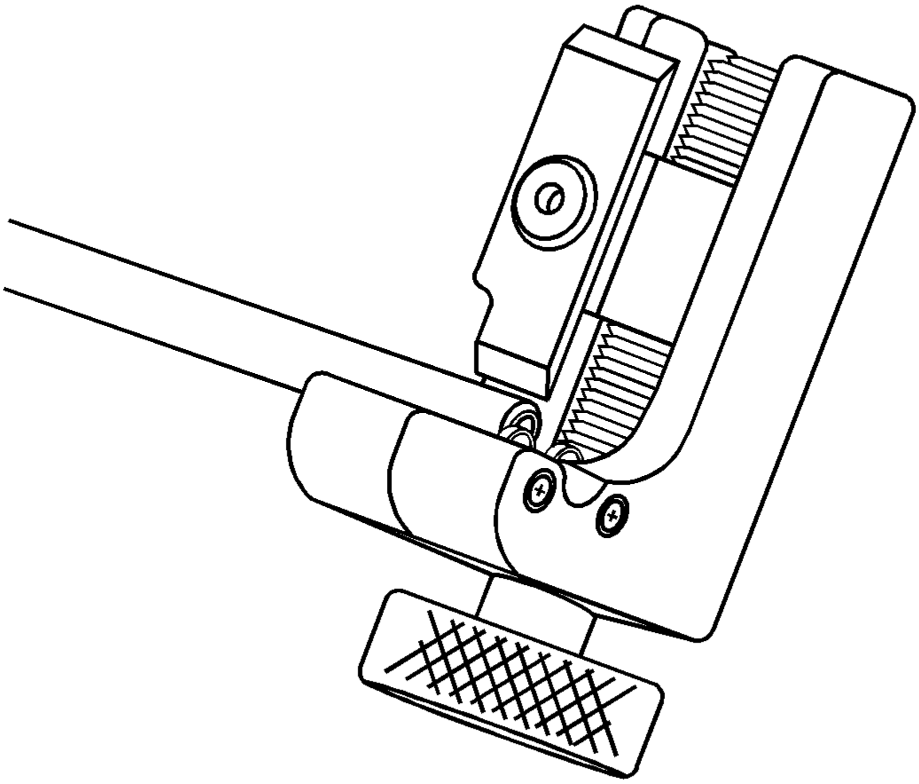

Fig. 59: Stripping Nylon Coating From Brake Pipe Ends
Courtesy of GENERAL MOTORS COMPANY

10. Strip the nylon coating from the brake pipe end to be flared, if necessary.
    - Select the appropriate blade on the coating stripping tool included in the **CH-45405** Brake Pipe Flaring Kit, by unthreading the blade block from the stripping tool and installing the block with the desired blade facing the tool rollers.

      Specification

      - 6.35 mm (0.250 in) blade for 4.76 mm (3/16 in) diameter pipe
      - 9.50 mm (0.374 in) blade for 6.35 mm (1/4 in) and 7.94 mm (5/16 in) diameter pipe
    - Insert the brake pipe end to be flared into the stripping tool to the depth of the ledge on the tool rollers.
    - While holding the brake pipe firmly against the stripping tool roller ledges, rotate the thumbwheel of the tool until the blade contacts the brake pipe coated surface.

      NOTE: **Do not gouge the metal surface of the brake pipe.**

    - Rotate the stripping tool in a clockwise direction, ensuring that the brake pipe end remains against the tool roller ledges.
    - After each successive revolution of the stripping tool, carefully rotate the thumbwheel of the tool clockwise, in order to continue stripping the coating from the brake pipe until the metal pipe surface is exposed.
    - Loosen the thumbwheel of the tool and remove the brake pipe.

      NOTE: **Ensure that all loose remnants of the nylon coating have been removed from the brake pipe.**

- Inspect the stripped end of the brake pipe to ensure that the proper amount of coating has been removed.

  Specification

  - 6.35 mm (0.250 in) for 4.76 mm (3/16 in) diameter pipe
  - 9.50 mm (0.374 in) for 6.35 mm (1/4 in) and 7.94 mm (5/16 in) diameter pipe

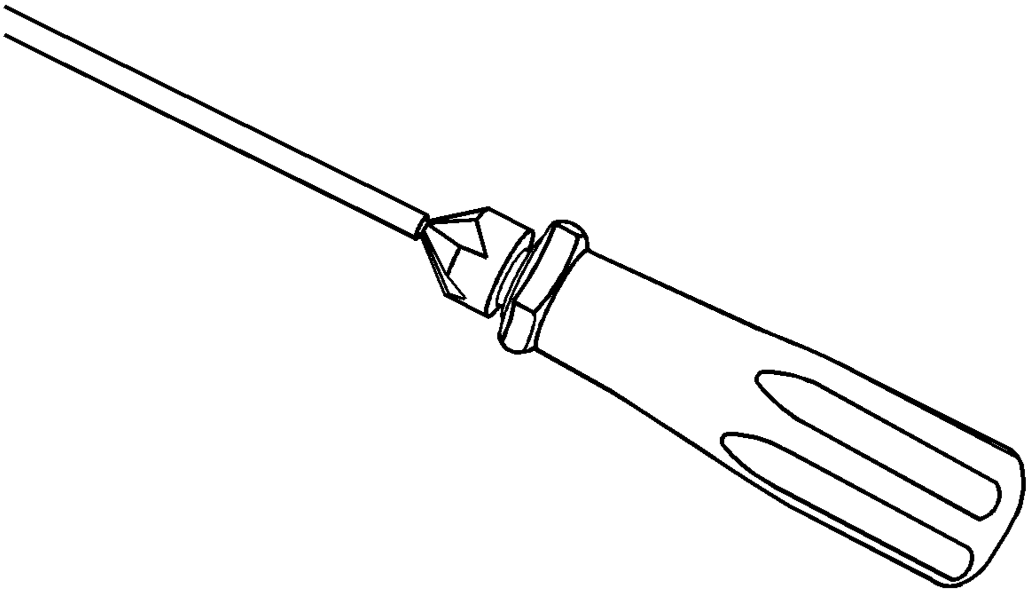

Fig. 60: Chamfering Pipe Using De-Burring Tool
Courtesy of GENERAL MOTORS COMPANY

11. Chamfer the inside and outside diameter of the pipe with the de-burring tool included in the **CH-45405** Brake Pipe Flaring Kit.
12. Install the tube nuts on the brake pipe, noting their orientation.
13. Clean the brake pipe and the **CH-45405** Brake Pipe Flaring Kit of lubricant, contaminants, and debris.

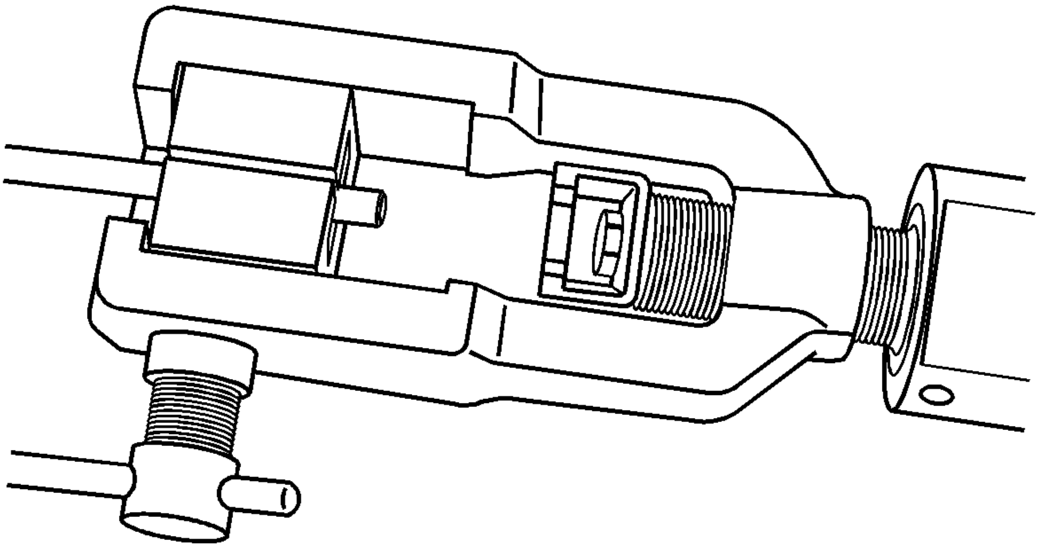

Fig. 61: Installing Die Halves Into Die Cage
Courtesy of GENERAL MOTORS COMPANY

14. Loosen the die clamping screw of the **CH-45405** Brake Pipe Flaring Kit.
15. Select the corresponding die set and install the die halves into the die cage with the full, flat face of one die facing the clamping screw, and the counterbores of both dies facing the forming ram.

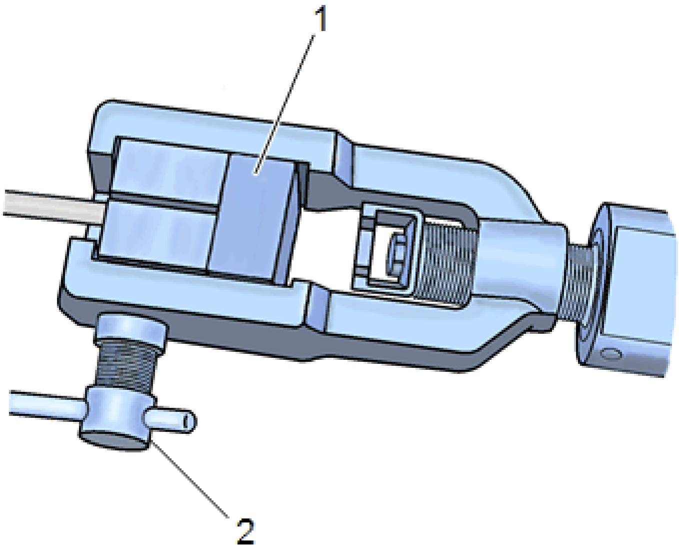

Fig. 62: Clamping Screw And Unused Die
Courtesy of GENERAL MOTORS COMPANY

16. Place the flat face of an unused die (1) against the die halves in the clamping cage and hold firmly against the counterbored face of the dies.
17. Insert the prepared end of the pipe to be flared through the back of the dies until the pipe is seated against the flat surface of the unused die (1).
18. Remove the unused die (1).
19. Ensure that the rear of both dies are seated firmly against the enclosed end of the die cage.
20. Firmly hand tighten the clamping screw (2) against the dies.

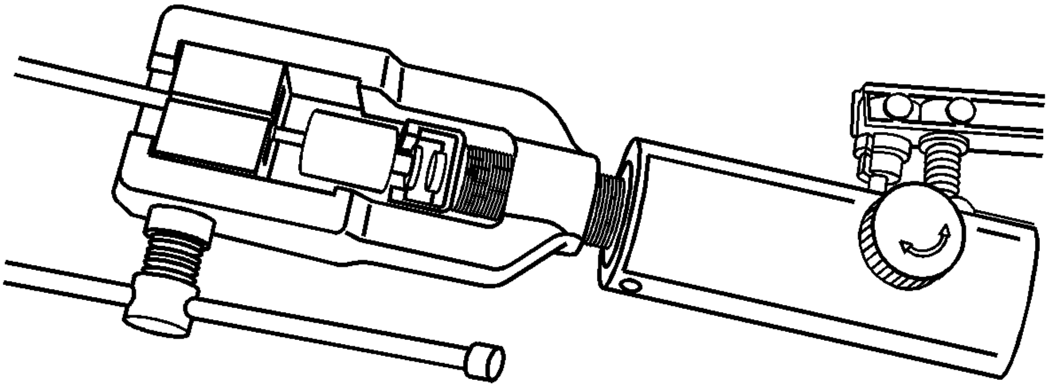

Fig. 63: Rotating Body Of Special Tool To Bottom Against Die Cage
Courtesy of GENERAL MOTORS COMPANY

21. Select the appropriate forming mandrel and place into the forming ram.
22. Rotate the hydraulic fluid control valve clockwise to the closed position.
23. Rotate the body of the **CH-45405** Brake Pipe Flaring Kit until it bottoms against the die cage.

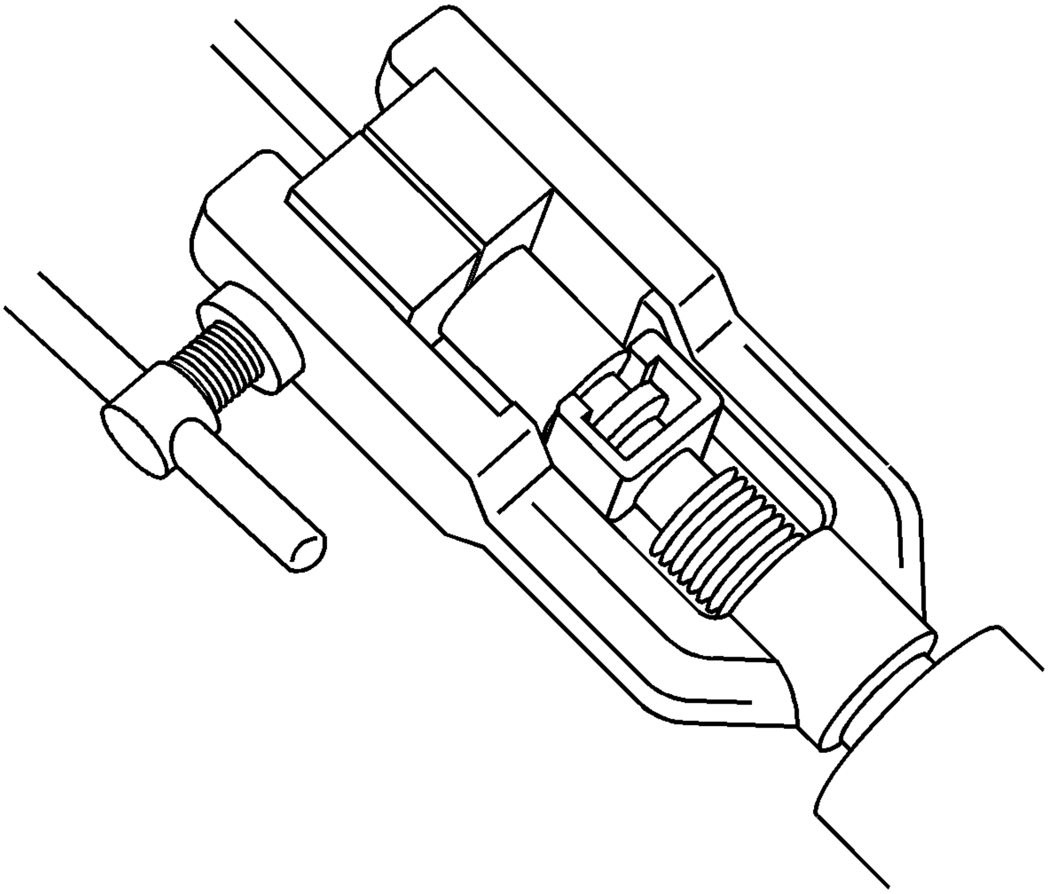

Fig. 64: Bottoming Forming Mandrel Against Clamping Dies Using Pipe Flaring Tool
Courtesy of GENERAL MOTORS COMPANY

24. While guiding the forming mandrel into the exposed end of pipe to be flared, operate the lever of the **CH-45405** Brake Pipe Flaring Kit until the forming mandrel bottoms against the clamping dies.
25. Rotate the hydraulic fluid control valve counterclockwise to the open position to allow the hydraulic forming ram to retract.

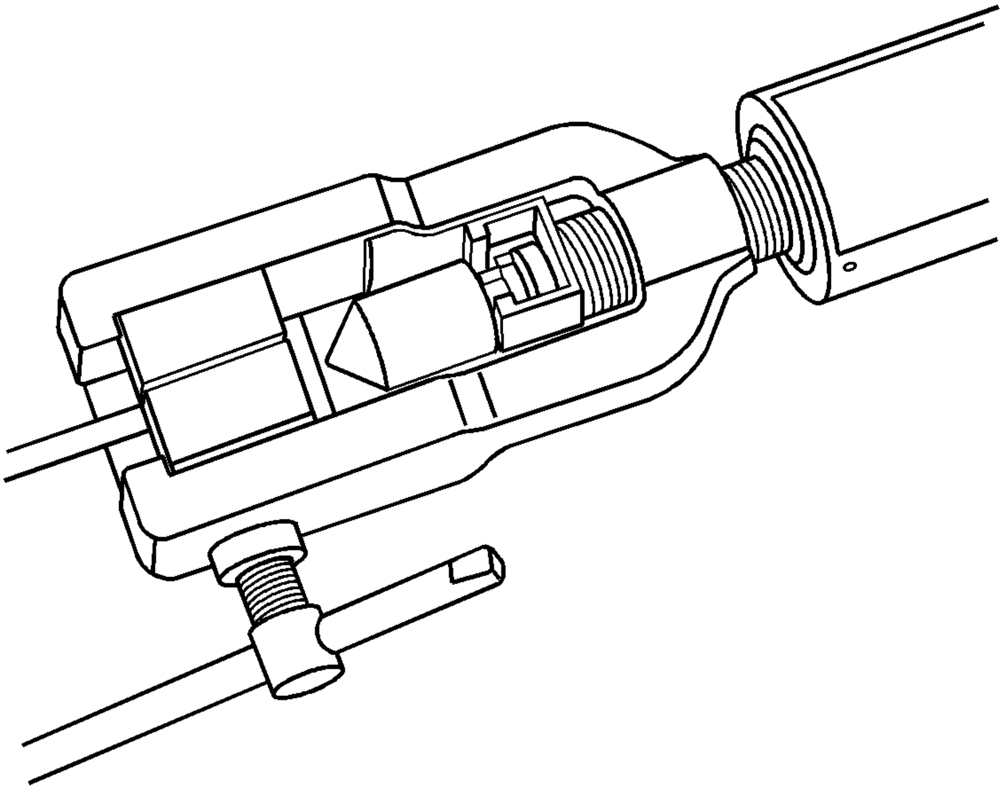

Fig. 65: Finishing Cone In Forming Ram
Courtesy of GENERAL MOTORS COMPANY

26. Insert the finishing cone into the forming ram.
27. Rotate the hydraulic fluid control valve clockwise to the closed position.
28. Rotate the body of the **CH-45405** Brake Pipe Flaring Kit until it bottoms against the die cage.
29. While guiding the finishing cone into the exposed end of pipe to be flared, operate the lever of the **CH-45405** Brake Pipe Flaring Kit until the finishing cone bottoms against the dies.
30. Rotate the hydraulic fluid control valve counterclockwise to the open position to allow the hydraulic forming ram to retract.
31. Loosen the die clamping screw and remove the dies and pipe.
32. If necessary, lightly tap the dies until the die halves separate.

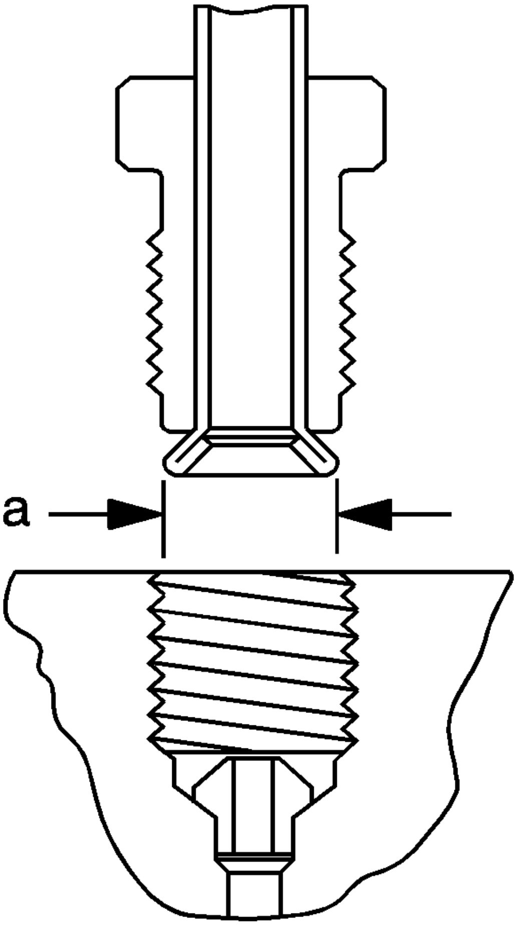

Fig. 66: Identifying Correct Brake Pipe Flare Shape & Diameter
Courtesy of GENERAL MOTORS COMPANY

33. Inspect the brake pipe flare for correct shape and diameter (a).

    Specification

    - 6.74 - 7.10 mm (0.265 - 0.279 in) flare diameter for 4.76 mm (3/16 in) diameter pipe
    - 8.57 - 9.27 mm (0.344 - 0.358 in) flare diameter for 6.35 mm (1/4 in) diameter pipe
    - 10.42 - 10.79 mm (0.410 - 0.425 in) flare diameter for 7.94 mm (5/16 in) diameter pipe
34. If necessary, using the removed section of brake pipe as a template, shape the new pipe with a suitable brake pipe bending tool.

    NOTE: **When installing the pipe, maintain a clearance of 19 mm (3/4 in) from all moving or vibrating components.**

35. Install the pipe to the vehicle with the appropriate brake pipe unions, as required.
36. If previously released, secure the brake pipe to the retainers.
37. Install any components that may have been removed to gain access to the brake pipe.
38. Bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding**
39. With the aid of an assistant, inspect the brake pipe flares for leaks by starting the engine and applying the brakes.

FRONT BRAKE PIPE REPLACEMENT - RIGHT SIDE

Removal Procedure

WARNING: **Refer to Brake Fluid Irritant Warning .**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

3. Disable the high voltage system. Refer to **High Voltage Disabling**
4. Remove Front Wheelhouse Liner-Right Side @ Vehicle. Refer to **Front Wheelhouse Liner Replacement**
5. Remove the radiator surge tank bolts and reposition the heater surge tank from the heater surge tank bracket with the hoses connected. Refer to **Heater Coolant Surge Tank Replacement**

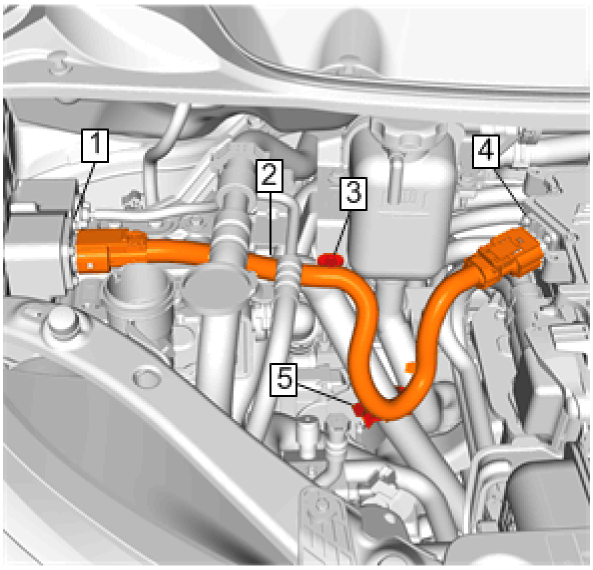

Fig. 67: Drive Motor Battery Positive and Negative Cable
Courtesy of GENERAL MOTORS COMPANY

4. Remove Drive Motor Battery Positive and Negative Cable (1). Refer to **Drive Motor Battery Positive and Negative Cable Replacement**

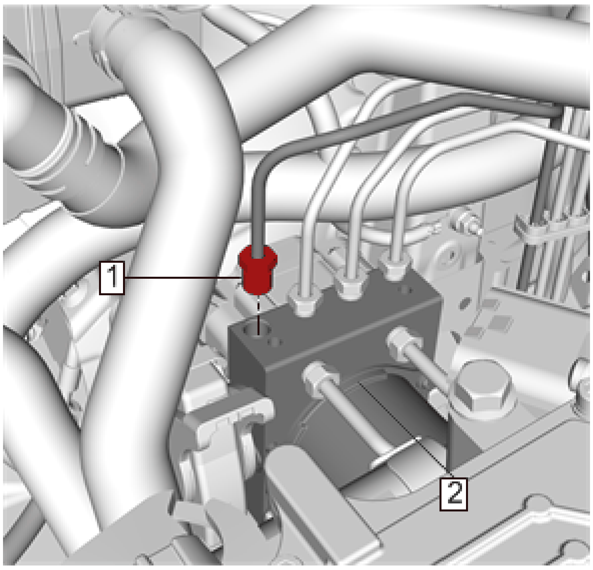

Fig. 68: Front Brake Pipe Fitting And Brake Pressure Modulator Valve
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Cap the brake pressure modulator valve port to prevent brake fluid loss and contamination.**

5. Remove Front Brake Pipe Fitting (1) @ Brake Pressure Modulator Valve (2)

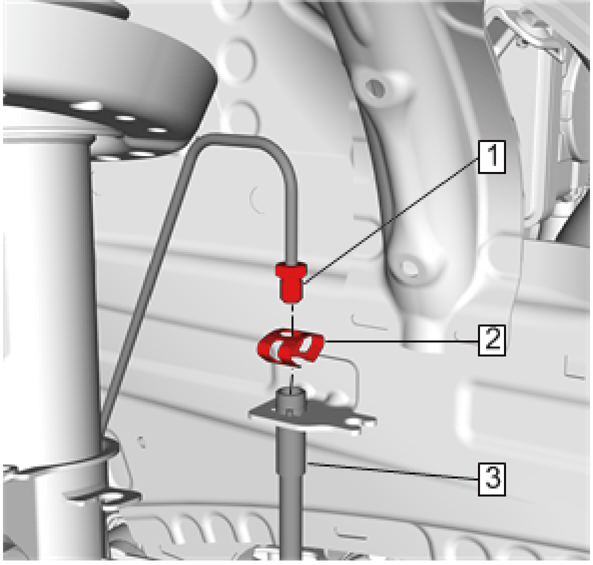

Fig. 69: Front Brake Pipe Fitting, Hose And Retainer

6. Remove Front Brake Pipe Fitting (1) @ Front Brake Hose (3)
7. Remove Front Brake Hose Retainer (2)

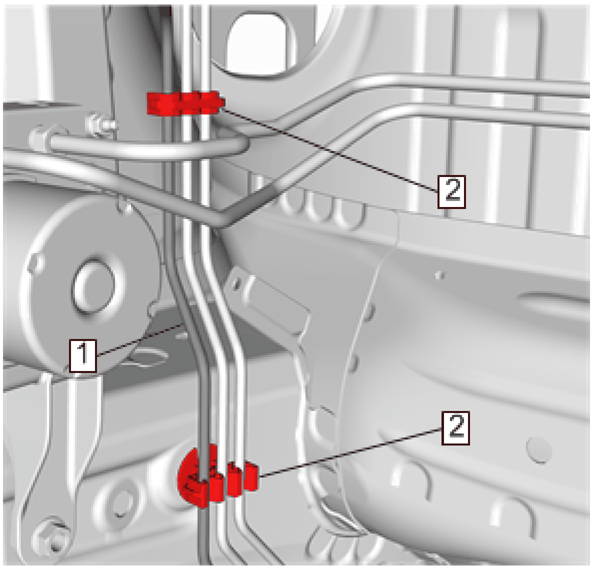

Fig. 70: Front Brake Pipe And Brake Pipe Clips
Courtesy of GENERAL MOTORS COMPANY

8. Unclip Front Brake Pipe (1) @ Brake Pipe Clips (2) (Qty: 2)

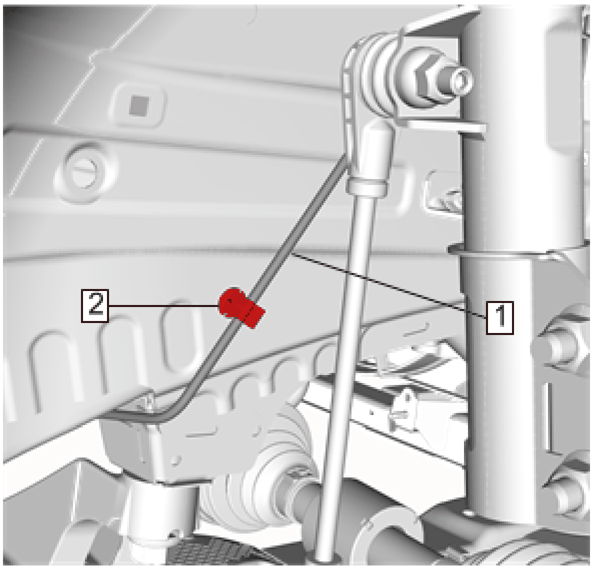

Fig. 71: Front Brake Pipe And Brake Pipe Clip
Courtesy of GENERAL MOTORS COMPANY

9. Unclip Front Brake Pipe (1) @ Brake Pipe Clip (2)
10. Remove Front Brake Pipe (1) @ Vehicle

Installation Procedure

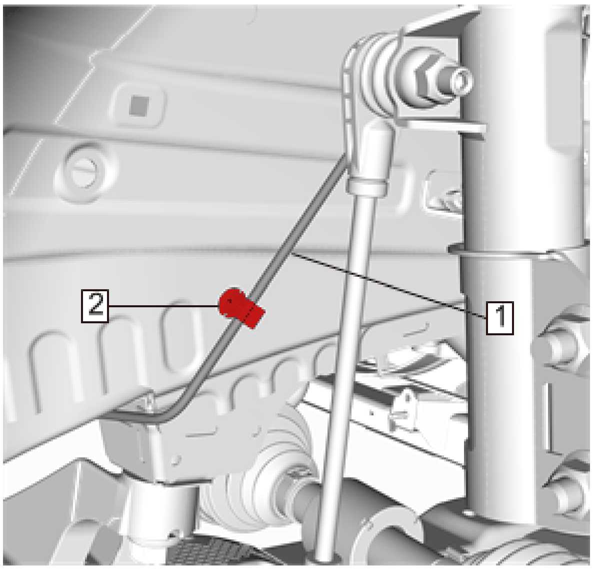

Fig. 72: Front Brake Pipe And Brake Pipe Clip
Courtesy of GENERAL MOTORS COMPANY

1. Install Front Brake Pipe (1) @ Vehicle
2. Install Front Brake Pipe (1) @ Brake Pipe Clip (2)

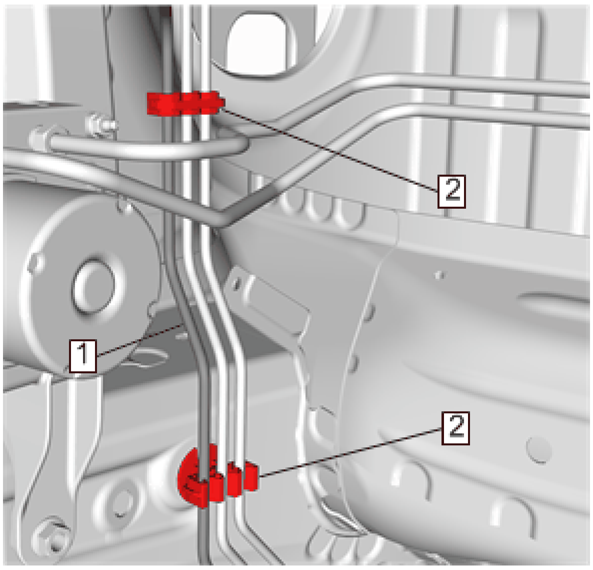

Fig. 73: Front Brake Pipe And Brake Pipe Clips
Courtesy of GENERAL MOTORS COMPANY

3. Install Front Brake Pipe (1) @ Brake Pipe Clips (2) (Qty: 2)

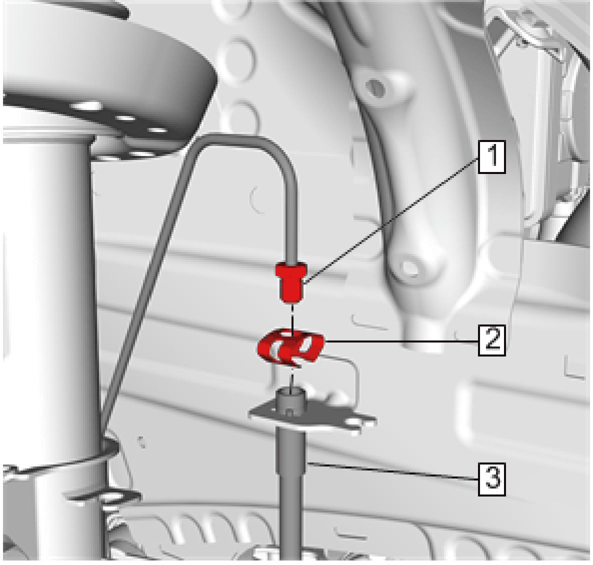

Fig. 74: Front Brake Pipe Fitting, Hose And Retainer
Courtesy of GENERAL MOTORS COMPANY

4. Install Front Brake Hose Retainer (2)

CAUTION: **Refer to Fastener Caution .**

5. Install and tighten Front Brake Pipe Fitting (1) @ Front Brake Hose (3) to 18 N.m (13 lb ft)

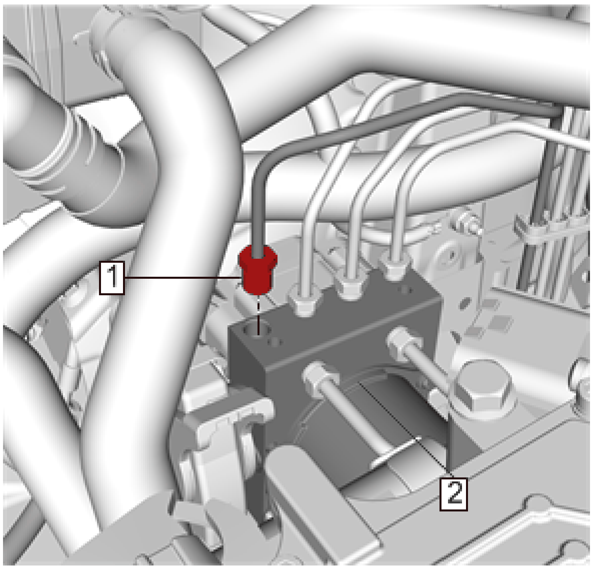

Fig. 75: Front Brake Pipe Fitting And Brake Pressure Modulator Valve
Courtesy of GENERAL MOTORS COMPANY

6. Install and tighten Front Brake Pipe Fitting (1) @ Brake Pressure Modulator Valve (2) to 18 N.m (13 lb ft)

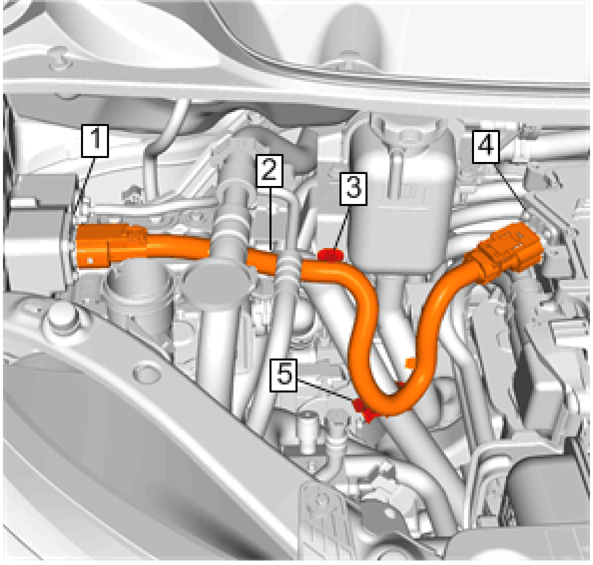

Fig. 76: Drive Motor Battery Positive and Negative Cable
Courtesy of GENERAL MOTORS COMPANY

7. Install Drive Motor Battery Positive and Negative Cable (1). Refer to **Drive Motor Battery Positive and Negative Cable Replacement**
8. Install the heater surge tank to the heater surge tank bracket. Refer to **Heater Coolant Surge Tank Replacement**
9. Install Front Wheelhouse Liner-Right Side @ Vehicle. Refer to **Front Wheelhouse Liner Replacement**
10. Enable the high voltage system. Refer to **High Voltage Enabling**
11. Bleed the brake system. Refer to **Hydraulic Brake System Bleeding**

FRONT BRAKE PIPE REPLACEMENT - LEFT SIDE

Removal Procedure

WARNING: **Refer to Brake Fluid Irritant Warning .**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

1. Disable the high voltage system. Refer to **High Voltage Disabling**
2. Remove the radiator surge tank bolts and reposition the heater surge tank from the heater surge tank bracket with the hoses connected. Refer to **Heater Coolant Surge Tank Replacement**

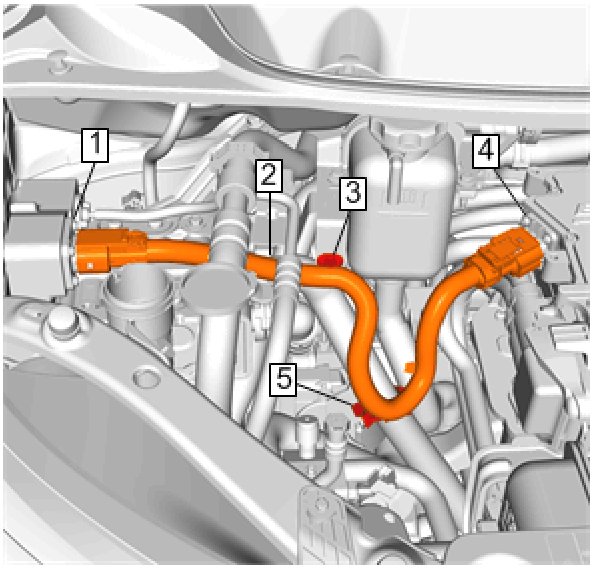

Fig. 77: Drive Motor Battery Positive and Negative Cable
Courtesy of GENERAL MOTORS COMPANY

3. Remove Drive Motor Battery Positive and Negative Cable (1). Refer to **Drive Motor Battery Positive and Negative Cable Replacement**

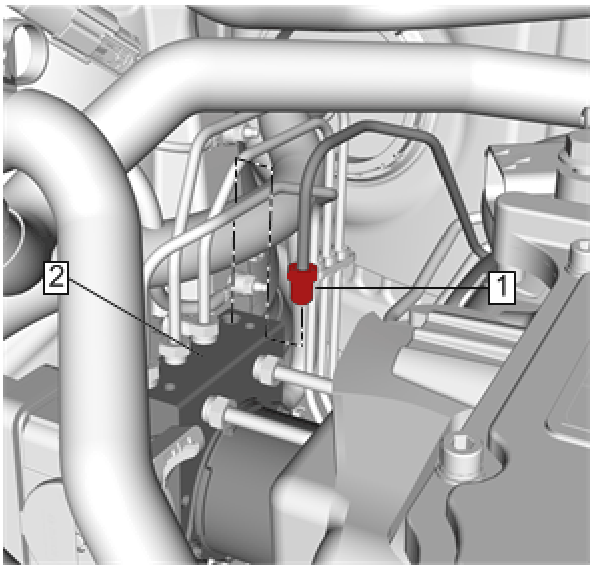

Fig. 78: Front Brake Pipe Fitting And Brake Pressure Modulator Valve
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Cap the brake pressure modulator valve port to prevent brake fluid loss and contamination.**

4. Remove Front Brake Pipe Fitting (1) @ Brake Pressure Modulator Valve (2)

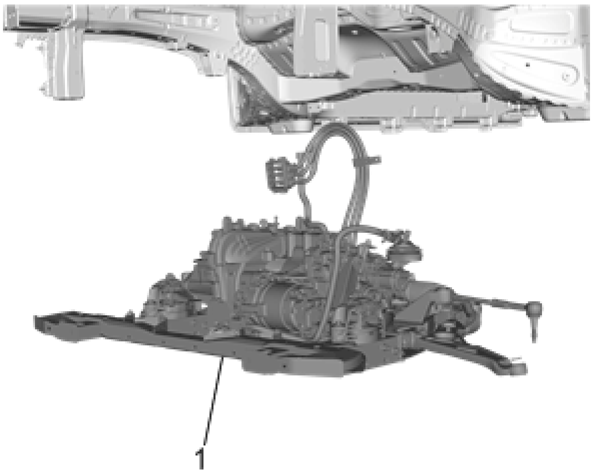

Fig. 79: Automatic Transmission and Drivetrain and Front Suspension Frame Assembly

9. Unclip Front Brake Pipe (1) @ Brake Pipe Clip (2)

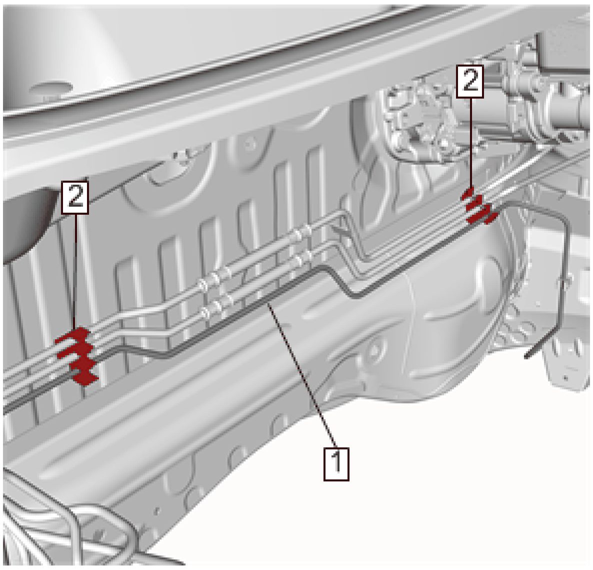

Fig. 83: Front Brake Pipe And Brake Pipe Clips
Courtesy of GENERAL MOTORS COMPANY

10. Unclip Front Brake Pipe (1) @ Brake Pipe Clips (2) (Qty: 2)
11. Remove Front Brake Pipe (1) @ Vehicle

Installation Procedure

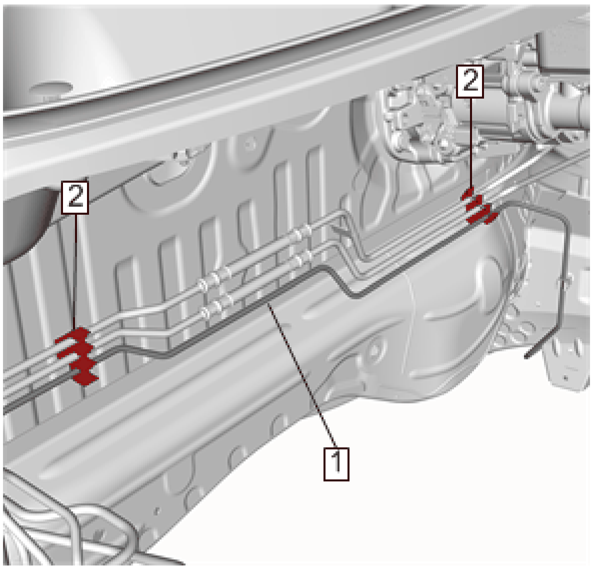

Fig. 84: Front Brake Pipe And Brake Pipe Clips
Courtesy of GENERAL MOTORS COMPANY

1. Install Front Brake Pipe (1) @ Vehicle
2. Install Front Brake Pipe (1) @ Brake Pipe Clips (2) (Qty: 2)

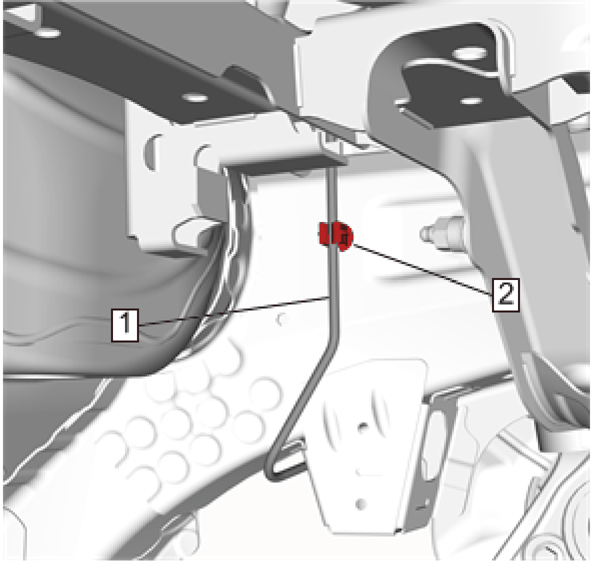

Fig. 85: Front Brake Pipe And Brake Pipe Clip
Courtesy of GENERAL MOTORS COMPANY

3. Install Front Brake Pipe (1) @ Brake Pipe Clip (2)

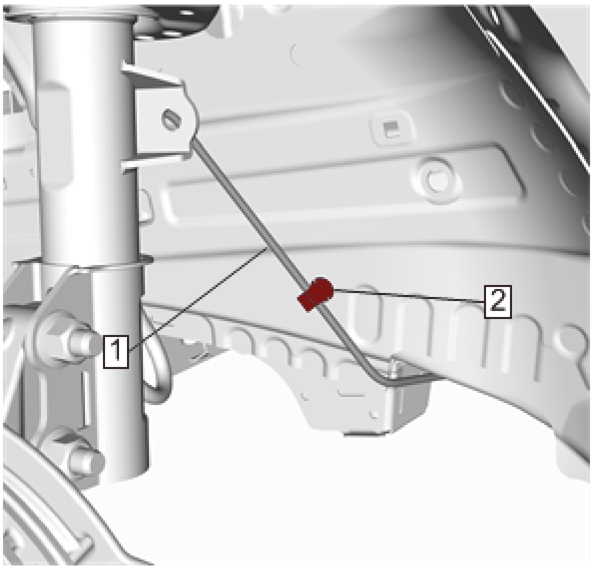

Fig. 86: Front Brake Pipe And Brake Pipe Clip
Courtesy of GENERAL MOTORS COMPANY

4. Install Front Brake Pipe (1) @ Brake Pipe Clip (2)

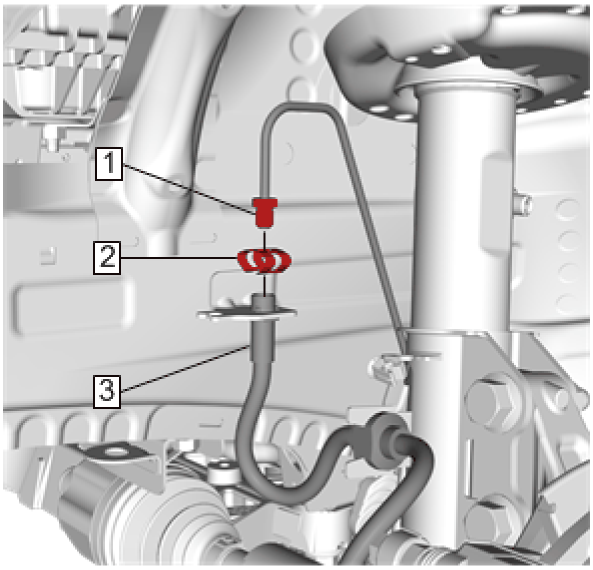

Fig. 87: Front Brake Pipe Fitting, Hose And Retainer
Courtesy of GENERAL MOTORS COMPANY

5. Install Front Brake Hose Retainer (2)

CAUTION: **Refer to Fastener Caution .**

6. Install and tighten Front Brake Pipe Fitting (1) @ Front Brake Hose (3) to 18 N.m (13 lb ft)

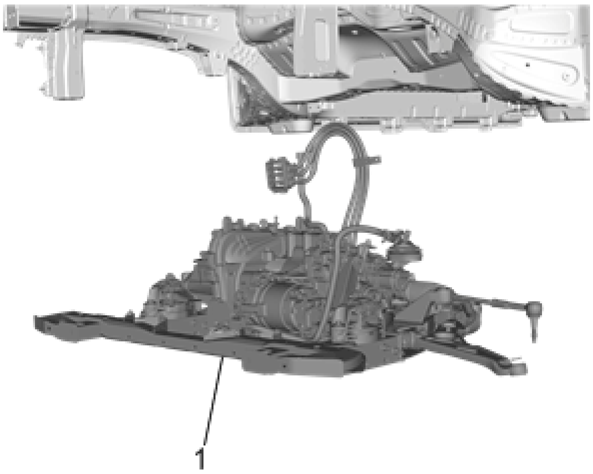

Fig. 88: Automatic Transmission and Drivetrain and Front Suspension Frame Assembly
Courtesy of GENERAL MOTORS COMPANY

7. Install Automatic Transmission and Drivetrain and Front Suspension Frame Assembly (1). Refer to **Drivetrain and Front Suspension Frame Removal and Installation**

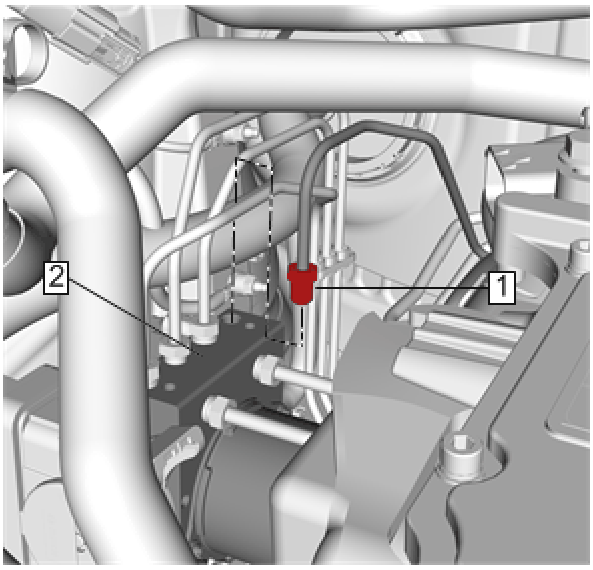

Fig. 89: Front Brake Pipe Fitting And Brake Pressure Modulator Valve
Courtesy of GENERAL MOTORS COMPANY

8. Install and tighten Front Brake Pipe Fitting (1) @ Brake Pressure Modulator Valve (2) to 18 N.m (13 lb ft)

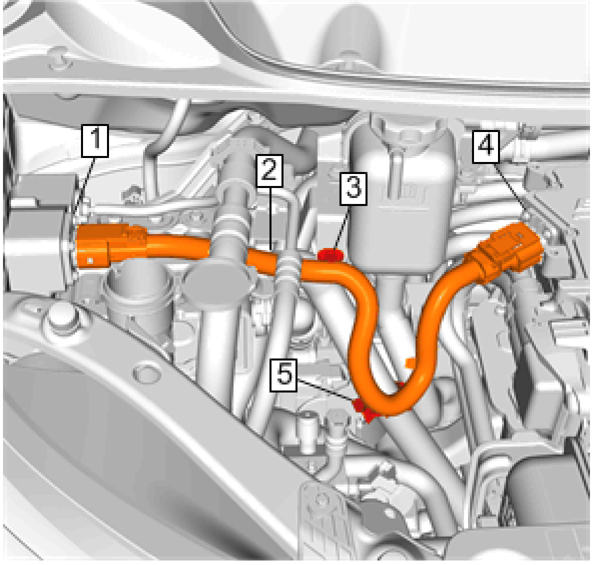

Fig. 90: Drive Motor Battery Positive and Negative Cable
Courtesy of GENERAL MOTORS COMPANY

9. Install Drive Motor Battery Positive and Negative Cable (1). Refer to **Drive Motor Battery Positive and Negative Cable Replacement**
10. Install the heater surge tank to the heater surge tank bracket. Refer to **Heater Coolant Surge Tank Replacement**
11. Enable the high voltage system. Refer to **High Voltage Enabling**
12. Bleed the brake system. Refer to **Hydraulic Brake System Bleeding**

FRONT BRAKE HOSE REPLACEMENT

Removal Procedure

WARNING: **Refer to Brake Fluid Irritant Warning .**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle**
2. Remove the front tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation**
3. Clean all dirt and foreign material from the brake hose ends and the brake pipe fitting.

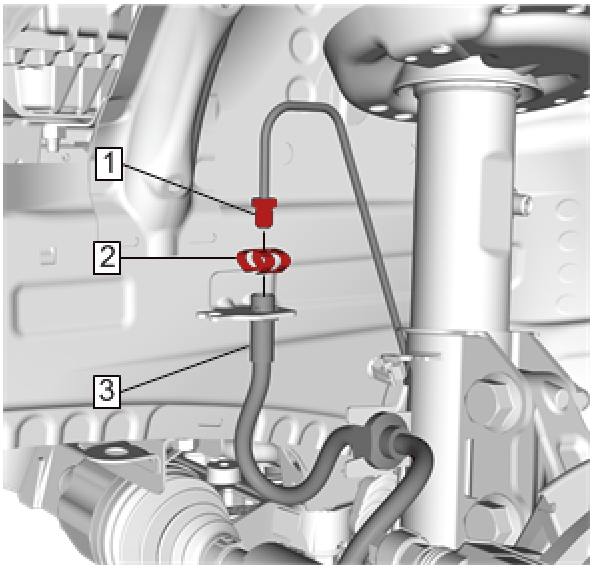

Fig. 91: Front Brake Pipe Fitting, Hose And Retainer
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Cap the brake pipe fitting to prevent brake fluid loss and contamination.**

4. Remove Front Brake Pipe Fitting (1) @ Front Brake Hose (3)
5. Remove Front Brake Hose Retainer (2)

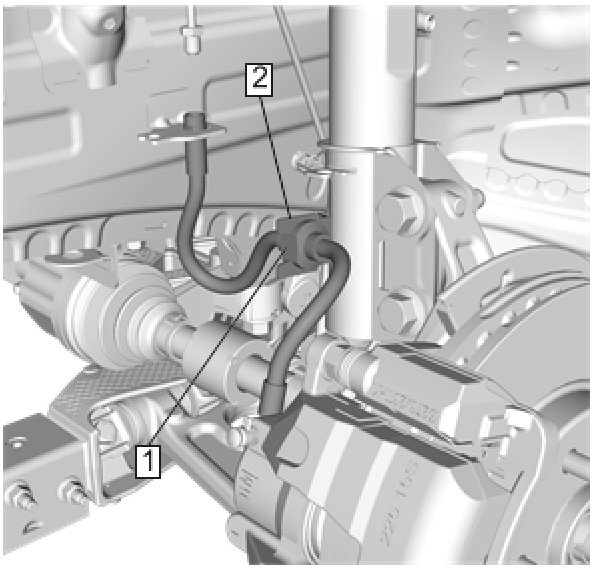

Fig. 92: Front Brake Hose And Front Suspension Strut Mounted Bracket
Courtesy of GENERAL MOTORS COMPANY

6. Unclip Front Brake Hose (1) @ Front Suspension Strut Mounted Bracket (2)

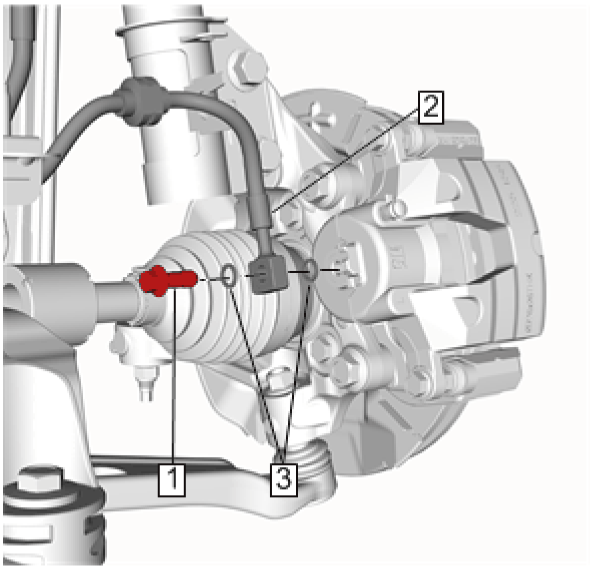

Fig. 93: Front Brake Hose, Fitting Bolt And Washers
Courtesy of GENERAL MOTORS COMPANY

7. Remove Front Brake Hose Fitting Bolt (1) @ Front Brake Caliper
8. Remove Front Brake Hose (2) @ Front Brake Caliper
9. Remove and DISCARD Front Brake Hose Washers (3) (Qty: 2)

NOTE: **These washers may be stuck to the brake caliper and/or the brake hose end.**

Installation Procedure

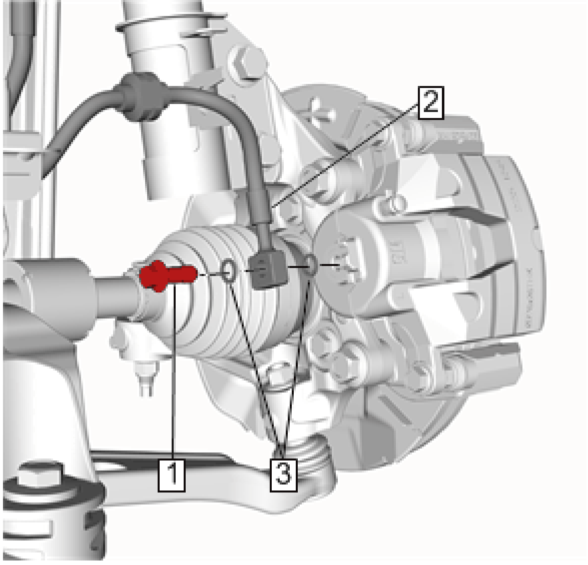

Fig. 94: Front Brake Hose, Fitting Bolt And Washers
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do NOT reuse the brake hose washers.**

1. Install NEW Front Brake Hose Washers (3) (Qty: 2). Install NEW.
2. Install Front Brake Hose (2) @ Front Brake Caliper

CAUTION: **Refer to Fastener Caution .**

3. Install and tighten Front Brake Hose Fitting Bolt (1) @ Front Brake Caliper to 40 N.m (30 lb ft)

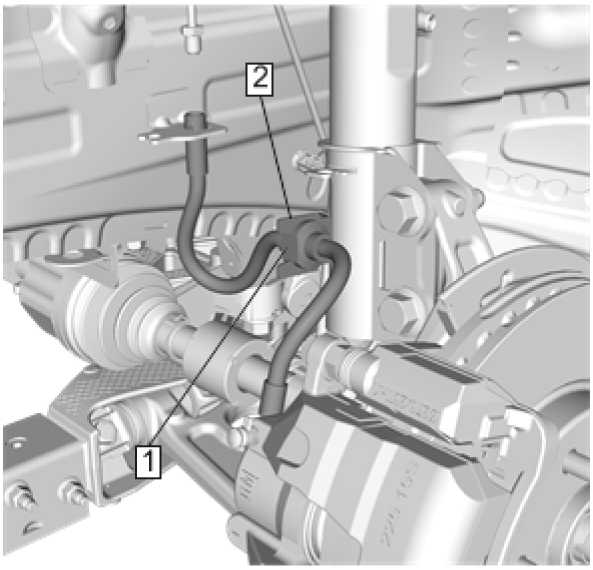

Fig. 95: Front Brake Hose And Front Suspension Strut Mounted Bracket
Courtesy of GENERAL MOTORS COMPANY

4. Install Front Brake Hose (1) @ Front Suspension Strut Mounted Bracket (2)

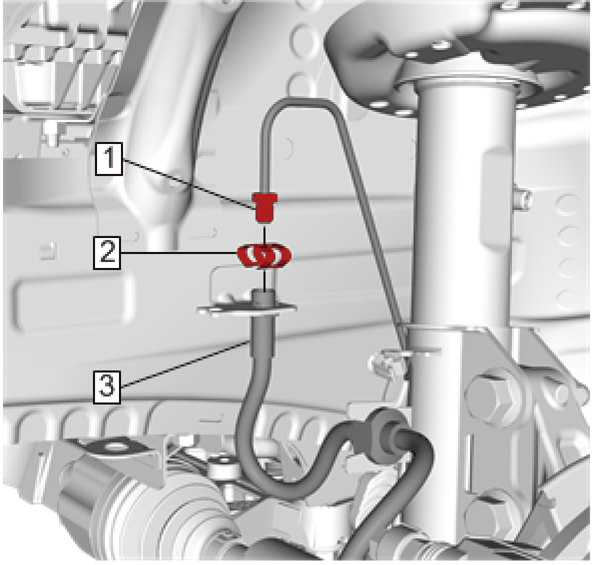

Fig. 96: Front Brake Pipe Fitting, Hose And Retainer
Courtesy of GENERAL MOTORS COMPANY

5. Install Front Brake Hose Retainer (2)
6. Install and tighten Front Brake Pipe Fitting (1) @ Front Brake Hose (3) to 18 N.m (13 lb ft)
7. Bleed the brake system. Refer to Hydraulic Brake System Bleeding
8. Install the front tire and wheel assembly. Refer to Tire and Wheel Removal and Installation
9. Lower the vehicle.

REAR BRAKE PIPE REPLACEMENT

Removal Procedure

WARNING: **Refer to Brake Fluid Irritant Warning .**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle
2. Remove the rear tire and wheel assembly. Refer to Tire and Wheel Removal and Installation
3. Clean all dirt and foreign material from the brake hose ends and the brake pipe fitting.

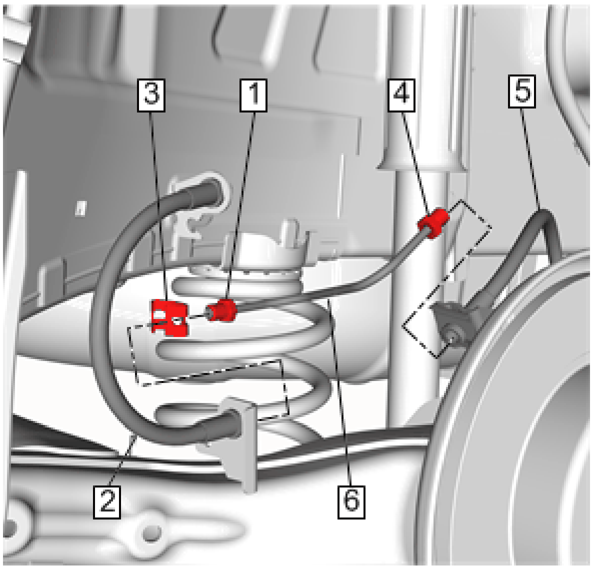

Fig. 97: Rear Brake Pipe, Fittings, Hoses And Retainer
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Cap the brake pipe fitting to prevent brake fluid loss and contamination.**

4. Remove Rear Brake Pipe Fitting (1) @ Rear Brake Hose (2)

5. Remove Rear Brake Pipe Fitting (4) @ Rear Brake Front Hose (5)
6. Remove Rear Brake Pipe (6) @ Vehicle
7. Remove Rear Brake Hose Retainer (3)

Installation Procedure

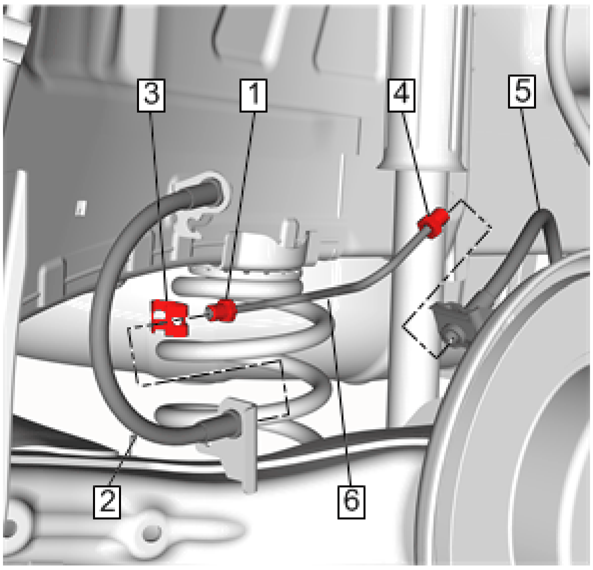

Fig. 98: Rear Brake Pipe, Fittings, Hoses And Retainer
Courtesy of GENERAL MOTORS COMPANY

1. Install Rear Brake Hose Retainer (3)
2. Install Rear Brake Pipe (6) @ Vehicle

CAUTION: **Refer to Fastener Caution .**

3. Install and tighten Rear Brake Pipe Fitting (4) @ Rear Brake Front Hose (5) to 18 N.m (13 lb ft)
4. Install and tighten Rear Brake Pipe Fitting (1) @ Rear Brake Hose (2) to 18 N.m (13 lb ft)
5. Bleed the brake system. Refer to **Hydraulic Brake System Bleeding**
6. Install the rear tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation**
7. Lower the vehicle.

REAR BRAKE FRONT HOSE REPLACEMENT

Removal Procedure

WARNING: **Refer to Brake Fluid Irritant Warning .**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle**
2. Remove the rear tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation**
3. Clean all dirt and foreign material from the brake hose ends and the brake pipe fitting.

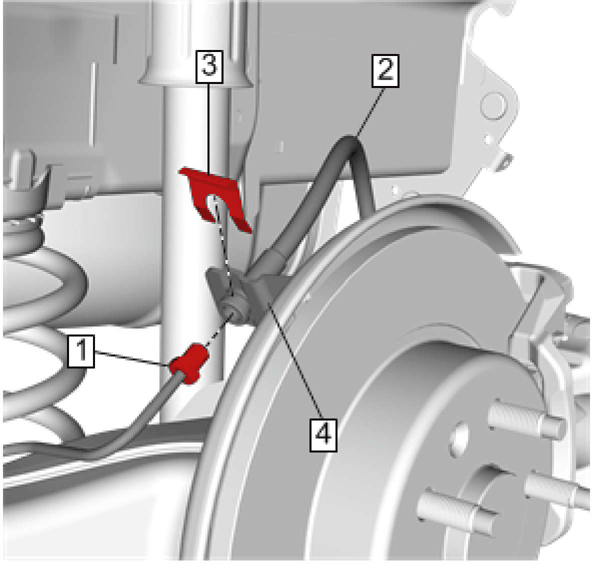

Fig. 99: Rear Brake Pipe Fitting, Rear Brake Front Hose, Clip And Bracket
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Cap the brake pipe fitting to prevent brake fluid loss and contamination.**

4. Remove Rear Brake Pipe Fitting (1) @ Rear Brake Front Hose (2)
5. Remove Rear Brake Hose Clip (3) @ Rear Brake Hose Bracket (4)

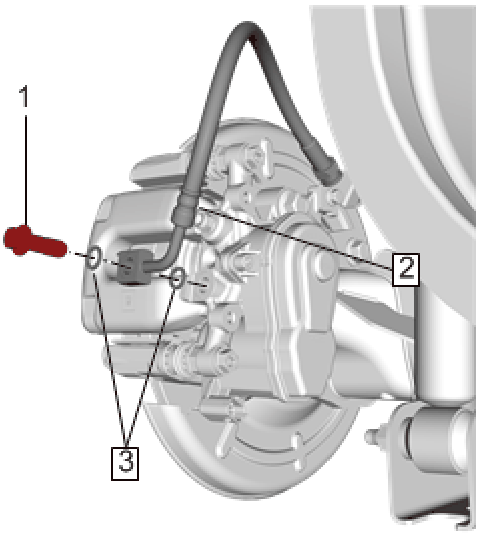

Fig. 100: Rear Brake Front Hose, Fitting Bolt And Sealing Washers
Courtesy of GENERAL MOTORS COMPANY

6. Remove Rear Brake Hose Fitting Bolt (1) @ Rear Brake Caliper
7. Remove Rear Brake Front Hose (2) @ Rear Brake Caliper
8. Remove and DISCARD Rear Brake Hose Washers (3) (Qty: 2)

NOTE: **These washers may be stuck to the brake caliper and/or the brake hose end.**

Installation Procedure

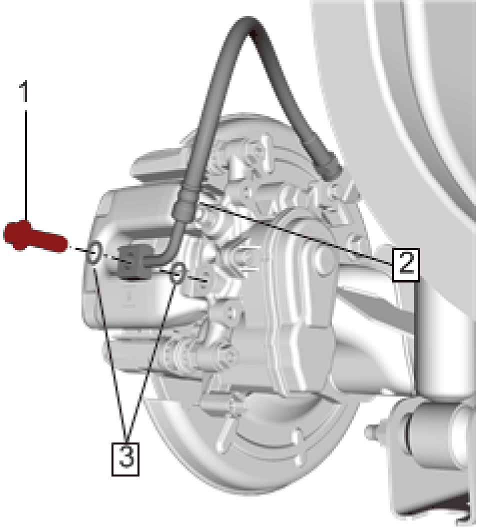

Fig. 101: Rear Brake Front Hose, Fitting Bolt And Sealing Washers
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do NOT reuse the brake hose washers.**

1. Install NEW Rear Brake Hose Washers (3) (Qty: 2). Install NEW.
2. Install Rear Brake Front Hose (2) @ Rear Brake Caliper

CAUTION: **Refer to Fastener Caution .**

3. Install and tighten Rear Brake Hose Fitting Bolt (1) @ Rear Brake Caliper to 40 N.m (30 lb ft)

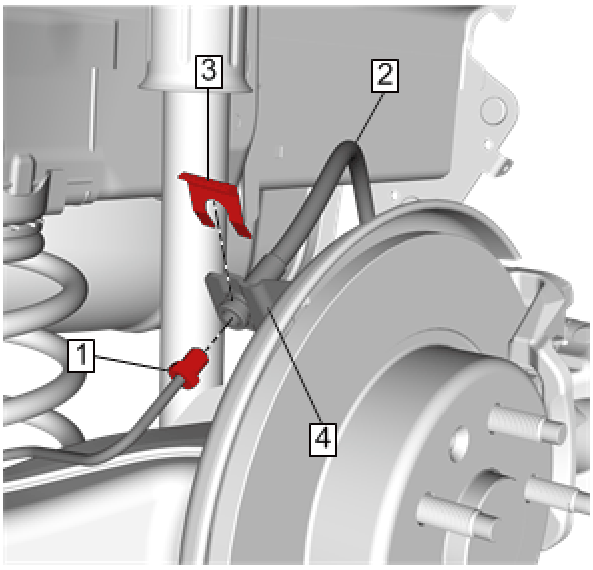

Fig. 102: Rear Brake Pipe Fitting, Rear Brake Front Hose, Clip And Bracket
Courtesy of GENERAL MOTORS COMPANY

4. Install Rear Brake Hose Clip (3) @ Rear Brake Hose Bracket (4)
5. Install and tighten Rear Brake Pipe Fitting (1) @ Rear Brake Front Hose (2) to 18 N.m (13 lb ft)
6. Bleed the brake system. Refer to Hydraulic Brake System Bleeding
7. Install the rear tire and wheel assembly. Refer to Tire and Wheel Removal and Installation
8. Lower the vehicle.

REAR BRAKE HOSE REPLACEMENT

Removal Procedure

WARNING: **Refer to Brake Fluid Irritant Warning .**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle
2. Remove the rear tire and wheel assembly. Refer to Tire and Wheel Removal and Installation
3. Clean all dirt and foreign material from the brake hose ends and the brake pipe fitting.
4. Unclip Rear Wheel Speed Sensor Harness @ Rear Brake Hose

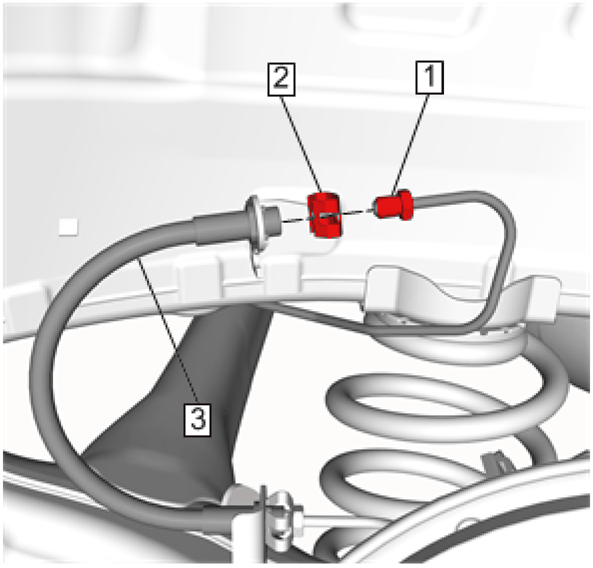

Fig. 103: Rear Brake Pipe Fitting, Rear Brake Hose And Retainer
Courtesy of GENERAL MOTORS COMPANY

NOTE: Cap the brake pipe fitting to prevent brake fluid loss and contamination.

5. Remove Rear Brake Pipe Fitting (1) @ Rear Brake Hose (3)
6. Remove Rear Brake Hose Retainer (2)

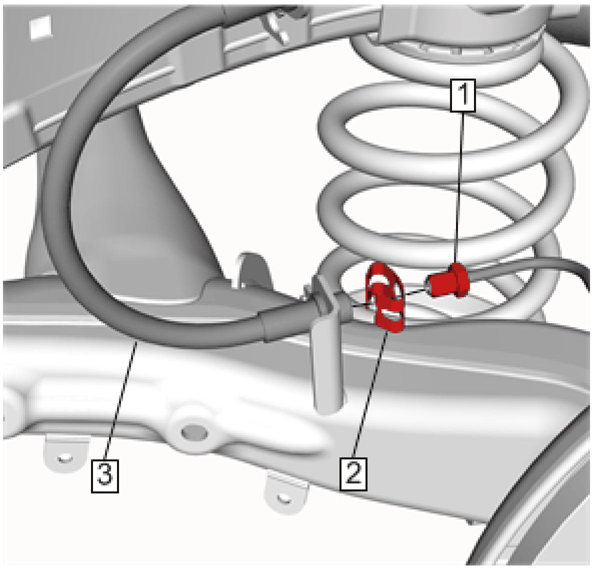

Fig. 104: Rear Brake Pipe Fitting, Rear Brake Hose And Retainer
Courtesy of GENERAL MOTORS COMPANY

7. Remove Rear Brake Pipe Fitting (1) @ Rear Brake Hose (3)
8. Remove Rear Brake Hose Retainer (2)
9. Remove Rear Brake Hose (3) @ Vehicle

Installation Procedure

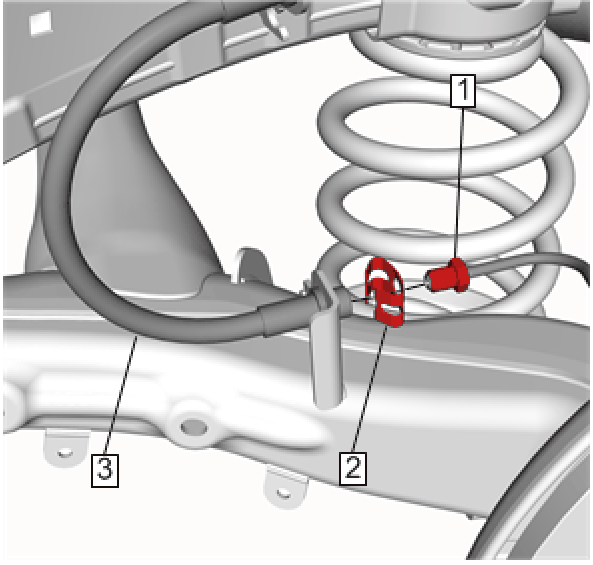

Fig. 105: Rear Brake Pipe Fitting, Rear Brake Hose And Retainer
Courtesy of GENERAL MOTORS COMPANY

1. Install Rear Brake Hose (3) @ Vehicle
2. Install Rear Brake Hose Retainer (2)

CAUTION: **Refer to Fastener Caution .**

3. Install and tighten Rear Brake Pipe Fitting (1) @ Rear Brake Hose (3) to 18 N.m (13 lb ft)

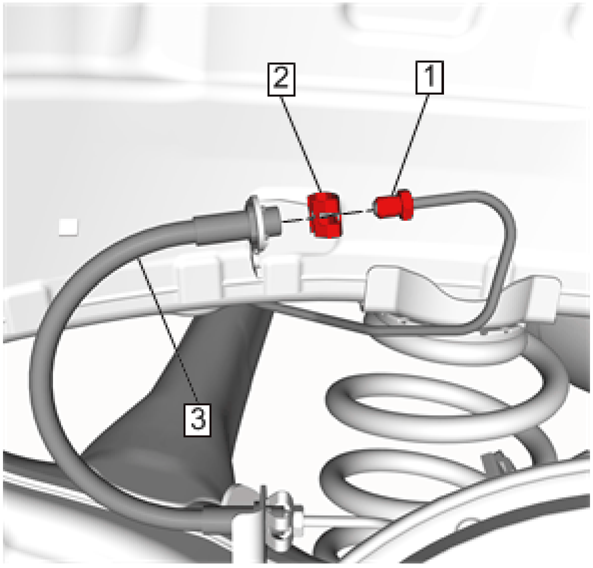

Fig. 106: Rear Brake Pipe Fitting, Rear Brake Hose And Retainer
Courtesy of GENERAL MOTORS COMPANY

4. Install Rear Brake Hose Retainer (2)
5. Install and tighten Rear Brake Pipe Fitting (1) @ Rear Brake Hose (3) to 18 N.m (13 lb ft)
6. Clip Rear Wheel Speed Sensor Harness @ Rear Brake Hose
7. Bleed the brake system. Refer to Hydraulic Brake System Bleeding
8. Install the rear tire and wheel assembly. Refer to Tire and Wheel Removal and Installation
9. Lower the vehicle.

HYDRAULIC BRAKE SYSTEM BLEEDING

WARNING: **Refer to Brake Fluid Irritant Warning .**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

CAUTION: **Only use products that comply with GM specifications and check**

manufacturer information respectively. We recommend the use of GM genuine products. Instructions must be followed at all times. The use of any type of fluid other than the recommended type of brake fluid, may cause contamination which could result in damage to the internal rubber seals and/or rubber linings of hydraulic brake system components.

If hydraulic components were serviced on only one wheel hydraulic circuit, perform the following procedure.

Bleeding a Single Hydraulic Brake Circuit

1. Place the Power button in the Service Only Mode.
2. Place a clean shop cloth beneath the brake master cylinder to catch brake fluid spills.
3. Clean the outside of the reservoir on and around the reservoir cap prior to removing the cap and diaphragm.
4. Fill the brake master cylinder reservoir to the maximum-full level with GM approved brake fluid from a clean, sealed brake fluid container. Refer to **Adhesives, Fluids, Lubricants, and Sealers**

NOTE: **The pressure bleeding equipment must be the diaphragm type. The rubber diaphragm between the air supply and the brake fluid prevents air, moisture, oil, and other contaminants from entering the hydraulic system.**

5. Following the brake pressure bleeder manufacturer's instructions, fill the brake pressure bleeder with GM approved brake fluid from a clean, sealed brake fluid container.
6. Install the appropriate master cylinder reservoir adapter and connect the brake pressure bleeder.
7. Charge the brake pressure bleeder air tank to 170-200 kPa/1.7-2.0 bar (25-30 psi), or as recommended by the brake pressure bleeder manufacturer's instructions.
8. Open the brake pressure bleeder fluid tank valve to allow pressurized brake fluid to enter the brake hydraulic system.

NOTE: **Any brake fluid leaks identified require repair prior to completing this procedure.**

9. Wait approximately 30 seconds, then inspect the entire hydraulic brake system for external brake fluid leaks.
10. Install a proper box-end wrench onto the wheel hydraulic circuit bleeder valve which has been serviced.
11. Install a transparent hose over the end of the bleeder valve.
12. Submerge the open end of the transparent hose into a transparent container partially filled with brake fluid from a clean, sealed brake fluid container.
13. Loosen the bleeder valve to purge air from the wheel hydraulic circuit.
14. Allow fluid to flow until air bubbles stop flowing from the bleeder.
15. After all air has been purged from the hydraulic circuit, tighten the bleeder valve and install the dust cap.

NOTE: **The brake reservoir may have residual pressure after the bleeding operation is complete. Wrap a clean shop towel around the bleeder adapter and all hose connections before disconnecting the pressure bleeding equipment to prevent brake fluid from contacting and damaging vehicle components and painted surfaces.**

16. Close the brake pressure bleeder fluid tank valve then disconnect the brake pressure bleeder from the master cylinder reservoir bleeder adapter.
17. Remove the master cylinder reservoir bleeder adapter from the master cylinder reservoir.
18. Fill the brake master cylinder reservoir to the maximum-fill level with GM approved brake fluid from a clean, sealed brake fluid container.
19. Slowly press and release the brake pedal. Observe the brake pedal feel.

20. If the brake pedal feels spongy, perform the Bleeding the Complete Brake Hydraulic System procedure:
21. Turn the ignition key ON, with the engine OFF. Check to see if the brake system warning lamp remains illuminated.

NOTE: **DO NOT allow the vehicle to be driven until it is diagnosed and repaired.**

22. If the brake system warning lamp remains illuminated, refer to **Diagnostic Starting Point - Vehicle** .

Bleeding the Complete Brake Hydraulic System

1. Place the Power button in the Service Only Mode.
2. Place a clean shop cloth beneath the brake master cylinder to catch brake fluid spills.
3. Clean the outside of the reservoir on and around the reservoir cap prior to removing the cap and diaphragm.
4. Fill the brake master cylinder reservoir to the maximum-full level with GM approved brake fluid from a clean, sealed brake fluid container. Refer to **Adhesives, Fluids, Lubricants, and Sealers**

NOTE: **The pressure bleeding equipment must be the diaphragm type. The rubber diaphragm between the air supply and the brake fluid prevents air, moisture, oil, and other contaminants from entering the hydraulic system.**

5. Following the brake pressure bleeder manufacturer's instructions, fill the brake pressure bleeder with GM approved brake fluid from a clean, sealed brake fluid container.
6. Install the appropriate master cylinder reservoir adapter and connect the brake pressure bleeder.
7. Charge the brake pressure bleeder air tank to 170-200 kPa/1.7-2.0 bar (25-30 psi), or as recommended by the brake pressure bleeder manufacturer's instructions.
8. Open the brake pressure bleeder fluid tank valve to allow pressurized brake fluid to enter the brake hydraulic system.

NOTE: **Any brake fluid leaks identified require repair prior to completing this procedure.**

9. Wait approximately 30 seconds, then inspect the entire hydraulic brake system for external brake fluid leaks.
10. Install a proper box-end wrench onto the RIGHT REAR wheel hydraulic circuit bleeder valve.
11. Install a transparent hose over the end of the bleeder valve.
12. Submerge the open end of the transparent hose into a transparent container partially filled with GM approved brake fluid from a clean, sealed brake fluid container.
13. Loosen the bleeder valve to purge air from the wheel hydraulic circuit.
14. Allow fluid to flow until air bubbles stop flowing from the bleeder.
15. After all air has been purged from the hydraulic circuit, tighten the bleeder valve and install the dust cap.
16. Install a proper box-end wrench onto the LEFT REAR wheel hydraulic circuit bleeder valve, then repeat steps 12-16.
17. Install a proper box-end wrench onto the RIGHT FRONT wheel hydraulic circuit bleeder valve, then repeat steps 12-16.
18. Install a proper box-end wrench onto the LEFT FRONT wheel hydraulic circuit bleeder valve, then repeat steps 12-16.
19. Close the brake pressure bleeder fluid tank valve.

NOTE: **The brake reservoir may have residual pressure after the bleeding operation is complete. Wrap a clean shop towel around the bleeder adapter and all hose connections before disconnecting the pressure**

bleeding equipment to prevent brake fluid from contacting and damaging vehicle components and painted surfaces.

20. Remove the brake pressure bleeding equipment from the vehicle.
21. Fill the brake master cylinder reservoir to the maximum-full level with GM approved brake fluid from a clean, sealed brake fluid container. Refer to **Adhesives, Fluids, Lubricants, and Sealers**
22. Slowly press and release the brake pedal. Observe the brake pedal feel.
23. If the brake pedal feels spongy, perform the following procedure.
    1. If equipped with antilock brakes, install a scan tool and perform the **Antilock Brake System Automated Bleed** to remove air which may be trapped in the BPMV.
    2. Inspect the hydraulic brake system for external leaks. Refer to **Brake System External Leak Inspection**
    3. Repeat the Bleeding the Complete Brake Hydraulic System procedure.
24. If the brake pedal still feels spongy, pressure bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding**
25. Turn the ignition switch ON with the engine OFF. Check to see if the brake system warning lamp remains illuminated.

NOTE: **DO NOT allow the vehicle to be driven until the brake system is diagnosed and repaired.**

26. If the brake system warning lamp remains illuminated, refer to **Diagnostic Starting Point - Vehicle** .

HYDRAULIC BRAKE SYSTEM FLUSHING

WARNING: **Refer to Brake Fluid Irritant Warning .**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

CAUTION: **Only use products that comply with GM specifications and check manufacturer information respectively. We recommend the use of GM genuine products. Instructions must be followed at all times. The use of any type of fluid other than the recommended type of brake fluid, may cause contamination which could result in damage to the internal rubber seals and/or rubber linings of hydraulic brake system components.**

1. Inspect the brake fluid for the following conditions, indicating brake fluid contamination:
    - Fluid separation, indicating two types of fluid are present; a substance other than the recommended brake fluid has been introduced into the brake hydraulic system
        - Swirled appearance - oil-based substance
        - Layered appearance - silicone-based substance
    - Fluid discoloration, indicating the presence of moisture or particles that have been introduced into the brake hydraulic system
        - Cloudy appearance - moisture
        - Dark appearance/suspended particles in fluid - dirt, rust, corrosion, brake dust
2. Inspect the master cylinder reservoir cap diaphragm and the reservoir-to-master cylinder grommets for swelling, indicating brake fluid contamination.
3. If the brake fluid WAS contaminated with an oil-based or a silicone-based substance, indicated by fluid separation and/or a swollen master cylinder reservoir cap diaphragm and/or swollen reservoir-to-master cylinder grommets, perform the following:
    1. Remove ALL of the following components listed from the vehicle. Each component contains internal rubber seals/linings which have been contaminated by the contaminated brake fluid in the brake hydraulic system.

       Refer to the procedures indicated as applicable:

    - **Master Cylinder Replacement**
    - **Front Brake Hose Replacement**
    - **Rear Brake Hose Replacement**
    - **Front Brake Caliper Replacement**
    - **Rear Brake Caliper Replacement**
    - **Electronic Brake Control Module with Brake Pressure Modulator Valve Replacement**
  2. Clean out all the hydraulic brake pipes using denatured alcohol, or equivalent.
  3. Dry the brake pipes using non-lubricated, filtered air.
  4. Repair or replace ALL of the following components listed and install them to the vehicle. Each component contains internal rubber seals/linings which have been contaminated by the contaminated brake fluid in the brake hydraulic system.

     Refer to the procedures indicated as applicable:

     - **Master Cylinder Replacement** ; also perform the following:

       Clean the brake master cylinder reservoir using denatured alcohol, or equivalent, then dry the reservoir using non-lubricated, filtered air. Inspect the reservoir for cracks and/or damage and replace if necessary. **Master Cylinder Reservoir Replacement**

       Replace the brake master cylinder reservoir cap.

     - **Front Brake Hose Replacement**
     - **Rear Brake Hose Replacement**
     - **Front Brake Caliper Replacement**
     - **Rear Brake Caliper Replacement**
     - **Electronic Brake Control Module with Brake Pressure Modulator Valve Replacement**

4. If the brake fluid was NOT contaminated with an oil-based or a silicone-based substance, but WAS contaminated with water or dirt, rust, corrosion, and/or brake dust, replace the brake master cylinder reservoir cap. The diaphragm may have allowed the moisture or particles to enter the hydraulic system.
5. Fill the brake master cylinder reservoir to the maximum-fill level with GM recommended brake fluid. Refer to **Adhesives, Fluids, Lubricants, and Sealers**
6. Pressure bleed the hydraulic brake system. Begin the procedure with the pressure bleeder reservoir filled to the maximum-fill level with the correct brake fluid as indicated. Refer to **Hydraulic Brake System Bleeding**

POWER BRAKE MASTER CYLINDER BOOSTER ASSEMBLY REPLACEMENT

Removal Procedure

WARNING: **Refer to Brake Fluid Irritant Warning .**

WARNING: **Use of eye goggles is necessary to prevent personal injury.**

CAUTION: **Refer to Brake Fluid Effects on Paint and Electrical Components Caution .**

1. Remove Brake Master Cylinder. Refer to **Master Cylinder Replacement**

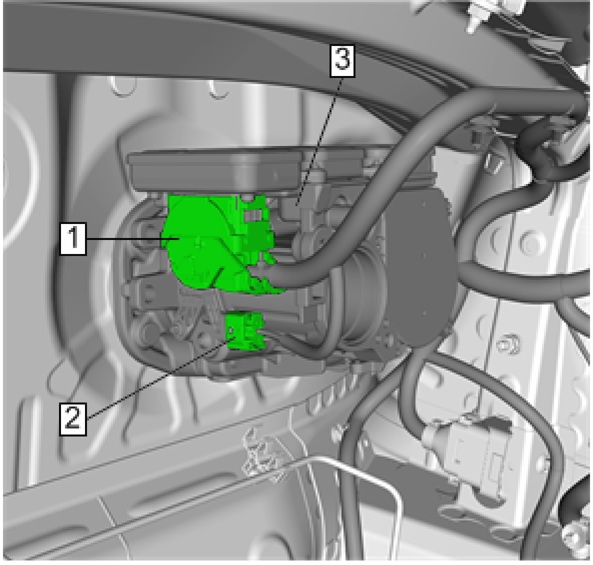

Fig. 107: Power Brake Booster And Electrical Connectors
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect Brake Booster Control Module Electrical Connector (1) @ Power Brake Booster (3)
3. Disconnect Brake Control Brake Pedal Position Sensor Electrical Connector (2) @ Power Brake Booster (3)

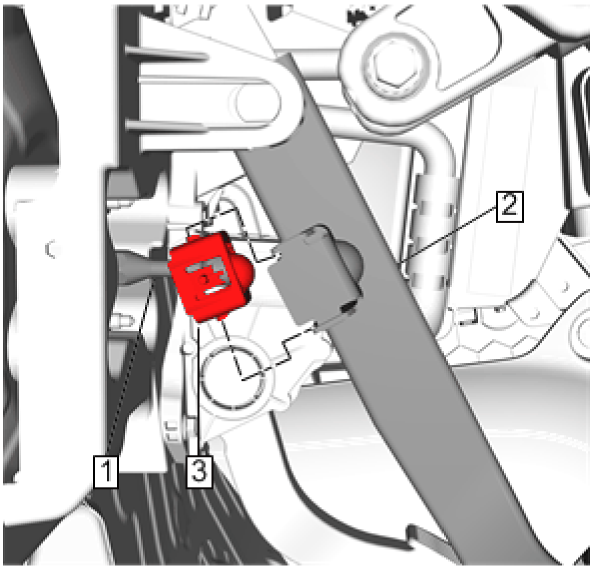

Fig. 108: Brake Pedal, Pushrod And Click Fit Connector
Courtesy of GENERAL MOTORS COMPANY

4. Disconnect Brake Pedal Pushrod (1) @ Brake Pedal (2)

   Press the 2 tabs of the click fit connector (3) together and pull the brake pedal a bit to facilitate the removal.

5. Remove and DISCARD Click Fit Connector (3) @ Brake Pedal Pushrod (1)

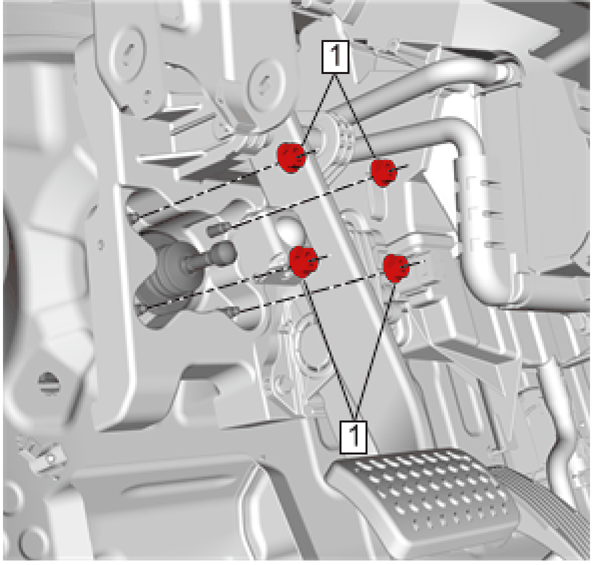

Fig. 109: Brake Pedal Nuts
Courtesy of GENERAL MOTORS COMPANY

6. Remove Brake Pedal Nuts (1) (Qty: 4)

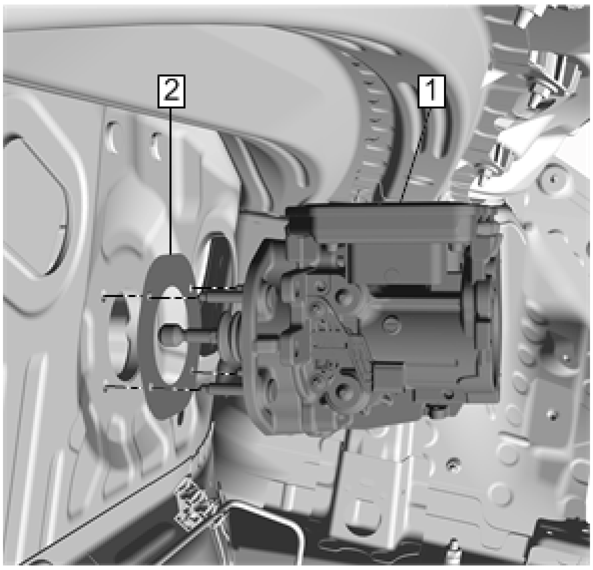

Fig. 110: Power Brake Booster And Brake Master Cylinder Spacer Gasket

7. Remove Power Brake Booster (1) @ Vehicle
8. Remove and DISCARD Brake Master Cylinder Spacer Gasket (2) @ Power Brake Booster (1)

Installation Procedure

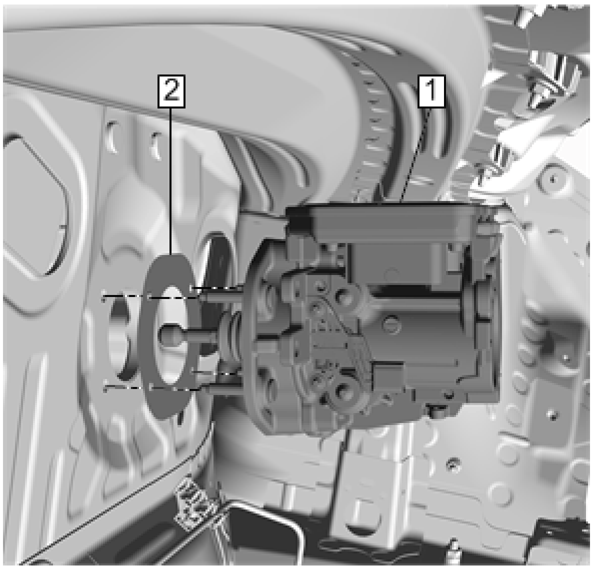

Fig. 111: Power Brake Booster And Brake Master Cylinder Spacer Gasket
Courtesy of GENERAL MOTORS COMPANY

1. Install NEW Brake Master Cylinder Spacer Gasket (2) @ Power Brake Booster (1).
2. Install Power Brake Booster (1) @ Vehicle

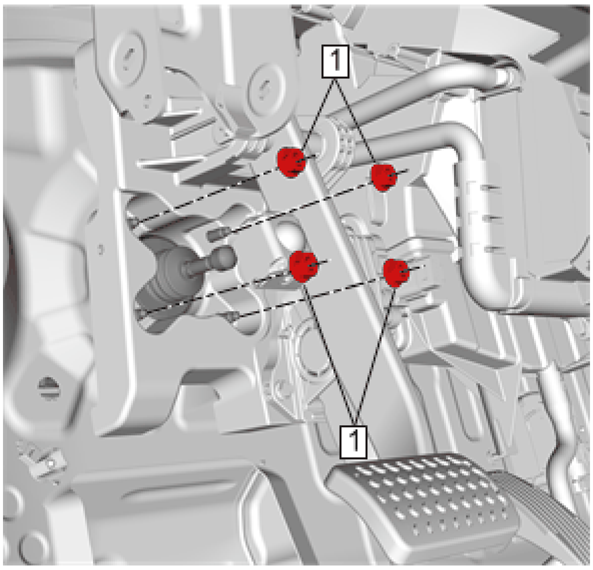

Fig. 112: Brake Pedal Nuts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **Refer to Fastener Caution .**

3. Install and tighten Brake Pedal Nuts (1) (Qty: 4) to 22 N.m (16 lb ft)

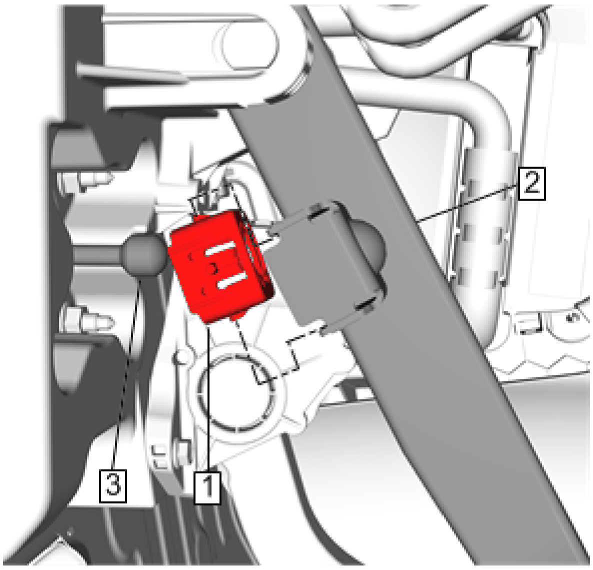

Fig. 113: Brake Pedal, Pushrod And Click Fit Connector
Courtesy of GENERAL MOTORS COMPANY

4. Install NEW Click Fit Connector (1) @ Brake Pedal (2)
5. Connect Brake Pedal Pushrod (3) @ Brake Pedal (2)

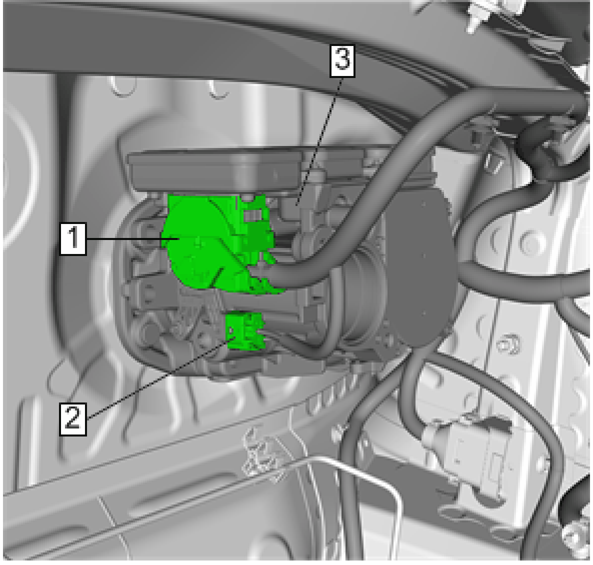

Fig. 114: Power Brake Booster And Electrical Connectors
Courtesy of GENERAL MOTORS COMPANY

6. Connect Brake Control Brake Pedal Position Sensor Electrical Connector (2) @ Power Brake Booster (3)
7. Connect Brake Booster Control Module Electrical Connector (1) @ Power Brake Booster (3)
8. Install Brake Master Cylinder. Refer to **Master Cylinder Replacement**
9. Bleed the brake system. Refer to **Hydraulic Brake System Bleeding**
10. Program and calibrate the power brake booster control module. Refer to **Control Module References**

DESCRIPTION AND OPERATION

POWER BRAKE BOOSTER DESCRIPTION AND OPERATION

Power Brake Booster Description and Operation

The brake booster is an electromechanical brake booster that replaces a vacuum booster including its vacuum supply. It is designed to make hybrid and electric vehicles more efficient by providing situation-dependent support when a driver initiates braking.

The brake booster unit takes the driver applied brake demand and transforms this into an amplified brake pressure and does not rely on vacuum to function. The brake booster unit is designed to operate together with an electronic stability control module which is normally responsible for ABS, traction control and stability control.

Since the brake booster unit operates electromechanically, it does not require vacuum from the engine and recovers almost all the energy lost in typical braking. It uses electrical current only during braking.

The brake booster unit consists of a PSM motor for force build up, and ECU for the control of the brake booster, a stage gear control to transmit the motor torque to the output pressure in the master cylinder, a vehicle interface to connect the brake booster and the vehicle, a pedal coupling unit to couple the brake booster with the vehicle pedal unit, a pedal travel sensor to detect the driver brake request, TMC to connect the brake booster with the braking system and a reservoir to support the braking system with brake fluid.

For maximum efficiency, a hybrid or EV must recover as much energy as possible when braking. Ideally, a vehicle would be slowed down purely by the electric motor, avoiding the loss of valuable energy through braking. The system recovers almost all the energy lost in typical braking operations by ensuring deceleration rates of up to 0.3 g are achieved using the electric motor alone. If the brakes are applied harder, the brake booster system generates the additional braking pressure needed in the traditional way, using the brake master cylinder.

The brake booster unit is purely electromechanical, without brake fluid, which means it can be rotated flexibly about the longitudinal axis.

BRAKE WARNING SYSTEM DESCRIPTION AND OPERATION

Brake Warning Indicator

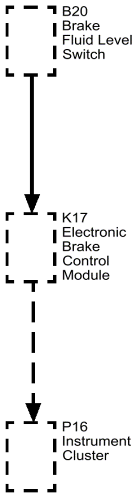

Fig. 115: Brake Warning System Block Diagram
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
P16	P16 Instrument Cluster
B20	B20 Brake Fluid Level Switch
K17	K17 Electronic Brake Control Module

The instrument cluster turns the brake warning indicator ON when the following occurs:

- The instrument cluster performs the bulb check. The brake warning indicator illuminates for 5 seconds.
- When the EBCM detects a too low brake fluid level it sets a DTC and sends a serial data message to the instrument cluster, which will illuminate.

Electronic brake control module (EBCM) monitors the brake fluid level in the brake fluid reservoir. When the fluid within the brake fluid reservoir is below the MIN level, contacts within the brake fluid level switch closes causing the voltage within the signal circuit to drop. The electronic brake control module (EBCM) will detect the voltage drop and will send a serial data message to the instrument cluster commanding the brake warning indicator to illuminate.

HYDRAULIC BRAKE SYSTEM DESCRIPTION AND OPERATION

System Component Description

The hydraulic brake system consists of the following:

Hydraulic Brake Master Cylinder Fluid Reservoir

Contains supply of brake fluid for the hydraulic brake system.

Hydraulic Brake Master Cylinder

Converts mechanical input force into hydraulic output pressure.
Hydraulic output pressure is distributed from the master cylinder through 2 hydraulic circuits,

supplying diagonally-opposed wheel apply circuits.

Hydraulic Brake Pressure Balance Control System

Regulates brake fluid pressure delivered to hydraulic brake wheel circuits, in order to control the distribution of braking force.
Pressure balance control is achieved through dynamic rear proportioning (DRP), which is a function of the ABS modulator.

Hydraulic Brake Pipes and Flexible Brake Hoses

Carries brake fluid to and from hydraulic brake system components.

Hydraulic Brake Wheel Apply Components

Converts hydraulic input pressure into mechanical output force.

System Operation

Mechanical force is converted into hydraulic pressure by the master cylinder, regulated to meet braking system demands by the pressure balance control system, and delivered to the hydraulic brake wheel circuits by the pipes and flexible hoses. The wheel apply components then convert the hydraulic pressure back into mechanical force which presses linings against rotating brake system components.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC C028B: PARK BRAKE MOTOR POSITION SENSOR - SIGNAL NOT PLAUSIBLE

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provide an overview of each diagnostic category.

DTC Descriptors

DTC C028B 5A

Park Brake Motor Position Sensor - Signal Not Plausible

Circuit/System Description

The Electronic Brake Control Module will diagnose the park brake motor circuits to verify that they are functioning properly. The park brake motor circuits are used to command actuator motor operation, which will apply and release the parking brake. These circuits are used to activate the actuator, which applies or releases pressure on the rear caliper pistons, ultimately applying and releasing the park brake.

The Park Brake Motor Position Sensor is an internal sensor to the park brake actuator, this sensor is used to monitor the park brake motor position.

Conditions for Running the DTC

Ignition OFF, ACCESSORY, or RUN mode.

Conditions for Setting the DTC

The electronic brake control module detects a park brake actuator motor position sensor signal malfunction.

Action Taken When the DTC Sets

- The electric parking brake is disabled, one release allowed.
- A message and/or a warning indicator may be displayed.

Conditions for Clearing the DTC

- The electronic brake control module clears the history DTC when a current DTC is not detected in 40 ignition cycles.
- Calibrate the electronic brake control module.

Circuit/System Verification

1. Vehicle ON.
2. Verify that DTC C028B is not set.
    - **If the DTC is set**
    1. Perform the Park Brake Calibration learn procedure. Refer to **Park Brake Calibration**.
    2. Vehicle ON.
    3. Apply and release the park brake.
    4. Verify the DTC is not set.
        - If the DTC is set, replace the K17 Electronic Brake Control Module.
        - If the DTC is not set
    5. All OK.
    - **If the DTC is not set**
3. All OK.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Left Park Brake Actuator Apply Control	C028F 02	C028F 04	C028F 01 C028F 0B C028F 63	C028F 00 C028F 0B
Left Park Brake Actuator Release Control	C028F 02	C028F 04	C028F 01 C028F 0B C028F 63	C028F 00 C028F 0B

Circuit/System Description

The Electronic Brake Control Module will diagnose the park brake motor circuits to verify that they are functioning properly. The park brake motor circuits are used to command actuator motor operation, which will apply and release the parking brake. These circuits are used to activate the actuator, which applies or releases pressure on the rear caliper pistons, ultimately applying and releasing the park brake.

When the Park Brake Switch is pulled, a signal is sent to the Electronic Brake Control Module which will supply 12 V to the apply control circuits and ground to the release control circuits which will cause the left and right park brake actuators to activate causing the park brakes to engage. When the Park Brake Switch is pressed, a signal is sent to the Electronic Brake Control Module which will supply 12 V to the released control circuits and ground to the apply control circuits which will cause the left and right park brake actuators to activate causing the park brakes to release.

Conditions for Running the DTC

- Ignition OFF, ACCESSORY, or RUN mode.
- Battery voltage is between 9 - 16 V

Conditions for Setting the DTC

The Electronic Brake Control Module detects a malfunction in the left park brake actuator or its circuits.

Action Taken When the DTC Sets

- The parking brake is disabled, one release allowed.
- A message and/or a warning indicator may be displayed.

Conditions for Clearing the DTC

- The Electronic Brake Control Module will clear the DTC after 40 consecutive ignition on/off cycles with at least one test pass in each ignition cycle and no test fail result.
- The condition for the DTC is no longer present.

Diagnostic Aids

After repairing any fault, the DTC will still be set as current and the park brakes will not function. It is necessary to clear the DTC with a scan tool in order to place the DTC in history and regain park brake function.

Circuit/System Verification

1. Verify the M104L Park Brake Actuator - Left apply when pulling the S91 Park Brake Switch.
    - **If the M104L Park Brake Actuator - Left does not apply**

      Refer to the Circuit/System Testing.

    - **If the M104L Park Brake Actuator - Left does apply**
2. Verify the M104L Park Brake Actuator - Left release when pressing the S91 Park Brake Switch.

- **If the M104L Park Brake Actuator - Left does not release**

  Refer to the Circuit/System Testing.

- **If the M104L Park Brake Actuator - Left does release**

3. All OK.

Circuit/System Testing

NOTE: **It is necessary to clear the DTC after any repair is made to regain park brake output control and have the DTC to set as history.**

1. Ignition OFF, disconnect the harness connector at the M104L Park Brake Actuator - Left and the harness connector at the K17 Electronic Brake Control Module. Ignition ON
2. Test for less than 1 V between the K17 Electronic Brake Control Module harness connector terminals listed below and ground:
   - Terminal 12
   - Terminal 13
   - **If 1 V or greater**

     Repair the short to voltage on the circuit.

   - **If less than 1 V**
3. Ignition OFF.
4. Test for infinite resistance between the K17 Electronic Brake Control Module harness connector terminals listed below and ground:
   - Terminal 12
   - Terminal 13
   - **If less than infinite resistance**

     Repair the short to ground on the circuit.

   - **If infinite resistance**
5. Test for less than 2 Ω between the M104L Park Brake Actuator - Left harness connector terminal 1 and the K17 Electronic Brake Control Module harness connector terminal 13
   - **If 2 Ω or greater**

     Repair the open/high resistance in the circuit.

   - **If less than 2 Ω**
6. Test for less than 2 Ω between the M104L Park Brake Actuator - Left harness connector terminal 2 and the K17 Electronic Brake Control Module harness connector terminal 12
   - **If 2 Ω or greater**

     Repair the open/high resistance in the circuit.

   - **If less than 2 Ω**
7. Install a 25 A fused jumper wire between one of the control terminals at the M104L Park Brake Actuator - Left and 12 V. Momentarily install a jumper wire between the other control terminal and ground. Reverse the jumper wires at least two times, the M104L Park Brake Actuator - Left should perform the apply and release function.
   - **If the actuator does not perform the apply and release function**

     Replace the M104L Park Brake Actuator - Left.

   - **If the actuator performs the apply and release function**
8. Replace the K17 Electronic Brake Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Rear Parking Brake Actuator Replacement**
- **Control Module References** for control module replacement, programming and setup

DTC C0293: PARK BRAKE CONTROL SWITCH CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provide an overview of each diagnostic category.

Circuit/System Description

The parking brake function is integrated into the Electronic Brake Control Module. The Electronic Brake Control Module contains the logic for applying and releasing the parking brake when commanded by the Park Brake Control Switch. The Electronic Brake Control Module will perform diagnostics on the Park Brake Control Switch and its wiring harness to verify it is functioning properly.

The Park Brake Control Switch diagnostic checks for failure conditions in the Park Brake Control Switch and associated wiring into the Electronic Brake Control Module.

Conditions for Running the DTC

Ignition OFF, ACCESSORY, or RUN mode.

Conditions for Setting the DTC

The Electronic Brake Control Module detects a short to battery, short to ground, open circuit, or an internal Parking Brake Control Switch malfunction. The Electronic Brake Control Module detects the apply or release button was activated for more than 90 s.

Action Taken When the DTC Sets

- The parking brake is disabled.

- A message and/or a warning indicator may be displayed.

Conditions for Clearing the DTC

- The Electronic Brake Control Module will clear the DTC after 40 consecutive ignition on/off cycles with at least one test pass in each ignition cycle and no test fail result.
- The condition for the DTC is no longer present.
- The Park Brake Control Switch button is INACTIVE using the scan tool without the switch being activated.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Park Brake Control Switch parameter changes between Released and Apply while pressing and releasing the S91 Park Brake Control Switch.
    - **If the parameter does not change**

      Refer to Circuit/System Test.

    - **If the parameter changes**
3. All OK.

Circuit/System Test

1. Ignition OFF, disconnect the harness connector at the K17 Electronic Brake Control Module. Ignition ON.
2. Test for less than 1 V between each circuit terminals listed below and ground;
    - Terminal 16
    - Terminal 32
    - Terminal 9
    - Terminal 15
    - Terminal 31
    - Terminal 8
    - **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

3. Ignition OFF.
4. Test for infinite resistance between the circuit terminals listed below and ground;
    - Terminal 16
    - Terminal 32
    - Terminal 9
    - Terminal 15
    - Terminal 31
    - Terminal 8
    - **If less than infinite resistance**

      Repair the short to ground on the circuit.

    - **If infinite resistance**
5. Test for less than 5 Ω between the circuit terminal 32 and the circuit terminal 31.
    - **If 5 Ω or greater**
    1. Ignition OFF, disconnect the harness connector at the S91 Park Brake Control Switch.
    2. Test for less than 2 Ω in the circuits end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the S91 Park Brake Control Switch.
    - **If less than 5 Ω**
6. Test for less than 5 Ω between the circuit terminal 8 and the circuit terminal 15.
    - **If 5 Ω or greater**
    1. Ignition OFF, disconnect the harness connector at the S91 Park Brake Control Switch.
    2. Test for less than 2 Ω in the circuits end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the S91 Park Brake Control Switch.
    - **If less than 5 Ω**
7. Test for less than 5 Ω between the circuit terminal 16 and the circuit terminal 9.
    - **If 5 Ω or greater**
    1. Ignition OFF, disconnect the harness connector at the S91 Park Brake Control Switch.
    2. Test for less than 2 Ω in the circuits end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the S91 Park Brake Control Switch.
    - **If less than 5 Ω**
8. Test for less than 5 Ω between the circuit terminal 9 and the circuit terminal 31 while closing the switch.
    - **If 5 Ω or greater**

      Replace the S91 Park Brake Control Switch.

    - **If less than 5 Ω**
9. Test for less than 5 Ω between the circuit terminal 9 and the circuit terminal 15 while closing the switch.
    - **If 5 Ω or greater**

      Replace the S91 Park Brake Control Switch.

    - **If less than 5 Ω**
10. Ignition OFF, all access doors closed, all vehicle systems OFF, disconnect the harness connector at the S91 Park Brake Control Switch.

11. Test for less than 10 Ω between the ground circuit terminal 8 at the S91 Park Brake Control Switch and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
12. Replace the S91 Park Brake Control Switch.
13. Verify that DTC C0293 does not set while operating the vehicle within the Conditions for Running the DTC.
    - **If the DTC sets**

      Replace the K17 Electronic Brake Control Module.

    - **If DTC does not set**
14. All OK.

1. Scan Tool Does Not Communicate With Low Speed GMLAN Device 2. Scan Tool Does Not Communicate With High Speed GMLAN Device				

Circuit/System Description

The serial data circuit is the means by which the devices in the vehicle communicate with each other. Once the scan tool is connected to the serial data circuit through the data link connector (DLC), the scan tool can be used to monitor each device for diagnostic purposes and to check for diagnostic trouble codes (DTC). When the vehicle is on, each device communicating on the serial data circuit sends a state of health message to ensure that the device is operating properly. When a device stops communicating on the serial data circuit, for example if the device loses power or ground, the state of health message it normally sends on the serial data circuit disappears. Other devices on the serial data circuit, which expect to receive that state of health message, detect its absence; those devices in turn set a DTC associated with the loss of state of health of the non communicating device. A loss of serial data communications DTC does not represent a failure of the devices that contain the stored DTC.

Conditions for Running the DTC

The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

A supervised periodic message from the electronic brake control module has not been received or the hybrid/EV powertrain control module 2 has detected an incorrect message counter.

Action Taken When the DTC Sets

DTC C1280 and C1281 are type A DTCs.

Conditions for Clearing the DTC

- DTC C1280 and C1281 are type A DTCs.
- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms.

Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:

  - A device on the data communication circuit was disconnected while the communication circuit is awake.
  - Power to one or more devices was interrupted during diagnosis.
  - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
  - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
  - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A device may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U-code.
- Do not replace a device reporting a U-code. The U-code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between the device and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the device using multiple GMLAN busses.
- Use **Data Link References** to determine what GMLAN serial data communications the non communicating device uses.
- The device may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the non communicating device.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC U0073, U0074, U0077, U0078, U007A, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
   - **If any of the DTCs are set**

   Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If none of the DTCs are set**

3. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Use the schematics and connector end views to identify the device's ground, B+, ignition, accessory wake up serial data, and serial data circuit terminals.**

1. Vehicle OFF, all access doors closed, all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Disconnect the harness connector at the K17 Electronic Brake Control Module.
2. Test for less than 10 Ω between the following ground circuit terminals and ground:
   - Terminal 14
   - Terminal 46
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K17 Electronic Brake Control Module.
   - **If the test lamp illuminates**
5. Verify a test lamp illuminates between the ignition circuit terminal 36 and ground.
   - **If the test lamp does not illuminate**
   1. Vehicle OFF, disconnect the harness connectors at the K9 Body Control Module.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If the test lamp illuminates**
6. Vehicle OFF, all access doors closed, all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Disconnect the harness connectors at the K114B Hybrid/EV Powertrain Control Module 2.
7. Test for less than 2 Ω in each serial data circuits end to end between the K17 Electronic Brake Control Module and the K114B Hybrid/EV Powertrain Control Module 2.
   - **If 2 Ω or greater**

Repair the open/high resistance in the serial data circuit.

- **If less than 2 Ω**

8. Reconnect all of the harness connectors at the K17 Electronic Brake Control Module and the K114B Hybrid/EV Powertrain Control Module 2. Vehicle in Service Mode.
9. Program the K17 Electronic Brake Control Module. Refer to **Electronic Brake Control Module Programming and Setup**
10. Vehicle in Service Mode. Apply and release the park brake.
11. Verify that DTC C1280 or C1281 is not set.
    - **If DTC C1280 or C1281 is set**
    1. Replace the K17 Electronic Brake Control Module.
    2. Vehicle in Service Mode.
    3. Verify that DTC C1280 or C1281 is not set.
        - If DTC C1280 or C1281 is set, replace the K114B Hybrid/EV Powertrain Control Module 2.
        - If DTC C1280 or C1281 is not set
    4. All OK.
    - **If DTC C1280 or C1281 is not set**
12. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC C1303: AUTOMATIC PARK BRAKE FUNCTION MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis:**Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC C1303

Automatic Park Brake Function Malfunction

Circuit/System Description

For an overview of the component/system, refer to:**Electronic Parking Brake Description**

Conditions for Running the DTC

System Voltage= 9 to 16 V

Conditions for Setting the DTC

Electric Park Brake=Inoperative - When requested by the One-Pedal Driving function.

Actions Taken When the DTC Sets

One-Pedal Driving=Unavailable

Conditions for Clearing the DTC

- Malfunction=Not Present
- A history DTC will clear after 40 consecutive malfunction-free ignition cycles.

Circuit/System Verification

1. Ignition - On / Vehicle - In Service Mode
2. Verify no other DTCs are set.
    - **If any other DTCs are set**

      Refer to:**Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If no other DTCs are set**
3. Perform all necessary programming and setup procedures for the control module:K17 Electronic Brake Control Module
4. Ignition - On / Vehicle - In Service Mode
5. Apply the parking brake.
6. Release the parking brake.
7. Verify the DTC does not set.
    - **If DTC C1303 is set**
    1. Replace the component:K17 Electronic Brake Control Module
    2. Ignition - On / Vehicle - In Service Mode
    3. Verify DTC C1303 is not set.
        - If the DTC sets - Replace the component:K114A Hybrid/EV Powertrain Control Module 1
        - If DTC C1303 is not set
    4. All OK.
    - **If DTC C1303 is not set**
8. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: **Diagnostic Repair Verification**

- For control module replacement, programming, and setup refer to: **Control Module References**

DTC C1586: RIGHT PARK BRAKE ACTUATOR CIRCUIT (HEV)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provide an overview of each diagnostic category.

DTC Descriptors

DTC C1586

Right Park Brake Actuator Circuit

For symptom byte information, refer to: **Symptom Byte List**

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Right Park Brake Actuator Apply Control	C1586 0C	C1586 04	C1586 0B	C1586 00 C1586 0F
Right Park Brake Actuator Release Control	C1586 0C	C1586 04	C1586 0B	C1586 00 C1586 0F

Circuit/System Description

The Electronic Brake Control Module will diagnose the park brake motor circuits to verify that they are functioning properly. The park brake motor circuits are used to command actuator motor operation, which will apply and release the parking brake. These circuits are used to activate the actuator, which applies or releases pressure on the rear caliper pistons, ultimately applying and releasing the park brake.

When the Park Brake Switch is pulled, a signal is sent to the Electronic Brake Control Module which will supply 12 V to the apply control circuits and ground to the release control circuits which will cause the left and right park brake actuators to activate causing the park brakes to engage. When the Park Brake Switch is pressed, a signal is sent to the Electronic Brake Control Module which will supply 12 V to the released control circuits and ground to the apply control circuits which will cause the left and right park brake actuators to activate causing the park brakes to release.

Conditions for Running the DTC

- Vehicle ON or in SERVICE MODE.
- Battery voltage is between 9 - 16 V

Conditions for Setting the DTC

The Electronic Brake Control Module detects a malfunction in the right park brake actuator or its circuits.

Action Taken When the DTC Sets

- The parking brake is disabled, one release allowed.
- A message and/or a warning indicator may be displayed.

Conditions for Clearing the DTC

- The Electronic Brake Control Module will clear the DTC after 40 consecutive ignition on/off cycles with at least one test pass in each ignition cycle and no test fail result.
- The condition for the DTC is no longer present.

Diagnostic Aids

After repairing any fault, the DTC will still be set as current and the park brakes will not function. It is necessary to clear the DTC with a scan tool in order to place the DTC in history and regain park brake function.

Circuit/System Verification

1. Verify the M104R Park Brake Actuator - Right apply when pulling the S91 Park Brake Switch.
   - **If the M104R Park Brake Actuator - Right does not apply**

     Refer to the Circuit/System Testing.

   - **If the M104R Park Brake Actuator - Right does apply**
2. Verify the M104R Park Brake Actuator - Right release when pressing the S91 Park Brake Switch.
   - **If the M104R Park Brake Actuator - Right does not release**

     Refer to the Circuit/System Testing.

   - **If the M104R Park Brake Actuator - Right does release**
3. All OK.

Circuit/System Testing

NOTE: **It is necessary to clear the DTC after any repair is made to regain park brake output control and have the DTC to set as history.**

1. Ignition OFF, disconnect the harness connector at the M104R Park Brake Actuator - Right and the harness connector at the K17 Electronic Brake Control Module. Ignition ON
2. Test for less than 1 V between the K17 Electronic Brake Control Module harness connector terminals listed below and ground:
   - Terminal 2
   - Terminal 3
   - **If 1 V or greater**

     Repair the short to voltage on the circuit.

   - **If less than 1 V**
3. Ignition OFF.
4. Test for infinite resistance between the K17 Electronic Brake Control Module harness connector terminals listed below and ground:
   - Terminal 2
   - Terminal 3

    - **If less than infinite resistance**

      Repair the short to ground on the circuit.

    - **If infinite resistance**

5. Test for less than 2 Ω between the M104R Park Brake Actuator - Right harness connector terminal 1 and the K17 Electronic Brake Control Module harness connector terminal 2
    - **If 2 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 2 Ω**

6. Test for less than 2 Ω between the M104R Park Brake Actuator - Right harness connector terminal 2 and the K17 Electronic Brake Control Module harness connector terminal 3
    - **If 2 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 2 Ω**

7. Install a 25 A fused jumper wire between one of the control terminals at the M104R Park Brake Actuator - Right and 12 V. Momentarily install a jumper wire between the other control terminal and ground. Reverse the jumper wires at least two times, the M104R Park Brake Actuator - Right should perform the apply and release function.
    - **If the actuator does not perform the apply and release function**

      Replace the M104R Park Brake Actuator - Right.

    - **If the actuator performs the apply and release function**

8. Replace the K17 Electronic Brake Control Module.

SYMPTOMS - PARK BRAKE

NOTE: **Review the system operation in order to familiarize yourself with the system functions. Refer to Electronic Parking Brake Description.**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the park brake system.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Park Brake Will Not Hold or Release
- Park Brake System Diagnosis

PARK BRAKE WILL NOT HOLD OR RELEASE

Step	Action	Yes	No
1	Were you sent here from the Park Brake Symptom Table?	Go to **Step 2**	Go to Symptoms - Park Brake
2	Inspect the park brake system for proper operation. Refer to Park Brake System Diagnosis. Did you find and correct a condition?	Go to **Step 4**	Go to **Step 3**
3	Inspect the disc brake system for proper operation. Refer to Disc Brake System Diagnosis . Did you find and correct a condition?	Go to **Step 4**	Go to Symptoms - Park Brake
4	Road test the vehicle in order to confirm proper operation. Refer to Brake System Vehicle Road Test . Is the condition still present?	Go to **Step 2**	System OK

PARK BRAKE SYSTEM DIAGNOSIS

Step	Action	Yes	No
DEFINITION: This diagnostic table is designed to diagnose ONLY the components of the PARK brake system in order to determine if the PARK brake system is operating properly. You will be directed by the appropriate Symptom Table to go to other brake system diagnostic tables as appropriate.			
1	1. Raise and support the vehicle with the rear axle supported by jack stands. Lifting and Jacking the Vehicle . 2. Shift the transmission into NEUTRAL. 3. With the park brake RELEASED, attempt to rotate the rear wheels to check the rear brakes for a significant amount of drag. Do the rear brakes have a significant amount of drag?	Go to **Step 4**	Go to **Step 2**
2	1. Shift the transmission into NEUTRAL. 2. Apply the park brake. 3. Attempt to rotate the rear wheels to check the rear brakes for a significant amount of drag. Do the rear brakes have a significant amount of drag?	Go to **Step 4**	Go to **Step 3**
3	Do the electronic park brake actuators working?	Go to **Step 10**	Go to **Step 5**
4	Calibrate the park brake. Park Brake Calibration Do the rear brakes have a significant amount of drag?	Go to **Step 5**	Go to **Step 10**

Step	Action	Yes	No
5	1. Check the fuse of the electronic park brake. 2. Check visual the electronic park brake actuators, the wiring harness and the electrical connectors. 3. Check visual the electronic brake control module, the wiring harness and the electrical connector. 4. Check the electronic park brake system with a scan tool. Did you find the condition?	Go to **Step 6**	Go to **Step 7**
6	- Replace the fuse as necessary. - Replace the wiring harness as necessary. - Replace the park brake actuator switch as necessary. **Parking Brake Actuator Switch Replacement** - Replace the parking brake actuators as necessary. **Rear Parking Brake Actuator Replacement** Did you correct the condition?	Go to **Step 9**	Go to **Step 6**
7	**CAUTION:** **Do not depress the brake pedal with the brake rotors and/or the brake drums removed, or with the brake calipers repositioned away from the brake rotors, or damage to the brake system may result.** 1. Remove the rear disc brake pads. **Rear Disc Brake Pads Replacement** . 2. Inspect the disc brake pads for looseness, damaged, broken or missing components. 3. Check the brake caliper piston seals for cracks. 4. Check the brake caliper pistons for movement 5. Check the electronic park brake actuators for a seized condition. Does the park brake hardware and/or the park brake actuators require replacement?	Go to **Step 8**	Go to **Step 10**
8	1. Replace the rear brake hardware components as necessary. **Rear Disc Brake Pads Replacement** 2. Replace the rear brake calipers as necessary. **Rear Brake Caliper Replacement** Did you complete the replacement?	Go to **Step 9**	-

Step	Action	Yes	No
9	1. Calibrate the electronic brake system. Park Brake Calibration Did you complete the replacement and adjustment?	Go to **Step 10**	Go to Symptoms - Park Brake
10	Install or connect any components that were removed or disconnected during diagnosis. Did you complete the operation?	Park Brake System OK	Go to Symptoms - Park Brake

REPAIR INSTRUCTIONS

PARK BRAKE CALIBRATION

1. Block the drive wheels.
2. Install a scan tool to the vehicle.
3. Turn the ignition switch to the ON/RUN position with the engine OFF.
4. Select Configuration/Reset Functions from the electronic brake control module menu.
5. Perform the parking brake calibration procedure.

4. Connect Electrical Connector (1) @Rear Park Brake Actuator (2)
5. Install the rear tire and wheel assembly. Tire and Wheel Removal and Installation
6. Lower the vehicle.
7. Calibrate the park brake. Park Brake Calibration

REAR PARKING BRAKE SERVICE MODE SELECTION

In order to perform repairs on certain parts of the rear brake system, it is necessary to fully retract the park brake caliper pistons. There are two ways to set the park brake into service mode. The preferred method is with a scan tool.

With Scan Tool

1. Install a scan tool.
2. Turn the ignition ON with the engine OFF.
3. Select Electronic Brake Control Module.
4. Select Control Functions.

NOTE: **Do NOT apply any brake pressure during this step.**

5. Select Rear Brake Caliper Piston Retract.

Without Scan Tool

1. Turn the ignition ON with the engine OFF.
2. Press accelerator pedal halfway down.
3. Place the park brake switch in the release position and hold for 10 seconds. Release the park brake switch.
4. Within 5 seconds, place the park brake switch into the release position again.

Exiting Service Mode

The park brake can be taken out of service mode with either of the following methods:

- With a scan tool, select Rear Brake Caliper Piston Extend.
- Place the park brake switch in the apply position.

DESCRIPTION AND OPERATION

ELECTRONIC PARKING BRAKE DESCRIPTION

Vehicles with the electric parking brake have a switch in the center console or on the dash, which takes the place of the manual parking brake system, the foot pedal and release handle. In case of insufficient electrical power, the electric parking brake cannot be applied or released.

Electronic Brake Control Module

The parking brake function is integrated into the Electronic Brake Control Module. The Electronic Brake Control Module contains the logic for applying and releasing the parking brake when commanded by the Park Brake Switch.

When the Park Brake Switch is pulled, a signal is sent to the Electronic Brake Control Module which will supply 12 V to the apply control circuits and ground to the release control circuits which will cause the left and right park brake actuators to activate causing the park brakes to engage. When the Park Brake Switch is pressed, a signal is sent to the Electronic Brake Control Module which will supply 12 V to the released control circuits and ground to the apply control circuits which will cause the left and right park brake actuators to activate causing the park brakes to release.

The Electronic Brake Control Module will diagnose the park brake motor circuits to verify that they are functioning properly. The park brake motor circuits are used to command actuator motor operation, which will apply and release the parking brake. These circuits are used to activate the actuator, which applies or releases pressure on the rear caliper pistons, ultimately applying and releasing the park brake.

The Park Brake Motor Position Sensor is an internal sensor to the park brake actuator, this sensor is used to monitor the park brake motor position.

Electric Parking Brake Apply

The electric parking brake can be applied any time the vehicle is stopped or in motion. The electric parking brake is applied by momentarily lifting up on the park brake control switch. The red park brake light will momentarily flash while the parking brake is being applied. Once fully applied, the red park brake light will turn on. If the electric parking brake is applied while the vehicle is in motion, a chime will sound, and the message "Release Park Brake Switch" will be displayed.

If the red park brake light is flashing, the electric parking brake is only partially applied or released, or there is a problem with the electric parking brake. The message "Service Park Brake" will be displayed.

The vehicle may automatically apply the electric parking brake in some situations when the vehicle is not moving. This is normal, and is done to periodically check the correct operation of the electric parking brake system.

Electric Parking Brake Release

To release the electric parking brake, turn the ignition switch to the ON or RUN position, apply and hold the brake pedal, and push down momentarily on the park brake control switch. When the electric parking brake is released the red park brake light turns off.

The electric parking brake can be used to prevent roll back for vehicles with a manual transmission taking off on a hill. In a situation where no roll back is desired, an applied electric parking brake will allow both feet to be used for the clutch and accelerator pedals in preparation for starting the vehicle moving in the intended direction. In this situation, perform the normal clutch and accelerator actions required to begin moving the vehicle. There is no need to push the switch to release the electric parking brake. To disable this feature lift and hold the park brake control switch while the vehicle is in motion, this will keep the electric parking brake applied.

One-Pedal Driving

The Electronic Brake Control Module contains the logic for the parking brake function. The EBCM sends out a EPB availability and application status signal on the high speed GMLAN which is monitored by the Hybrid Powertrain Control Module. The electronic parking brake can be automatically applied during One-Pedal Driving (OPD).

The vehicle provides One-Pedal Driving modes that are selectable using the drive unit shifter or Regen on Demand. One-Pedal Driving modes allow for increased deceleration without use of the brake and will bring the vehicle to a complete stop in many cases. The brake pedal should still be used to hold the vehicle at a stop, even when it may not seem necessary. The brake pedal may be required to bring the vehicle to a stop on sloped surfaces.

In One-Pedal Driving modes, the accelerator pedal can be used to control the deceleration rate of the car all the way to a stop. Completely lifting off of the accelerator pedal will result in an aggressive deceleration. However, by slowly lifting off of the accelerator pedal and making adjustments lightly on the accelerator pedal, the deceleration of the vehicle can be adjusted as desired.

If the vehicle begins to move after coming to a complete stop, the Electric Parking Brake may apply to prevent undesired movement. Applying the accelerator pedal will automatically release the Electric Parking Brake as the car moves forward.

2017 COLLISION

Paint and Coatings - Bolt EV

INTRODUCTION

BASECOAT/CLEARCOAT PAINT SYSTEMS

WARNING: **Exposure to isocyanates during paint preparation and application processes can cause severe breathing problems. Read and follow all of the instructions from the manufacturers of painting materials, equipment, and protective gear.**

All paint finish repairs of rigid exterior surfaces must meet GM standards. Refer to the latest revision of the GM Approved Refinish Materials book to identify the paint systems you may use that have been engineered to meet GM standards. The GM Approved Refinish Materials book supplies all approved products, including volatile organic compound (VOC) compliant regulations recommended by the individual manufacturer, and detailed procedures for materials used in their paint system.

The latest revision of the GM Approved Refinish Materials booklet is located on the Genuine GM Parts website at www.genuinegmparts.com.

ANTI-CORROSION TREATMENT AND REPAIR

WARNING: **When applying sound deadeners, or anti-corrosion materials due care and preventative measures must be exercised to prevent any material from being sprayed into door and quarter panel mechanisms such as door locks, window run channels, window regulators and seat belt retractors, as well as any moving or rotating mechanical or suspension parts on the underbody, particularly the parking brake cable. After material application, be sure that all body drain holes are open. Improper application may increase chance of corrosion damage or limit the operation of moving parts, resulting in personal injury.**

Any procedure that disturbs these special treatments, such as panel replacement or collision damage repair operations, may leave the metal unprotected and result in corrosion. Proper recoating of these surfaces with service-type anti-corrosion material is essential.

After repair and/or replacement parts are installed, all accessible bare metal surfaces must be treated with metal conditioner and reprimed. Refer to the GM Approved Refinish Materials book which identifies the paint systems you may use.

The latest revision of the GM Approved Refinish Materials booklet is located on the Goodwrench website at www.gmgoodwrench.com.

Anti-corrosion compounds are light-bodied materials designed to penetrate between metal-to-metal surfaces, such as pinch-weld joints, hem flanges, and integral panel attaching points where metal surfaces are difficult to coat with conventional undercoating materials, and are inaccessible for painting. The materials that are suitable for interior and exterior are listed in the chart below. Conventional undercoating is recommended in order to coat large areas, such as replacement door and quarter outer panels, floor pan sections, lids, hoods, fenders, etc. During undercoating operations, care should be taken to prevent the material from being sprayed into door and quarter panel hardware mechanisms, such as door locks, window run channels, window regulators, and seat belt retractors. On the underbody, the material should not be applied to any moving or rotating part, energy absorbing bumper components, or shock absorbers. After undercoating, ensure that all body drain holes are open.

Interior Protectant

The following products are available from GM Dealer Equipment. For technical information, call 187-Permatex (1-877-376-2839):

Permatex Part Number	Description
310-JDI-UCA1	Permatex Canister and Wand Assembly
310-81881	Permatex Amber Rust Proofing (24 oz) (Qty of 12)
310-81882	Permatex Amber Rust Proofing (1 gal)

Exterior Protectants

The following product is available from *ECP, Inc. Contact them at 1-800-323-3521 or www.ecpinc.net.

08801	No Clean-Up Applicator Gun
05917	Weld-Thru Coating
08891	Rust Fighter-I

The following product is available from *Transtar Autobody Technologies. Contact the company at 1-800-824-2843 or www.tat-co.com.

Part Number	Description
4353	Weld-Through Primer

*We believe these sources and their products to be reliable. There may be additional manufacturers of such material. General Motors does not endorse, indicate any preference for, or assume any responsibility for the products from these firms, or for any such items which may be available from other sources.

These sealers are intended to prevent water and dust from entering the vehicle and also are anti-corrosion barriers. Sealers are applied to such areas as rear compartment lid hem flanges, wheelhouse, quarter outer, floor, cowl, roof, and various other panel to panel attaching points. The originally sealed joints are obvious and any damage to these sealed locations should be corrected by resealing. Attaching points of new replacement panels should be resealed. Replacement lids and doors will also require sealing in the hem flange areas.

Flanged joints, overlap joints, and seams should be sealed using a quality sealer of medium-bodied consistency. The sealer used must retain its flexible characteristics after curing and be paintable.

Open joints which require bridging of the sealer in order to close a gap should be sealed using a heavy-bodied caulking material. Follow the label directions for the material selected.

Color application may be required in order to restore repaired areas such as hood, fenders, doors, quarters, lid, roof, engine compartment, underbody, and inner panels to original appearance. When this is necessary, conventional refinishing preparation, undercoat buildup, and color application techniques should be followed.

Deadener materials, spray-on type, are used on various metal panels in order to provide corrosion resistance and joint sealing. They control the general noise level inside the passenger area of the vehicle. When deadeners are disturbed because of damage, are removed during repair operations, or a new replacement panel is installed, the deadener material must be replaced by a service equivalent material. The application pattern and location of deadener materials can be determined by observing the original production installation.

Cleaning of the interior and underbody panel surfaces is necessary when original galvanized or other anti-corrosion materials have been burned off during welding or heating operations. Removal of the residue from burning will require additional care in such areas as interior surfaces of box-type construction and when configurations of the metal panels limit access to interior surfaces.

REPAIR INSTRUCTIONS

CLEARCOAT REPAIR WITHOUT REPAINTING

1. Thoroughly wash the repair area with Liquid Wash and Wax GM P/N 1052870 or the equivalent.
2. Environmental damage may be corrected. Refer to Environmental Fallout (Acid Rain), or Rail Dust Damage Repair.

NOTE: Follow all of the instructions from the manufacturer of the polishing material.

3. Use a paint gauge before, during, and after sanding and/or polishing, to avoid removing too much clearcoat. Refer to Paint Gauges.

ENVIRONMENTAL FALLOUT (ACID RAIN)

CAUTION: Refer to Clearcoat/Ultraviolet Screeners Caution .

NOTE: Always refer to the manufacturer's packaged instructions for the detailed procedures of materials used for compounding and/or polishing.

Since the severity of the condition varies from area to area, proper diagnosis of the contamination extent is critical to the success of the repairs. Perform the diagnosis under high intensity fluorescent lighting on the horizontal surfaces (hood, roof panel, rear compartment lid), after the surfaces have been properly cleaned by washing the vehicle with GM Wash and Wax GM P/N 1237841 (Canadian P/N 10953203), or equivalent.

There are 3 basic types of acid rain damage:

Surface Level Contamination

May be repaired by simply washing the vehicle, cleaning the surface with a silicone wax and grease remover, neutralizing acidic residue, and finesse polishing. Refer to Surface Level Contamination Repair.

Clearcoat Etching

Slight etching is still noticeable after the above washing and finesse polishing procedure. Refer to Slight Clearcoat Damage - Wet Sanding, Finesse Polishing.

Basecoat Etching

Severe etching beyond the clearcoat into the basecoat in the affected areas will require refinishing. Refer to Basecoat/Clearcoat Paint Systems.

Surface Level Contamination Repair

1. Thoroughly wash and dry the contaminated area with GM Wash and Wax GM P/N 1237841 (Canadian P/N 10953203), or equivalent.
2. Clean the affected area with silicone, wax and grease remover.
3. Remove and neutralize acidic residue by cleaning the contaminated areas with a mixture of baking soda and water (1 tablespoon of baking soda per 1 liter or 1 quart of water). Rinse thoroughly and dry the panel completely.
4. Apply finesse-type polish with a foam panel. If damage has been repaired, remove any swirl marks with a dual action orbital polisher and foam pad.
5. If some damage remains, refer to Slight Clearcoat Damage - Wet Sanding, Finesse Polishing.

Slight Clearcoat Damage - Wet Sanding, Finesse Polishing

1. Select a small contaminated test area.
2. Film thickness should be taken prior to the sanding and polishing. Refer to **Paint Gauges**.
3. Wet sand and finesse polish the contaminated test area. If during the polishing you suspect or observe that etching has penetrated into the basecoat, too much clearcoat has been removed during sanding, or base color is transferred to the polishing pad during polishing, then the affected areas will require refinishing. Refer to **Basecoat/Clearcoat Paint Systems**.

PAINT GAUGES

Paint thickness gauges measure the total thickness of the vehicle finish. It is important to accurately measure the thickness of the finish on each vehicle as the thickness of the finish will vary on each vehicle. Use a paint gauge before the sanding process in order to accurately measure how much finish there is to remove before, during, and after the sanding process. Paint gauges range from magnetic pull type to sophisticated electronic types, and are available from a variety of sources. The older magnetic type gauges, at best have a 5 percent accuracy range and are not sensitive enough to detect removal of 0.02 mm 0.5 mil (0.0005 in) clearcoat. The newer type magnetic gauges have improved accuracy ranges. Most gauges are confined to checking either ferrous metal, steel, non-ferrous metal, or aluminum panel. At this time, there are no viable gauges for reading film thickness on composite (SCM doors, RIM fenders) panels. The more sophisticated electronic paint thickness gauges (ETG) digital type gauges are able to read film thickness on both ferrous and non-ferrous metal panel. Digital ETG gauges may have an accuracy range of 1 percent and include thickness standards for recalibration. The following paint thickness gauges are available. Call 1-800-GM-TOOLS for information:

Paint Thickness Gauges

- 147-5437-ETG Standard model
- 147-5437-ETG-P Standard model with print option
- 147-5437-N-ETG-N Non-ferrous model for aluminum panels
- 147-5437-NP-ETG-NP Non-ferrous model with print option
- 147-54437-SD-ETG Steel and aluminum gauge

CLEARCOAT THICKNESS

The clearcoat on the vehicle is typically 0.059 - 0.078 mm (1.5 - 2 mils [0.0015 - 0.0020 in]) thick. The clearcoat contains ultraviolet screeners. Removing more than 0.5 mils (0.019 in) of the clearcoat may result in early paint failure.

RAIL DUST DAMAGE REPAIR

WARNING: **Refer to Eye Protection Warning .**

NOTE: **If rail dust has penetrated into the basecoat, the panel requires refinishing. Ensure all the rail dust has been removed prior to refinishing or the rust spots will return.**

Rail dust damage comes from the tiny iron particles produced from the friction between the train wheels and the track. It can also be deposited on vehicles if stored near any operation producing iron dust (i.e., steel ore yards). This dust can either lay on top of, or embed into the paint surface. It is usually diagnosed as bumps in the paint surface or rust colored spots in the paint.

1. Move the vehicle to a cool shaded area and ensure the vehicle surfaces are cool during the removal process.
2. Thoroughly wash the repair area with Liquid Wash and Wax GM P/N 1052870, or equivalent.
3. Wipe the area dry.
4. Clean the affected area with silicone, wax and grease remover.
5. Perform the removal process according to the manufacturer's directions of the type of repair material used (Gel Type Oxalic Acid or Clay Type Non-Acid Based). If, upon inspection, some

particles are still present, the process may be repeated. If the damage has been repaired, complete the repair to the entire panel.

6. Polish the entire panel after the removal process. If small pits remain in the clearcoat after all of the damage has been repaired, refer to **Clearcoat Repair without Repainting**.

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - WHEEL DRIVE SHAFTS

IMPORTANT: Complete the following steps prior to beginning the wheel drive shaft diagnosis.

1. Review the **Vibration Diagnosis, Starting Point, and Correction** .
2. Perform the **Vibration Analysis - Road Testing (EL-38792-A Electronic Vibration Analyzer)** **Vibration Analysis - Road Testing (CH-51450-NVH Oscilloscope)** in order to effectively diagnose the concern.
3. Review the system operation in order to become familiar with the system function. Refer to **Wheel Drive Shafts Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket equipment and modifications which could affect the operation of the wheel drive shafts or other rotating components.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Thoroughly inspect the entire wheel drive shaft for visible damage, leaking joint seals, and missing seal clamps.

- Inspect the wheel drive shaft seals for cuts, tears, or other damage which may allow the loss of lubricant and the entry of contaminants.

Symptom List

After performing the Visual/Physical Inspection and no visual signs of damage or other interference impairing the wheel drive shaft function is apparent, it may be necessary to remove the wheel drive shaft from the vehicle and manipulate the joints manually. Any binding or otherwise impeded movement of the joints may indicate damage which could contribute to the concern. Refer to the following:

- **Click Noise In Turns**
- **Clunk When Accelerating from Coast**
- **Clunk Noise When Accelerating During Turns**
- **Shudder or Vibration During Acceleration**

CLICK NOISE IN TURNS

A click noise occurring during turns may be caused by a worn or damaged wheel drive shaft outer joint. This may be more apparent while simultaneously turning and accelerating. This click is caused by wear and/or damage to the constant velocity joint bearings and/or races. Commonly, this damage or wear is caused by the loss of lubricating grease from the constant velocity joint and the entry of foreign material or contaminants.

Carefully inspect the wheel drive shaft seals for cuts, tears or other damage which may allow the lubricating grease to escape. The loss of this grease will cause damage to the wheel drive shaft constant velocity joint in a very short period of time.

If inspection reveals no visual evidence of wear or damage, it may be necessary to remove the wheel drive shaft from the vehicle and manipulate the inner joint manually. Any binding or impeded movement of the joint may indicate damage which could contribute to the concern.

CLUNK WHEN ACCELERATING FROM COAST

A clunk noise occurring when accelerating from coast or a standing start may be caused by a worn or damaged wheel drive shaft inner joint. The common cause of wheel drive shaft inner joint damage is the loss of lubricating grease and/or the presence of foreign material and contaminants in the joint. This usually occurs as a result of a torn or damaged inner joint seal.

Carefully inspect the wheel drive shaft seal for cuts, tears or other damage that may allow the loss of the lubricating grease and/or the entry of contaminants.

If inspection reveals no visual evidence of wear or damage, it may be necessary to remove the wheel drive shaft from the vehicle and manipulate the inner joint manually. Do not allow the outer joint to separate from the wheel drive shaft bar. Any binding or impeded movement of the joint may indicate damage which could contribute to the concern.

CLUNK NOISE WHEN ACCELERATING DURING TURNS

A clunk noise that occurs while accelerating during turns may be caused by wear and/or damage to the inboard and the outboard joints in combination. The loss of lubricant and/or the presence of contaminants can cause damage to the internal components of the joints.

Carefully inspect the joint seals for cuts, tears or other damage. Joint seals that are damaged may allow lubricant leakage and the entry of contaminants.

If inspection reveals no visual evidence of wear or damage, it may be necessary to remove the wheel drive shaft from the vehicle and manipulate the inner joint manually. Do not allow the outer joint to separate from the wheel drive shaft bar. Any binding or impeded movement of the joints may indicate damage which could contribute to the concern.

SHUDDER OR VIBRATION DURING ACCELERATION

In order to diagnose a shudder or vibration during acceleration, refer to **Vibration Diagnosis, Starting Point, and Correction** .

REPAIR INSTRUCTIONS

FRONT WHEEL DRIVE SHAFT REPLACEMENT

Special Tools

- **CH-49376** Wheel Hub Holding Tool
- **CH-49400** Hub Spindle Remover
- **EN-956-1** Extension

Equivalent regional tools: Special Tools

Removal Procedure

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the front tire and wheel assembly. Refer to Tire and Wheel Removal and Installation
3. Remove Front Compartment Air Deflector. Refer to Front Compartment Air Deflector Replacement

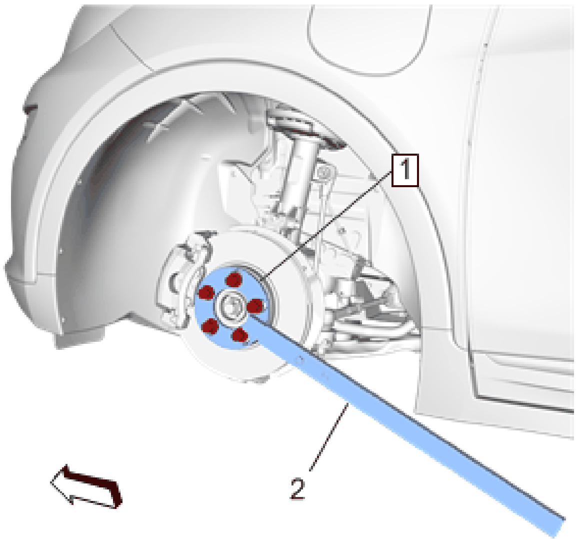

Fig. 1: Wheel Hub Holding Tool And Extension
Courtesy of GENERAL MOTORS COMPANY

4. Install the CH-49376 wheel hub holding tool (1) with the EN-956-1 extension (2) to the wheel hub with the wheel nuts and support the wheel hub holding tool outer end on a safety stand.

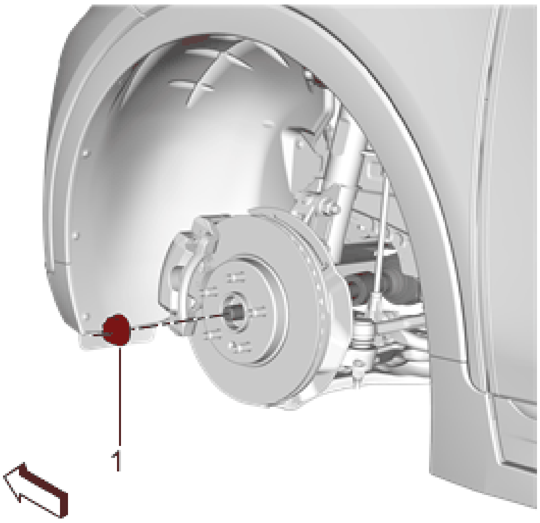

Fig. 2: Front Wheel Drive Shaft Nut
Courtesy of GENERAL MOTORS COMPANY

NOTE: The wheel drive shaft nut must be discarded after removal.

5. Remove and DISCARD Front Wheel Drive Shaft Nut (1) @ Front Wheel Drive Shaft

6. Remove the CH-49376 wheel hub holding tool from the wheel hub.

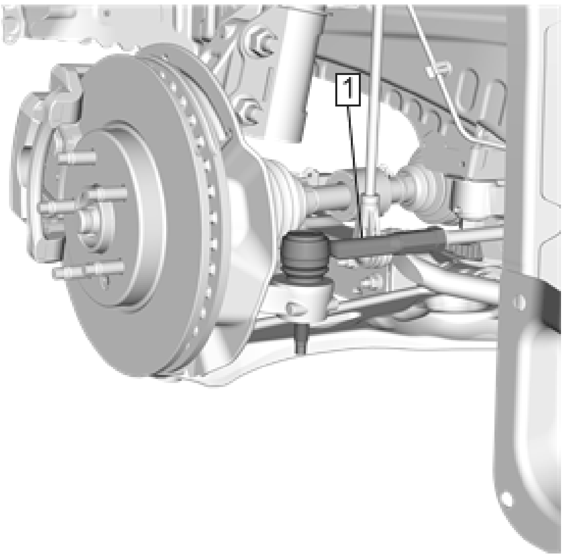

Fig. 3: Steering Linkage Outer Tie Rod

Courtesy of GENERAL MOTORS COMPANY

7. Separate Steering Linkage Outer Tie Rod (1) @ Steering Knuckle. Refer to Steering Linkage Outer Tie Rod Replacement

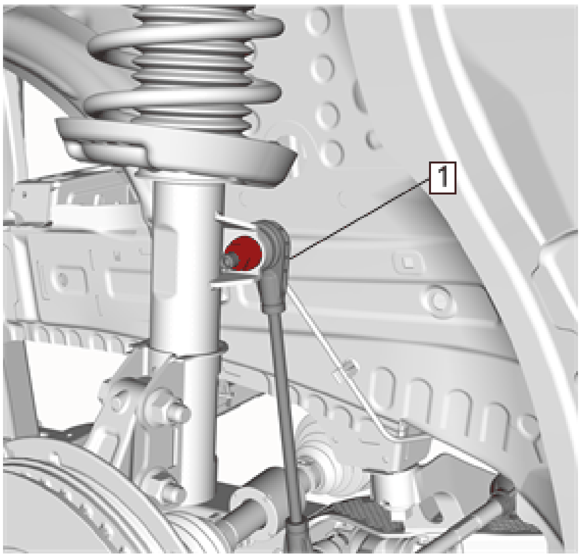

Fig. 4: Front Stabilizer Shaft Link

Courtesy of GENERAL MOTORS COMPANY

8. Separate Front Stabilizer Shaft Link (1) @ Front Suspension Strut. Refer to Stabilizer Shaft Link Replacement

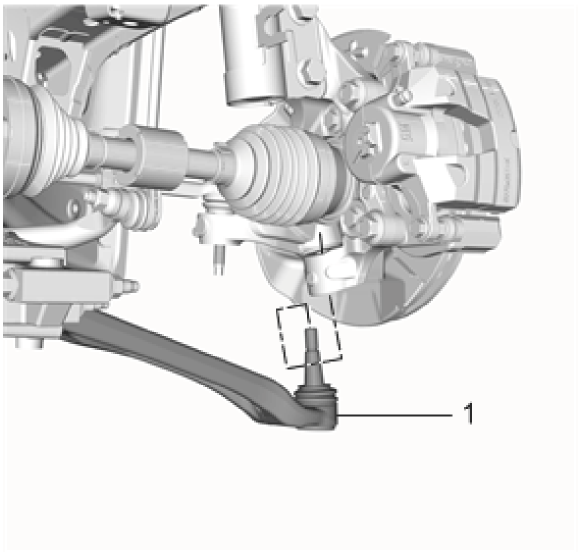

Fig. 5: Front Lower Control Arm Ball Joint
Courtesy of GENERAL MOTORS COMPANY

9. Separate Front Lower Control Arm Ball Joint (1) @ Steering Knuckle. Refer to **Lower Control Arm Replacement**

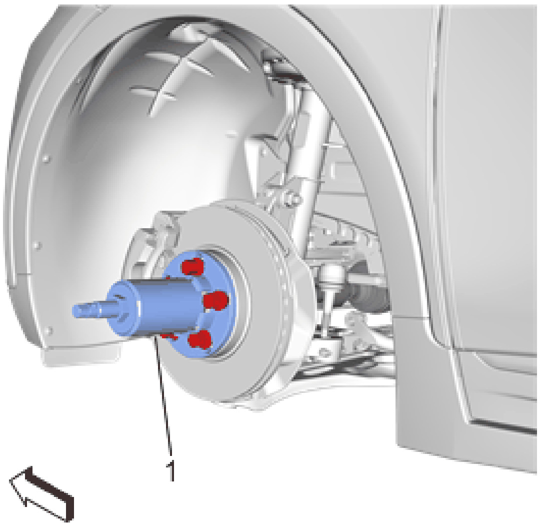

Fig. 6: Hub Spindle Remover
Courtesy of GENERAL MOTORS COMPANY

10. Using the CH-49400 hub spindle remover (1), disconnect the wheel drive shaft from the steering knuckle.

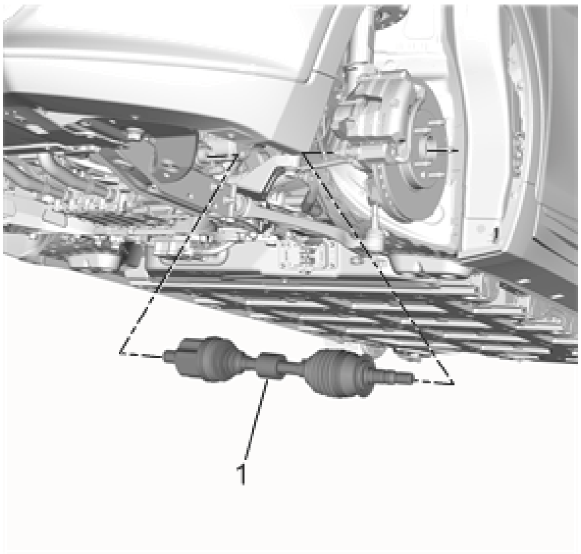

Fig. 7: Front Wheel Drive Shaft
Courtesy of GENERAL MOTORS COMPANY

11. Remove Front Wheel Drive Shaft (1) @ Vehicle

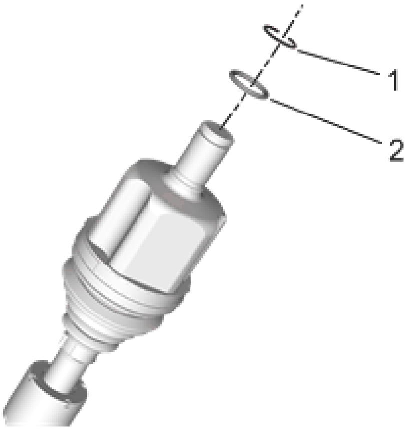

Fig. 8: Front Wheel Drive Shaft Retaining Ring And Seal
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The wheel drive shaft retaining ring and seal must be discarded after removal.**

12. Remove and DISCARD Front Wheel Drive Shaft Retaining Ring (1) @ Front Wheel Drive Shaft
13. Remove and DISCARD Front Wheel Drive Shaft Seal (2) @ Front Wheel Drive Shaft

Installation Procedure

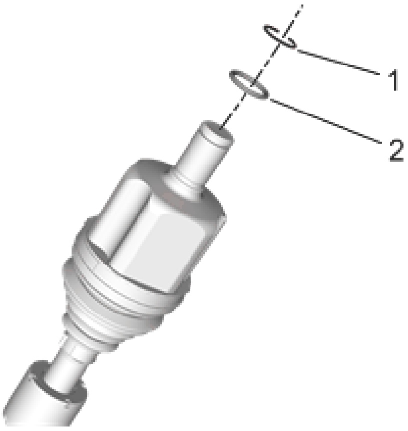

Fig. 9: Front Wheel Drive Shaft Retaining Ring And Seal
Courtesy of GENERAL MOTORS COMPANY

1. Install NEW Front Wheel Drive Shaft Seal (2) @ Front Wheel Drive Shaft
2. Install NEW Front Wheel Drive Shaft Retaining Ring (1) @ Front Wheel Drive Shaft

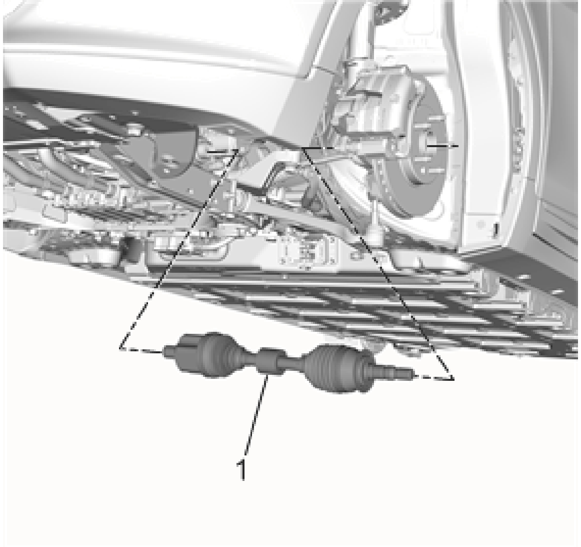

Fig. 10: Front Wheel Drive Shaft
Courtesy of GENERAL MOTORS COMPANY

3. Install Front Wheel Drive Shaft (1) @ Vehicle

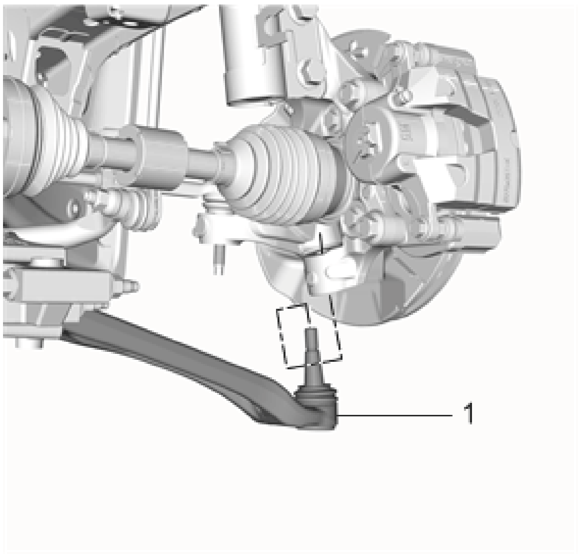

Fig. 11: Front Lower Control Arm Ball Joint
Courtesy of GENERAL MOTORS COMPANY

4. Install Front Lower Control Arm Ball Joint (1) @ Steering Knuckle. Refer to **Lower Control Arm Replacement**

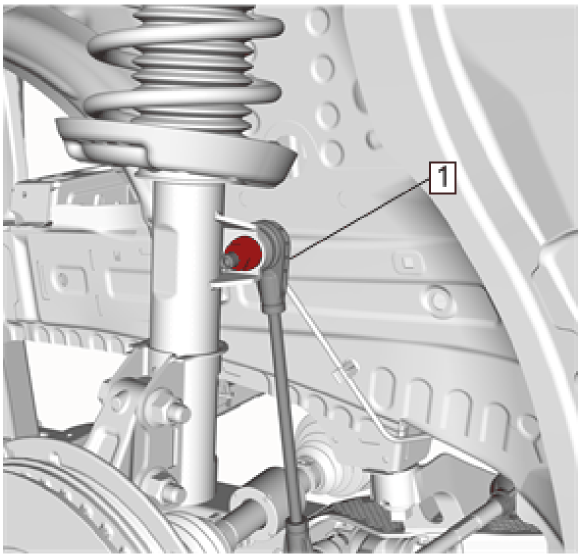

Fig. 12: Front Stabilizer Shaft Link
Courtesy of GENERAL MOTORS COMPANY

5. Install Front Stabilizer Shaft Link (1) @ Front Suspension Strut. Refer to **Stabilizer Shaft Link Replacement**

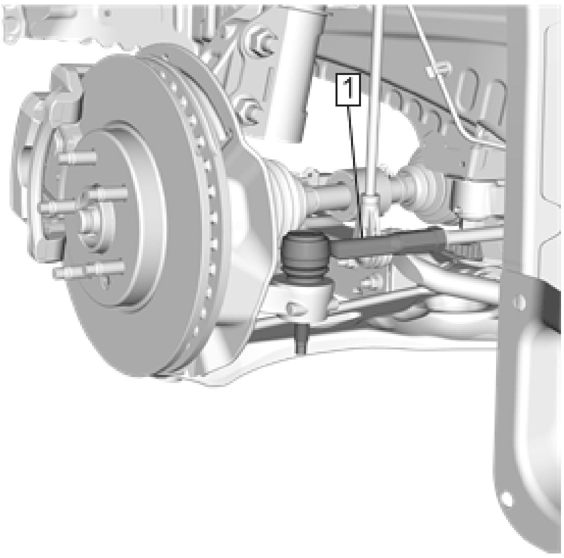

Fig. 13: Steering Linkage Outer Tie Rod
Courtesy of GENERAL MOTORS COMPANY

6. Install Steering Linkage Outer Tie Rod (1) @ Steering Knuckle. Refer to **Steering Linkage Outer Tie Rod Replacement**

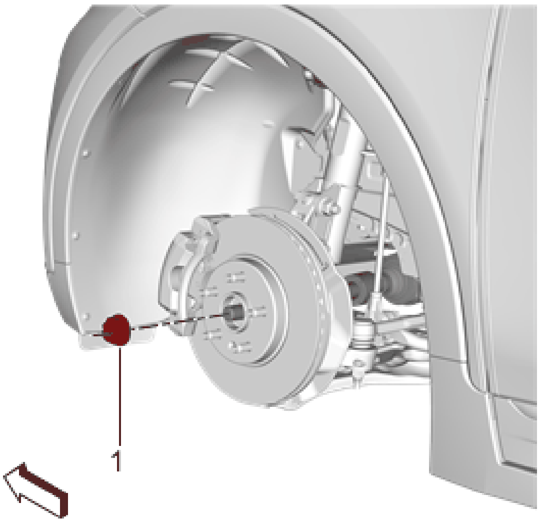

Fig. 14: Front Wheel Drive Shaft Nut
Courtesy of GENERAL MOTORS COMPANY

7. Install NEW Front Wheel Drive Shaft Nut (1) @ Front Wheel Drive Shaft

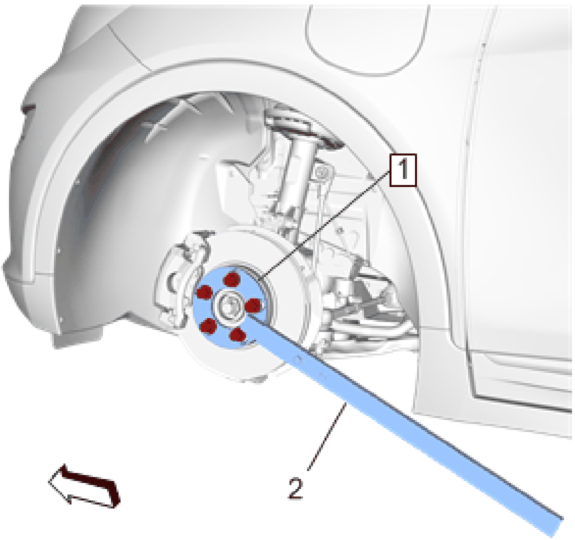

Fig. 15: Wheel Hub Holding Tool And Extension
Courtesy of GENERAL MOTORS COMPANY

8. Install the CH-49376 wheel hub holding tool (1) with the EN-956-1 extension (2) to the wheel hub with the wheel nuts and support the wheel hub holding tool outer end on a safety stand.

CAUTION: **Refer to Fastener Caution**

9. Tighten Front Wheel Drive Shaft Nut @ Front Wheel Drive Shaft
    1. First Pass: 150 N.m (111 lb ft)
    2. Second Pass: Loosen 45 Degrees
    3. Final Pass: 250 N.m (185 lb ft)
10. Remove the CH-49376 wheel hub holding tool from the wheel hub.
11. Install Front Compartment Air Deflector. Refer to **Front Compartment Air Deflector Replacement**
12. Install the front tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation**
13. Lower the vehicle.

FRONT WHEEL DRIVE SHAFT INNER JOINT AND BOOT REPLACEMENT

Removal Procedure

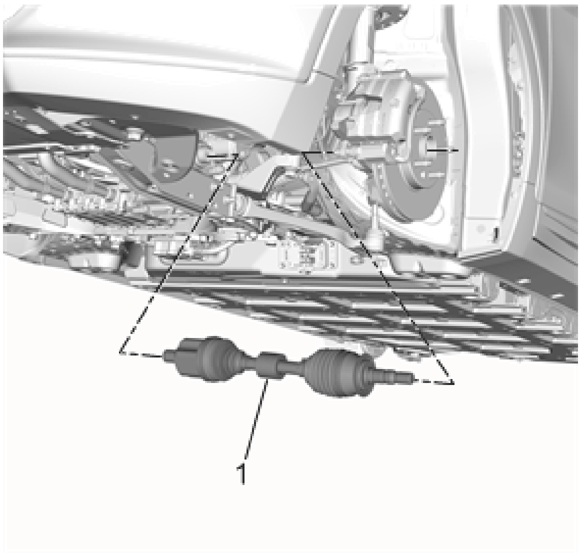

Fig. 16: Front Wheel Drive Shaft
Courtesy of GENERAL MOTORS COMPANY

1. Remove Front Wheel Drive Shaft (1) @ Vehicle. Refer to **Front Wheel Drive Shaft Replacement**

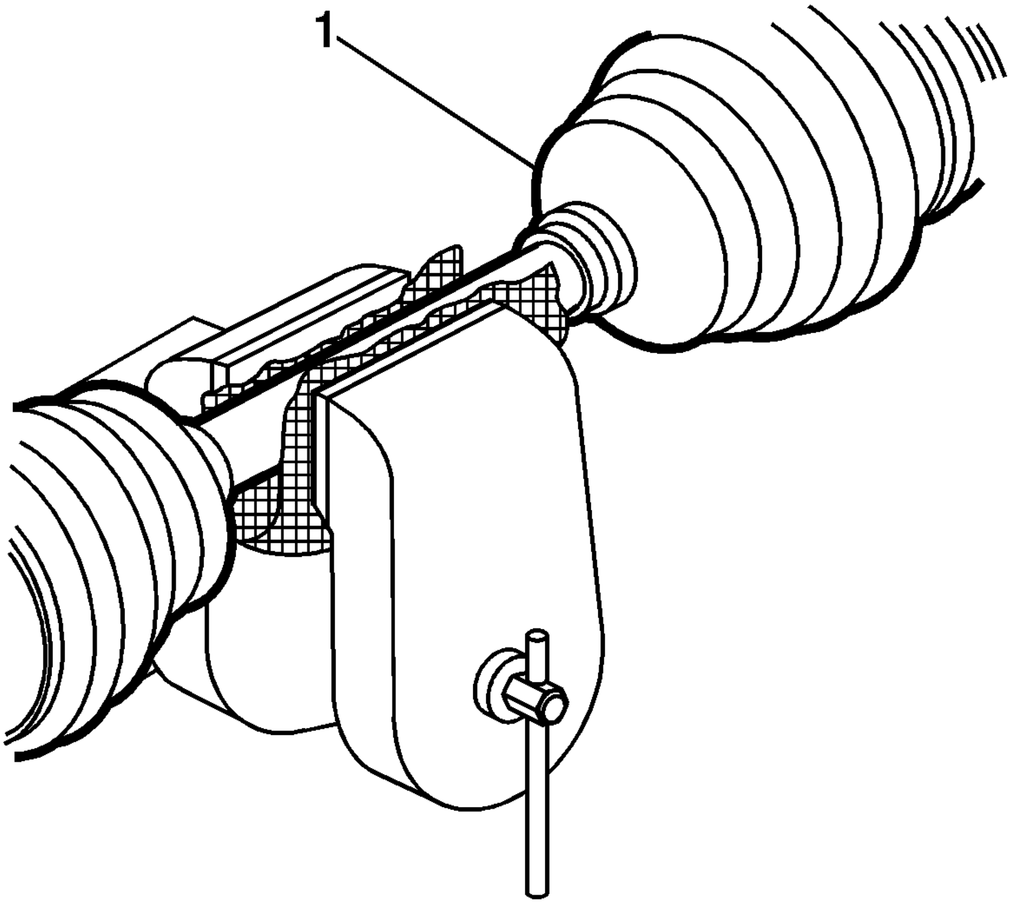

Fig. 17: Wheel Drive Shaft In Vise
Courtesy of GENERAL MOTORS COMPANY

2. Position the wheel drive shaft (1) in a soft jawed vise and clamp securely.

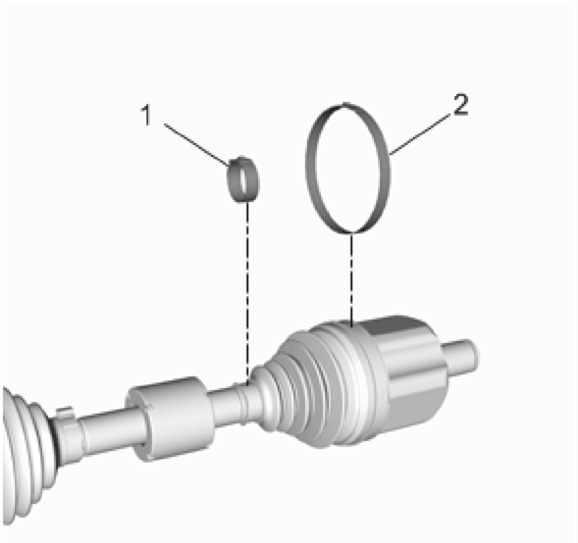

Fig. 18: Inboard Boot Inner Clamp And Outer Clamp

Courtesy of GENERAL MOTORS COMPANY

2. Position the boot (1) on the wheel drive shaft (2).

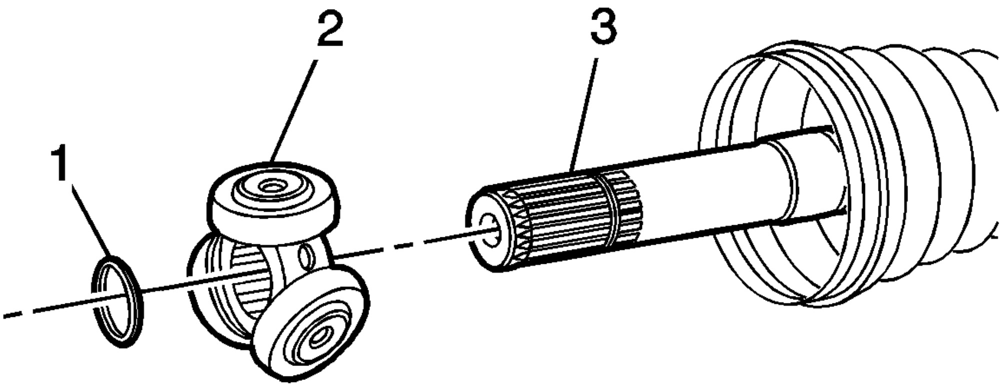

Fig. 36: Wheel Drive Shaft, Tripot Spider And Retaining Clip
Courtesy of GENERAL MOTORS COMPANY

3. Install the tripot spider assembly (2) to the wheel drive shaft (3), until seated against the shoulder.
4. Install the retaining ring (1) in the wheel drive shaft (3).
5. Place approximately half of the grease in the kit into the boot and place the remainder in the tripot housing.

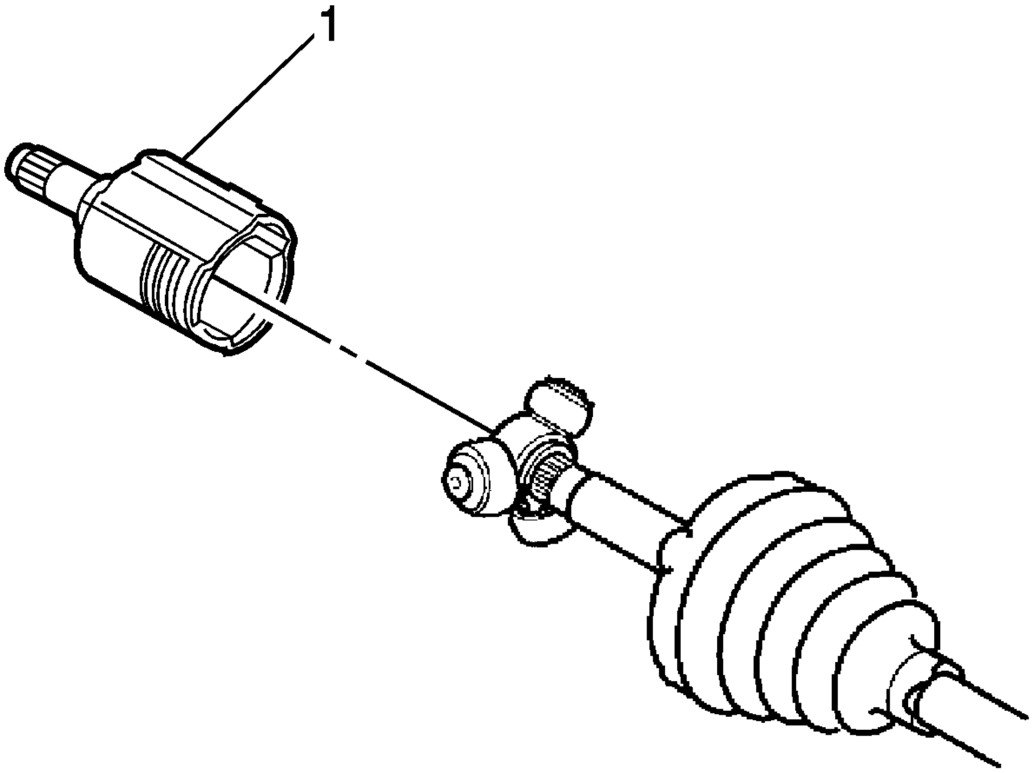

Fig. 37: Tripot Housing
Courtesy of GENERAL MOTORS COMPANY

6. Install the tripot housing (1) on the wheel drive shaft.

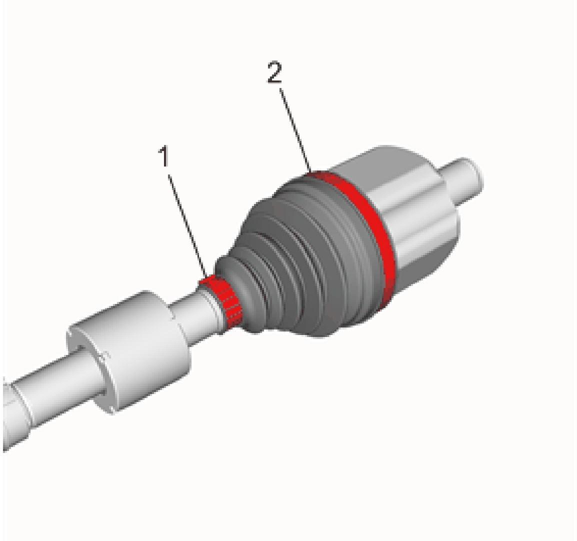

Fig. 38: Inboard Boot Inner Clamp And Outer Clamp
Courtesy of GENERAL MOTORS COMPANY

7. Compress and lock the inboard boot inner clamp (1) and outer clamp (2) using an appropriate earless seal clamp tool.

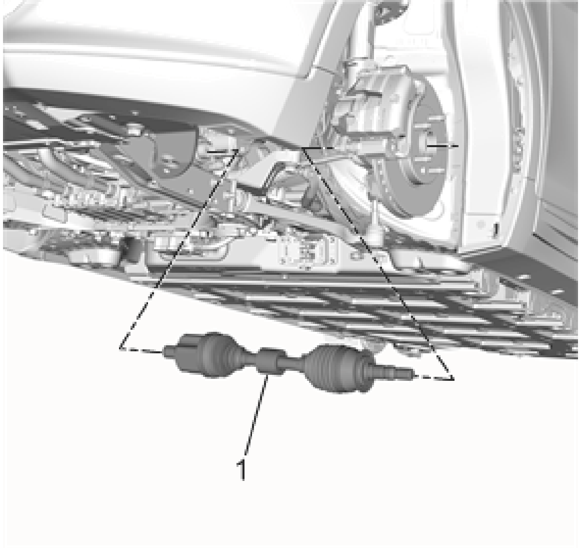

Fig. 39: Front Wheel Drive Shaft
Courtesy of GENERAL MOTORS COMPANY

8. Install Front Wheel Drive Shaft (1) @ Vehicle. Refer to **Front Wheel Drive Shaft Replacement**

DESCRIPTION AND OPERATION

WHEEL DRIVE SHAFTS DESCRIPTION AND OPERATION

Front wheel drive axles are flexible assemblies.

Front wheel drive axles consist of the following components:

- A front wheel drive shaft tripot joint (inner joint)
- A front wheel drive shaft constant velocity joint (outer joint)
- A front wheel drive shaft

  The front wheel drive shaft connects the front wheel drive shaft tripot joint and the front wheel drive shaft constant velocity joint.

The front wheel drive shaft tripot joint is completely flexible. The front wheel drive shaft tripot joint can move in and out.

The front wheel drive shaft constant velocity joint is flexible, but the front wheel drive shaft constant velocity joint cannot move in and out.

Boots And Clamps

The front wheel drive shaft constant velocity joint and the front wheel drive shaft tripot joint boots in the front wheel drive axle are made of a thermoplastic material.

The clamps in the front wheel drive axle are made of stainless steel.

The boot provides the following functions:

- Protection of the internal parts of the front wheel drive shaft constant velocity joint and the front wheel drive shaft tripot joint

  The boot protects the grease from the following sources of damage:

  - Harmful atmospheric conditions, such as extreme temperatures or ozone gas
  - Foreign material, such as dirt or water
- Allows angular movement and the axial movement of the front wheel drive shaft tripot joint
- Allows angular movement of the front wheel drive shaft constant velocity joint

NOTE: **Protect the boots from sharp tools and from the sharp edges of the surrounding components. Any damage to the boots or the clamps will result in leakage. Leakage**

will allow water to leak into the front wheel drive shaft tripot joint and the front wheel drive shaft constant velocity joints. Leakage will also allow grease to leak out of the front wheel drive shaft tripot joints and the front wheel drive shaft constant velocity joints. Leakage may cause noisy front wheel drive axle operation and eventual failure of the internal components.

The clamps provide a leak proof connection for the front wheel drive shaft tripot joint and the front wheel drive shaft constant velocity joint at the following locations:

- The housing
- The front wheel drive shaft

The thermoplastic material performs well under normal conditions and normal operation. However, the material is not strong enough to withstand the following conditions:

- Abusive handling
- Damage from sharp objects, such as sharp tools or any sharp edges of the surrounding components in the vehicle

Front Wheel Drive Shaft Tripot Joint (Inner Joint)

The front wheel drive shaft tri-pot joint is made with the tripot design without an over-extension limitation retainer.

The joint is constructed as follows for vehicles that are equipped with an automatic transmission:

- The left front wheel drive axle has a female spline. The female spline installs over a stub shaft that protrudes from the transaxle.
- The right front wheel drive axle has a female spline. The right front wheel drive axle uses barrel type snap rings in order to interlock with the intermediate shaft.

Front Wheel Drive Shaft Constant Velocity Joint (Outer Joint)

The front wheel drive shaft constant velocity joint is made with the Rzeppa joint design.

The shaft end (which mates with the knuckle/hub) has a helical spline. The helical spline ensures a tight, press-type fit.

This design prevents end play between the hub bearing and the front wheel drive axle.

DTC B1277	Cellular Phone Microphone Circuit
DTC B127E	Front Video Display Output Signal
DTC B1287	Amplifier Control Signal Circuit
DTC B1446 or B1447	Backup Power Source
DTC B2455	Cellular Phone Microphone Circuit
DTC B2462	Global Positioning System (GPS) Signal
DTC B2470	Cellular Phone Antenna Circuit Malfunction
DTC B2476 or B2482	Cellular Phone Select Service Switch

CRUISE CONTROL SYSTEM - DTCS

CRUISE CONTROL SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC P0572 or P0573	Brake Switch Circuit 1 Low/High Voltage
DTC P0575	Cruise Control Switch Signal Message Counter Incorrect
DTC P0703	Brake Switch Signal Message Counter Incorrect
DTC P158A	Cruise Control Calibration Incorrect

DATA COMMUNICATION SYSTEM - DTCS

DATA COMMUNICATION SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION (1 OF 2)

DTC	Description
DTC B1000	Electronic Control Unit
DTC B1001	Option Configuration
DTC B1016	Vehicle Identification Number Information Not Programmed
DTC B101D	Electronic Control Unit Hardware
DTC B101E	Electronic Control Unit Software
DTC C056D	Electronic Control Unit Hardware
DTC C056E	Electronic Control Unit Software
DTC P0601, P0607, P060A-P060C, P0610, P062F, P16E9-P16F0, or P262B	Control Module
DTC P06E4 (Hybrid/EV Powertrain Control Module 2)	Control Module Wake-Up Circuit Performance
DTC P0A1F, P1A01, P1A05, or P1A06	Battery Energy Control Module
DTC P16B7	Electric A/C Compressor Control Module Wake-Up Circuit Performance
DTC P16B8, P16BA	Electric A/C Compressor Control Module
DTC P1E8E, P1E91, P1E94-P1E97, P1E9A-P1E9D, P1EA0-P1EA3, P1F06-P1F09, P1FAC-P1FC2, P1FCF-P1FD4, P1FF3, P3031-P3034, P3037, P303C-P303F, or P3042	Hybrid/EV Battery Interface Control Module
DTC P1EB1	Hybrid/EV Battery Interface Control Module Software Incompatible
DTC P1EB2, P1EB5, P1FA6-P1FAB, P3030, or P303B	Hybrid/EV Battery Interface Control Module Not Programmed

DTC	Description
DTC P1EB9	High Voltage Energy Management Communication Bus Enable Circuit
DTC P1EC1 or P1EC2	Battery Energy Control Module High Voltage Energy Management Communication Bus Enable Circuit Low Voltage
DTC U0020	Low Speed CAN Bus
DTC U0073 or U2100	Control Module Communication Bus A Off, CAN Bus Communication
DTC U0074	Control Module Communication Powertrain Expansion CAN Bus Off
DTC U0077	Control Module Communication Chassis Expansion CAN Bus Off
DTC U0078	Control Module Communication Low Speed CAN Bus Off
DTC U007A	Control Module Communication High Voltage Energy Management CAN Bus Off
DTC U007B	Control Module Communication High Speed Extension CAN Bus Off
DTC U007C	Control Module Communication High Speed Extension CAN Bus 2 Off
DTC U007D	Control Module Communication Low Speed Extension CAN Bus Off
DTC U0100, U02FF	Lost Communication
DTC U0300, U0336	Software Incompatibility
DTC U0400, U05FF	Invalid Data Received
DTC U1026	Lost Communication with Transfer Case Control Module
DTC U1340, U135F	Chassis/Engine Control Module, Lost Communication
DTC U1500, U15FF	LIN Bus
DTC U1653	Chassis Systems High Speed Communication Enable Circuit
DTC U179A	Lost Communication with Hybrid Powertrain Control Module 2
DTC U179D	Lost Communication with Brake System Control Module 2 on Chassis Expansion Bus
DTC U1803	Lost Communication with Hybrid Powertrain Control Module 2
DTC U1806	Battery Energy Control Module High Voltage Energy Management CAN Bus Off
DTC U180B	Battery Energy Control Module High Speed CAN Bus Off
DTC U1814	Powertrain Wake-Up Communication Circuit
DTC U1817	Lost Communication with Hybrid Powertrain Control Module on Powertrain Expansion CAN Bus

DATA COMMUNICATION SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION (2 OF 2)

DTC	Description
DTC U1818	Lost Communication with Engine Control Module on Powertrain Expansion Communication Bus
DTC U182D	Lost Communication with Hybrid Powertrain Control Module 2 on Powertrain Expansion Communication Bus

DTC	Description
DTC U1833	Lost Communication with Electronic Brake Control Module on Chassis Expansion CAN Bus
DTC U183E	Lost Communication with Telematics Communication Interface Control Module on Low Speed CAN Bus
DTC U184A	Lost Communication with Body Control Module on Low Speed CAN Bus
DTC U184B	Lost Communication with Remote Heater and Air Conditioning Control Module on Low Speed CAN Bus
DTC U184C	Lost Communication with Instrument Cluster on Low Speed CAN Bus
DTC U184D	Lost Communication with Radio on Low Speed CAN Bus
DTC U184E	Lost Communication with Inflatable Restraint Sensing and Diagnostic Module on Low Speed CAN Bus
DTC U185A	Lost Communication with Battery Energy Control Module on High Voltage Energy Management CAN Bus
DTC U185B	Battery Energy Control Module Lost Communication with Hybrid/EV Powertrain Control Module 2 on High Voltage Energy Management CAN Bus
DTC U1860	Electric A/C Compressor Control Module Lost Communication with Hybrid Powertrain Control Module 2
DTC U1885	Battery Energy Control Module Lost Communication with Hybrid/EV Powertrain Control Module
DTC U18A4	Lost Communication with Hybrid/EV Battery DC Charging Communications Gateway Module on High Voltage Energy Management CAN Bus
DTC U18A6	Lost Communication with Right Object Detection Control Module on Dedicated Bus 1
DTC U18A9	Lost Communication With Transmission Range Control Module on Chassis Expansion CAN Bus
DTC U18AA	Transmission Range Control Module Lost Communication with Engine Control Module
DTC U18AB	Transmission Range Control Module Lost Communication with Chassis Control Module on High Speed CAN Bus
DTC U18AC	Transmission Range Control Module Lost Communication with Chassis Control Module on Chassis Expansion CAN Bus
DTC U18AD	Transmission Range Control Module Lost Communication with Electronic Brake Control Module on Chassis Expansion CAN Bus
DTC U18AF, U18B4	Lost Communication
DTC U18B5	Lost Communication With Hybrid Powertrain Control Module on Chassis Expansion CAN Bus
DTC U18B9, U18BF	Primary/Secondary High Speed CAN Bus Subnet Configuration List
DTC U2099	High Speed Communication Enable Circuit
DTC U2160, U2231	Lost Communication
DTC U2401	Battery Energy Control Module Dedicated Bus 1 Off

DTC	Description
DTC U2409	Transmission Range Control Module High Speed CAN Bus Off
DTC U240A	Transmission Range Control Module Chassis Expansion CAN Bus Off
DTC U2500, U25FF	Invalid Data Received
DTC U2602	Battery Energy Control Module Lost Communication with Hybrid/EV Powertrain Control Module 2
DTC U2603, U2606 or U2617-U2624	Battery Energy Control Module Lost Communication with Hybrid/EV Battery Interface Control Module
DTC U3000	Control Module
DTC U3012	Control Module Improper Wake-up Perfomance

FIXED AND MOVEABLE WINDOWS - DTCS

FIXED AND MOVEABLE WINDOWS - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC B0283	Rear Defogger Circuit
DTC B316B, B317A, B318A, or B319A	Window Switch
DTC B3205	Driver Window Motor Circuit

HORN SYSTEM - DTCS

HORN SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC B010E	Pedestrian Friendly Alert Audio Output Circuit
DTC B274E or B274F	Low Horn Output Short to Battery

HVAC SYSTEM - AUTOMATIC - DTCS

HVAC SYSTEM - AUTOMATIC - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC B0173 or B0178	Upper/Lower Left Duct Air Temperature Sensor Circuit
DTC B018A, B048C, B048F, or B1395	Windshield Temperature Sensor/Humidity Sensor Circuit
DTC B0193	Front Blower Motor Speed Circuit
DTC B0223, B0233, B023A, or B0408	Air Flow/Temperature Control
DTC B048E	Auxiliary Heater System Malfunction
DTC B3844	Engine Coolant Circulation Pump Circuit
DTC P0532 or P0533	Air Conditioning (A/C) Refrigerant Pressure Sensor Circuit Low/High Voltage
DTC P0534	Air Conditioning (A/C) Refrigerant Charge Low
DTC P0D69, P0D7F	A/C Compressor
DTC P151C or P2516, P2518	Air Conditioning (A/C) Refrigerant Low Side Pressure Sensor
DTC P154F	Electric A/C Compressor motor Input Current-Positive Contactor State Not Plausible
DTC P156A, P156C	Air Conditioning (A/C) Pressure Too High when A/C Off, Too Low when A/C On
DTC P15C6 or P15C8, P15CB	Electric A/C Compressor
DTC P1F0A, P1F0D	A/C Compressor Motor, Electric A/C Compressor Control Module

HYBRID / EV BATTERY HEATING AND COOLING - DTCS

HYBRID / EV BATTERY HEATING AND COOLING - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC P0480	Cooling Fan Relay Control Circuit
DTC P0A7E	Hybrid/EV Battery Pack High Temperature
DTC P0A9C, P0A9E, P0AC6-P0ACD, P0AE9-P0AEB, P0BC3-P0BC5, or P0C34-P0C36	Hybrid/EV Battery Temperature Sensor
DTC P0C43, P0C46	Hybrid/EV Battery Pack Coolant Temperature Sensor
DTC P0C47, P1E8C, or P1E8D	Hybrid/EV Battery Pack Coolant Pump Circuit
DTC P0CE9, P1F44, or P1F45	Hybrid/EV Electronics Coolant Pump Circuit
DTC P0CEF, P0CF2	Hybrid/EV Electronics Coolant Temperature Sensor
DTC P1485, P1487	Cooling Fan Output Circuit
DTC P19FA, P19FC	Hybrid/EV Electronics Coolant Pump Feedback Circuit
DTC P19FD, P19FF	Hybrid/EV Battery Pack Coolant Pump Feedback Circuit
DTC P148A, P148C	Cooling Fan Signal Circuit
DTC P1EC6	Hybrid/EV Battery Pack Heater Performance
DTC P1FFB, P1FFE	Hybrid/EV Battery Pack Coolant Level Sensor Circuit
DTC P1FFF	System Isolation / Coolant Level Sensor Fault - Hybrid/EV Battery Charging System Disabled

HYBRID / EV CONTROL SYSTEM - DTCS

HYBRID / EV CONTROL SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC P057B, P057E	Brake Pedal Position Sensor
DTC P0601, P0604, P0606, or P062F (Hybrid Powertrain Control Module 1)	Control Module
DTC P0601, P0604, P0606, P062F, P0630, P16F3, or P262B (ECM)	Control Module
DTC P061B	Control Module Torque Calculation Performance
DTC P0641, P0651, P0697, or P06A3	5 V Reference 1/2/3/4 Circuit
DTC P0650, P263A, or P263B	Malfunction Indicator Lamp (MIL) Control Circuit
DTC P0685, P0687, P0689, P0690, or P1682	Engine Controls Ignition Relay Control/Feedback Circuit
DTC P06AF	Torque Management System Performance - Forced Engine Shutdown
DTC P06B1 or P06B2	Sensor Supply Voltage Circuit Low/High Voltage
DTC P0A3F, P0A40, P0C52, P0C53, P0C5C, P0C5D, or P1B03	Drive Motor Position Sensor
DTC P0A5E, P0A61, or P0A64	Drive Motor Phase U/V/W Low Current
DTC P0A78	Drive Motor Inverter Performance
DTC P0A8D or P0A8F	14 V Power Module System Voltage Low/High Voltage
DTC P0AC4, P1E00, P25A2, P25C9, or P26C8	Hybrid/EV Powertrain/Brake System/Chassis Control Module

DTC	Description
DTC P0AEE, P0AEF, P0AF0, P0BD2, P0BD4, or P0BDC-P0BDE	Drive Motor Inverter Temperature Sensor
DTC P0BE6, P0BE8, P0BEA-P0BEC, P0BEE, P0BEF, or P0BF0	Drive Motor Phase U/V/W Current Sensor
DTC P0BFD	Drive Motor Phases U-V-W Not Plausible
DTC P0C01	Drive Motor High Current
DTC P0C0B	Drive Motor Inverter Supply Voltage Circuit
DTC P0C11, P0C13	Drive Motor Inverter Phase U/V/W High Temperature
DTC P0C17 or P1B0F	Drive Motor 1 Position Not Learned/Learn Incorrect
DTC P0C19	Drive Motor Torque Delivered Performance
DTC P0C2D or P0C2E	Electric/Auxiliary Transmission Fluid Pump Control Module Feedback Circuit Low/High Voltage
DTC P0C4E	Drive Motor Position Exceeded Learning Limit
DTC P0C76	Hybrid/EV Battery System High Voltage Present
DTC P150D or P150E	Supply Voltage Circuit 2/Circuit 1 Low Voltage
DTC P15F1	Axle Torque Request Signal Message Counter Incorrect
DTC P15FC	Hybrid/EV Battery Contactor Status Message Counter Incorrect
DTC P16F3	Control Module Redundant Memory Performance
DTC P16F4	Control Module Transmission Range Switch Input Circuitry Performance
DTC P16FF	Engine Controls Ignition Relay Request Signal Message Counter Incorrect
DTC P190A, P190C	Drive Motor 1 Inverter Phase U/V/W Temperature Erratic
DTC P1AE8 or P1AE9	Drive Motor Control Module Hybrid/EV Battery Voltage Sense Circuit Low/High Voltage
DTC P1AEC or P1AEE	Drive Motor Control Module Hybrid/EV Battery System Voltage
DTC P1AF0	Drive Motor Control Module Hybrid/EV Battery Voltage System Isolation Lost
DTC P1AF4 or P1AF5	Drive Motor Control Module Hybrid/EV Battery Voltage Isolation Sensing Circuit 1 Low/High Voltage
DTC P1B0B or P1B0C	Drive Motor Control Module Hybrid/EV Battery Voltage Isolation Sensing Circuit 2 Low/High Voltage
DTC P1B0D	Drive Motor 1 Control Module Drive Motor 1 Overspeed
DTC P1B41	Drive Motor Control Module Hybrid/EV Battery Voltage Isolation Sensing Performance
DTC P1E0A	Drive Motor Control Module Torque Calculation Performance
DTC P1E4A	Control Module Redundant Drive Motor 1 Speed Sensing Circuit
DTC P1F59, P1F5A, or P1F5B	14 Volt Power Module Status Terminal Circuit
DTC P1F5D or P1F5E	14 Volt Power Module L-Terminal Circuit Low/High Voltage
DTC P2122, P2123, P2127, P2128, or P2138	Accelerator Pedal Position (APP) Sensor
DTC P2797	Auxiliary Transmission Fluid Pump Performance

DTC	Description
DTC P2798 or P2799	Auxiliary Transmission Fluid Pump Control Circuit Low/High Voltage

HYBRID / EV ENERGY STORAGE - DTCS

HYBRID / EV ENERGY STORAGE - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC P0A0C or P0A0D	High Voltage System Interlock Circuit Low/High Voltage
DTC P0A7F	Hybrid/EV Battery Pack Life
DTC P0AA1, P0AA4, P0AD9, P0ADD, P0AE4, P0D09, P0D0A, P1EBD, P1EC0, or P1EC3	Hybrid/EV Battery, Battery Charging System
DTC P0AA6 or P1AE6	Hybrid/EV Battery, Battery Energy Control Module
DTC P0ABB, P0ABC, or P0ABD	Hybrid/EV Battery Voltage Sensor
DTC P0AC1, P0AC2, P0B10, P0B11, P0B13, P1EBA, or P1EBB	Hybrid/EV Battery Low/High Resolution Current Sensor
DTC P0AF8	Hybrid System Voltage
DTC P0AFA or P0AFB	Hybrid/EV Battery System Voltage Low/High Voltage
DTC P0B3B, P0BBB, P1B16-P1B2D, P1B45-P1BFE, P1E01-P1E06, or P1E4C-P1E8B	Hybrid/EV Battery 1 Through 96 Circuit
DTC P0C78 or P3061	Hybrid/EV Battery Precharge
DTC P1A07, P1E93, P1E99, P1E9F, P1EA5, P1FC3, P1FC8, P3035, or P3040	Hybrid/EV Battery Interface Control Module
DTC P1B3F or P1B40	High Voltage System Interlock Circuit 2 Low/High Voltage
DTC P1E92, P1E98, P1E9E, P1EA4, P1FC9, P1FCA, P1FCE, P3036, or P3041	Hybrid/EV Battery Interface Control Module 1 Through 12 Cell Balancing Circuit
DTC P1EAB or P1EAC	Battery Energy Control Module, Hybrid/EV Battery Cell Overvoltage Signal
DTC P1EAD, P1EB0 or P3240-P3253	Hybrid/EV Battery Interface Control Module 1 Through 12 Cell Overvoltage
DTC P1FD5, P1FF2, P3038-P303A, or P3043-P3045	Hybrid/EV Battery Interface Control Module 1 Through 12 Voltage Sensor
DTC P1F17	System Isolation / Impact Sensor Fault - Hybrid/EV Battery System Contactors Open
DTC P1FF4	System Isolation / Impact Sensor Fault - Hybrid/EV Battery System Contactors Open

HYBRID / EV PLUG-IN CHARGING - DTCS

HYBRID / EV PLUG-IN CHARGING - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC P0CF4, P0CF6 (North America, Korea)	Control Pilot Circuit
DTC P0CF9 or P0D01	Control Pilot Charging Switch/Ventilation Switch Performance
DTC P0D1F	Control Module Date/Time Synchronization Performance
DTC P0D26	Battery Charger System Precharge Time Too Long

DTC	Description
DTC P0D2B or P0D2C	Control Pilot Indicator Control Circuit/Charge Status Indicator Control Circuit
DTC P0D3E, P0D40	Battery Charger Input Voltage Sensor
DTC P0D4D, P0D4F	Battery Charger Hybrid/EV Battery Output Voltage Sensor
DTC P0D57, P0D59 (North America, Korea)	Proximity Detection Circuit
DTC P0D5A	Proximity Detection Circuit Erratic
DTC P0D5E	Battery Charger System High Voltage Present
DTC P0E61 or P0E65	Battery Charger Enable/Control Circuit
DTC P1ECE	Battery Charger Total Output Power Performance
DTC P1EE6 (North America, Korea)	Battery Charger AC Voltage Not Present
DTC P3002, P3003, P301F, or P3020	Hybrid/EV Battery DC Charging Positive Voltage Sensor
DTC P3005, P3006, P3021, or P3022	Hybrid/EV Battery DC Charging Negative Voltage Sensor
DTC P300B	Hybrid/EV Battery DC Charging Output Current Performance
DTC P300C, P300D, or P300F	Hybrid/EV Battery DC Charging Port Temperature Sensor Circuit Low/High/Erratic
DTC P3010, P3013, or P3014	Hybrid/EV Battery DC Charging Port Lock
DTC P3015, P3018, P301C, or P301D	Hybrid/EV Battery DC Charging Positive/Negative Contactor
DTC P301E	Hybrid/EV Battery DC Charging Contactors Opened Under Load - DC Charging Disabled
DTC P3027, P302A (Dubai)	Charge Port Lock Position Sensor
DTC P302B, P302D	Charge Port Lock Actuator Position Sensor
DTC P302F (North America, Korea)	Hybrid/EV Battery DC Charging System Isolation Fault
DTC P325C or P325D	Hybrid/EV Battery DC Charging Communication Gateway Module Processor Performance
DTC P325F (North America, Korea)	Hybrid/EV Battery DC Charging Communication Gateway Module - Offboard DC Charger Communication Interrupted

HYDRAULIC BRAKE SYSTEM - DTCS

HYDRAULIC BRAKE SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC C0075	Brake Pedal Position Sensor Performance
DTC C0126	Brake Fluid Level Sensor Circuit
DTC C0267	Low Brake Fluid Indicated
DTC C029F	Brake Booster System Performance
DTC C0579, C057A, or C057E	Brake Booster Control Module Temperature Sensor
DTC C057F, C0582, C058A, C0590, C0591, C0595, C0596, or C1275, C1277	Brake Booster Motor/Rotor/Control Module
DTC C0580 or C0594	Brake Booster Motor 1
DTC C1278 or C1279	Brake System Data 1/Data 2 Message Counter Incorrect
DTC C1449	System Configuration Error
DTC P057B, P057E, P05DC-P05DF, or P05E0	Brake Pedal Position Sensor
DTC P0601, P0603, P0604, P0606, P060B, or P062F	Control Module
DTC P0642, P06A6, or P06A7	Sensor Reference Voltage

DTC	Description
DTC P25C6 or P25C7	Brake Booster Temperature Sensor Circuit

IMMOBILIZER SYSTEM - DTCS

IMMOBILIZER SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC B2955	Security Sensor Data Circuit Malfunction
DTC B302A	Mobile Telephone Communications Interface Requested Immobilization
DTC B3031	Security Controller In Learn Mode
DTC B3055	No Transponder Modulation or No Transponder
DTC B305C	Immobilizer Transponder of Wrong Type Programmed
DTC B3060	Unprogrammed Transponder Identification Code Received
DTC B389A	Environment Identification
DTC B3902	Incorrect Immobilizer Identifier Received
DTC B3924, B3928	Incorrect Environmental Identifier Received
DTC B3935	Transponder Authentication
DTC B3976	Unconfigured Transponder
DTC B3984	Device 1 Environment Identifier Not Programmable
DTC P0513	Immobilizer Key Incorrect
DTC P0633	Immobilizer Key Not Programmed
DTC P162B	Remote Vehicle Speed Limiting Signal Message Counter Incorrect
DTC P1631	Immobilizer Fuel Enable Signal Not Correct
DTC P1649	Immobilizer Security Code Not Programmed

INSTRUMENT PANEL SYSTEM DISPLAYS AND GAUGES - DTCS

INSTRUMENT PANEL SYSTEM DISPLAYS AND GAUGES - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC B0550	Odometer Circuit General Memory Malfunction
DTC B071F	Transmission Range Indicator Internal Malfunction
DTC P0071, P0074	Ambient Air Temperature Sensor

KEYLESS ENTRY SYSTEM AND REMOTE FUNCTIONS - DTCS

KEYLESS ENTRY SYSTEM AND REMOTE FUNCTIONS - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC B305D	Challenge Active Circuit
DTC B3101	Keyless Entry Data Link Circuit
DTC B3105	Keyless Entry Transmitters
DTC B3106	Keyless Entry Data Link
DTC B3109, B3113	Keyless Entry Transmitter 1/2/3/4 Battery
DTC B310D, B310F	Keyless Entry Transmitter 6/7/8 Battery
DTC B3119	Keyless Entry Antenna 1
DTC B3120	Keyless Entry Antenna 2
DTC B3121	Keyless Entry Antenna 3
DTC B3122	Keyless Entry Antenna 4

DTC	Description
DTC B3123	Keyless Entry Antenna 5
DTC B3124	Keyless Entry Antenna 6

LIGHTING SYSTEM - DTCS

LIGHTING SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC B1395	Control Module Voltage Reference Output Circuit Low/High Voltage
DTC B1480	Battery Rundown Protection Circuit Short to Ground
DTC B2540	Rear Fog Lamps Control Circuit
DTC B2545	Backup Lamps Circuit
DTC B2570	Trunk Lamp Control Circuit Short to Ground
DTC B257A	Headlamp Switch Input Signals Correlation Malfunction
DTC B2580	Headlamp High Beam Control Circuit
DTC B2585 or B3867	Left/Right Park Lamps Control Circuit
DTC B258A	Low Beam Control Circuit
DTC B2600 or B2605	Left/Right Daytime Running Lamps Control Circuit Short to Ground
DTC B2610	Passenger Compartment Dimming 1 Circuit
DTC B2615	Passenger Compartment Dimming 2 Circuit Short to Ground
DTC B2625	Display Dimming Pulse Width Modulation Output Circuit Short to Ground
DTC B3588	Rear Fog Lamp Switch Circuit Malfunction
DTC B3596	Hazard Lamps Request Circuit Malfunction
DTC B3600	Passenger Compartment Dimming Request Signal Circuit Low/High Voltage
DTC B3650	High Beam Request Signal Circuit Performance - Signal Invalid
DTC B3806	High Beam and Headlamp Flash Select Circuit Malfunction
DTC B3881 or B3882 (MBM)	Left/Right Tail Lamp Circuit
DTC B3881 or B3882 (MAH/MBC/MAW/MCX)	Left/Right Tail Lamp Circuit
DTC B3883	License Plate Lamp Circuit
DTC B3884	Center High Mounted Stop Lamp Circuit
DTC B388B or B388C (MBM)	Auxiliary Left/Right Tail and Stop Lamp Circuit
DTC B388B or B388C (MAH/MBC/MAW/MCX)	Auxiliary Left/Right Tail and Stop Lamp Circuit
DTC B3890 or B3891 (MBM)	Trailer Backup/Fog Lamps Circuit
DTC B3890 or B3891 (MAH/MBC/MAW/MCX)	Trailer Backup/Fog Lamps Circuit
DTC B3948 or B3949	Left/Right Front Turn Signal Circuit
DTC B3950 or B3951	Left/Right Rear Turn Signal Circuit
DTC C0277 or C0890	Brake Pedal Position Sensor Circuit
DTC C0297	Brake Applied Output Circuit Short to Ground

OBJECT DETECTION SYSTEM AND PEDESTRIAN PROTECTION SYSTEM - DTCS

OBJECT DETECTION SYSTEM AND PEDESTRIAN PROTECTION SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC B094C	Right Side Object Detection Control Module
DTC B0954, B0955, B0956, or B0957	Parking Assist Front Sensor
DTC B095D or B095E	Parking Assist Rear Sensor Left/Right Side Circuit
DTC B0958, B0959, B0960, or B0961	Parking Assist Rear Sensor
DTC B0967 or B0968	Parking Assist On/Off Switch
DTC B096B	Parking Assist Switch Parallel Parking Circuit
DTC B096C or B096D	Parking Assist Side Sensor Left/Right Front Circuit
DTC B0987	Vehicle Direction Camera Indicator Circuit
DTC B1008	Calibration Data Not Programmed
DTC B1011	System Disabled Information Stored
DTC B1015	Vehicle Identification Number Information
DTC B101D (DTC set in K109 Frontview Camera Module)	Electronic Control Unit Hardware
DTC B127B	Rearview Camera Input Signal Circuit Malfunction
DTC B1405	Control Module Voltage Reference Output 2 Circuit
DTC B356A	Vehicle Direction Warning Switch Circuit
DTC B390D	Frontview Camera Module Incorrect Mounting
DTC B390F	Frontview Camera
DTC B395A	Rearview Camera
DTC B395B	Sideview Camera - Left
DTC B395C	Sideview Camera - Right
DTC B399A	Frontview Camera Supply Circuit Short to Battery/Ground
DTC B399B	Rearview Camera Supply Circuit Short to Battery/Ground
DTC B399C	Sideview Camera - Left Supply Circuit Short to Battery/Ground
DTC B399D	Sideview Camera - Right Supply Circuit Short to Battery/Ground
DTC P15F6	Front Object Detection Control Module Torque Request Signal Message Counter Incorrect

PARKING BRAKE SYSTEM - DTCS

PARKING BRAKE SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC C028B	Park Brake Motor Position Sensor - Signal Not Plausible
DTC C028F	Left Park Brake Actuator Circuit
DTC C0293	Park Brake Control Switch Circuit
DTC C1280 or C1281	Electric Park Brake Availability Status Message Counter Incorrect
DTC C1303	Automatic Park Brake Function Malfunction
DTC C1586 (HEV)	Right Park Brake Actuator Circuit
DTC C1587 (HEV)	Left Park Brake Actuator
DTC C1588 (HEV)	Right Park Brake Actuator

POWER DOOR LOCK SYSTEM AND RELEASE SYSTEMS - DTCS

POWER DOOR LOCK SYSTEM AND RELEASE SYSTEMS - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC B1474 or B3849	Passenger/Driver Exterior Door Handle Switch Circuit
DTC B1534 or B1535	Left/Right Rear Door Handle Switch Circuit
DTC B297B or B297C	Driver Door Open Switch Circuit Not Plausible
DTC B3125, B3130, or B3135	Driver Door Only/All Doors Unlock/Lock Circuit
DTC B3140, B3145, B3150, or B3155	Door Unlock/Lock Switch Circuit
DTC B324A or B3245	Rear Cargo Door Unlock Motor Circuit/Lock Actuator Circuit
DTC P0CCC, P0CCE, or P0CCF	Charge Port Door Position Sensor Circuit

POWER STEERING SYSTEM - DTCS

POWER STEERING SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC C0176	Control Module Temperature Sensor
DTC C0460	Steering Wheel Angle Sensor
DTC C0545	Steering Wheel Torque Sensor
DTC C056E	Electronic Control Unit Software

SEAT BELT SYSTEM - DTCS

SEAT BELT SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC B0072 or B0073	Driver/Passenger Seat Belt Switch Circuit
DTC B059A	Passenger Seat Belt Indicator Circuit

SECONDARY AND CONFIGURABLE CUSTOMER CONTROL SYSTEM - DTCS

SECONDARY AND CONFIGURABLE CUSTOMER CONTROL SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC B3622	Steering Wheel Controls Signal Circuit

SUPPLEMENTAL INFLATABLE RESTRAINT SYSTEM - DTCS

SUPPLEMENTAL INFLATABLE RESTRAINT SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC B0012 or B0013	Driver Steering Wheel Air Bag Deployment Loop Stage 1/Stage 2
DTC B0014, B0021, B0031, or B0038	Seat Side Air Bag Deployment Loop
DTC B0015, B001A, B001B, or B0022	Driver/Passenger Seat Belt Retractor/Anchor Pretensioner Deployment Loop
DTC B0016, B0018, B0023, or B0025	Roof Rail Air Bag Deployment Loop
DTC B0017 or B0024	Driver/Passenger Knee Air Bag Deployment Loop
DTC B0019 or B0020	Passenger Instrument Panel Air Bag Deployment Loop Stage 1/Stage 2
DTC B0052	Deployment Commanded
DTC B0071	Passenger Seat Belt Tension Sensor Circuit
DTC B0081 (Passenger Presence System)	Passenger Presence Module

DTC	Description
DTC B0081 (Inflatable Restraint Sensing and Diagnostic Module)	Passenger Presence Module
DTC B0082	Passenger Presence Detection Sensor
DTC B0083 or B0084	Left Front/Right Front Impact Sensor
DTC B0085 or B0088	Left Front/Right Rear Side Impact Sensor
DTC B0086 or B0087	Right Front/Left Rear Side Impact Sensor
DTC B0091	Center Front Impact Sensor
DTC B0092 or B0093	Left Center/Right Center Side Impact Sensor
DTC B067F or B0680	Passenger Air Bag On/Off Indicator Circuit
DTC B1001 (Inflatable Restraint Sensing and Diagnostic Module)	Option Configuration
DTC B1001 (Passenger Presence System)	Option Configuration Error
DTC B1019	System Configuration Error

TIRE PRESSURE MONITORING SYSTEM - DTCS

TIRE PRESSURE MONITORING SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC C0569	System Configuration Malfunction
DTC C0750, C0755, C0760, or C0765	Tire Pressure Sensor
DTC C0775	Tire Pressure Monitoring System Sensors Malfunction

WIPER SYSTEM AND WASHER SYSTEM - DTCS

WIPER SYSTEM AND WASHER SYSTEM - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC B370A	Rain Sensor
DTC B370B	Rear Wiper Function Control Circuit
DTC B371A	Windshield Wiper Motor Internal Malfunction
DTC B371C	Front Wiper Motor 2
DTC B3811	Rear Washer Relay Circuit
DTC B3873	Front Washer Relay Circuit

WIRING SYSTEMS AND POWER MANAGEMENT - DTCS

WIRING SYSTEMS AND POWER MANAGEMENT - DIAGNOSTIC TROUBLE CODE (DTC) IDENTIFICATION

DTC	Description
DTC B097B	Power Mode Start Switch Circuit
DTC B1370	Control Module Ignition On and Start Circuit
DTC B1445	Control Module Voltage Output Circuit
DTC B144A	Run Power Relay Circuit
DTC B144B	Run/Crank Power Relay Circuit
DTC B1451	Accessory Power Circuit
DTC B147E or B147F	Battery Saver Relay Set/Reset Secondary Circuit
DTC B305E	Interruptible RAP Relay Circuit
DTC P15B9 or P15BA	Electric A/C Compressor Control Module Ignition On/Start Switch Circuit Low/High Voltage
DTC P16E8	Engine Controls Ignition Relay Signal Message Counter Incorrect

DTC	Description
DTC P17B3 or P17B4	Transmission Range Control Module Ignition 1 Switch Circuit Low Voltage
DTC P17B5	Transmission Range Control Module Ignition Switch Accessory Position Circuit Low Voltage
DTC P1A5E or P1A5F	Battery Energy Control Module Ignition On/Start Switch Circuit Low/High Voltage
DTC P1A60	Battery Energy Control Module Ignition Accessory Switch Circuit Low Voltage
DTC P2534 or P2535	Ignition On/Start Switch Circuit Low/High Voltage
DTC P2537	Ignition Accessory Switch Circuit Low Voltage

12 V Starting and Charging - Bolt EV

SPECIFICATIONS

FASTENER SPECIFICATIONS

Reusable Threaded Fastener Tightening Specifications

Application	Specification
	Metric (English)
NOTE: *All fasteners listed in this table can be reused after removal.*	
Auxiliary Battery Negative Cable Fastener	22 N.m (16 lb ft)
Auxiliary Battery Positive Cable Fastener	22 N.m (16 lb ft)
Auxiliary Battery Positive Cable Nut	22 N.m (16 lb ft)
Battery Distribution Fuse Block Nut	22 N.m (16 lb ft)
Battery Negative Cable Clamp Ground Wire Fastener	5 N.m (44 lb in)
Battery Negative Cable Extension Cable Fastener - Lower	22 N.m (16 lb ft)
Battery Negative Cable Extension Cable Fastener - Upper	15 N.m (11 lb ft)
Battery Negative Cable Fastener	5 N.m (44 lb in)
Battery Negative Cable Nut	9 N.m (80 lb in)
Battery Positive and Negative Cable Ground Nut	22N.m (16 lb in)
Battery Positive Cable Clamp Fastener	5 N.m (44 lb in)
Battery Positive Cable Nut - 12V battery	22 N.m (16 lb in)
Battery Positive Cable Nut - Module	15 N.m (11 lb ft)
Battery Retainer Assembly Bolt	8 N.m (71 lb in)
Battery Tray Bolt	11.5 N.m (102 lb in)
Battery Tray Support Nut	9 N.m (80 lb in)
Body Wiring Harness Nut	5 N.m (44 lb in)
Engine Wiring Harness Bracket Bolt	9 N.m (80 lb in)
Engine Wiring Harness Bracket Nut	9 N.m (80 lb in)
Engine Wiring Harness Junction Block Bolt	1.5 N.m (13 lb in)

DTC P1EFC

Battery Charger Control Module System Voltage Low Voltage

Circuit/System Description

The vehicle control modules or sensors monitor the system voltage to verify the system voltage is within the normal operating range.

Conditions for Running the DTC

The vehicle is ON.

Conditions for Setting the DTC

The control module or sensor detects a system voltage of less than approximately 9 V or greater than 18 V for approximately 5 seconds.

Action Taken When the DTC Sets

- A driver information center message and/or warning indicator may be displayed.
- The control module may be temporarily disabled.

Conditions for Clearing the DTC

The system voltage returns to normal operating range.

Diagnostic Aids

- A high or low voltage DTC set or voltage value in multiple modules/sensors indicates a concern in the 12 V charging system.
- A possible cause of this DTC could be overcharging with a 12 V battery charger or jump starting.

Circuit/System Verification

1. Vehicle OFF, disconnect the T18 battery charger cord set. Measure and record the 12 V battery voltage at the battery terminals. The battery voltage should stabilize between 12.4 and 12.8 V within a few minutes of turning the Vehicle OFF.
    - If not within the specified range, refer to **Battery Inspection/Test**.

2. Vehicle ON, accessories OFF, measure and record the 12 V battery voltage at the battery terminals. The voltage should be at least 0.5 V greater than the voltage measured in step 1 but less than 15 V.
    - If not within the specified range, refer to DC Power Conversion Test .
3. Observe the appropriate module scan tool B+ and ignition voltage parameters. The voltage readings should be within 1 V of the battery voltage.

Circuit/System Testing

NOTE: **Use the schematic to identify the following:**

- **Control modules the vehicle is equipped with**
- **The control modules ground, B+, and Ignition circuit terminal IDs and connectors**

1. Vehicle OFF, disconnect the harness connectors at the appropriate control module.

    NOTE: **Some control module ground circuits may require up to 20 minutes to achieve a resistance reading of less than 10 Ω. In most cases the readings will drop below 20 Ω within 1 minute indicating the control modules are going to sleep.**

2. Vehicle OFF, scan tool disconnected, open and close the driver door and wait 1 minute. Test for less than 10 Ω between each ground circuit terminal and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
3. If equipped, verify that a test lamp illuminates between each B+ circuit terminal and ground.
    - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
4. If equipped, Vehicle in Service Mode, verify that a test lamp illuminates between each ignition circuit terminal and ground.
    - If the test lamp does not illuminate, test the ignition circuit for a short to ground or an open/high resistance.
5. If all circuits test normal, replace the control module.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Control Module References for control module replacement, programming and setup

DTC B1516: BATTERY CURRENT SENSOR

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC B1516 08

Battery Current Sensor Signal Invalid

DTC B1516 66

Battery Current Sensor Wrong Mounting Position

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	B1516 08	B1516 08	B1516 08	B1516 08, B1516 66
Low Reference	-	B1516 08	-	-

Circuit/System Description

The battery current sensor is a 3-wire hall effect current sensor. The body control module (BCM) supplies 5 V and ground to the battery current sensor. The battery current sensor measures the amount of current flowing to or from the battery, and supplies a pulse width modulation (PWM) signal to the BCM.

Conditions for Running the DTC

B1516 08

The BCM is awake.

B1516 08

The BCM is awake.

Conditions for Setting the DTC

B1516 08

The battery current signal is less than 4 percent or greater than 96 percent duty cycle for 2 minutes.

B1516 66

The battery current polarity is positive for 2 minutes.

Action Taken When the DTC Sets

The regulated voltage control is disabled.

Conditions for Clearing the DTC

The DTC passes when the battery current returns to the normal range for 15 seconds.

Diagnostic Aids

DTC B1516 08 could be set by overcharging with a battery charger or jump starting.

Circuit/System Testing

B1516 08

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B18 Battery Current Sensor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 30 Ω between the low reference circuit terminal B and ground.
   - **If 30 Ω or greater**
     1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module.
     2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
   - **If less than 30 Ω**
3. Vehicle ON.
4. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal A and ground.
   - **If less than 4.8 V**
     1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
     2. Test for infinite resistance between the 5 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
     3. Test for less than 2 Ω in the 5 V reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
   - **If greater than 5.2 V**
     1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, Vehicle ON.
     2. Test for less than 1 V between the 5 V reference circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
   - **If between 4.8 - 5.2 V**
5. Test for 4.8 - 5.2 V between the signal circuit terminal C and ground.
   - **If less than 4.8 V**
     1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
     2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
     3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
   - **If greater than 5.2 V**
     1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, Vehicle ON.
     2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
   - **If between 4.8 - 5.2 V**
6. Test or replace the B18 Battery Current Sensor.

B1516 66

1. Verify that the B18 Battery Current Sensor is installed securely around the negative battery cable, with the tape tab pointing away from the negative terminal on the C1 Battery.
   - **If the B18 Battery Current Sensor is not installed correctly**

Remove and reinstall the B18 Battery Current Sensor properly.

- **If the B18 Battery Current Sensor is installed correctly**

2. Replace the B18 Battery Current Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Battery Current Sensor Replacement**
- **Control Module References** for BCM replacement, programming, and setup.

DTC B151A: LOW BATTERY CAPACITY DETECTED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B151A 58

Low Battery Capacity Detected

Circuit/System Description

The body control module (BCM) monitors the battery voltage level during an engine crank event to detect a low battery voltage condition.

Conditions for Running the DTC

The vehicle is ON

Conditions for Setting the DTC

A minimum crank battery voltage is less than the minimum crank battery voltage threshold for 16 consecutive crank events.

Action Taken When the DTC Sets

A driver information center message is displayed.

Conditions for Clearing the DTC

The DTC will clear if the minimum crank voltage is greater than the minimum crank voltage threshold during a crank event.

DTC B1527: PARASITIC LOAD

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B1527 00

Parasitic Load

Circuit/System Description

The body control module (BCM) monitors the state of charge of the electrical system.

Conditions for Running the DTC

The ignition is in Accessory or Run mode.

Conditions for Setting the DTC

The state of charge at ignition ON is 30% lower than when the engine was running and battery drain is more than 2 A.

Action Taken When the DTC Sets

There is no battery telltale illuminated or DIC message displayed.

Conditions for Clearing the DTC

- The DTC will clear if the fault does not return after 50 consecutive ignition cycles.
- The DTC will clear when run state of charge is greater than or equal to 80%.
